1	Welcome to the Delphix Continuous Data documentation!	71
2	Quick references	74
3	Release notes.....	75
3.1	New features	75
3.1.1	Release 28.0.0.0.....	75
3.1.2	Release 27.0.0.0.....	75
3.1.3	Release 26.0.0.0.....	76
3.1.4	Release 25.0.0.0.....	76
3.1.5	Release 24.0.0.0.....	77
3.1.6	Release 23.0.0.0.....	77
3.1.7	Release 22.0.0.0.....	78
3.1.8	Release 21.0.0.0.....	78
3.1.9	Release 20.0.0.0.....	79
3.1.10	Release 19.0.0.0.....	79
3.1.11	Release 18.0.0.0.....	80
3.1.12	Release 17.0.0.0.....	81
3.1.13	Release 16.0.0.0.....	81
3.1.14	Release 15.0.0.0.....	81
3.1.15	Release 14.0.0.0.....	82
3.1.16	Release 13.0.0.0.....	83
3.1.17	Release 12.0.0.0.....	84
3.1.18	Release 11.0.0.0.....	84
3.1.19	Release 10.0.0.0.....	85
3.1.20	Release 9.0.0.0.....	85
3.1.21	Release 8.0.0.0.....	85
3.1.22	Release 7.0.0.0.....	86
3.1.23	Release 6.0.17.0.....	86

3.1.24	Release 6.0.16.0.....	86
3.1.25	Release 6.0.15.0.....	87
3.1.26	Release 6.0.14.0.....	88
3.1.27	Release 6.0.13.0.....	89
3.1.27.1	New in this release.....	89
3.1.27.2	Certifications.....	90
3.1.28	Release 6.0.12.0.....	90
3.1.28.1	New in this release.....	90
3.1.28.2	Certifications.....	91
3.1.29	Release 6.0.11.0.....	91
3.1.29.1	New in this release.....	91
3.1.29.2	Certifications.....	92
3.1.30	Release 6.0.10.0.....	92
3.1.30.1	Virtualization.....	92
3.1.30.2	Certifications.....	93
3.1.30.3	Virtualization.....	93
3.1.31	Release 6.0.9.0.....	93
3.1.31.1	Virtualization.....	93
3.1.31.2	Certifications.....	94
3.1.32	Release 6.0.8.0.....	94
3.1.32.1	Virtualization.....	94
3.1.33	Release 6.0.7.0.....	95
3.1.33.1	Virtualization.....	95
3.1.34	Release 6.0.6.0.....	96
3.1.34.1	Virtualization.....	96
3.1.34.2	Certifications.....	97
3.1.35	Release 6.0.5.0.....	98
3.1.35.1	Virtualization.....	98
3.1.35.2	Certifications.....	98

3.1.36	Release 6.0.4.0.....	99
3.1.36.1	Virtualization	99
3.1.36.2	Certifications	99
3.1.37	Release 6.0.3.0.....	99
3.1.37.1	Virtualization	99
3.1.37.2	Certifications	100
3.1.38	Release 6.0.2.0.....	101
3.1.38.1	Virtualization	101
3.1.38.2	Certifications	101
3.1.39	Release 6.0.1.0.....	101
3.1.39.1	Certifications	102
3.1.40	Release 6.0.0.0.....	102
3.2	Fixed issues.....	103
3.2.1	Release 28.0.0.0 Changes.....	104
3.2.1.1	Fixes that take effect immediately after upgrading.....	104
3.2.2	Release 27.0.0.0 Changes.....	104
3.2.2.1	Fixes that take effect after upgrading and rebooting.....	104
3.2.3	Fixes that take effect immediately after upgrading.....	105
3.2.4	Release 26.0.0.0 Changes.....	106
3.2.5	Fixes that take effect after upgrading and rebooting.....	106
3.2.6	Fixes that take effect immediately after upgrading.....	107
3.2.7	Release 25.0.0.0 Changes.....	109
3.2.8	Fixes that take effect immediately after upgrading.....	109
3.2.9	Release 24.0.0.0 Changes.....	110
3.2.10	Fixes that take effect after upgrading and rebooting.....	110
3.2.11	Fixes that take effect immediately after upgrading.....	111
3.2.12	Release 23.0.0.0 Changes.....	112
3.2.13	Fixes that take effect after upgrading and rebooting.....	112
3.2.14	Fixes that take effect immediately after upgrading.....	112

3.2.15	Release 22.0.0.0 Changes.....	114
3.2.16	Fixes that take effect immediately after upgrading.....	114
3.2.17	Release 21.0.0.1 Changes.....	117
3.2.18	Fixes that take effect immediately after upgrading.....	117
3.2.19	Release 21.0.0.0 Changes.....	117
3.2.20	Fixes that take effect after upgrading and rebooting.....	117
3.2.21	Fixes that take effect immediately after upgrading.....	117
3.2.22	Release 20.0.0.0 Changes.....	119
3.2.23	Fixes that take effect after upgrading and rebooting.....	119
3.2.24	Fixes that take effect immediately after upgrading.....	119
3.2.25	Release 19.0.0.0 Changes.....	121
3.2.26	Fixes that take effect after upgrading and rebooting.....	121
3.2.27	Fixes that take effect immediately after upgrading.....	121
3.2.28	Release 18.0.0.1 Changes.....	123
3.2.29	Fixes that take effect immediately after upgrading.....	123
3.2.30	Release 18.0.0.0 Changes.....	123
3.2.31	Fixes that take effect immediately after upgrading.....	123
3.2.32	Release 17.0.0.0 Changes.....	124
3.2.33	Fixes that take effect immediately after upgrading.....	124
3.2.34	Release 16.0.0.0 Changes.....	126
3.2.35	Fixes that take effect after upgrading and rebooting (optional).....	126
3.2.36	Fixes that take effect immediately after upgrading.....	126
3.2.37	Release 15.0.0.0 Changes.....	127
3.2.38	Fixes that take effect after upgrading and rebooting (optional).....	127
3.2.39	Fixes that take effect immediately after upgrading.....	128
3.2.40	Release 14.0.0.0 Changes.....	129
3.2.41	Fixes that take effect after upgrading and rebooting (optional).....	129
3.2.42	Fixes that take effect immediately after upgrading.....	130
3.2.43	Release 13.0.0.0 Changes.....	131

3.2.44	Fixes that take effect immediately after upgrading.....	131
3.2.45	Release 12.0.0.0 Changes.....	133
3.2.46	Security fixes.....	133
3.2.47	Fixes that take effect after upgrading and rebooting (optional).....	133
3.2.48	Fixes that take effect immediately after upgrading.....	133
3.2.49	Release 11.0.0.0 changes	135
3.2.50	Security fixes.....	135
3.2.51	Fixes that take effect after upgrading and rebooting (optional).....	135
3.2.52	Fixes that take effect immediately after upgrading.....	136
3.2.53	Release 10.0.0.1 changes	140
3.2.54	Fixes that take effect after upgrading and rebooting (optional).....	140
3.2.55	Release 10.0.0.0 changes	140
3.2.56	Fixes that take effect after upgrading and rebooting (optional).....	140
3.2.57	Fixes that take effect immediately after upgrading.....	141
3.2.58	Release 9.0.0.1 changes	143
3.2.59	Release 9.0.0.0 changes	143
3.2.60	Fixes that take effect after upgrading and rebooting (optional).....	143
3.2.61	Fixes that take effect immediately after upgrading.....	144
3.2.62	Release 8.0.0.0 changes	145
3.2.63	Fixes that take effect after upgrading and rebooting (optional).....	145
3.2.64	Fixes that take effect immediately after upgrading.....	146
3.2.65	Release 7.0.0.0 changes	149
3.2.66	Fixes that take effect after upgrading and rebooting (optional).....	149
3.2.67	Fixes that take effect after upgrading and rebooting (optional).....	149
3.2.68	Fixes that take effect immediately after upgrading.....	150
3.2.69	Release 6.0.17.0 changes	153
3.2.70	Security fixes.....	153
3.2.71	Fixes that take effect after upgrading and rebooting (optional).....	153
3.2.72	Fixes that take effect immediately after upgrading.....	154

3.2.73	Release 6.0.16.0 changes	157
3.2.74	Release 6.0.15.0 changes	159
3.2.75	Fixes that take effect after upgrading and rebooting (optional).....	159
3.2.76	Fixes that take effect immediately after upgrading.....	159
3.2.77	Release 6.0.14.0 changes	162
3.2.78	Security fixes	162
3.2.79	Fixes that take effect immediately after upgrading.....	162
3.2.80	Fixes that take effect after upgrading and rebooting (optional).....	165
3.2.81	Release 6.0.13.1 changes	165
3.2.82	Fixes that take effect immediately after upgrading.....	165
3.2.83	Release 6.0.13.0 changes	166
3.2.84	Security fixes	166
3.2.85	Fixes that take effect immediately after upgrading.....	166
3.2.86	Release 6.0.12.1 changes	169
3.2.87	Fixes that take effect immediately after upgrading.....	169
3.2.88	Release 6.0.12.0 changes	169
3.2.89	Log4j updates.....	169
3.2.90	Fixes that take effect immediately after upgrading.....	170
3.2.91	Release 6.0.11.0 changes	173
3.2.92	Security fixes	173
3.2.93	Fixes that take effect immediately after upgrading.....	173
3.2.94	Fixes that take effect after upgrading and rebooting (optional).....	176
3.2.95	Release 6.0.10.1 changes	177
3.2.96	Fixes that take effect immediately after upgrading.....	177
3.2.97	Release 6.0.10.0 changes	177
3.2.98	Fixes that take effect immediately after upgrading.....	177
3.2.99	Fixes that take effect after upgrading and rebooting (optional).....	181
3.2.100	Release 6.0.9.0 changes	182
3.2.101	Fixes that take effect immediately after upgrading.....	182

3.2.102	Fixes that take effect after upgrading and rebooting (optional).....	186
3.2.103	Release 6.0.8.1 changes	186
3.2.104	Fixes that take effect immediately after upgrading.....	186
3.2.105	Release 6.0.8.0 changes	186
3.2.106	Fixes that take effect immediately after upgrading.....	186
3.2.107	Fixes that take effect after upgrading and rebooting (optional).....	190
3.2.108	Release 6.0.7.0 changes	191
3.2.109	Fixes that take effect immediately after upgrading.....	191
3.2.110	Fixes that take effect after upgrading and rebooting (optional).....	195
3.2.111	Release 6.0.6.1 changes	195
3.2.112	Fixes that take effect immediately after upgrading.....	195
3.2.113	Release 6.0.6.0 changes	196
3.2.114	Fixes that take effect immediately after upgrading.....	196
3.2.115	Fixes that take effect after upgrading and rebooting (optional).....	199
3.2.116	Fixes that take effect after upgrading and rebooting (optional).....	200
3.2.117	Release 6.0.5.0 changes	200
3.2.118	Fixes that take effect immediately after upgrading.....	200
3.2.119	Fixes that take effect after upgrading and rebooting (optional).....	203
3.2.120	Release 6.0.4.2 changes	203
3.2.121	Fixes that take effect immediately after upgrading.....	203
3.2.122	Release 6.0.4.1 changes	204
3.2.123	Fixes that take effect immediately after upgrading.....	204
3.2.124	Release 6.0.4.0 changes	204
3.2.125	Fixes that take effect immediately after upgrading.....	204
3.2.126	Release 6.0.3.1 changes	206
3.2.127	Fixes that take effect after upgrading and rebooting (optional).....	206
3.2.128	Release 6.0.3.0 changes	207
3.2.129	Fixes that take effect immediately after upgrading.....	207
3.2.130	Fixes that take effect after upgrading and rebooting (optional).....	211

3.2.131	Release 6.0.2.1 changes	212
3.2.132	Fixes that take effect immediately after upgrading.....	212
3.2.133	Fixes that take effect after upgrading and rebooting (optional).....	212
3.2.134	Release 6.0.2.0 changes	213
3.2.135	Fixes that take effect immediately after upgrading.....	213
3.2.136	Fixes that take effect after upgrading and rebooting (optional).....	215
3.2.137	Release 6.0.1.1 changes	216
3.2.138	Fixes that take effect after upgrading and rebooting (optional).....	216
3.2.139	Release 6.0.1.0 changes	216
3.2.140	Fixes that take effect immediately after upgrading.....	216
3.2.141	Fixes that take effect after upgrading and rebooting (optional).....	220
3.2.142	Release 6.0.0.0 changes	221
3.2.143	Fixes that take effect immediately after upgrading.....	221
3.2.144	Fixes that take effect after upgrading and rebooting (optional).....	224
3.2.145	Release 6.0.15.0 changes	226
3.2.146	Fixes that take effect after upgrading and rebooting (optional).....	226
3.2.147	Fixes that take effect immediately after upgrading.....	226
3.2.148	Release 6.0.14.0 changes	228
3.2.149	Security fixes	228
3.2.150	Fixes that take effect immediately after upgrading.....	229
3.2.151	Fixes that take effect after upgrading and rebooting (optional).....	232
3.2.152	Release 6.0.13.1 changes	232
3.2.153	Fixes that take effect immediately after upgrading.....	232
3.2.154	Release 6.0.13.0 changes	232
3.2.155	Security fixes	232
3.2.156	Fixes that take effect immediately after upgrading.....	233
3.2.157	Release 6.0.12.1 changes	236
3.2.158	Fixes that take effect immediately after upgrading.....	236
3.2.159	Release 6.0.12.0 changes	236

3.2.160	Log4j updates.....	236
3.2.161	Fixes that take effect immediately after upgrading.....	237
3.2.162	Release 6.0.11.0 changes	240
3.2.163	Security fixes.....	240
3.2.164	Fixes that take effect immediately after upgrading.....	240
3.2.165	Fixes that take effect after upgrading and rebooting (optional).....	243
3.2.166	Release 6.0.10.1 changes	244
3.2.167	Fixes that take effect immediately after upgrading.....	244
3.2.168	Release 6.0.10.0 changes	244
3.2.169	Fixes that take effect immediately after upgrading.....	244
3.2.170	Fixes that take effect after upgrading and rebooting (optional).....	248
3.2.171	Release 6.0.9.0 changes	249
3.2.172	Fixes that take effect immediately after upgrading.....	249
3.2.173	Fixes that take effect after upgrading and rebooting (optional).....	253
3.2.174	Release 6.0.8.1 changes	253
3.2.175	Fixes that take effect immediately after upgrading.....	253
3.2.176	Release 6.0.8.0 changes	253
3.2.177	Fixes that take effect immediately after upgrading.....	253
3.2.178	Fixes that take effect after upgrading and rebooting (optional).....	258
3.2.179	Release 6.0.7.0 changes	259
3.2.180	Fixes that take effect immediately after upgrading.....	259
3.2.181	Fixes that take effect after upgrading and rebooting (optional).....	263
3.2.182	Release 6.0.6.1 changes	263
3.2.183	Fixes that take effect immediately after upgrading.....	263
3.2.184	Release 6.0.6.0 changes	264
3.2.185	Fixes that take effect immediately after upgrading.....	264
3.2.186	Fixes that take effect after upgrading and rebooting (optional).....	267
3.2.187	Fixes that take effect after upgrading and rebooting (optional).....	268
3.2.188	Release 6.0.5.0 changes	268

3.2.189	Fixes that take effect immediately after upgrading.....	268
3.2.190	Fixes that take effect after upgrading and rebooting (optional).....	271
3.2.191	Release 6.0.4.2 changes	271
3.2.192	Fixes that take effect immediately after upgrading.....	271
3.2.193	Release 6.0.4.1 changes	272
3.2.194	Fixes that take effect immediately after upgrading.....	272
3.2.195	Release 6.0.4.0 changes	272
3.2.196	Fixes that take effect immediately after upgrading.....	272
3.2.197	Release 6.0.3.1 changes	274
3.2.198	Fixes that take effect after upgrading and rebooting (optional).....	274
3.2.199	Release 6.0.3.0 changes	274
3.2.200	Fixes that take effect after upgrading and rebooting (optional).....	274
3.2.201	Release 6.0.2.1 changes	275
3.2.202	Fixes that take effect immediately after upgrading.....	275
3.2.203	Fixes that take effect after upgrading and rebooting (optional).....	276
3.2.204	Release 6.0.2.0 changes	276
3.2.205	Fixes that take effect immediately after upgrading.....	276
3.2.206	Fixes that take effect after upgrading and rebooting (optional).....	279
3.2.207	Release 6.0.1.1 changes	279
3.2.208	Fixes that take effect after upgrading and rebooting (optional).....	279
3.2.209	Release 6.0.1.0 changes	280
3.2.210	Fixes that take effect immediately after upgrading.....	280
3.2.211	Fixes that take effect after upgrading and rebooting (optional).....	284
3.2.212	Release 6.0.0.0 changes	284
3.2.213	Fixes that take effect immediately after upgrading.....	284
3.2.214	Fixes that take effect after upgrading and rebooting (optional).....	287

3.3.36	Version 6.0.0.0	347
3.4	Data source integration (plugin) release notes.....	348
3.4.1	Cassandra release notes.....	348
3.4.1.1	New features (Cassandra)	349
3.4.1.2	Fixed issues (Cassandra).....	350
3.4.2	CockroachDB release notes.....	350
3.4.2.1	New features (CockroachDB)	350
3.4.2.2	Fixed issues (CockroachDB).....	352
3.4.2.3	Known Issues (CockroachDB)	352
3.4.3	Couchbase release notes.....	352
3.4.3.1	New features (Couchbase)	353
3.4.3.2	Fixed issues (Couchbase).....	353
3.4.4	IBM Db2 release notes	356
3.4.4.1	New features (IBM Db2).....	356
3.4.4.2	Fixed issues (IBM Db2).....	364
3.4.4.3	Known issues (IBM Db2).....	370
3.4.5	MongoDB release notes	374
3.4.5.1	New features (MongoDB).....	374
3.4.5.2	Fixed issues (MongoDB)	376
3.4.5.3	Known issues (MongoDB).....	379
3.4.6	MySQL release notes.....	379
3.4.6.1	New features (MySQL)	379
3.4.6.2	Fixed issues (MySQL).....	381
3.4.7	Oracle E-Business Suite (EBS) 12.2 release notes	384
3.4.7.1	New features (EBS).....	384

3.4.7.2	Fixed issues (EBS)	389
3.4.7.3	Known issues (EBS).....	395
3.4.8	PostgreSQL release notes.....	398
3.4.8.1	New features (PostgreSQL)	398
3.4.8.2	Fixed issues (PostgreSQL).....	403
3.4.8.3	Known issues (PostgreSQL)	410
3.4.9	SAP HANA release notes	412
3.4.9.1	New features (SAP HANA).....	412
3.4.9.2	Fixed issues (SAP HANA).....	415
3.4.9.3	Known issues (SAP HANA)	418
3.4.10	Yugabyte release notes	431
3.4.10.1	New features (Yugabyte).....	431
3.4.10.2	Fixed issues (Yugabyte)	432
3.5	Windows connector release notes	433
3.5.1	New features (Windows connector).....	433
3.5.1.1	Release 1.37.0.0.....	433
3.5.2	Fixed issues (Windows connector).....	433
3.5.2.1	Release 1.36.0.0.....	434
3.5.2.2	Release 1.34.0.0.....	434
3.5.2.3	Release 1.33.0.0.....	434
3.5.2.4	Release 1.32.0.0.....	434
3.5.2.5	Release 1.28.0.0.....	435
3.5.2.6	Release 1.27.0.0.....	435
3.5.2.7	Release 1.22.0.0.....	435
3.5.2.8	Release 1.21.0.0.....	435
3.5.2.9	Release 1.20.0.0.....	436
3.6	API changes	436
3.6.1	API changes in Delphix 28.0.0.0	437
3.6.1.1	What's new?	437

3.6.1.2	What's changed?	437
3.6.2	API changes in Delphix 27.0.0.0	438
3.6.2.1	What's new?	438
3.6.2.2	What's changed?	439
3.6.3	API changes in Delphix 26.0.0.0	440
3.6.3.1	What's new?	440
3.6.3.2	What's changed?	440
3.6.4	API changes in Delphix 25.0.0.0	440
3.6.4.1	What's changed?	440
3.6.4.2	What's new?	440
3.6.5	API changes in Delphix 24.0.0.0	440
3.6.5.1	What's new?	441
3.6.5.2	What's changed?	441
3.6.6	API changes in Delphix 23.0.0.0	441
3.6.6.1	What's new?	441
3.6.6.2	What's changed?	442
3.6.7	API changes in Delphix 22.0.0.0	442
3.6.7.1	What's changed?	442
3.6.7.2	What's new?	443
3.6.8	API changes in Delphix 21.0.0.0	443
3.6.8.1	What's new?	443
3.6.8.2	What's changed?	443
3.6.9	API changes in Delphix 20.0.0.0	444
3.6.9.1	What's New?	444
3.6.9.2	What's Changed?	444
3.6.10	API changes in Delphix 19.0.0.0	445
3.6.10.1	What's new?	445
3.6.10.2	What's changed?	445
3.6.11	API changes in Delphix 18.0.0.0	446

3.6.11.1	What's New?	446
3.6.11.2	What's Changed?	446
3.6.12	API Changes in Delphix 17.0.0.0	447
3.6.12.1	What's New?	447
3.6.13	API Changes in Delphix 16.0.0.0	447
3.6.13.1	What's Changed?	447
3.6.14	API Changes in Delphix 15.0.0.0	448
3.6.14.1	What's Changed?	448
3.6.14.2	What's New?	449
3.6.15	API Changes in Delphix 14.0.0.0	449
3.6.15.1	What's Changed?	449
3.6.15.2	What's New?	450
3.6.16	API Changes in Delphix 13.0.0.0	450
3.6.16.1	What's Changed?	451
3.6.16.2	What's New?	451
3.6.17	API Changes in Delphix 12.0.0.0	451
3.6.17.1	What's Changed?	452
3.6.17.2	What's New?	453
3.6.18	API changes in Delphix 11.0.0.0	454
3.6.18.1	What's changed?	454
3.6.18.2	What's new?	456
3.6.19	API changes in Delphix 10.0.0.0	457
3.6.19.1	What's new?	458
3.6.20	API changes in Delphix 9.0.0.0	459
3.6.20.1	What's changed?	459
3.6.20.2	What's new?	460
3.6.21	API changes in Delphix 8.0.0.0	461
3.6.21.1	What's changed?	461
3.6.21.2	What's new?	463

3.6.22	API changes in Delphix 7.0.0.0.....	464
3.6.22.1	What's changed?.....	464
3.6.22.2	What's new?	464
3.6.23	API changes in Delphix 6.0.17.0	467
3.6.23.1	What's changed?.....	467
3.6.23.2	What's new?	469
3.6.24	API changes in Delphix 6.0.16.0	470
3.6.24.1	What's changed?.....	470
3.6.24.2	What's new?	471
3.6.25	API changes in Delphix 6.0.15.0	472
3.6.25.1	What's changed?.....	472
3.6.25.2	What's new?	473
3.6.26	API changes in Delphix 6.0.14.0	475
3.6.26.1	What's changed?.....	475
3.6.26.2	What's new?	476
3.6.27	API changes in Delphix 6.0.13.0	478
3.6.27.1	What's changed?.....	478
3.6.27.2	What's new?	480
3.6.28	API changes in Delphix 6.0.12.0	483
3.6.28.1	What's changed?.....	483
3.6.28.2	What's new?	485
3.6.29	API changes in Delphix 6.0.11.0	487
3.6.29.1	What's changed?.....	487
3.6.29.2	What's new?	490
3.6.30	API changes in Delphix 6.0.10.0	492
3.6.30.1	What's changed?.....	493
3.6.30.2	What's new?	494
3.6.31	API changes in Delphix 6.0.9.0.....	495
3.6.31.1	What changed	495

3.6.31.2	What is new	497
3.6.32	API changes in Delphix 6.0.8.0.....	498
3.6.32.1	What changed	498
3.6.32.2	What is new	501
3.6.33	API changes in Delphix 6.0.7.0.....	503
3.6.33.1	What's changed.....	503
3.6.33.2	What 's new	504
3.6.34	API changes in Delphix 6.0.6.0.....	506
3.6.34.1	What's changed.....	507
3.6.35	API changes in Delphix 6.0.5.0.....	507
3.6.35.1	What's changed.....	507
3.6.35.2	What's new	508
3.6.36	API changes in Delphix 6.0.4.0.....	510
3.6.36.1	What's changed.....	510
3.6.36.2	What's new	511
3.6.37	API changes in Delphix 6.0.3.0.....	512
3.6.37.1	What's changed.....	512
3.6.37.2	What's new	513
3.7	Support matrices	515
3.7.1	Kerberos support matrix.....	516
3.7.1.1	Oracle - Red Hat Enterprise Linux (RHEL)	516
3.7.1.2	SAP ASE - Red Hat Enterprise Linux (RHEL)	518
3.7.1.3	IBM Db2 support matrix	520
3.7.1.4	IBM Db2 - Red Hat Enterprise Linux (RHEL).....	520
3.7.1.5	IBM Db2 - Advanced Interactive eXecutive (AIX).....	521
3.7.2	Data source certifications	522
3.7.2.1	Legal notice.....	522
3.7.2.2	Goals.....	522
3.7.2.3	Data sources	522

3.7.2.4	Cadence for data source database version changes	523
3.7.2.5	Cadence for operating system version changes	523
3.7.2.6	Appendix.....	523
3.7.3	Select connectors matrix	526
3.7.3.1	Couchbase.....	526
3.7.3.2	Architecture options	528
3.7.3.3	Mongo.....	529
3.7.3.4	Architecture options	531
3.7.3.5	Microsoft SQL backup ingestion.....	532
3.7.3.6	Architecture options	533
3.7.3.7	Oracle backup ingestion.....	534
3.7.3.8	Architecture Options.....	535
3.7.3.9	SAPIQ.....	536
3.7.3.10	Architecture options	537
3.7.3.11	Cockroach	538
3.7.3.12	Cassandra	541
3.8	Upgrade matrix.....	542
3.9	Tested browser and operating systems.....	545
3.10	Deprecated and end-of-life features	546
3.10.1	Release 26.0.0.0.....	546
3.10.1.1	Deprecated features	546
3.10.1.2	End-of-life features	546
3.10.2	Release 23.0.0.0.....	546
3.10.2.1	Deprecated features	546
3.10.3	Release 21.0.0.0.....	546
3.10.3.1	Deprecated features	546
3.10.4	Release 17.0.0.0.....	547
3.10.4.1	End-of-life feature	547
3.10.5	Release 11.0.0.0.....	547

3.10.5.1	End-of-life feature	547
3.10.6	Release 10.0.0.0.....	547
3.10.6.1	Deprecated features	547
3.10.7	Release 9.0.0.0.....	547
3.10.7.1	Deprecated features	547
3.10.8	Release 6.0.17.0.....	548
3.10.8.1	End-of-life features	548
3.10.8.2	Deprecated features	548
3.10.9	Release 6.0.12.0.....	548
3.10.9.1	End-of-life features	548
3.10.10	Release 6.0.11.0.....	548
3.10.10.1	Deprecated features	548
3.10.10.2	End-of-life features	549
3.10.11	Release 6.0.10.0.....	549
3.10.11.1	End-of-life features	549
3.10.12	Release 6.0.9.0.....	549
3.10.12.1	End-of-life features	549
3.10.13	Release 6.0.8.0.....	550
3.10.13.1	End-of-life features	550
3.10.14	Release 6.0.7.0.....	550
3.10.14.1	End-of-life features	550
3.10.15	Release 6.0.5.0.....	550
3.10.16	Release 6.0.4.0.....	550
3.10.16.1	End-of-life features	550
3.10.16.2	Deprecated features	551
3.10.17	Release 6.0.2.0.....	551
3.10.17.1	End-of-life features	551
3.10.18	Release 6.0.0.0.....	551
3.10.18.1	End-of-life features	551

3.11	Licenses and notices	552
4	Overview	553
4.1	What is Delphix?.....	553
4.2	What is Delphix Continuous Data?.....	553
4.3	Deployment	553
4.4	Environments	553
4.5	Data Source.....	554
4.6	Virtual Databases.....	554
4.7	Product information.....	554

4.8.1	Products	557
4.8.2	Interfaces	557
4.8.3	Core concepts	558
4.8.4	Continuous Data	559
4.8.5	Architecture.....	560
4.8.6	Datasets	562
4.8.7	Data Source Connectors	564
4.8.8	Transparent Data Encryption (TDE) definitions	564
4.8.9	Users roles.....	565
4.8.10	User privileges.....	566
4.8.11	Types of notification.....	567
4.8.12	Delphix Self-Service terms	567
4.9	Product icon reference	569
5	Deployment	571

5.1	Accessing the Continuous Data Engine	571
5.1.1	Default users	571
5.1.2	Access methods	572
5.1.2.1	Accessing the Delphix Continuous Data Engine using a web browser ..	572
5.1.2.2	Accessing the Delphix Continuous Data Engine using administrative Command Line Interface (CLI)	573
5.1.2.3	Accessing the Delphix Continuous Data Engine using the Delphix web API.....	574
5.2	Standard deployment architecture	574
5.2.1	Overview	574
5.3	Checklist of information required for installation and configuration	575
5.3.1	Overview	575
5.3.2	Hypervisor specific options.....	575
5.3.3	Optional information required for initial configuration	577
5.4	Network connectivity requirements.....	580
5.4.1	Overview	580
5.4.2	General outbound from the Delphix engine port allocation	580
5.4.3	General inbound to the Delphix Engine port allocation	581
5.4.4	Firewalls and intrusion detection systems (IDS)	582
5.4.5	Setting up network access to the Delphix engine.....	583
5.4.5.1	Overview	583
5.4.5.2	Procedure	583
5.5	Installation and initial system configurations.....	585
5.5.1	Initial setup.....	585
5.5.1.1	Overview	585
5.5.1.2	Welcome.....	586
5.5.1.3	Administrators	586
5.5.1.4	Time	587
5.5.1.5	Network	587
5.5.1.6	Network security	588

5.5.1.7	Storage	588
5.5.1.8	Outbound connectivity.....	589
5.5.1.9	Authentication	590
5.5.1.10	Kerberos	590
5.5.1.11	Registration	591
5.5.1.12	Summary	591
5.5.1.13	Azure object storage setup	592
5.5.1.14	AWS object storage setup.....	600
5.5.1.15	GCP object storage setup	602
5.5.1.16	OCI object storage setup.....	606
5.5.1.17	Other S3 compatible object storage setup.....	610
5.5.1.18	Updating object storage endpoints	612
5.5.2	Customizing the Delphix Continuous Data Engine system settings	613
5.5.2.1	Overview	613
5.5.2.2	Procedure	613
5.5.2.3	Enabling hot-adding.....	615
5.5.2.4	Post-requisites	616
5.5.3	Installing an OVA or AMI	616
5.5.3.1	Overview	616
5.5.3.2	Procedure to install an OVA	616
5.5.3.3	Procedure to install an AMI.....	617
5.6	Validating host deployment with host Checker	618
5.6.1	Overview	618
5.6.2	Procedure	618
5.7	Deployment for VMware.....	619
5.7.1	Overview	619
5.7.2	Supported ESX versions	620
5.7.3	Virtual machine hardware versions	620
5.7.4	Virtual CPUs	621

5.7.5	Memory.....	621
5.7.6	Network	622
5.7.7	SCSI controller	624
5.7.8	General storage.....	624
5.7.9	Delphix storage options.....	625
5.7.9.1	Delphix VM configuration storage	625
5.7.9.2	Delphix engine system disk storage	625
5.7.9.3	Database storage.....	626
5.7.9.4	Option 1: Block Storage for database storage.....	626
5.7.9.5	Option 2: Elastic Data where Object storage is used for database storage and block storage is used for cache.....	628
5.7.10	Additional VMware configuration notes.....	628
5.7.11	Procedure to install an OVA	628
5.8	Deployment for KVM.....	630
5.8.1	Overview	630
5.8.2	Pre-requisites	630
5.8.3	Virtual CPUs	631
5.8.4	Memory.....	632
5.8.5	Network	632
5.8.6	SCSI controller	633
5.8.7	General storage.....	633
5.9	Deployment for Hyper-V	634
5.9.1	Overview	634
5.9.2	Supported versions.....	635
5.9.3	Virtual CPUs	635
5.9.4	Memory.....	636
5.9.5	Network	636
5.9.6	SCSI controller	637
5.9.7	General storage.....	637

5.9.8	Delphix storage options.....	638
5.9.8.1	Delphix engine system disk storage.....	638
5.9.8.2	Database storage.....	638
5.9.9	Procedure for deploying with Hyper-V.....	639
5.9.9.1	Overview.....	639
5.9.9.2	Creating a Delphix engine VM.....	640
5.9.9.3	Customize the VM by selecting settings.....	640
5.10	Deployment for AWS EC2.....	640
5.10.1	Overview.....	640
5.10.2	Instance types.....	641
5.10.3	Network configuration.....	641
5.10.4	EBS configuration.....	642
5.10.5	General storage configuration.....	643
5.10.6	Additional AWS configuration notes.....	643
5.10.7	Prerequisites to deploying in AWS.....	644
5.10.7.1	Overview.....	644
5.10.7.2	Prerequisites.....	644
5.10.7.3	Geographic distribution in regions and availability zones.....	645
5.10.8	Procedure for deploying in AWS.....	646
5.10.8.1	Overview.....	646
5.10.8.2	Procedure to install an AMI.....	646
5.10.8.3	Subscribe to the Delphix virtualization engine marketplace image.....	646
5.10.8.4	Launching the Delphix engine.....	647
5.10.8.5	Configuring the Delphix engine.....	650
5.10.8.6	Logging in for the first time.....	650
5.10.8.7	Next steps.....	650
5.10.9	AWS RDS Custom for Oracle and SQL Server.....	651
5.10.9.1	Overview.....	651
5.11	Deployment for Microsoft Azure.....	651

5.11.1	Overview	651
5.11.2	Instance types	652
5.11.3	Network configuration	652
5.11.4	Storage configuration	653
5.11.5	Extensions	654
5.11.6	Prerequisites to deploying in Azure	654
5.11.6.1	Overview	654
5.11.6.2	Prerequisites	654
5.11.7	Procedure for deploying in Azure.....	656
5.11.7.1	Overview	656
5.11.7.2	Deploying the Delphix engine	656
5.11.7.3	Configuring the Delphix engine virtual machine	657
5.11.7.4	Configuring the Delphix engine	658
5.11.7.5	Next steps	658
5.11.8	Enabling Azure accelerated networking	658
5.11.8.1	Overview	658
5.11.8.2	Individual VMs and VMs in an availability set.....	658
5.12	Deployment for Google cloud platform	659
5.12.1	Overview	659
5.12.2	Machine types	660
5.12.3	Network configuration	660
5.12.4	Storage configuration	661
5.12.5	Prerequisites to deploying in GCP	662
5.12.5.1	Overview	662
5.12.5.2	Prerequisites	662
5.12.5.3	Additional GCP configuration notes	663
5.12.6	Procedure for deploying in GCP	663
5.12.6.1	Overview	663
5.12.6.2	Deployment in Google cloud console	663

5.12.6.3	Deployment in Google cloud marketplace	664
5.12.6.4	Configuring the Delphix engine	664
5.12.6.5	Next Steps	664
5.13	Deployment for OCI.....	665
5.13.1	Overview	665
5.13.2	Compute image types.....	665
5.13.3	Supported shapes.....	665
5.13.4	Network configuration.....	666
5.13.5	General storage configuration	668
5.13.6	Additional OCI configuration notes.....	668
5.13.7	Prerequisites to deploying OCI.....	669
5.13.7.1	Overview	669
5.13.7.2	Prerequisites	669
5.13.8	Procedure for deploying in OCI	670
5.13.8.1	Overview	670
5.13.8.2	Download and verify the Delphix engine image	670
5.13.8.3	Upload the Delphix engine image as an object.....	671
5.13.8.4	Creating a custom compute image from an object.....	671
5.13.8.5	Launching the Delphix engine	672
5.13.8.6	Create block storage volumes	673
5.13.8.7	Attach block storage volumes	674
5.13.8.8	Configuring the Delphix engine.....	674
5.13.8.9	Next steps	675
5.14	Deployment for IBM cloud.....	675
5.14.1	Overview	675
5.14.2	Supported profiles	675
5.14.3	Network configuration.....	676
5.14.4	General storage configuration	677
5.14.5	Additional IBM configuration notes.....	677

5.14.6	Prerequisites for deploying in IBM Cloud.....	678
5.14.6.1	Overview	678
5.14.6.2	Prerequisites	678
5.14.7	Procedure for deploying in the IBM Cloud.....	679
5.14.7.1	Overview	679
5.14.7.2	Deploying from the IBM software catalog	679
5.14.7.3	Downloading the Delphix image	680
5.14.7.4	Uploading the Delphix engine image as an object.....	681
5.14.7.5	Creating a custom image	681
5.14.7.6	Launching the Delphix engine	682
5.14.7.7	Creating block storage volumes	683
5.14.7.8	Attaching block storage volumes	683
5.14.7.9	Configuring the Delphix engine	684
5.14.7.10	Next steps	684
5.15	Hotfix information.....	684
5.15.1	Overview	684
6	Configuration.....	685
6.1	Configuration.....	685
6.1.1	Registration management.....	685
6.1.2	User and authentication management	685
6.1.3	Network and DNS management	685
6.1.4	Capacity and resource management.....	685
6.1.5	Monitoring and log management	685
6.1.6	Performance analytics management	686
6.1.7	Starting, stopping, and restarting your engine	686
6.1.8	Usage data management	686
6.2	Registration management.....	686
6.2.1	Retrieving the Delphix engine registration code	686
6.2.2	Regenerating the Delphix engine registration code.....	687

6.3	User and authentication management	687
6.3.1	Users and groups	688
6.3.1.1	User types and user management	688
6.3.1.2	User privileges for Delphix objects	689
6.3.1.3	Managing groups	691
6.3.1.4	Authentication mechanisms	691
6.3.1.5	Assigning group and object ownership	692
6.3.1.6	Adding and deleting groups	692
6.3.1.7	Managing system administrators	694
6.3.1.8	Managing Delphix users	699
6.3.1.9	Managing individual profile information	703
6.3.2	Authentication mechanisms	703
6.3.2.1	How to setup auto-authentication	704
6.3.2.2	Configuring and using LDAP with the Delphix engine	706
6.3.2.3	Configuring single sign-on.....	710
6.3.2.4	Configuring and managing kerberos	713
6.3.2.5	Configuring OAuth2 authentication for API access.....	726
6.4	Network and DNS management	731
6.4.1	General network and connectivity requirements	731
6.4.1.1	Overview	731
6.4.1.2	General outbound from the Delphix engine port allocation	731
6.4.1.3	General inbound to the Delphix engine port allocation	732
6.4.1.4	Firewalls and intrusion detection systems (IDS)	732
6.4.2	Network performance configuration options.....	733
6.4.2.1	Optimal network architecture for the Delphix engine	733
6.4.2.2	Network operations using the Delphix session protocol.....	736
6.4.2.3	Network performance test tool interface	739
6.4.2.4	Working with dataset performance	744
6.4.2.5	Network performance expectations and troubleshooting	745

6.4.3	Determining the Delphix server ID and host name	747
6.4.3.1	Server setup application method	747
6.4.3.2	Delphix admin application	748
6.4.3.3	CLI method	749
6.4.4	Configuring multiple DNS domain names in DNS search list	750
6.4.4.1	Procedure	750
6.4.4.2	To update DNS using the CLI:	752
6.4.5	How to change the IP address of the Delphix engine.....	753
6.4.5.1	Changing the IP address	753
6.4.5.2	Changing the IP address via CLI	754
6.4.6	How to change the hostname of the Delphix engine.....	755
6.4.6.1	Changing the hostname	755
6.4.7	How to change the DNS server of the Delphix engine.....	757
6.4.8	Configuring a second network interface	758
6.4.8.1	Procedure	758
6.5	NFSv4 configuration	760
6.5.1	Overview	760
6.5.2	Dataset status tab NFS reasons	760
6.5.3	NFSv4-Only mode	761
6.6	Capacity and resource management.....	762
6.6.1	An overview of capacity and performance information	762
6.6.1.1	The performance reservoir and capacity threshold warnings	762
6.6.1.2	Ways to view capacity usage	763
6.6.1.3	Using and understanding the storage capacity screen	764
6.6.1.4	Understanding Delphix disk usage	770
6.6.1.5	Reviewing historical capacity from the CLI	771
6.6.2	Setting quotas	774
6.6.2.1	Quota thresholds.....	775
6.6.2.2	Disallowed database actions when in quota critical threshold	776

6.6.3	Deleting objects to increase capacity.....	777
6.6.4	Adding, expanding, and removing storage devices	779
6.6.4.1	Prerequisites	779
6.6.4.2	Adding or increasing storage and/or cache.....	780
6.6.4.3	Expanding a storage/cache device.....	780
6.6.4.4	Removing device storage	781
6.6.5	Delphix storage migration	783
6.6.5.1	Getting started	783
6.6.5.2	Understanding Delphix storage migration.....	784
6.6.5.3	Limitations of Delphix storage migration.....	785
6.6.5.4	User interface	785
6.6.5.5	Device removal for storage migration	785
6.6.5.6	Getting the UUID of an RDM disk from VMware via the vSphere GUI.....	788
6.6.5.7	Getting the UUID of a VMDK from VMware, via ssh to the ESX server...	790
6.6.5.8	Getting the UUID of a VMDK from VMware, via VMware PowerCLI	790
6.6.5.9	In-place block-to-object storage migration	791
6.6.6	Managing source data.....	796
6.6.7	An overview of held space	797
6.6.7.1	Scenario description	797
6.7	Monitoring and log management	799
6.7.1	Configuring SNMP	800
6.7.1.1	Prerequisites	800
6.7.1.2	Configuring SNMP for v2.....	801
6.7.1.3	Configuring SNMP for v3.....	802
6.7.1.4	CLI: viewing SNMP engine ID	807
6.7.1.5	Supported MIBs	808
6.7.1.6	Examples	808
6.7.2	Viewing action status	809
6.7.2.1	Action sidebar procedure	809

6.7.2.2	Description	809
6.7.2.3	Sub-action	810
6.7.2.4	Errors	811
6.7.3	Viewing jobs	811
6.7.4	System faults	813
6.7.4.1	Overview	813
6.7.4.2	Delphix object-based environment monitor faults.....	814
6.7.4.3	Viewing faults.....	814
6.7.4.4	Addressing faults.....	815
6.7.4.5	Fault lifecycle example	816
6.7.4.6	Viewing system faults	817
6.7.5	Accessing audit logs	819
6.7.5.1	Overview	819
6.7.5.2	Procedure	820
6.7.5.3	Sorting and filtering	821
6.7.5.4	Column resizing and tooltips	821
6.7.5.5	Exporting results	822
6.7.6	Creating support logs	822
6.7.6.1	Using the GUI.....	822
6.7.6.2	Using the CLI	824
6.7.7	Setting support access control.....	824
6.7.8	Setting syslog preferences.....	825
6.7.8.1	Severity levels for syslog messages.....	827
6.7.9	Support access audit logs.....	827
6.7.9.1	Overview	828
6.7.9.2	Listing the session audit logs	828
6.7.9.3	Downloading a session audit log	828
6.7.9.4	Reviewing a session audit log.....	829
6.7.9.5	Limitations.....	829

6.7.9.6	Deleting a session audit log	829
6.7.10	Diagnosing connectivity errors	830
6.7.10.1	Failed actions	830
6.7.10.2	Viewing active faults.....	831
6.7.11	Email (SMTP) alert notifications.....	832
6.7.11.1	Overview	832
6.7.11.2	Configuring the SMTP gateway	832
6.7.11.3	Alert profiles	834
6.7.11.4	A simple profile	836
6.7.11.5	A compound alert profile.....	836
6.7.11.6	Complex alert profile	837
6.7.12	Fluentd plugin service for API modules.....	841
6.7.12.1	Overview	841
6.7.12.2	Technical details	842
6.7.12.3	Splunk integration	850
6.7.12.4	Creating Fluentd plugins.....	875
6.8	Performance analytics management	884
6.8.1	Performance analytics.....	885
6.8.1.1	Performance analytics tool overview	885
6.8.1.2	Working with performance analytics graphs in the graphical user interface.....	887
6.8.1.3	Performance analytics statistics reference	890
6.8.1.4	Performance analytics tool API reference	891
6.8.1.5	Performance analytics case study: using a single statistic	899
6.8.1.6	Performance analytics case study: using multiple statistics	903
6.8.2	Storage performance configuration options.....	911
6.8.2.1	Optimal storage configuration parameters for the Delphix engine	911
6.8.2.2	Storage performance test tool (fio).....	912
6.8.2.3	Storage performance expectations and troubleshooting	918

6.8.3	Architecture for performance - hypervisors and host.....	919
6.8.3.1	Architecture best practices hypervisor host ESX	919
6.8.4	Target host OS and database configuration options	922
6.8.4.1	OS-specific tuning recommendations	922
6.8.4.2	OS-specific tuning recommendations for windows	931
6.8.5	Block storage cache reports	932
6.8.5.1	Block storage access graph.....	932
6.8.5.2	Accessing a block cache report from the CLI	933
6.9	Usage data management	934
6.9.1	Disabling user-click analytics.....	935
6.10	Starting, stopping, and restarting your engine	936
6.10.1	Factory reset	936
6.10.2	Restart	937
6.10.3	Reboot	938
6.10.4	Power off	939
6.11	Introduction to privilege elevation profiles.....	939
6.11.1	Support for privilege elevation profiles.....	940
6.11.2	How do privilege elevation profiles work?.....	940
7	Upgrade	942
7.1	Upgrade	942
7.2	Upgrading the Delphix Engine: Overview	942
7.2.1	Types of upgrade	942
7.2.2	Outline of the upgrade process.....	943
7.3	Upgrade prerequisites	944
7.3.1	Scheduling downtime	944
7.3.2	Verifying the integrity of the downloaded upgrade image	945
7.3.3	Verifying connectivity to datasets and environments	945
7.4	Downloading the upgrade image	946
7.5	Uploading the upgrade image	947

7.5.1	Upgrade verification.....	949
7.5.1.1	Understanding the verification page.....	950
7.5.2	Resolving upgrade checks	952
7.5.2.1	Overview	952
7.5.2.2	Upgrade severities checks	952
7.5.2.3	Upgrade check actions	954
7.6	Applying the upgrade.....	957
7.6.1	Failure to quiesce a dataset.....	958
7.7	Post upgrade.....	960
7.7.1	Failures	960
8	Security.....	961
8.1	Security principles.....	961
8.2	Product security	962
8.2.1	Delphix product security.....	962
8.2.1.1	Overview	962
8.2.1.2	Software delivery security	963
8.2.1.3	Ancillary components.....	963
8.2.2	Software updates.....	963
8.2.2.1	Patch annually.....	963
8.2.2.2	Subscribe to Delphix notifications	963
8.2.3	Network security	963
8.2.3.1	General port allocation	964
8.2.4	Password vault support.....	965
8.2.4.1	Overview	965
8.2.4.2	Configuring password vaults	965
8.2.4.3	Using password vaults	966
8.2.4.4	Roles and privileges for CyberArk and HashiCorp users.....	966
8.2.4.5	Supported environments and databases	966
8.2.4.6	Setting up a vault via GUI.....	966

8.2.4.7	Setting up Vault via API	977
8.2.5	Certificate management.....	980
8.2.5.1	Configuring network security settings.....	981
8.2.5.2	Configuring network settings.....	992
8.2.5.3	KeyStore settings.....	1002
8.2.5.4	TrustStore settings	1004
8.3	Replication security	1006
8.3.1	Choose encrypt and compress when replicating	1006
8.4	Object security	1006
8.4.1	User management	1007
8.4.1.1	Secure user management	1007
8.4.1.2	Use LDAP for authentication.....	1007
8.4.1.3	Create named users.....	1007
8.4.1.4	Assign least privileges.....	1007
8.4.1.5	Consider Delphix self-service functionality	1007
8.4.1.6	Disable ADMIN and SYSADMIN	1008
8.4.2	Source database security.....	1008
8.4.2.1	Choose minimum privileges for Delphix DB user	1008
8.4.2.2	Protect the Delphix DB user password.....	1008
8.4.2.3	Use database encryption functionality to encrypt sensitive data at rest.....	1008
8.4.2.4	Choose encrypt and compress when linking	1008
8.4.3	Source and target host security	1009
8.4.3.1	Oracle on UNIX.....	1009
8.4.3.2	Windows	1009
8.5	System configuration	1010
8.5.1	Maintain system time with NTP.....	1010
8.5.2	Enable phone home	1011
8.5.3	Register your Delphix engine.....	1011

8.5.4	Enable LDAP for authentication.....	1011
8.5.5	Enable SMTP and/or SNMP monitoring.....	1011
8.6	GUI security	1011
8.6.1	Overview	1011
8.6.2	Reduce inactive session timeout to 15 minutes.....	1011
8.6.3	Use a URL from your domain and create a signed certificate	1012
8.6.4	Disable HTTP access.....	1012
8.7	Repave Delphix Engine	1012
8.7.1	Overview	1012
8.7.2	Block storage engines	1012
8.7.2.1	Prerequisites	1012
8.7.2.2	How to Repave a Delphix Engine	1013
8.7.2.3	Repave API calls	1013
8.7.2.4	POST calls	1015
8.7.3	Elastic Data engines (engines backed by object storage)	1021
8.7.3.1	Prerequisites	1021
8.7.3.2	How to repave a Delphix Elastic Data Engine	1022
8.7.3.3	Repave API calls	1024
8.7.3.4	REST API POST calls to execute the repave process.....	1027
8.8	Masking sensitive data.....	1038
8.9	Audit logs.....	1038
8.9.1	Review audit logs monthly	1038
8.9.2	Forward audit logs to central server via syslog	1038
8.10	Support security	1038
8.10.1	Delphix operating system (DxOS)	1039
8.10.1.1	Disable support access (optional)	1039
8.11	Password policies.....	1039
8.11.1	Getting started	1039
8.11.2	Understanding password policies	1039

8.11.3	Default password policy	1040
8.11.4	Changing the password policy	1040
8.11.4.1	Who can change password policy for whom	1040
8.11.5	What operations can be done by administrators	1040
8.11.6	Password policy parameters	1040
8.11.7	Restrictions	1041
8.12	Additional topics	1041
8.12.1	Perform a yearly audit	1041
8.12.2	Port scan	1041
8.12.3	Security testing	1041
8.12.4	Security banner	1041
8.12.5	Virtual database security	1042
9	Datasets	1043
9.1	Getting started with datasets	1043
9.1.1	Datasets overview	1044
9.1.2	Dataset support	1044
9.1.2.1	Limitations	1046
9.1.3	General architecture	1046
9.1.3.1	Ingestion overview	1046
9.1.3.2	Staging Pull vs. Staging Push	1048
9.1.3.3	Provisioning	1049
9.1.4	Environment management	1050
9.1.4.1	Overview	1050
9.1.4.2	Environment configuration requirements	1050
9.1.4.3	Adding and discovering an environment	1052
9.1.4.4	Network requirements	1053
9.1.4.5	Environment users	1055
9.1.4.6	Delphix toolkit	1057
9.1.4.7	Java Development Kit (JDK)	1057

9.1.4.8	Data communication encryption.....	1062
9.1.4.9	Environment operations	1067
9.1.4.10	Validating host environments with HostChecker	1071
9.1.4.11	Manually recovering a database after V2P	1073
9.1.5	dSource management	1074
9.1.5.1	Overview	1074
9.1.5.2	Linking dSources.....	1074
9.1.5.3	The dSource timeflow.....	1074
9.1.5.4	The dSource snapshot.....	1074
9.1.5.5	dSource operations.....	1074
9.1.6	Virtual database (VDB) management.....	1080
9.1.6.1	Overview	1080
9.1.6.2	VDB Timeflow	1080
9.1.6.3	VDB Snapshot	1080
9.1.6.4	VDB operations	1080
9.1.6.5	Automatic VDB restart on target server after reboot	1089
9.1.7	Hook operations.....	1093
9.1.7.1	Overview	1093
9.1.7.2	Creating hook operations	1093
9.1.7.3	Hook operations templates.....	1095
9.1.7.4	Hook operations list.....	1097
9.1.7.5	Self-Service interaction with hooks	1100
9.1.8	Shell operations	1101
9.1.8.1	RunCommand operation	1101
9.1.8.2	RunBash operation	1101
9.1.8.3	Running processes in the background	1102
9.1.8.4	Examples of running background processes.....	1102
9.1.9	Other operations	1102
9.1.9.1	RunExpect operation.....	1103

9.1.9.2	Environment variables	1103
9.1.9.3	Secure credential management.....	1103
9.1.10	Policies	1105
9.1.10.1	Overview	1105
9.1.10.2	Default vs. Custom policies	1106
9.1.10.3	Setting different policies for objects in a group.....	1106
9.1.10.4	Create a custom policy.....	1108
9.1.10.5	Policies and timezones	1108
9.1.10.6	Configure retention on individual snapshots	1109
9.1.11	Basic troubleshooting.....	1110
9.1.11.1	Environment	1110
9.1.11.2	Delphix Toolkit.....	1110
9.1.11.3	dSource and virtual databases (VDB).....	1110
9.1.11.4	Log management.....	1110
9.2	Cassandra data sources.....	1111
9.2.1	Cassandra virtualization process	1113
9.2.2	Cassandra requirements and prerequisites.....	1114
9.2.2.1	Support matrix.....	1114
9.2.2.2	Database / OS support matrix.....	1114
9.2.2.3	Supported ingestion matrix	1115
9.2.2.4	Engine compatibility matrix.....	1115
9.2.2.5	Limitations.....	1115
9.2.2.6	Requirements for staging and target Cassandra environments.....	1115
9.2.3	Cassandra installation and upgrade.....	1117
9.2.3.1	Prerequisites	1117
9.2.3.2	Downloading the connector	1117
9.2.3.3	Installing the connector.....	1118
9.2.3.4	Upgrade the dSource	1120
9.2.4	Cassandra connector operations	1123

9.2.4.1	Discovering Cassandra installations	1124
9.2.4.2	Linking Cassandra data sources	1129
9.2.4.3	Provisioning Cassandra virtual databases.....	1133
9.2.5	Troubleshooting Cassandra data sources	1138
9.2.5.1	Logging.....	1138
9.2.6	Cassandra developer's guide	1141
9.2.6.1	Discovering Cassandra environment.....	1141
9.2.6.2	Cassandra source config operations	1142
9.2.6.3	Linking Cassandra operations	1143
9.2.6.4	Provisioning Cassandra operations via CLI	1145
9.3	CockroachDB data sources.....	1148
9.3.1	Seed	1148
9.3.2	AWS S3 Backup.....	1149
9.3.3	Disk Backup.....	1150
9.3.4	Google Cloud Platform (GCP)	1150
9.3.5	CockroachDB virtualization process	1151
9.3.6	CockroachDB requirements and prerequisites	1152
9.3.6.1	CockroachDB support matrices.....	1152
9.3.6.2	Requirements for cockroachDB source databases.....	1154
9.3.6.3	Network and connectivity requirements for CockroachDB.....	1156
9.3.6.4	Sudo privileges for the CockroachDB environment OS user.....	1159
9.3.7	CockroachDB installation and upgrade	1161
9.3.7.1	Downloading the connector	1161
9.3.7.2	Installing the connector.....	1162
9.3.7.3	Upgrading the connector.....	1163
9.3.8	CockroachDB connector operations.....	1164
9.3.8.1	Discovering installations for CockroachDB.....	1164
9.3.8.2	Linking CockroachDB data sources.....	1168
9.3.8.3	Provisioning a CockroachDB virtual database.....	1179

9.3.9	Troubleshooting CockroachDB data sources	1186
9.3.9.1	CockroachDB Plugin logs	1186
9.3.9.2	CockroachDB Cluster logs	1186
9.3.10	CockroachDB developer's guide	1187
9.3.10.1	CockroachDB discovery operations	1188
9.3.10.2	CockroachDB sourceconfig operations	1188
9.3.10.3	CockroachDB linking operations.....	1188
9.3.10.4	CockroachDB provision operations	1191
9.4	Couchbase data sources.....	1193
9.4.1	Couchbase virtualization process	1193
9.4.2	Couchbase requirements and prerequisites	1194
9.4.2.1	Requirements for source databases	1194
9.4.2.2	Requirements for staging and target databases	1195
9.4.2.3	Staging prerequisites for ingestion using backups	1195
9.4.2.4	Couchbase support matrices.....	1195
9.4.2.5	Couchbase network and connectivity requirements	1197
9.4.2.6	Couchbase host environment requirements.....	1199
9.4.3	Couchbase installation and upgrade.....	1202
9.4.3.1	Prerequisites	1202
9.4.3.2	Downloading the connector	1202
9.4.3.3	Installing the connector.....	1203
9.4.3.4	Upgrading the connector.....	1203
9.4.3.5	Upgrading Couchbase version on source, staging, and target host.....	1203
9.4.4	Couchbase connector operations.....	1204
9.4.4.1	Discovering Couchbase installations	1204
9.4.4.2	Linking Couchbase data sources.....	1207

1 Welcome to the Delphix Continuous Data documentation!

This information explains how to deploy Continuous Data Engines for data virtualization, use its features, or tune its configurations for optimal performance. The content has been organized into several categories, available from the lefthand navigation.

3 Release notes

This section covers the following topics:

- [New features](#) (see page 75)
- [Fixed issues](#) (see page 103)
- [Known issues](#) (see page 288)
- [Data source integration \(plugin\) release notes](#) (see page 348)
- [Windows connector release notes](#) (see page 433)
- [API changes](#) (see page 436)
- [Support matrices](#) (see page 515)
- [Upgrade matrix](#) (see page 542)
- [Tested browser and operating systems](#) (see page 545)
- [Deprecated and end-of-life features](#) (see page 546)
- [Licenses and notices](#) (see page 552)

3.1 New features

3.1.1 Release 28.0.0.0

- **Allow provisioning of a vPDB from a non-multitenant source into an existing virtual CDB target**
Continuous Data Engines now support the provisioning of a vPDB from a non-multitenant source into an existing virtual container database (vCDB) target.
- **Improvements in Oracle 19C 5.1.0**
Enhancements have been made for provisioning Oracle 19C databases, focusing on improved compatibility and expanded support. New privilege elevation requirements for Oracle EBS environments and additional configuration options for virtual CDBs are included. Benefit from streamlined database setup and customization through enhanced listener configurations and support for environment-specific variables. Additionally, new hooks utilities have been added to simplify clone and pre-snapshot operations, providing greater flexibility in managing Oracle environments.
- **Documentation**
Broad improvements are introduced in the datasets documentation for [Oracle](#) (see page 1419) and [SQL Server](#) (see page 2072) data sources.

3.1.2 Release 27.0.0.0

- **AWS Amazon Linux support for unstructured data (vFiles)**
Continuous Data Engines now support the unstructured data virtualization ([vFiles](#) (see page 2270)) solution for AWS Amazon Linux.
- **Repave for Elastic Data Engines**
Following the initial phase of delivering Repave for all-block engines, the same capability is being

delivered for engines configured with [Elastic Data](#) (see page 1021). This allows users to replace Delphix Continuous Data Engines with a new engine (on the same version) and reattach its storage.

- **ESXi 8.0 u3 support for the Delphix platform**
Users can upgrade or deploy engines with ESXi 8.0 u3.

3.1.3 Release 26.0.0.0

- **CockroachDB**
Introduced the ability to download backups from Google Cloud Storage and ingest them from a multi-node staging server. These features will allow for faster ingestion and better dataset snapshots.
- **IBM Db2**
Certified IBM AIX v7.2 on POWER9 hardware.
- **MySQL**
Certified MySQL and Percona v8.0 on RHEL v8.9 and lower. In addition, potentially sensitive data has been redacted during the generation of support bundles.

3.1.4 Release 25.0.0.0

- **Automatic restart for VDB and vPDBs in Oracle RAC environment**
This release supports automatic restart of virtual sources in an Oracle RAC environment. If this feature is enabled for an Oracle virtual source in a RAC environment, the VDB or vPDB instance on a cluster node will be automatically restarted whenever that node is rebooted.
- **iSCSI encryption**
The data transfer between Continuous Data and target/staging environments takes place through NFS and iSCSI. In efforts to maintain the highest security standards, this release brings the ability to encrypt iSCSI traffic.
- **Windows connector cipher enhancements**
To help enhance the user experience of configuring Windows connector ciphers, this release removes the need to manually configure the PREFERRED_CIPHERSUITES files in lieu of a newly implemented API, accessible via CLI. This API accepts a list of preferred ciphers and automatically updates the PREFERRED_CIPHERSUITES file on all Windows host or specified hosts, if provided. By connecting to each host via the connector, the API replaces the existing preferred cipher list.
- **MySQL**
Amazon Linux 2 host environments are now supported, in addition to the Staging Push linking strategy for AWS RDS and RDS Aurora. Fixes have also been implemented to resolve invalid special characters in the my.cnf file and the immutable backup folder for Delphix-initiated backup linking.
- **Oracle E-Business Suite (EBS)**
Added support to specify a Disaster Recovery node or Intermediate Server to support linking for disaster recovery scenarios. In addition, the Application Tier password updates now occur following the Enable/Disable operations to hasten the rotation process.

3.1.5 Release 24.0.0.0

- **Engine object limit**
The number of objects a Delphix Continuous Data Engine can manage has been expanded from 400 to 750.
- **Password Vault credential cache**
The Password Vault implementation sees continued improvements with the enablement of credential caching. This reduces the frequency of credential retrievals by the Delphix Continuous Data Engine that occur for each environment access request, ultimately minimizing excessive calls to the vault, thus enhancing performance.
- **PostgreSQL**
Provisioning datasets from existing PostgreSQL dSources is now supported. More information can be found in the [Provisioning a PostgreSQL VDB](#)⁴⁴ section.
- **Kubernetes driver**
Provisioning a PostgreSQL data set via the Kubernetes (K8) Driver from an existing PostgreSQL dSource is now supported. With this, volume cloning and tagging VDBs is also supported. More information can be found in the [Kubernetes \(K8\) driver](#)⁴⁵ documentation.
- **Certifications**
 - Oracle 11gR2 on RHEL 8.10 (24.0.0.0+)
 - Oracle 12cR1 on RHEL 8.10 (24.0.0.0+)
 - Oracle 12cR2 on RHEL 8.10 (24.0.0.0+)
 - Oracle 19c on RHEL 8.10 (24.0.0.0+)
 - Oracle 21c on RHEL 8.10 (24.0.0.0+)

3.1.6 Release 23.0.0.0

- **Elastic data for GCP**
Support has been expanded to elastic data for Google Cloud Platform (GCP) object storage. Initially, support was limited to GCP block storage.
- **Password Vault cache**
Configurable caching is introduced to reduce vault access requests by the Delphix Continuous Data engine.
- **Sybase TLS/SSL**
Delphix Continuous Data now supports security protocols for ASE instances that only use TLS/SSL connections authenticating via a client certificate.
- **PostgreSQL**
Certification has been added for RHEL 9.x.
- **Documentation**
Broad improvements continue across multiple areas of documentation, including Cassandra, MySQL,

⁴⁴ <https://cd.delphix.com/docs/latest/provisioning-a-postgresql-virtual-database-point-i>

⁴⁵ <https://ecosystem.delphix.com/docs/main/kubernetes>

and SAP HANA. Documentation revisions have also been made to clarify new upgrade paths for all connectors.

3.1.7 Release 22.0.0.0

- **Enhanced Windows Active Directory log experience**
The Delphix SQL Server install base is growing fast, and with that growth, our biggest users are experiencing excessive login entries to their Domain Controllers from Windows target hosts, and also from environment monitoring to targets and sources. Improvements have been made in Delphix code to optimize the AD logon calls to the Domain Controller.
- **API activity log shipping**
Today, users are unable to ship an audit trail of API activity off-engine. This means they cannot reliably detect vulnerability exploit attempts by analyzing Delphix logs. To respond to this important security requirement, Nginx access logs are now shipped to the Delphix Fluentd service.
- **Cassandra**
This version is primarily a bug-fix release. Refer to the Cassandra [Release Notes](#)⁴⁶ for more details.
- **MySQL**
Certified AWS RDS and RDS Aurora using the Staging Push ingestion mechanism. In addition, we streamlined the Staging Push configuration for all sources.
- **Oracle EBS**
This version is primarily a bug-fix release. Refer to the Oracle EBS [Fixed issues](#)⁴⁷ for more details.
- **PostgreSQL**
In v4.2.0, an issue was resolved where some expected tables were missing after a single database refresh or restore. This had the unintended effect of failing a previously working ingestion. This change has been removed and will be re-implemented in a future version. Refer to the PostgreSQL [Fixed issues](#)⁴⁸ for more details.
- **YugabyteDB**
The YugabyteDB database is now supported. Added AWS S3 support.
- **Documentation updates**
Broad improvements continue across multiple areas of documentation, including Oracle EBS.

3.1.8 Release 21.0.0.0

- **Documentation Updates**
Broad improvements continue across multiple areas of documentation, including CockroachDB and MySQL.
- **Oracle**
RedHat Enterprise Linux (RHEL) v9.0 through v9.3 are now supported for Oracle 19c.
- **IBM Db2**
The connector now supports IBM AIX 7.2 and RHEL 9.2.

⁴⁶ https://delphix.github.io/cassandra/Release_Notes/1.2.0/Release-v1.2.0/

⁴⁷ <https://cd.delphix.com/docs/latest/fixed-issues-ebs>

⁴⁸ <https://cd.delphix.com/docs/latest/fixed-issues-postgresql>

- **MySQL**
Improvements have been made to the UI for linking a MySQL dSource in the wizard, where only properties applicable to the selected linking method are shown.

3.1.9 Release 20.0.0.0

- **Customizable local listeners for Oracle VDBs and Virtual CDBs**
Database administrators need to configure database listener parameters for multiple reasons, notably for security, performance optimization and resource management. Previous improvements brought support to customize local listeners for Oracle VDBs in single-instance environments. This functionality has now been expanded to encompass the customization of local listeners for VDBs in cluster environments, in addition to Virtual Container Databases in both cluster and single-instance environments.
 - **Customizable local listeners for Oracle MT RAC VDBs:** Delphix now supports customizing local listeners when provisioning a VDB in an Oracle RAC environment. In addition, this allows you to provision a vPDB into a new vCDB in a non-RAC or RAC environment, update local listeners for a VDB in a RAC environment, and update local listeners for a vCDB in a non-RAC or RAC environment.
- **Support Delphix operations for Oracle RAC VDBs/vPDBs during downtime:** Oracle RAC is used for production databases to ensure their availability 24/7. To comply with business continuity guidelines, Delphix now supports the following VDB/vPDB operations when one or more hosts of the Oracle RAC clusters are down: Provisioning, enable/disable, refresh, start/stop, and rollback. This enhancement includes VDBs/vPDBs in vCDBs and Linked CDBs.
- **Staging Push online DB mode for SQL Server:** Delphix now supports database online mode for Staging Push dSources for SQL Server, keeping the source database open for transactions, as needed. Before this enhancement, Staging Push source databases were required to be in restoring mode only. This enhancement is supported for SQL Server deployed on-premises and in the cloud (for both self-managed databases and SQL PaaS environments).
- **IBM Db2:** RHEL v9.2 is now supported for IBM Db2 v11.5, including IBM Db2 v11.5.9.
- **MySQL:** Added Staging Push support for AWS RDS and AWS RDS Aurora MySQL. Certified Amazon Linux 2 as staging and target host environments.
- **Oracle E-Business Suite (EBS):** Oracle EBS's DB Tech Stack on IBM AIX v7.2 is now supported. The EBS App Tier is not supported on IBM AIX v7.2.
- **SAP HANA:** HANA SPS 06 and SPS 07 are now supported on the SUSE Operating Systems.
- **Documentation updates:** Broad improvements continue across multiple areas of our documentation, including Couchbase, IBM Db2, MongoDB, and MySQL.

3.1.10 Release 19.0.0.0

- **Documentation updates**
Broad improvements have been made across multiple areas of documentation, including the [Delphix Overview](#) (see page 553), [Product information](#) (see page 554), [Glossary](#) (see page 556), [Getting started in Datasets](#) (see page 1043) section, and the [PostgreSQL](#) (see page 1831) dataset section.

- **UI for object storage connectivity modifications**
Key rotation, endpoint URL, regions, and authentication types may now be modified for existing connected object storage through the UI, in addition to the previously available API and CLI options.
- **Improved migration time to Elastic Data**
Leveraging Elastic Data with Continuous Data provides significant cost savings by leveraging object storage in addition to block storage. We have decreased the time to execute migrating an engine from a standard Continuous Data Engine to an Elastic Data Engine. A reboot is required to enable this feature enhancement.
- **TDE support for Hardware Security Module (HSM) solutions**
Integration with HSM solutions such as Oracle Key Vault (OKV) and CipherTrust help enhance security by offering robust TDE capabilities that ensure encryption keys are securely managed and stored. Delphix can now connect to OKV and CipherTrust to perform all operations within TDE environments managed by any of these solutions.
- **SAP HANA support**
HANA SPS 06 and SPS 07 are now supported on SUSE Operating Systems.
- **Oracle EBS support**
EBS on IBM AIX v7.2 is now supported.
- **MongoDB support**
MongoDB is now supported on RHEL 9.0.

3.1.11 Release 18.0.0.0

- **Decreased VDB downtime**
There are two types of upgrades for Continuous Data, full upgrades where VDB downtime is incurred during a system reboot, and deferred updates where there is no system reboot and therefore no downtime. Note that some features will require a full upgrade. The full upgrade process has been enhanced to minimize VDB downtime, limiting it to the duration of the system restart. VDBs now remain operational throughout the upgrade, experiencing downtime solely during the system reboot phase. This enhancement will be in effect for upgrades from 18.0.0.0 or greater.
- **Object storage modification**
Key rotation, endpoint URL, regions, and authentication types may now be modified for existing connected object storage through the API and CLI.
- **NFS encryption**
Adds support for Repave and Oracle RAC configurations with NFS encryption.
- **IBM Db2 HealthChecker**
The HealthChecker can now validate staging and target environment configuration to simplify implementation. This joins existing support for Oracle E-Business Suite (EBS).
- **PostgreSQL**
Provided WAL Logs will no longer automatically roll forward a dSource. This action will now occur only when a dSource snapshot is taken to eliminate unknown changes.
- **SAP HANA certification**
Certified SAP HANA SPS 06 and 07.
- **ESXi 8.0 U2 certification**
Certified VMware ESXi 8.0 U2.

3.1.12 Release 17.0.0.0

- **NFS encryption**
Using encryption over NFS between Continuous Data Engines and the target and staging hosts is now supported. Please consult with your account team as to whether this is an appropriate fit for your needs.
- **MySQL on Linux:**
"Manual Ingestion" has been renamed "Staging Push" to standardize on the established Delphix ingestion architectures. Strengthened the refresh and snapshot workflow to minimize occasional failures. Please review the [upgrade path](#)⁴⁹ for installation guidance.
- **Oracle E-Business Suite (EBS)**
Updated the virtual database provisioning hooks to support the Solaris operating system. This release is recommended to all users as it contains various bugs and security fixes.
- **Couchbase support**
Support has been added to define multiple buckets, configure RAM sizes, and ingest multiple full backups. Additionally, the connector will now report data source sizing.
- **Microsoft SQL server backup**
Improved how easily you can bring in data from Microsoft SQL Server on Azure by automatically updating the Access Control Lists (ACLs), allowing users of various staging and target environments to better manage their files and folders.

3.1.13 Release 16.0.0.0

- **Bug fixes and performance improvements**
This release focuses on a number of bug fixes and performance improvements. More details can be found on the [Fixed issues](#)⁵⁰ page.

3.1.14 Release 15.0.0.0

- **Improved SQL Server Access Control List (ACL) update time for file stream files (for VDB operations)**
Mitigates delays caused by the longer Access Control List (ACL) update time compared to the transaction log interval, which is achieved by bypassing ACL checks during virtual database operations.
- **Fluentd logs download**
Adds a capability that allows you to download Fluentd logs for debugging, as well as import the logs into analysis tools.
- **In-place conversion of an engine to Elastic Data (object storage)**
System administrators can now convert an existing all-block-storage Continuous Data Engine to

⁴⁹ <https://cd.delphix.com/docs/19.0.0.0/mysql-matrix>

⁵⁰ <https://cd.delphix.com/docs/19.0.0.0/fixes>

Elastic Data (with object storage), in-place, without the need to replicate to a new engine. Note that a reboot update is required to use this feature.

- **Certification of Oracle 19c and 21c on SUSE 15 SP5**
Oracle 19c and 21c on SUSE 15 SP5 are now certified.
- **Datapatch**
Adds support for invoking Datapatch against Oracle VDBs when they are provisioned, refreshed, rewound, started, or enabled via Delphix UI and CLI.
- **Export an Oracle non multitenant or PDB snapshot to a physical Oracle ASM or Exadata database**
This feature enables you to export data from an Oracle non multitenant, PDB snapshot, or timeflow point to a physical Oracle database that uses Oracle Automatic Storage Management (ASM). This feature is especially useful for Oracle target environments running on Exadata or ExaCC systems.
- **IBM Db2**
 - **SSL/TLS support for HADR ingestion**
The Db2 plugin introduces SSL/TLS support for HADR ingestion, enhancing data security during replication by encrypting data in transit between primary and standby databases.
 - **Dynamic UI for Db2 virtualization**
With the introduction of various dynamic UI features, you can now experience a streamlined and user-friendly interface that adapts based on your selected choices, simplifying the linking process.
- **Redeploy support (Repave)**
Continuous Data Engines may now be disconnected from their storage and redeployed, maintaining the previous configuration and data. Redeployment support only works with the same Delphix Engine version. Currently, engine redeployment is not supported on Elastic Data Engines, which is expected to be available in a subsequent release.

3.1.15 Release 14.0.0.0

- **Elastic Data**
Previously referred to as “Cloud Engines”, Continuous Data with Elastic Data allows you to leverage lower-cost object storage in addition to traditional block storage. This has the effect of dramatically decreasing the operational overhead of Continuous Data while enabling new use cases like long-term archival and retention.
 - **Private data center Elastic Data**
Previously, Elastic Data was only available for Continuous Data Engines deployed in AWS (using S3) or Azure (using BLOB storage). We now support deploying Elastic Data with on-premises, S3-compatible object storage arrays.
 - **Elastic Data on Oracle Cloud Infrastructure**
Elastic Data may now be used in OCI, providing decreased operational overhead and enabling new use cases, as mentioned above.
- **Replication Failback**
In the case of a failure on a primary Continuous Data Engine, failover may be used to swap operations to a secondary Engine. Previously, this was a one-time, terminal action. With failback, you can restore

operations back to the primary engine if the failure has been resolved, or if you simply want to test the failover process.

- **PurgeLogs operation**

The PurgeLogs operation now includes support for Oracle Multitenant dSources.

- **Oracle Staging Push**

The Staging Push method of ingestion now supports point-in-time provisioning of data.

- **Couchbase**

Couchbase 7.1.3 is now supported and several bugs have been resolved, such as increasing buffer size in the bucket-list command, backup restore failures, and replication status checks.

- **MySQL/Linux**

There is now guidance for upgrading Source, Staging, and Target environments from MySQL 5.7 to v8.0. In addition, new guardrails have been introduced to prevent incompatible refresh and rollback operations.

- **PostgreSQL**

All RHEL v8.x operating systems are now supported. In addition, new protections have been introduced to prevent accidental modification of parameters via VDB Config Template configuration.

- **SAP HANA**

VDB provisioning has been improved in scenarios when SAP HANA services `scriptserver` and others are missing volume information.

- **Support for upgrading OpenJDK Java**

Enables the ability to provide your own Adoptium OpenJDK upgrades without upgrading the product. Extends “Bring Your Own Java” to include Adoptium, not just Oracle.

- **ESXi 8.0 U1**

Continuous Data may now be run on VMware ESXi 8.0 U1.

3.1.16 Release 13.0.0.0

- **Recovery from failed vPDB in a Linked CDB**

A variety of factors may cause an Oracle virtual pluggable database to fail in a linked container database. It is now possible to recover from a failed Pluggable Virtual Database with a forced refresh or rewind operation.

- **IBM Db2**

Support for RHEL 8.8 has now been certified for Delphix. This release was originally published in June.

- **MongoDB**

Additional parameters are now supported in the `mongodump` and `mongorestore` commands. Backups and restores can be customized more flexibly to improve data extraction and ingestion speeds, such as parallel collections processing.

- **PostgreSQL**

Support has been added for PostgreSQL 15.0 on RHEL 9.0 and Azure Flexible Server for PostgreSQL 14.0. The source sizing calculation has also been updated to more accurately represent the correct database size.

- **SQL Server**

The following are now supported:

- SQL Server 2016 on Windows Server Core 2016
- SQL Server 2019 on Windows Server Core 2019
- SQL Server 2022 on Windows Server Core 2022
- SQL Server Developer Edition for all supported SQL Server versions

3.1.17 Release 12.0.0.0

- **User audit for Delphix support**

In a case where engine access is granted to Delphix Support to debug or fix issues, or any actions take any actions, this is now tracked in its own audit log.

- **SMTP TLS**

You can now add a certification for SMTP TLS authentication via the API or command line.

- **Refresh/Rewind of Oracle VDBs and vPDBs that have been exported to Oracle ASM Databases**

Users may now refresh or rewind Oracle VDBs or vPDBs that have been exported to physical ASM databases. The performance of the export to ASM can also be improved with the ability to specify specific RMAN file section sizes.

- **IBM Db2**

The v4.6.0 release supports Staging Push with the Database Partitioning feature (DPF) and custom mount points.

- **MongoDB**

The v1.3.0 release supports passing additional parameters to mongodump and mongorestore. This adds parallel processing and flexibility to improve data extraction and ingestion speeds.

3.1.18 Release 11.0.0.0

- **Staging push read-only Oracle databases**

Supports staging-push ingestion from read-only databases.

- **Partial ingestion via Oracle staging push**

Partial ingestion enables the ability to ingest only selected Oracle tablespaces with Staging Push. This feature allows you to subset the Oracle database by choosing only specific tablespaces.

- **MongoDB**

Supports MongoDB Enterprise 6.0 and Mongo Atlas, including cluster-to-cluster sync to enable ingestion of large, sharded databases.

- **MySQL/Linux**

Supports MySQL v8 across all certified editions.

- **PostgreSQL**

Supports point-in-time (PIT) provisioning using external logs and ingestion using the “pg_dumpall” utility.

3.1.19 Release 10.0.0.0

- **Azure key vault integration**
This release adds Azure Key Vault support for storing and accessing secrets, keys, and certificates necessary for Continuous Data operations.
- **NFSv4 only mode**
 - This release adds support for turning off NFSv3 on the engine.

3.1.20 Release 9.0.0.0

- **READ_COMMITTED_SNAPSHOT parameter can now be set during VDB provisioning**
This feature allows the SQL Server *READ_COMMITTED_SNAPSHOT* database parameter to be defined during VDB Provision operations, either by specifying it as a VDB Configuration Parameter or associating the VDB with a VDB Configuration Template. If defined, the parameter will be automatically set during Provision, Refresh, and Rewind operations for the VDB.
- **Export an Oracle virtual DB or virtual PDB to a physical Oracle ASM or Exadata database**
This feature enables you to export data from an Oracle Virtual database (VDB) or a Multitenant (MT) vPDB to a physical Oracle database that uses Automatic Storage Management (ASM). This feature is especially useful for Oracle target environments running on Exadata or ExaCC systems.

3.1.21 Release 8.0.0.0

- **Oracle: Multiple virtual PDBs in a virtual CDB**
This feature enables you to provision and manage multiple Oracle virtual PDBs to a virtual CDB (vCDB).
 - A vCDB is a Delphix-managed, fully compatible Oracle Container Database created and maintained by Delphix as part of the VDB provisioning workflow. This workflow allows organizations to automate their Oracle data lifecycle end-to-end, which results in developer productivity enhancements. Additionally, because container databases allow it, Oracle users benefit from the Oracle licensing agreement (which allows hosting up to three PDBs inside a vCDB).

This feature is only supported for Oracle versions 12.1.0.2 (with a patch for Oracle bug 18967466) and later.

- **Source sizing for HANA**
This feature enables you to calculate the source dataset size based on the total allocated space on the mount point provided by the Delphix Engine for the dataset.
- **Support for multiple backup paths in DB2**
This feature supports multiple backup paths instead of one for dSource ingestion. This allows you to

provide a single backup path for the dSource ingestion and add more backup paths with a dynamic UI to accommodate for the extra backup directories where the backup was split into.

3.1.22 Release 7.0.0.0

- **Oracle: Multitenant TDE for VCDBs**
Use transparent data encryption (TDE) with virtual container databases to secure data-at-rest. Existing TDE keys can be used or data can be rekeyed upon deployment. Automated KeyStore sanitization ensures production TDE keys are not shared to non-production environments.
- **Oracle: staging push**
Pushes new data to the Delphix DevOps Data Platform instead of requesting data on a polling interval. Isolate ingests to Delphix from production instances. Gives the ability to leverage third-party backup applications. Full-tested integration with Oracle Data Guard and Active Data Guard allows for staging DB to be the standby DB, enabling tight point-in-time snapshots.
- **Cassandra: new Continuous Data connector**
Continuously sync to Cassandra databases and deploy data to non-production environments. Deploy data from multiple Cassandra nodes as a single virtual database. Track source changes along a continuous time flow and redeploys data from any time. Quickly deploy data to new ephemeral instances. Branch production data, apply data masking, and deploy to new developer sandbox environments.

Multiple Device Removal for Delphix Engines version 6.0.12.0 to 6.0.17.X contains a breaking kernel module change that requires a reboot in order for the new module to load. With that, a deferred reboot engine upgrade operation will be unable to remove devices until a reboot is performed.

3.1.23 Release 6.0.17.0

- **Source sizing for Postgres and IBM Db2**
This feature brings improved visibility for data source ingest management and metrics with data source size information logs. The source volume sizes can now be viewed through engine APIs and easily integrate with automation scripts.
- **Environment variables in hooks**
This feature allows users to customize data deployments with hook scripts using environment variables, defined by plugin connectors in `DLPX_DATA_DIRECTORY`. Automated hook scripts can be executed during pre and post-deployment.

3.1.24 Release 6.0.16.0

- **Elastic Data engines on Microsoft Azure**
You can now use Azure Blob object storage in place of block storage to reduce operational

costs. Cache only necessary data to engines in order to maintain consistent VDB performance. Allows for elastic expansion of your storage footprint as-you-go in the cloud. Quickly deploy data to engines across regions, combining these tools to achieve potential cost savings of 25%-80% depending on use and workloads.

- **Elastic Data engines cache resize**
This feature allows your Elastic Data engine cache to meet changing cost-performance demands on-the-fly by fine-tuning cache ratios for data ingestion and distribution use cases. Adapt to different workloads, saving costs during idle situations and delivering high performance during heavy workloads.
- **Continuous Vault: additional security controls**
New security controls are introduced for Ransomware Protection when using [Delphix Continuous Vault](#) (see page 2381). Alert Profiles, dSources, and LogSync profiles can now be locked on Continuous Data Source Engines. Delphix Continuous Ransomware Protection Solution provides Continuous Data Protection, Recovery, Detection, and Compliance.
- **Non-admin user password reset**
Non-admin users will be able to request a password reset if an email is associated with the account. The password reset will continue to be controlled through LDAP/SSO for users on IdP platforms. Self-service password reset is available both within the UI and CLI.
- **Zero trust update for SAP HANA connector**
A “least-privileged” OS user can now be used to run virtualization operations on a Delphix target host. Aligning with Zero Trust initiatives, Delphix no longer requires a high-level OS user for virtualization.
- **Increased mount security**
This change brings improved security controls that limit connections to Delphix Engines only from a defined host list. NFS mount checks will now run on ephemeral mount points matched to specific host UIDs. Mount checks are used to verify that the Continuous Data Engine is mountable before running virtualization operations.
- **iSCSI parameter warnings**
New warning to ensure iSCSI parameters on Windows Targets are optimized for Delphix Engines. The check runs for Target environments during Add, Refresh, and Enable operations.
- **Database port customization for EBS plugin**
This feature supports the provisioning of VDBs in EBS dbTechStack & AppsTier plugins to run on a customized port. You can now provision database binaries(ORACLE_HOME) cloning and listener process to run on a custom DB port and Application tier to connect to that port.

3.1.25 Release 6.0.15.0

- **Oracle MT TDE for system tablespaces**
The next release enables system tablespaces on Oracle Virtual Databases to be encrypted using transparent data encryption (TDE). Oracle system tables store database table information, index, sequences, and other objects. Encrypting system tables in non-prod environments enforce security controls and prevents database index and metadata tampering.
- **Staging push for Postgres**
Staging push enables organizations to push data into Delphix without having to directly query production instances. With staging push, teams can use 3rd party solutions to recover data to

staging instances that automatically sync to Continuous Data. This also enables logical replication workflows (common for PaaS sources) and the use of tools like pgbackrest.

- **Staging Push for IBM Db2 HADR**

Staging push will be added in the next release for IBM Db2 in a High Availability Disaster Recovery (HADR) configuration. This gives teams an alternative way to sync data into the Continuous Data.

- **Cache analysis for Elastic Data engines**

We plan to add a UI for teams to better understand the effectiveness of allotted Delphix Elastic Data engine cache size. This enables users to optimize DCE cache sizes to meet required cost-performance levels for VDBs.

- **Storage device removal UI**

The team will be able to remove disks on engines backed by block storage through the UI in addition to the CLI in 6.0.15.

- **Zero trust for Postgres**

6.0.15 supports custom “least privilege” OS user roles to be assigned to the “Delphix_OS” user to perform virtualization operations from Postgres sources.

- **TDE source database support for EBS plugin**

6.0.15 supports TDE source databases for the EBS plugin.

Certifications

- Oracle 19c on RHEL 8.6 (6.0.15.0+)
- Oracle 21c on RHEL 8.6 (6.0.15.0+)
- AppData on RHEL 8.6 (6.0.15.0+)

3.1.26 Release 6.0.14.0

- The **Delphix DevOps data platform** will feature some product name changes to better align with our offered solutions:
 - **Continuous Data** (Virtualization)
 - **Continuous Compliance** (Masking)
 - **Continuous Vault** (Data vault)
- **Single engine Continuous Vault**

The Single Engine Continuous Vault provides effective protection against ransomware attacks in a standalone Delphix Engine. This option may be preferable for deployments where maintaining two separate engines is not architecturally necessary. See Delphix Continuous Vault for more information.
- **AWS Elastic Data engines**

This offering will support the use of AWS S3 object storage in place of traditional block storage, making it easier and more efficient to store more data for longer with Delphix. For this release, only engines deployed on AWS are supported, with support for other infrastructures to come.
- **Microsoft SQL Server Virtual-to-Physical (V2P) improvements**

With these new improvements, users can specify a separate drive for SQL Server transaction log files, since these often need to split across multiple locations due to size. This ensures that DB files rehydrate in the manner that is most efficient during initial V2P, which helps avoid unnecessary downtime; this works in tandem with our ransomware solution. An additional enhancement to improve transfer performance involves replacing XCopy with Robocopy multithreading capabilities.

- **Oracle MT TDE support for encrypted system tablespaces**
Every Oracle database has a system tablespace that is always used to store system data, including information about database tables, indexes, sequences, and other objects. Oracle TDE can encrypt, in addition to the data itself, the system tablespace for maximum security. This feature allows Delphix to provision VDBs with TDE-enabled encrypted system tablespaces to maintain the overall database security in non-production environments.
- **Staging push for SAP HANA via CommVault**
CommVault is the most popular backup application for SAP HANA. We have certified that the backup application can be used as expected by our customers with our new Staging Push capability.
- **Salesforce data protect and version performance improvements**
The March release will allow the user to configure up to 30 parallel upload threads (a 10x increase), improving our restore performance to ensure a fast recovery. We've also added several improvements towards faster and leaner retries for any records that fail during restore, plus increased the efficiency and reuse of API calls while downloading data (leading to faster backups and better resource utilization).
- **Ingest and restore for PostgreSQL**
This feature allows you to ingest logical backups (pg_dump/pg_restore) from PostgreSQL, which enables workflows for direct ingestion from PaaS data sources (AWS Aurora & RDS), deployment to IaaS-hosted targets, and selective ingestion of individual databases from multiple database instances of PostgreSQL.

Certifications

- Oracle 19c on RHEL 8.5 (6.0.14.0+)
- Oracle 21c on RHEL 8.5 (6.0.14.0+)
- AppData on RHEL 8.5 (6.0.14.0+)

3.1.27 Release 6.0.13.0

3.1.27.1 New in this release

- **Support for AWS object storage**
This release adds support for the use of AWS S3 object storage in place of traditional block storage. This release currently supports only those engines that are deployed on AWS.
- **Staging push for SQL Server**
This release supports staging push for SQL Server. Staging push allows you to push data to Delphix if you have tools, configurations, or security concerns that do not work with the existing pull model. Staging push enables, for example, compatibility with data stored in backup systems and gives you control over the staging database. For more information, see [Staging Push Implementation for SQL Server \(see page 2080\)](#).
- **Support for TLS 1.3**
This release provides support for TLS 1.3 for connections from the virtualization engine to the host and engine-to-engine communication.
- **Auto vPDB restart for single instance linked CDBs**
This release supports the auto-restart feature for single-instance vPDBs in a linked CDB. The auto-

restart feature allows the virtualization engine to detect and restart VDBs if the remote host has been restarted.

- **Transparent Data Encryption (TDE) for Oracle Multitenant RAC (Oracle 12.2 and 21c)**
The Oracle TDE feature encrypts the sensitive data (database tables and tablespaces) stored on the disk. This prevents misuse of the data if the disks or storage mediums are lost or stolen. The data is transparently decrypted for authorized users when they access the data. Our large enterprise customers leverage Oracle RAC configurations for their business-critical applications. This release adds support for Oracle 12.2 and 21c. For more information, see [Provisioning a TDE-enabled vPDB to a Cluster Target](#) (see page 1615).
- **FluentD monitoring**
FluentD is a popular open-source data logging layer for DevOps and [Site Reliability Engineering \(SRE\) teams](#)⁵¹ to stream telemetry to their chosen monitoring solution to improve systems observability. Delphix already provides the ability to forward data events and performance metrics to [Splunk](#)⁵². Delphix 6.0.13 enables additional Fluentd configurations to be developed and added to the engine, extending [telemetry output](#)⁵³ to new tools like ELK, New Relic, and DataDog.
- **Db2 plugin version 4.1.3**
This plugin release resolves some issues that are listed in the [Db2 Release Notes](#) (see page 356).
- **EBS plugin version 3.0.3**
This plugin release resolves some issues that are listed in the [EBS Release Notes](#) (see page 384).

3.1.27.2 Certifications

- **Virtualization**
 - Microsoft Windows Server 2022
 - Oracle E-Business Suite (EBS) 12.2.11 in OCI
- **Hypervisors/Clouds**
 - ESXi 7.0 U3c

3.1.28 Release 6.0.12.0

3.1.28.1 New in this release

- **HANA staging push**
The HANA 2.0 plugin introduces the Staging Push feature. This feature provides a new data ingestion mechanism that helps users to push data into the Delphix-provided mount point on their own. For more information, see [Delphix Architecture for HANA](#) (see page 2024).
- **Multiple device removal**
You can now remove multiple storage devices at a time when engines are over-provisioned or when moving to new storage. This is done only after ensuring sufficient resources to support the removal.

⁵¹ <https://www.delphix.com/solutions/sre-teams>

⁵² <https://splunkbase.splunk.com/app/4373/>

⁵³ <https://www.fluentd.org/dataoutputs>

- **Transparent Data Encryption (TDE) for Oracle Multitenant RAC (Oracle 18c and 19c)**
The Oracle TDE feature encrypts the sensitive data (database tables and tablespaces) stored on the disk. This prevents misuse of the data if the disks or storage mediums are lost or stolen. The data is transparently decrypted for authorized users when they access the data. Our large enterprise customers leverage Oracle RAC configurations for their business-critical applications. We have added support for provisioning a TDE-encrypted vPDB to a linked (Physical CDB) target RAC environment on Oracle 18c and 19c in this release. For more information, see [Provisioning a TDE-enabled vPDB to a Cluster Target](#) (see page 1615).

3.1.28.2 Certifications

- Oracle 21c on SLES 15 SP3 (6.0.11.0+)
- Oracle 19c on SLES 15 SP3 (6.0.11.0+)
- Oracle 21c on SLES 15 SP2 (6.0.11.0+)
- Oracle 19c on SLES 15 SP2 (6.0.11.0+)
- AppData on RHEL 8.4 (6.0.11.0+)

3.1.29 Release 6.0.11.0

3.1.29.1 New in this release

- **OAuth2 API support**
The Virtualization and Masking engine APIs are now accessible via OAuth2 tokens that improve Delphix's security offerings. For more information, see [Configuring OAuth2 Authentication for API Access](#) (see page 726).
- **Oracle support for Exadata, Exadata Cloud, or Exadata Cloud-at-Customer (ExaCC) cluster**
This release adds support for Exadata, Exadata Cloud, or Exadata Cloud-at-Customer (ExaCC) Cluster for Oracle databases. For more information, see [Oracle Support Matrix](#)⁵⁴.
- **Apply Hotfixes using the self-service UI**
You can now apply hotfixes using the self-service upgrade UIs.
- **TDE for Oracle Multitenant - support for rekey**
Oracle Advanced Security Transparent Data Encryption (TDE) provides the ability to create virtual pluggable databases with a new key (independent from the source database). This is to facilitate another layer of security - ensuring that different keys are used in the production and non-production systems. For more information, see [Provisioning a TDE-enabled vPDB](#)⁵⁵.
- **Modify DBID for non-multitenant Oracle VDBs after provisioning**
You can now generate a new DBID after a VDB is provisioned and refreshed. For more information, see [Generate a New DBID for Oracle VDBs](#) (see page 1638). Support for multitenant databases is currently not available.

⁵⁴ <https://cd.delphix.com/docs/latest/oracle-matrix>

⁵⁵ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/4817661/Provisioning+a+TDE-enabled+vPDB>

- **New wizard for creating replication profile**

A new multi-step wizard is now available that replaces the previous in-place editing option to manage Replication Profiles. For more information, see [Replication User Interface](#) (see page 2434).

3.1.29.2 Certifications

- Oracle 21c on RHEL 8.4, RHEL 8.3, SLES 15 SP1 (6.0.11.0+)
- Oracle 19c on RHEL 8.4 (6.0.10.0+)
- Exadata Cloud-at-Customer(ExaCC)/Exadata support for Oracle 12.2 on OEL 7.8 and OEL 7.9

3.1.30 Release 6.0.10.0

3.1.30.1 Virtualization

- **SQL Server-support for Azure storage backups**

SQL native backups can now be read directly from Azure Cloud storage. For more information, see [Restoring SQL Backups Stored in Azure Cloud Storage](#) (see page 2225).

- **Support dSource upgrades from Non-MT to MT in Oracle**

Once a dSource is converted to a multitenant PDB, you will be able to share its storage blocks with its non-multitenant predecessor. Delphix will only store the incremental changes to the database. For more information, see [Prepare and Upgrade a Non-MT Oracle dSource to MT](#) (see page 1548).

- **Oracle-provision to the latest Point-In-Time on RAC**

Provision to the latest point-in-time is now supported.

- **Flexible ORACLE_HOME permissions configuration**

Removed the need to set permissions of the "\$ORACLE_HOME/dbs" subdirectory using STARTUP SPFILE syntax to simplify Oracle operations. For more information, see [Requirements for Oracle Hosts and Databases](#) (see page 1452).

- **Support for manually starting an Oracle VDB**

An Oracle VDB can now be manually started. For more information, see [Manually Starting a VDB](#) (see page 1670).

- **Attach and detach Oracle CDB containers**

Detaching, attaching, and linking of the Oracle CDB containers is now supported via CLI. For more information, see [CLI Cookbook: Attaching, Detaching, or Linking a CDB](#) (see page 2650).

- **Password vaults and remote hooks for UI**

In the 6.0.9.0 release, we introduced the ability to use password vaults with hooks. This allows our customers to ensure a high level of security with all operations with external systems. This can now be configured via the user interface. For more information, see the [Secure credential management](#)⁵⁶ section in the linked page.

- **NFSv4**

NFSv4 is now enabled by default. For more information, see [NFSv4 Configuration](#) (see page 760).

⁵⁶ <https://cd.delphix.com/docs/latest/other-operations>

- **12-month support for upgrades and Forward Compatible Replication (FCR)**
To better align with the Delphix support program, Engine upgrades, and FCR operations must be within versions no more than 12 months apart. For example, upgrading to version 6.0.10.0 will require the previous version to be at least 6.0.4.0. For more information, see [Upgrade Matrix](#) (see page 542) and [Replication Overview](#) (see page 2399).
- **HANA plugin port control**
You can now keep the port numbers consistent throughout the HANA VDB life cycle so that the connections made to the VDBs are not disrupted during their life cycle. For more information, see [Provisioning HANA VDBs: An Overview](#) (see page 2062).
- **User-specified mount path For Db2 dSource**
You can now specify a mount path of your choice to host the dSource dataset on the target host. For more information, see the [Db2 connector operations](#)⁵⁷ section.
- **Staging push automation for Db2 dSource**
You can now use a set of scripts that can be used to automate the restore and roll forward operations on the dSource.

3.1.30.2 Certifications

3.1.30.3 Virtualization

- **OCI VM.Standard.E4** (see page 665)
- **AWS r5n.24xlarge** (see page 640)
- **Oracle 21C RH 8.3**⁵⁸

3.1.31 Release 6.0.9.0

3.1.31.1 Virtualization

- **Delphix data vault - additions**
In continuation to the **Delphix data vault for ransomware protection** released in 6.0.8.0, this release enables you to manage this feature from the Delphix Engine user interface and also lets you monitor the regular valid replication received. For more information, see [Delphix Data Vault](#) (see page 2381).
- **TLS 1.3**
The TLS 1.3 support is added as an available secure connection option at the Engine Admin Console to be used between engines.
- **Phonehome data collection frequency**
The default collection period for the Phonehome users is now changed to daily. For more information, see [System Configurations - Enable Phone Home](#) (see page 1010).

⁵⁷ <https://cd.delphix.com/docs/latest/ibm-db2-connector-operations>

⁵⁸ <https://cd.delphix.com/docs/latest/oracle-matrix>

- **Password vaults for remote hooks**

With this release, the hooks running on environments can now obtain credentials from the engine and its configured password vaults. These credentials can be used to perform custom authentication tasks in a secure manner. Currently, this feature is supported via the command line interface only. For more information, see [Passing Credentials Securely to Hook Operations \(see page 1102\)](#).

- **Delphix integrations (dxi) docker image**

A new dockerized version of the dxi library is now available. For more information, see [Docker Image](#)⁵⁹.

3.1.31.2 Certifications

- **Virtualization**

- EBS 12.2 on Oracle 19c
- Db2 11.1.4.6 Fix pack

- **Hypervisors/Clouds**

- ESXi 7.0 U2

3.1.32 Release 6.0.8.0

3.1.32.1 Virtualization

- **Delphix data vault**

The Delphix Data Vault for ransomware protection (accessible via CLI) enables organizations to recover access to their application data much faster than traditional backup solutions after malicious attacks. It relies on the new **data vault** Replication feature, which replicates critical business DB data stored on Delphix engines to a new target engine called Data Vault. Once securely stored on the Data Vault, the replicated DB data can be used to recover business applications upon a ransomware attack with very low RTO and RPO.

- **Dxi executable and support for encrypted credentials**

We will be distributing the dxi CLI, a Delphix solution built to facilitate simpler and seamless integration of Delphix Platform Operations into existing workflows, such as Windows, macOS, and RHEL binaries. This will simplify adoption and remove the requirement on Python. Delphix has also added encryption for the login credentials.

- **Expansion of retention period on replicated objects**

At present, when snapshots on the replication source engine are deleted (either due to retention policies or user action), the next replication job will delete those snapshots on the replication target engine. This improvement will allow you to extend the retention period of replicated objects on target engines while keeping the original retention at the source. Once the object in the target engine reaches its retention period, it will be flagged and deleted by the policy agent based on a daily schedule.

⁵⁹ <https://hub.docker.com/r/delphix/dxi>

- **Db2 staging push**
Delphix now supports Staging Push for non-DPF Db2 databases. The Staging Push architecture will allow organizations to bring their data to Delphix, with their own tools and standard processes. This facilitates the use of any backup tool, a major ongoing source of requests. This should dramatically increase the volume of data that can be easily managed by Delphix.
- **HANA plugin staged architecture**
Delphix introduces a staging architecture for HANA virtualization. This will make it consistent with other virtualized data sources. This new architecture will build a foundation for future staging push capabilities, as Delphix has begun to introduce other platforms. These changes, together, will allow us to support more prospective organizations with various SAP-certified, 3rd-party backup applications for HANA. Delphix will continue to support the pull ingestion method with HANA native backups and logs.
- **ASE native encryption support**
SAP ASE version 16.0 introduces the ability to fully encrypt databases and provides protection for all the data, indexes, and transaction logs in a database. This offers full database protection while allowing the user to query and manage the data as usual, as the encryption is transparent to existing functions. In response to customer demand, we have added a security enhancement to support encrypted ASE databases. This allows customers to maintain the ASE encryption that is active on their sources and propagate that through to their VDBs.
- **System tunable interface**
A new web service API is introduced which allows you to set or receive the values of a system tunable via Delphix CLI. A Support engineer can now provide context via a Support case to modify these values.
- **Oracle customized full backups**
There is a rarely-seen bug in Oracle that results in some blocks not being written to the datafiles during an Oracle SnapSync operation. When this happens, the datafiles can become incomplete and provisioning/refreshing from that snapshot might fail. We are providing a SnapSync option via CLI that you can customize to accept all datafiles during an Oracle SnapSync operation to prevent this error.

3.1.33 Release 6.0.7.0

3.1.33.1 Virtualization

- **Simplified connection management for Oracle databases**
This feature streamlines the way that Delphix communicates and interacts with Oracle databases by simplifying the connection management infrastructure. Prior to this release, connections were established to Oracle databases using two different methods (remote connections from the Delphix Engine and local connections from the Delphix toolkit) and communication was performed with Oracle databases using two different users (a Delphix OS user and a Delphix DB user). Starting with this release, all communication with Oracle databases will be performed locally on the Oracle host and all connections to Oracle databases will be established using OS authentication. Existing Oracle dSources and VDBs will continue to function with no user intervention required. This feature results in several key benefits for Oracle DB customers such as the elimination of the requirement for a Delphix

DB user when linking, automated PDB discovery, elimination of Delphix interaction with any network listener, and many more.

- **Virtualization SDK support for password vaults**

Building off of the existing CyberArk and Hashicorp support for Oracle, SQL Server, and SAP ASE database user credentials, Continuous Data will extend password vault coverage to the virtualization SDK (vSDK). This will enable data sources that are connected via a vSDK plugin to incorporate this more secure method of authentication.

- **SAP ASE device mapping improvements**

The Continuous Data experience with SAP ASE heavily relies on and mirrors a database's device allocation from the initial load (creating the dSource) to provision (creating VDBs). As these source device allocations shift over time, Delphix maps these changes and propagates them to their associated Delphix objects. However, dramatic device layout changes can negatively impact performance. This enhancement provides a quality-of-life (QoL) improvement to the overall SAP ASE experience by providing better error handling and escape valves should a dSource get into a bad state due to a major device layout shift.

- **Improved storage utilization for large pools**

Up through the 6.0.6 release, Continuous Data has enforced a storage usage limit of 85%. Once met, this limit will cause certain API operations to be disabled to ensure engine data integrity. In the 6.0.7 release, this threshold is relaxed significantly. The new thresholds are as follows:

- "Warning": when 85% of the total storage quota is reached or 1536GB of free storage is remaining (whichever is less), which can be resolved/ignored, with no impact on system behavior.
- "Critical": when 90% of the total storage quota is reached or 1024GB of free storage is remaining (whichever is less), which cannot be resolved/ignored, with some impact on system behavior.
- "Minimum": when 95% of the total storage quota is reached or 512GB of free storage is remaining (whichever is less). In this case, a critical fault is raised and cannot be resolved/ignored, with a substantial impact on system behavior (stop policies, VDB operations, etc).

- **PVSCSI support**

In addition to LSI Logic, with the 6.0.7 release, Delphix has added support for the VMware Paravirtual vSCSI controller (aka PVSCSI). While VMware designed PVSCSI to support very high throughput with minimal processing cost, the performance improvements on Delphix engines can vary from case to case. In 6.0.7, we also support manual changes from LSI Logic to PVSCSI for currently deployed engines.

3.1.34 Release 6.0.6.0

3.1.34.1 Virtualization

- **Solaris x86 to Linux x86 Oracle DB provisioning**

This feature allows the provisioning of Oracle Virtual Databases from Solaris x86 dSources to Linux x86 target environments.

- **TDE for Oracle Multitenant**

Oracle Advanced Security Transparent Data Encryption (TDE) provides the ability to encrypt sensitive application data on storage. Delphix will now support TDE for Oracle 12cR2, 18c, and 19c multitenant. This release introduces support for single-instance linked container databases (CDBs) using software keystores. Virtual Container Database (vCDBs), RAC, and rekeying of the TDE encryption keys are not supported in this release.

Note:

Please note the following important restrictions for **TDE for the Oracle Multitenant** feature:

- TDE-enabled vPDBs must be provisioned to a linked CDB, not a vCDB.
- RAC dSources and target CDBs are not supported.
- The Oracle version must be 12.2 or higher (12.1 is not supported).
- System tables or tablespaces either in the PDB or CDB must not be encrypted.
- Oracle Key Vault is not supported.
- Hardware keystores are not supported.
- Keystores must not be on ASM storage.
- The dSource from which the initial provision is done must be encrypted when it is linked. Existing dSources cannot be encrypted without unlinking and creating a new dSource.
- Encrypting an already-provisioned unencrypted vPDB (with clear data) which is managed by Delphix is not supported
- **Single to Multitenant VDBs**
Oracle announced the end of support for non-multitenant databases in their 20c release, and as such, Oracle DB customers are planning their upgrade and migration programs. Delphix will now support provisioning a virtual pluggable database from a non-multitenant virtual database.
- Added support for **HashiCorp namespaces**.

3.1.34.2 Certifications

- **Virtualization**
 - ASE 15.7/16 on RHEL 7.9
 - Oracle 12.1 on RHEL 7.9 and SLES 12 SP5
 - Oracle 12.2 on RHEL 7.9 and SLES 12 SP5
 - Oracle 19c on RHEL 7.9 and SLES 12 SP5
- **Hypervisors/Clouds**
 - ESXi 7.0 U1

3.1.35 Release 6.0.5.0

3.1.35.1 Virtualization

- **NFSv4 support:**
Support has been added for Oracle and ASE on AIX.
- **Expanded Replication: Replication of non-data objects**
Our customers are increasingly using replication to facilitate moves of data across network boundaries, to the cloud, and for DR purposes. We've had long-standing requests to replicate more than just the data, and in this release, we will support the replication of users, roles, permissions, policies, and configuration templates.
- **Upgraded Windows Connector:**
The Windows Connector will now support newer versions of Microsoft's .NET framework (4.x), which encompasses myriad higher security standards, new functionality, etc. Previously, the connector relied on .NET 3.5 due to two dependencies: SQL Server and Powershell, both have since been removed with SQL Server 2016+ and Powershell update in 6.0.3.0.
- **Db2 Extensible Ingestion:**
We will now support an extensible model for ingesting Db2 data. In this new, additive, model, we will support customers manually performing a restore & roll forward of their staging database to Delphix from native backups or arbitrary third-party backup tools which integrate directly with Db2. This will allow customers to bring data from whatever system or backup they have and restore it to an exact point in time, as needed.

3.1.35.2 Certifications

- **Virtualization**
 - ASE 16.0 on RHEL8.1 and RHEL8.2 on 6.0.4+
 - ASE 16.0 on SLES12.4 on 6.0.4+
 - Oracle 19.7 on RH7.8 and RH8.0 on 5.3.9+ and 6.0.3+
 - ESX 7.0
 - NFS v4 support on AIX
 - IBM Cloud Catalog. Delphix is now available in the IBM Cloud Catalog, a private marketplace for trusted IBM Technology partners that is offered to large IBM enterprise customers. In 6.0.5 we will start with a few certified instances for virtualization and masking and will grow our presence as more the business justifies the cost and efforts. Specifically, we support the following instances:
 - mx2-8x64
 - mx2-16x128
 - mx2-32x256

- mx2-48x38
- Oracle Cloud: The following are newly supported instance types:
 - VM.Standard2.8
 - VM.Standard2.16
 - VM.Standard2.24

3.1.36 Release 6.0.4.0

3.1.36.1 Virtualization

- **HashiCorp and expanded CyberArk support:**

Delphix has extended both CyberArk and HashiCorp Vault support to Oracle Database Users in addition to previously supported ASE and MSSQL domain users. GUI support for HashiCorp Vault has been added during setup to authenticate host users and database users.

Note:

The HashiCorp namespace Enterprise feature is supported starting 6.0.6.0.

- **NFSv4 support:**

Support has been added for SuSE and Db2 on AIX.

3.1.36.2 Certifications

- **Virtualization**

- OCI Support
- NFSv4 support for Db2 on AIX and SuSE
- SQL Server Instances with a Managed Service Account

3.1.37 Release 6.0.3.0

3.1.37.1 Virtualization

- **CyberArk and Hashicorp vault support for virtualization:**

Delphix is introducing password vault support to authenticate environment and database linking and will support both CyberArk with Oracle and Hashicorp with CLI only.

- **Capacity management:**

Understanding where and how storage is used on Virtualization Engines can be a challenge, in particular, understanding how and where space is held and how to recover it. In this release, Delphix provides better details of held space, particularly around locked objects, and provides clear instructions about what steps are required to free up space.

- **Diagnosability:**
Additional performance health-check analytics in phone-home have been added to better troubleshoot and understand customer problems.
- **Powershell upgrade:**
Delphix is reducing our requirements for Windows hosts running PowerShell by allowing you to use any PowerShell version from 2.0 to 5.1. Delphix will now use the default available PowerShell version on each host. When specifying hooks (such as “configureClone”), users may specify whether to use 2.0 or whatever PowerShell version is installed on the host.
- **Support for Oracle read-only homes:**
Delphix is introducing support for Oracle read-only homes, which is a new Oracle feature starting with Oracle 18c. In a read-only Oracle home, all the configuration data and log files reside outside of the read-only Oracle home. This feature allows you to use the read-only Oracle home as a software image that can be distributed across multiple servers.
- **Replication performance:**
Delphix will continue to improve replication performance for replication specifications that include multiple objects and single-object replication throughput.
- **SAP ASE support for VDB upgrade:**
SAP ASE Customers will now be able to validate DBMS Upgrades with this feature that enables provisioning VDBs to a higher version than the source DB (e.g. ASE 15.7 > ASE 16).
- **Shared NFS for toolkits**
With this release, Delphix introduces shared NFS for clustered environments. Customers wish to use a common NFS mount point, in which the Delphix toolkit for each cluster node can be deployed. The product today only creates a directory with appliance UUID and OS user in the folder name and uses this for detection to determine if a host is already managed by that Engine. As such, this prevents the customer from utilizing common NFS storage due to name conflict.
When a new environment is created, upgraded or if the toolkit path is changed, a new toolkit is created with naming convention Delphix_COMMON_ for common directory and Delphix_ for user directory.
With this change, the customer can use mounts on shared file systems (like NFS) as a toolkit path for clustered environments without any naming conflict. This change is not intended for windows environments.

3.1.37.2 Certifications

- **Virtualization**
 - EBS 12.2 with RHEL 7.6
 - PostgreSQL 12.1 & 12.2 with RHEL 7.8
 - Oracle 11g R2 and Oracle 19c with RHEL 7.8 on 5.3.9.0 and 6.0.2+

3.1.38 Release 6.0.2.0

3.1.38.1 Virtualization

- **Support for Db2 Database Partition Feature (DPF):**
Delphix has long supported distributed Db2 (running on Unix/Linux Systems). However, Db2 supports partitioned databases as a means of scaling to larger, more complex systems. With this release, Delphix will now support Db2 DPF allowing you to scale to an increasing number of your Db2 databases.
- **Windows authentication for SQL Server:**
You will now be able to use Windows Authentication to link SQL Server databases. Rather than providing both a database user and a Windows user to ingest data, you can leverage one set of credentials (a Windows OS user) to perform all source operations. This capability will simplify SQL Server deployments and reduce Delphix's security requirements on source databases.
- **Smart failover:**
Smart Failover allows the Delphix Administrator to simplify failover processes by automating object conflict resolution. By selecting a new option "Automate Object Conflict Resolution" before the failover process starts, the failover process will rename all conflicting objects and show a report of all object changes at the end.
- **NFSv4 support:** In 6.0.2 Delphix will start providing NFSv4 for data sources running on RedHat 7.0 or later. NFSv4 can be enabled using the CLI. Support for additional host OS versions will be added in subsequent releases. Delphix will consider enabling NFSv4 by default for those supported configurations in a future release.
- **Support bundles not required for upgrade:** When upgrading from 6.0.0 or greater to a release 6.0.2 or greater, we no longer require support bundles to be sent to Delphix. This allows you to execute more self-service upgrades.

3.1.38.2 Certifications

- ASE 16.0 on AIX 7.1
- AWS r5n Instance Support: r5n.2xlarge, r5n.8xlarge, r5n.16xlarge
- Azure E Series Instance Support: E8s_v3, E16s_v3, E32s_v3
- Masking support of Oracle 19c.

3.1.39 Release 6.0.1.0

- **Masking extended connectors:** A very common request for masking has been to support additional data sources, outside of [the currently supported list](#)⁶⁰. Thus, the next step in the strategy is the release of Masking Extended Connectors, which will allow our customers to add JDBC drivers to the masking engine to facilitate the masking of additional data sources. This will allow masking to be

⁶⁰ <https://masking.delphix.com/docs/latest/data-source-support>

used for other common databases that can be accessed via JDBC, like SAP HANA, Informix, etc.

- **SQL server CDC support:** We have expanded our support for SQL Server databases using [Change Data Capture](#)⁶¹ (CDC), a SQL Server feature that captures all the change information that is applied to the databases and stores it in change tables. Now, users will have the ability to preserve CDC data and enable CDC for SQL Server VDBs.

3.1.39.1 Certifications

- **Virtualization**
 - ASE 16 and 15.7 with Solaris SPARC 11U3 and SPARC 11U4
 - ASE 16 and 15.7 with RHEL 7.7
 - SQL Server 2019 Support with Windows 2016 and Windows 2019
 - Oracle 19c with SUSE SLES 15 SP1
 - Oracle 19c with Solaris 11 U4 and U3 x86
- **Hypervisors:** The following hypervisors have been certified in 6.0.1.
 - VMware ESX 6.5 U1, U2, U3
 - VMware ESX 6.7 U3

3.1.40 Release 6.0.0.0

Google cloud support: Delphix now supports running in Google Cloud Platform for existing supported databases.

Enhanced Networking Adapter (ENA) support: Delphix supports networking on AWS instances with the Elastic Network Adapter (ENA). This offers our customers enhanced networking capabilities and more economical options. Notably, this includes the AWS R4 instance types.

- **Masking NFS/CIFS mount:** Our customers increasingly are masking files alongside their databases. The masking engine has classically supported this via FTP/SFTP but now to make things easier Delphix has introduced the ability to directly mount and mask a file system - over NFS and CIFS. This should dramatically simplify the process of file masking.
- **Oracle quality:** Continued focus on Oracle quality and have introduced several quality improvements with our 6.0 release.
- **Masking API updates:** 6.0 introduces a significant number of new endpoints, including mainframe control, as well as updates for existing endpoints. This release also introduces versioning for the masking API, allowing our customers to upgrade without risk of breaking their integrations.
- **AdoptOpenJDK 8 for the Delphix toolkit:** Delphix has changed the Java Development Kit (JDK) that is included with the toolkit, and is sent to all Delphix connected environments. Customers who require using Oracle Java may continue to do so with the feature to provide their own Java, which shipped in 5.3.5.
- **Removed instance check:** When running in AWS or Azure, the product will no longer raise a fault when it detects that it is running on an unsupported instance. This enables Delphix to certify

⁶¹ <https://docs.microsoft.com/en-us/sql/relational-databases/track-changes/about-change-data-capture-sql-server?view=sql-server-ver15>

previously released software on new instances without having to modify the software.

The product will still detect what instance it is running on and include this information in the user interface and phone home bundles. We will also continue to publish a matrix of supported instances for Azure, AWS, and GCP in the product documentation. Delphix provides no guarantee of performance or support for unsupported instance types.

- **Upgrade process:** The upgrade to 6.0 will be an in-place upgrade like other Delphix releases, there are a few changes that will improve the process overall for 6.0:
 - We will require an upgrade to an interim release first (either 5.3.6). This can be done at the same time as the customer upgrades to 6.0 or in the months prior.
 - We will be introducing new upgrade checks to ensure that customers are not using features that have been removed. For a list of removed features see [Deprecated and End-of-Life Features](#) (see page 546).
 - We will provide an upgrade image specific for each platform we support with Virtualization (VMWare, AWS, Azure, GCP). This will allow us to be more precise in customizing the images for each.

3.2 Fixed issues

Multiple Device Removal on engines version 6.0.12.0 to 6.0.17.2

For Data Engine versions between 6.0.12.0 and 6.0.17.2, there is a critical kernel module change that impacts the Multiple Device Removal feature. This change necessitates a reboot to activate the new module. Consequently, if your engine is still on versions within this range and has undergone a deferred reboot upgrade, it will not support Multiple Device Removal without a system reboot. Post-reboot, the feature will function normally.

In versions 7.0.0.0 and above, Multiple Device Removal operates as intended regardless of the upgrade method used, whether a deferred reboot upgrade or a full upgrade.

Block-to-object storage migration

For kernel versions below 15.0.0.0, in-place block-to-object storage migration is not possible. To utilize this feature, you must first complete a full upgrade to version 15.0.0.0 or higher.

3.2.1 Release 28.0.0.0 Changes

3.2.1.1 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-88967	Fixed an issue where configuration properties would become corrupt due to technical errors under certain circumstances, which caused the application to behave in an unexpected way.
DLPX-89629	Fixed a defect that could keep the UI/API inaccessible after applying a hotfix while the UI/API was down (i.e. applying the hotfix via support login).
DLPX-90001	Fixed a race condition that could result in a failed post-upgrade cleanup job after an upgrade has completed.
DLPX-91347	Changing the toolkit path now cleans up previously installed toolkit.
DLPX-91988	Fixed an issue where the missing log archive log destination was not being shown with the correct case.
DLPX-92294	Fixed a defect that could result in VDB downtime after a reboot or upgrade on Elastic Data Engines with a large cache size (e.g. 96TB).

3.2.2 Release 27.0.0.0 Changes

3.2.2.1 Fixes that take effect after upgrading and rebooting

Bug number	Description
DLPX-91889	Fixed a hang that could occur in iSCSI on networks with connection problems.

3.2.3 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-57070	The VDB provision directory group permission no longer needs to be set to 'asmadmin' in case there is a separation of privileges between the Oracle Grid home owner and the Oracle Database home owner.
DLPX-77130	Fixed an issue where provisioning from a dSource, having a "DDL on DATABASE" trigger, fails.
DLPX-77778	Fixed the SNMP manager's fault description message to correctly show the manager's address when its not able to send a message.
DLPX-78203	Improved <code>fault.oracle.repository.oracle.binary.permissions</code> , generated when the Oracle binary mode/permissions are incorrect.
DLPX-81096	Fixed an issue where the Delphix Continuous Data engine was not exporting the timeflow to the discovered Environment IP address when a list of NFS addresses is configured for an Environment.
DLPX-81938	Updated the error message to be clearer when adding a user to an existing environment fails due to wrong permissions set for the user.
DLPX-84538	Updated the action message to be clearer when Environment addition fails due to an invalid RSA key.
DLPX-88704, DLPX-88754	Fixed an issue where the <code>phonehome</code> enabled status was not correctly reflected in the application.
DLPX-90717	Updated the API doc for the <code>/user</code> endpoint to reflect the fact that <code>isDefault</code> is a read-only field.
DLPX-91402	Fixed an issue where the Oracle environment refresh operation may fail if the cluster host names are changed and the Delphix Continuous Data engine is not updated.

Bug number	Description
DLPX-91432	Fixed an issue where archive logs were being collected for an Oracle linked CDB, which does not contain any linked PDBs.
DLPX-91719	Fixed an issue that occurred during the deletion of a timeflow, due to retention, that causes <code>NoSuchElementException</code> related errors to the timeflow.
DLPX-91824	A warning fault is raised during validated sync to refresh the environment, in case new nodes are added to the MSSQL Source availability group.
DLPX-91845	Addresses a possible sector size mismatch when adding a new drive to an existing <code>zettacache</code> (block storage used as cache), after updating the engine instance type.
DLPX-91848	Replication now avoids discarding partially received state and attempts resuming from where it left off, in more use-cases.
DLPX-91863	Fixed an issue where the Provision VDB GUI was not listing all dSources or Groups under the Source step.
DLPX-91911	The UI will no longer permit an instance number of 0.

3.2.4 Release 26.0.0.0 Changes

3.2.5 Fixes that take effect after upgrading and rebooting

Bug number	Description
DLPX-91653	Adjusted an internal kernel parameter which can cause upgrade verification to fail.

3.2.6 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-43423	Added a fault to alert the user that an Oracle snapshot with offline datafiles will not be usable for rewind.
DLPX-58185	Fixed an issue where changing a Custom Policy while it is running on an object could cause the Policy execution to fail.
DLPX-74832	NTP validation has been introduced while adding a new NTP server. A warning fault will be raised if any added NTP server becomes invalid at a later stage, and a CRITICAL fault will be raised if all added NTP servers become invalid.
DLPX-78988	Fixed an issue where LogSync would not run on an Oracle standby dSource without any online redo logs, causing un-provisionable snapshots.
DLPX-86550	ORACLE_HOME being inspected by environment monitor task is now logged in the <toolkit_host_directory>/log/connector/debug.log log file on the Oracle host for diagnostic purposes.
DLPX-88504	During upgrade an invalid Oauth2 configuration won't prevent engine startup anymore, instead a critical fault will be raised.
DLPX-89693	Updated the action message to remove confusion while disabling the dSources in an environment.
DLPX-90044	Fixed an issue where if a vCDB contains a vPDB in MOUNT mode and the datafiles do not exist in the mounted Delphix filesystem, database recovery during refresh fails as Oracle erroneously tries to recover these OFFLINE data files.
DLPX-90958	The 'quota limit breach' fault messages have been enhanced to display actual sizes, in addition to percentages.
DLPX-91341	Fixed an issue where a detached Oracle standby CDB would incorrectly become active when a PDB is attached to the primary CDB, or vice versa.

Bug number	Description
DLPX-91509	When a VDB refresh happens on a replicated target engine with a lower plugin version than the source engine's plugin version, a fatal exception was raised. A user exception will now be raised instead.
DLPX-91536	The linking of an Oracle snapshot copy pluggable database is now prevented, as it is unsupported by Delphix.
DLPX-91539	Improved the error message when unpacking an upgrade image fails.
DLPX-91637	Fixed the unhandled exception on the GUI while adding the SDD profile for replication. The issue was occurring in a specific scenario when replicating a masked VDB from a replicated namespace dSource and VDB.
DLPX-91664	Fixed an issue in the <code>objectStorage</code> API on Block Storage engines.
DLPX-91699	Fixed an issue where host log files were filling up due to a lower value of logging level set.
DLPX-91737	Fixed an issue where provisioning an Oracle vPDB failed with <code>exception.oracle.targetscripts.db.pdb.temp</code> during temporary file creation, if the source PDB was created with the <code>CREATE_FILE_DEST</code> option.
DLPX-91753	Fixed an issue which causes failure during upgrade verification to Continuous Data version 11.0.0.0 and above if the engine has a history of having a very large number of dSource/VDB timeflows causing integer range overflow.
DLPX-91771	Improved logging of connectivity test results for Elastic Data engines.

3.2.7 Release 25.0.0.0 Changes

3.2.8 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-14722, DLPX-91032	Added a user-friendly message if <code>glogin.sql</code> or <code>login.sql</code> has settings that negatively impact the linking or provisioning of an Oracle VDB/vPDB.
DLPX-21809	Added an error message if VDB configuration parameters or templates contain an invalid string.
DLPX-85071	Fixed a space discrepancy issue in ASE where unused files were not being deleted during a snapshot with the drop and recreate option.
DLPX-88922	During a validated sync, if it is determined that the previously discovered AG node instances for a source environment have changed, a fault message will direct users to refresh the source environment and decrease the frequency of validated sync runs.
DLPX-90491	Fixed an issue where the SnapSync of a standby Oracle PDB might fail with <code>exception.oracle.sql.snapsync.mounted.pdb.not.consistent</code> during the initial load or full backup, if PDB SnapSync is not completed without interruption.
DLPX-90596	Fixed an issue where the Enable operation on an Oracle vPDB fails after the vPDB was exported to ASM using an in-place V2ASM operation, followed by a migrate operation.
DLPX-90636	Fixed an issue where provisioning an Oracle TDE-enabled vPDB configured with software keystore may fail with <code>ORA-28365: wallet is not open</code> .
DLPX-90642	Improved error messages from Oracle SnapSync operation failures due to abrupt termination of client-side processes/resources.
DLPX-90928	To prevent a failure during the provisioning from a PDB or vPDB dSource snapshot taken while the PDB datafiles are closed/offline, a validation to fail the snapshot itself has been inserted if the PDB datafiles are closed/offline.

Bug number	Description
DLPX-91017	Improvements have been made to the virtual-to-physical (V2P) event messages by replacing memory terminology with storage space.
DLPX-91260	Fixed an issue related to the cleanup of old system files.
DLPX-91299	Fixed an issue where having a custom definition of <code>PATH</code> or <code>ORACLE_HOME</code> in <code>.bashrc</code> or <code>.bash_profile</code> in Linux systems could lead to the failure of VDB refresh, amongst other VDB operations.
DLPX-91373	Introduced a case-insensitive comparison to remove files on a SQL Server staging host that are not present on the source anymore.
DLPX-91471	Fixed an issue to unblock the SQL Server provisioning process, even if disabling CDC fails due to permissions or other issues. Provided appropriate faults while taking snapshots when the CDC state is inconsistent.
DLPX-91506	Fixed an issue that was causing network updates during or after setup to fail.
DLPX-91525	Updated UI text for the 'Other S3 Compatible Object Storage' storage type to 'Private Cloud S3 Compatible Object Storage'.
DLPX-91559	Stopped the execution of a command injected via the source config path in the createEmpty API.

3.2.9 Release 24.0.0.0 Changes

3.2.10 Fixes that take effect after upgrading and rebooting

Bug number	Description
DLPX-89509	Fixed an issue that could cause up to 35% degradation in read workloads, in some cases.

3.2.11 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-37663	Fixed an issue where the Timeflow Repair tool fails with an internal error after encountering a file containing a \$ character.
DLPX-66830	Improved logic to determine operation timeouts on engines with several containers.
DLPX-81478	Enhanced the validated sync process for SAP ASE databases by adding support for the standby_access option during transaction log backups.
DLPX-86179	Added functionality that retries copying file chunks upon failure during JRE file copying for environment refresh or additions.
DLPX-88116	Fixed an issue where provisioning an Oracle VDB or a vPDB fails with ORA-03214 when adding tempfiles that have a non-default local uniform size, or no size is specified.
DLPX-89128	Fixed an issue related to the cleanup of old system files.
DLPX-90365	Introduced retries, wait time, and verbose output as configurable parameters while using Robocopy.
DLPX-90573	Fixed an issue where a support bundle generation would use lots of CPU on an engine with many SQLServer timeflows.
DLPX-90807	Fixed an issue causing the inability to read the backup server log from ASE 16, SP04, PL05 or higher.
DLPX-90879	Fixed an issue where an empty object-store region caused a fatal exception.
DLPX-91223	Fixed an issue where a replica-retention policy caused archive log snapshots to be unnecessarily retained.

Bug number	Description
DLPX-91396	Fixed frequent logging by an internal component which results in large log sizes.

3.2.12 Release 23.0.0.0 Changes

3.2.13 Fixes that take effect after upgrading and rebooting

Bug number	Description
DLPX-91010	Fixed an issue where large numbers of masked versions for SDD could occasionally cause a crash during replication.

3.2.14 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-30045	Improved the errors reported from provisioning requirement validations that were difficult to understand.
DLPX-32959	Improved the errors reported from provisioning requirement validations that were difficult to understand.
DLPX-37799	Improved the errors reported from provisioning requirement validations that were difficult to understand.
DLPX-62559	Added logic so that the notification channel name for a particular tab will persist for the lifetime of that tab.
DLPX-69881	Improved the errors reported from provisioning requirement validations that were difficult to understand.

Bug number	Description
DLPX-77122	Fixed an issue where the Continuous Data Engine may fail to cleanup timeflows and/or snapshots that are expired or no longer needed. A failure to cleanup after repeated attempts will cause the Delphix Management Service to become unavailable.
DLPX-83698	Improved the errors reported from provisioning requirement validations that were difficult to understand.
DLPX-85091	Fixed an issue which would allow customers to add devices that have different physical block sizes.
DLPX-89424	Added retry attempts for fetching iSCSI session during mounting.
DLPX-89638	Show better error message after Enable operation on a vPDB fails when the linked CDB is not up.
DLPX-89898	Fixed an issue to provide clear action to the user when the hostname or the host IQN is changed without following the recommended steps.
DLPX-89933	Fixed an issue that caused partial networking configuration updates, resulting in address removal when a static address is not passed.
DLPX-90199	Fixed an issue which prevented deletion of a vCDB having a vPDB that did not have a current timeflow.
DLPX-90373	Fixed an issue where if a node is added/deleted for a vCDB in a RAC cluster, enabling one of its vPDBs modified the <code>wallet_root</code> location of the vCDB.
DLPX-90612	Fixed an issue where aged cloud engines could experience a <code>zfs_object_agent</code> panic loop.
DLPX-90658	Corrected the logic for the calculation of iSCSI LUNs for the target server while linking and provisioning.
DLPX-90697	Fixed an issue where a job warning would be thrown when MSSQL database files contain trailing and leading ASCII whitespaces or a trailing ASCII period after the restore operation is performed.

Bug number	Description
DLPX-90748	Fixed an issue where enabling an Oracle vPDB failed with "Instance already in use on the target host" if there were two or more vCDBs with the same prefix on the target host.
DLPX-90785	Fixed an issue where the SnapSync operation for Oracle staging push dSources would fail with <code>exception.oracle.dsource.stagingdb.datafile.checkpoint_scn.not.matching</code> if the production database had read-only tablespaces.
DLPX-90788	Adjusted the NTP configuration to allow <code>ntpd</code> to change the system time when getting corrections from pooled servers.
DLPX-90805	ZFS filesystems are created with 128k block size for Oracle Staging Push dSources resulting in high CPU usage and NFS latency.

3.2.15 Release 22.0.0.0 Changes

3.2.16 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-72665	Fixed an issue where email alerts would continue being sent to disabled Admin users.
DLPX-74650	Fixed "Internal Server Error" in all Oracle vPDB operations after a canceled refresh operation.
DLPX-75466	Fixed an issue where provisioning an AppData database with default values, specifically when JSON is empty, throws an error from CLI.
DLPX-75493	Fixed <code>exception.executor.object.missing</code> in Oracle vPDB enable/refresh operations after a failed provisioning operation.

Bug number	Description
DLPX-78731	The <code>StorageTest testRegion</code> has been capped at 1TB.
DLPX-80913	Fixed a timing error where the device initialization monitor job would probe at the same time as initialization completes, which falsely detected and reported an error.
DLPX-83760	When a device removal is attempted with insufficient free space available, the resulting error message now clearly indicates the problem and the amount of free space needed.
DLPX-83856	Better actions are now provided when an environment refresh fails because of antivirus.
DLPX-85644	Fixed an issue which caused an Oracle vPDB delete job to hang.
DLPX-85995	Fixed an issue where a large hook script size may cause LogSync to fail with an <code>OutOfMemory</code> exception, causing the Delphix management service to crash.
DLPX-87824	For Oracle vPDBs, the TDE software-based keystore parameters, <code>parentTdeKeystorePath</code> and <code>targetVcdbKeystorePath</code> , should not be pointing to the same location.
DLPX-87934	Fixed an issue where a ZFS filesystem containing a clone of Oracle archive logs from the parent snapshot was not deleted after the failed provision/refresh of a vPDB, in a linked CDB or a VDB.
DLPX-88916	Added secure CSP header <code>Object-Src</code> .
DLPX-89268	Fixed an issue that was preventing Delphix from tracing file deletions over NFS.
DLPX-89324	Worker thread for plugins can now be controlled using a tunable, <code>APPDATA_INTERVAL_BETWEEN_VALIDATED_SYNC</code> .
DLPX-89562	Fixed an issue where Self-Service refresh could still get an <code>IllegalStateException</code> while running an Oracle vPDB reprovision, because of retries for reprovision.

Bug number	Description
DLPX-89691	For Linux hosts, <code>bash</code> is now expected to be available in the path as a prerequisite for the <code>toolkit</code> to run. This fixes an issue where disabled <code>vsyscall</code> kernel parameter leads to failure of multiple host related workflows including VDB operations.
DLPX-89696	Fixed an issue where the start of an Oracle RAC virtual PDB, in a virtual CDB, fails with an error <code>exception.oracle.targetscripts.pdb.open</code> , if the virtual PDB is already running.
DLPX-89930	Fixed an issue where an Oracle vPDB is not disabled first during upgrade, leading to an exception while disabling the vCDB.
DLPX-90181	Added defensive checks to report an error if PDB tempfile directories are created with the wrong permissions, due to an Oracle bug.
DLPX-90207	Converted the data type to float for handling larger network throughput values.
DLPX-90208	Addressed CVE-2024-22243 from <code>spring-core</code> .
DLPX-90407	Increased the default timeout for <code>datapatch</code> to 12 hours to account for longer time taken by the Oracle <code>datapatch</code> command.
DLPX-90371	Delphix will now provide a clear error message and suggested action when the Oracle <code>datapatch</code> command is terminated by Delphix due to a timeout.

3.2.17 Release 21.0.0.1 Changes

3.2.18 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-90533	Fix an issue where a customer may see recurring and somewhat persistent errors on the SETUP application.

3.2.19 Release 21.0.0.0 Changes

3.2.20 Fixes that take effect after upgrading and rebooting

Bug number	Description
DLPX-89825	Fixed an issue where CPU usage increases as the system has been running longer since a reboot, causing poor performance.

3.2.21 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-42204	Improved the error message shown when the Continuous Data Engine does not have enough storage to ingest an Oracle database.
DLPX-63594	While navigating back to the Dataset page from another page, the user's previous selected container will be loaded, instead of always loading the first one.
DLPX-74693	Enhanced the diagnosability of Commvault Restore failures as part of the validated sync job.

Bug number	Description
DLPX-76121	Incorporated a timeout mechanism into the script to streamline the process of adding iSCSI Login on the target, enhancing script reliability across its usage.
DLPX-84540 DLPX-89854	Fixed an issue to better highlight the Change CDC flag in the UI while provisioning a VDB.
DLPX-85313	Fixed an issue that causes the management service to restart when an Oracle VDB has a large number of archived logs.
DLPX-86990	Provided a more meaningful error message and action to the end user in case zvol creation times out.
DLPX-88265	Timeflow data is now loaded in batches only for the timeflow dates that are opened by the user, thus, improving load time of the Timeflow page.
DLPX-88831	Fixed an issue that would prohibit the enable/start of an Oracle RAC or multi-tenant virtual source, after a failed hook operation during its provisioning or refresh.
DLPX-89510	Fixed CVE-2023-48795
DLPX-89610	The Region field is no longer required when configuring on-premise Elastic Data engines via the CLI.
DLPX-89820	Fixed an issue where TDE-enabled vPDB provisioning using a dSource created in releases prior to 19.0.0.0 failed after upgrade.
DLPX-89894	Fixed an issue where the object storage API could result in 500 internal error response.
DLPX-90010	Fixed an issue where the engine would incorrectly assume a dSource is TDE-enabled when sqlnet.ora, in an Oracle database, contains the <code>WALLET_LOCATION</code> parameter to configure an external password wallet.

3.2.22 Release 20.0.0.0 Changes

3.2.23 Fixes that take effect after upgrading and rebooting

Bug number	Description
DLPX-89834	Fixed an issue that can cause excessive CPU usage and poor system performance after a system has been running for an extended period of time.

3.2.24 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-64990	When a user selects a group for replication but subsequently deselects specific objects, Continuous Data automatically deselects related parent groups. This ensures only the specifically chosen objects are replicated.
DLPX-69276	Verbatim regarding different “apply upgrade” types have been updated for better user experience.
DLPX-72414	Modified the action item UI to accommodate owner info.
DLPX-75574	Added the ability to apply changes to DNS Configuration via the UI.
DLPX-81656	Fixed an "unknown error" in Oracle environment discovery when the <code>LC_ALL</code> environment variable is set in the associated host's <code>bashrc</code> file.
DLPX-82055	Fixed an error when enabling/starting a Oracle RAC provisioned vPDB in a linked CDB if one of the cluster nodes is down.
DLPX-84710	Improved handling of missing networking devices after instance type migration.

Bug number	Description
DLPX-86069	Fixed an issue where after critical engine storage utilization issue is resolved, an attempt is made to incorrectly resume replicated dSources.
DLPX-86611	Fixed an issue to prevent redundant faults on the Continuous Data Engine caused by failed restores of source database backups on Commvault. This avoids the recreation of the staging database on the dSource, thus saving significant infrastructure resources.
DLPX-88039	Added the actual error message in output and updated the message to be more generic.
DLPX-88414	Fixed an issue where an Oracle vCDB was getting re-registered with the default listener (port 1521) after a host environment refresh.
DLPX-88679	Fixed an internal error in running the <code>purgeLog</code> API for a linked CDB after all PDBs are migrated out from it.
DLPX-89115	Fixed an issue where a provisioning job warning is posted because of "ORA-25153: Temporary Tablespace is Empty".
DLPX-89386	Support bundles now contain diagnosable session information for iSCSI.
DLPX-89436	Fixed an issue where a new value for the tunable <code>ORACLE_MT_PROVISION_SORT_AREA_SIZE</code> did not come into effect during provision or refresh of Oracle vPDBs.
DLPX-89538	Fixed an issue where storage space recovery did not happen right after a failover commit operation.
DLPX-89597	Addressed HF-1283 & HF-1328.
DLPX-89817	Fixed an issue where TDE software keystore based provisioning fails after upgrading to Continuous Data Engine 19.0.0.0 release.

3.2.25 Release 19.0.0.0 Changes

3.2.26 Fixes that take effect after upgrading and rebooting

Bug number	Description
DLPX-88884	Fixed kernel deadlock issue that may occur during block-to-object storage migration.

3.2.27 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-22606	Added better messaging in the event of Windows Host reaching the Maximum LUN Limit.
DLPX-72967	Fixed an issue where if CRS Home is on a different version than Oracle Home, the export job tried to run the SQLPlus utility from the CRS HOME instead of Oracle Home, leading to job failure.
DLPX-74892	Clarified a user error that did not provide exact details when missing <code>gtar</code> causes Solaris Environment discovery failure.
DLPX-77378	Labels for <code>autoVDBRestartValue</code> throughout in the app has been made uniform to Yes/No.
DLPX-77621	Added relevant error message when the LDAP server name is not resolved.
DLPX-82158	Fixed an issue when discovering an Oracle RAC cluster, instance numbers starting with 1 were automatically assigned, resulting in SnapSync failures.
DLPX-82754	Fixed wrong environment name shown in summary and progress page when running Network Performance tool throughput test and DSP test.

Bug number	Description
DLPX-84115	Fixed an issue where Java core analysis, when generating support bundles, can sometimes get stuck without timing out.
DLPX-86028	Fixed inconsistent behavior of capacity historical data calculation when an ownerless container is encountered.
DLPX-87822	Fixed an issue to provide better action in the event of Windows Environment creation or refresh failure caused by invalid characters in the database name.
DLPX-87965	Fixed internal error for Data Vault Replication spec when spec schedule's Cron expression has a single white space at the end of expression.
DLPX-88322	Fixed an issue where if a datafile is added when a SnapSync job is running, provision or refresh to the snapshot generated by the SnapSync job will fail.
DLPX-88753	Fixed an issue where refreshing or provisioning a RAC vPDB may fail on Oracle 12.x with the error, "failed to apply logs in database recovery" if a PDB is open in some RAC nodes and mounted in others. This could also happen for a non-RAC database in some situations, but has been resolved.
DLPX-88925	Upgrades during block to object storage migration are now allowed.
DLPX-89004	Fixed an issue that could occur when converting instance types on a Cloud Engine.
DLPX-89068	Fixed an issue where a RAC vCDB is provisioned with only 2 online log groups with 4MB each, per thread. This is the minimum allowed size for online logs. Now, the user can specify the desired number and size of log groups for a RAC or non-RAC vCDB.
DLPX-89300	Fixed an issue related to MSSQL full backup hangs by logging the <code>robocopy</code> command output to the log file, at the Delphix connector logs folder, during sync operation.
DLPX-89392	Fixed a race condition during an 'Apply now' upgrade that may cause the boot loader to become corrupted.

3.2.28 Release 18.0.0.1 Changes

3.2.29 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-89392	Removed race condition during an "Apply now" upgrade where the engine's boot loader may get corrupted.

3.2.30 Release 18.0.0.0 Changes

3.2.31 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-69788	Fixed an issue where the audit log did not tell the reason of login failure when the same username is defined under DOMAIN & SYSTEM.
DLPX-71024	Fixes an issue where device links were not being generated correctly.
DLPX-78465	Fixed an issue where the Delphix management stack could fail to start when finalizing a deferred upgrade that was initiated while the stack was down.
DLPX-79498	Fixed an error message when the DelphixConnector service is already installed with the previous version.
DLPX-80623	Fixed an issue where starting an Oracle vPDB in a linked CDB failed after one of the RAC nodes is rebooted.
DLPX-83344	Fixed an issue where the Delphix Fluentd service would silently accept invalid Splunk configurations without testing the connection first.

Bug number	Description
DLPX-84824	Fixed a failure in Oracle dSource snapshot operation due to the <code>tracert</code> command timing out.
DLPX-85466	Fixed an issue where an event type that does not match the defined regex pattern lead to failure in creating an alert profile.
DLPX-86212	Fixed an issue where an invalid <code>hec_host</code> value can be saved to the Splunk configuration without actionable feedback being provided.
DLPX-87844	Fixed an issue where the SSH connectivity test did not detect expired passwords.
DLPX-88114	Fixed an issue where a replication job on a target engine could cause an upgrade to fail.

3.2.32 Release 17.0.0.0 Changes

3.2.33 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-50012	Fixed missing timeflow error when enabling VDBs post replication failover.
DLPX-57673	Fixed an issue where Support bundle generation can be time consuming if the engine has a large number of core files to process.
DLPX-78962	Updated the suggested error action to offer improved guidance to users in the event of a SQL server hook script failure caused by disabled or uninstalled Windows PowerShell 2.0.
DLPX-81559	Fixed an issue after upgrading an Oracle VDB from 12c to 19c where the VDB refresh fails with, "failed to mount database instance" due to ORA-01130 or ORA-00201 errors.

Bug number	Description
DLPX-82143	Fixed an issue causing unneeded CPU utilization that occurred due to excessive reads of Fluentd configuration.
DLPX-84565	Fixed an issue with the <code>telegraf.service</code> restarting in a loop after an upgrade.
DLPX-85494	Fixed a deadlock between a replication lock and the metadata store connection pool.
DLPX-86966	Fixed an issue that was leaving stale metadata after the deletion of <code>tlog</code> backup snapshots in the Staging Push environment.
DLPX-87401	MSSQL File mapping for V2P operations now supports regex with <code>?</code> (i.e. <code>?i</code>) for case insensitive search.
DLPX-88040	Clarifications have been added to provide better insight to the reason for disabling some datasets during SDD Replication.
DLPX-88056	Prevented database file deletion for new VDBs when the old VDB is dropped after replication failover.
DLPX-88113	Added a banner to <code>move-to-asm.sh</code> warning users about deprecation and impending EOL in Continuous Data 23.0.0.0 (May 2024)
DLPX-88143	Increase disk removal threshold to 90% used space from the previous limit of 80%.
DLPX-88351	Fixed an issue where the support bundle redactor runs out of memory when too many alerts are loaded at once into memory, which resulted in all metadata being missed from support bundles.
DLPX-88480	Fixed an issue when provisioning, refreshing, or rewinding an Oracle vPDB that has a different minor version than the target Oracle Home, and datapatch is enabled, it may fail with, "ORA-01652: unable to extend temp segment by 128 in tablespace TEMP".
DLPX-88488	Fixed an issue where not enough samples are collected for performance analysis.

Bug number	Description
DLPX-88518	Fixed an issue where the <code>undo_tablespace</code> parameter was considered restricted and not allowed to be changed by the user after an Oracle VDB is provisioned.

3.2.34 Release 16.0.0.0 Changes

3.2.35 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-87910	Fixed a delay that may occur when an Elastic Data Engine has had devices removed and added, and is then upgraded from 11.0.0.0 or earlier to 12.0.0.0 - 15.0.0.0 (inclusive).

3.2.36 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-78318	Fixed an issue where the first SnapSync of an Oracle DoubleSync snapshot incorrectly showed missing logs.
DLPX-84253	Fixed an issue preventing users from being able to delete Delphix-generated CA certificates if no dependencies exist.
DLPX-87163	Fixed an issue where the Environment refresh job failed with "The object OraclePDBConfig does not exist on the system".
DLPX-87320	Fixed an issue where exporting a VDB or vPDB to ASM would fail with ORA-32771 when the database has a temporary bigfile tablespace.

Bug number	Description
DLPX-87516	SQL server database files will be dropped from the staging database DATA\db directory when the source database drops the files. All files and folders not part of the MSSQL database will be removed from the DATA\db folder.
DLPX-87702	Fixed an issue where provisioning an Oracle VDB/vPDB fails with "ORA-03214: File Size specified is smaller than minimum required" when temp files have a non-default local uniform size.
DLPX-87885	Fix provided to raise a fault for replicated Python Plugins with an unsupported vSDK build API version and mark them as inactive.
DLPX-87908	Fixed an issue where fixed_vdb_parameters (uncustomizable parameters) are incorrectly updated and resulted in the inability to perform VDB snapshot operations.
DLPX-88250	Fixed an issue where a missing NTP configuration could prevent upgrade image verification from succeeding.

3.2.37 Release 15.0.0.0 Changes

3.2.38 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-86450	Fixes a hang in the I/O subsystem that can cause the Delphix Engine to become unresponsive.
DLPX-86595	Increased the limit of masked timeflows per snapshot from 32 to 16000 for SDD.

3.2.39 Fixes that take effect immediately after upgrading

Bug Number	Description
DLPX-72342	Environment discovery will not fail if Ag Listeners are not reachable from the Engine. If a listener is unreachable, it will be reported during linking or sync operation.
DLPX-79973	Fixed an issue where the Splunk HEC Token could leak in Support Bundle through the fluent.conf file.
DLPX-80093	Removed fluent.conf file from Support Bundles.
DLPX-83609	The 'Type' column filter in the admin UI Jobs page now contains the DB_ROLLBACK job type.
DLPX-85082	Browser Tab title changed from Delphix System to "engineName - Delphix Setup".
DLPX-86892	Fixed an issue where the vCDB TDE refresh failed if "Target vCDB TDE KeyStore Location" is set with "tde" trailing path.
DLPX-86894	Fixed an issue where after a canceled refresh operation, VDB refresh or delete may fail due to error code <code>exception.oracle.vdb.no.virtual.datafiles.found</code> . If a workaround is still needed, disable the VDB and try the operation again.
DLPX-86964	Fixed an issue where if a <code>SOURCE_DISABLE</code> job of a TDE-enabled VPDB is interrupted after it's unplugged from the CDB, but before it's dropped from the CDB, any subsequent disable jobs against the vPDB would fail.
DLPX-86965	Escaped constructs in Regex Patterns (for example, \Q, \E) are now allowed for MSSQL V2P File Mappings.
DLPX-87224	Fixed an issue where the Privilege section of the User Management wizard was momentarily hanging for Engines with multiple datasets or groups.
DLPX-87454	Updated MSSQL JDBC driver to version 7.4.1.0. This fixes the issue that created multiple faults with <code>RejectedExecutionException</code> .

Bug Number	Description
DLPX-87522	Fixed an issue where the <code>move-to-asm.sh</code> script could fail with, "move-to-asm.sh: Failed to move online log files", while attempting to move online log files to ASM.
DLPX-87547	Analytics timestamps are now accurate when the collection interval is customized via the CLI.
DLPX-87623	Fixed an issue related to provisioning failures from a snapshot taken after opening the staging database with the <code>resetlogs</code> option.
DLPX-87624	Fixed an issue related to provisioning failures from a snapshot taken after opening the staging database with the <code>resetlogs</code> option.
DLPX-87649	Fixed an issue preventing retries of upgrades after quiesce failures.
DLPX-87650	Fixed an issue regarding upgrade verification error version 13 (stack startup verification failed) due to <code>StreamReadConstraints</code> limit when deserializing event bundles.

3.2.40 Release 14.0.0.0 Changes

3.2.41 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-86764 , DLPX-87360	Added a mechanism to automatically restart internal service if I/O to object storage is not making progress.
DLPX-86962	Eliminated deadlock scenario introduced by upstream changes to ZFS.

3.2.42 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-67911	Fixed issues related to having stale mounts on staging and target host.
DLPX-71914	Capacity table UI for received replica now shows aggregated size for virtual and source datasets.
DLPX-79098	Seconds is also shown as part of the snapshot point in time on the Summary of Refresh Wizard.
DLPX-83250	Support for SSL for Fluentd/Insight data consumers.
DLPX-84003	Fixed an issue where provisioning an Oracle vPDB into a new vCDB when the source PDB\$SEED has a TEMP tablespace, where the initial allocation plus file headers is greater than 100M (for 8k blocksize) fails with "ORA-03214: File Size specified is smaller than minimum required".
DLPX-85770	Fixed a failure reported by a start operation on a self-service container or an enable operation for a Oracle virtual source that is already enabled.
DLPX-86195	Fix ensures the <code>is_encrypted</code> flag is inherited during provisioning via snapshot. Activate with the tunable <code>CREATE. ENCRYPTED. SEED. DB</code> set to true (the default is false).
DLPX-86620	Instead of raising faults for <code>java.util.concurrent.RejectedExecutionException</code> , changes have been made to log the issue in debug logs and fail silently, to reduce noise.
DLPX-86644	Fixed an issue where a TDE-enabled vPDB provision or refresh operation fails with a misleading error if the parent CDB or parent PDB's primary key is missing in the parent TDE keystore on the target host.
DLPX-86685	Fixed an issue causing VDB operations to fail after upgrade verification is run.
DLPX-86805	Updated Spring Framework dependency version to 5.3.28.

Bug number	Description
DLPX-86854	Fixed an issue that caused post-upgrade cleanup to fail.
DLPX-86906	Fixed an issue to prevent linking an Oracle PDB that is added manually in a virtual CDB.
DLPX-87006	Fixed an issue in refreshing self-service containers with ordered sources, post upgrade to 12.0.0.0.
DLPX-87038	Fixed a size discrepancy in the OVA to fix certain deployment issues.
DLPX-87219	Post-refresh SnapSync of an Oracle VDB/vPDB fails with <code>exception.oracle.vdb.uncustomizable.parameters.changed</code> after the PDB is detached/attached following a standby switchover.

3.2.43 Release 13.0.0.0 Changes

3.2.44 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-61403	If an Oracle CDB/vCDB has a quota policy configured, Delphix will ensure that PDB/vPDBs are disabled/enabled properly when quota policy disables/enables the CDB/vCDB.
DLPX-71066	Fixed an issue to provide better action when a plugin upload fails due to the existence of a badly provisioned VDB.
DLPX-74553	Fixed an issue where the <code>Target Database Exists</code> error may be thrown during VDB provisioning, if a VDB was present during the last Environment Refresh.
DLPX-78987	A RAC node can only be disabled if no virtual sources are in 'running' status on the node.

Bug number	Description
DLPX-81268	Fixed an issue where executing <code>expect</code> commands logged sensitive information.
DLPX-84624	Removed build date from the Upgrade Images page UI.
DLPX-85298	Created new Oracle faults for quota policy violation with more details for error and action text.
DLPX-85747	AWS Cloud engines now support IMDSv2.
DLPX-86109	Fixed an issue where Oracle VDB unquiesce/enable may fail after a failed quiesce/disable on 10.0.0.X or 11.0.0.X.
DLPX-86163	Fixed an issue where if TNS_ADMIN for an Oracle vCDB was wrongly set during provision or refresh, it would cause older clients such as SQL*Plus 9.2.0.8 and Oracle Application Server 10.1.0.3 to fail with <code>ORA-28040: No matching authentication protocol</code> .
DLPX-86272	Fixed an issue for secondary nodes with different MSSQL instance owners than the primary node, where it now works with Delphix Managed backups.
DLPX-86344	Fixed an issue related to failed Delphix engine upgrades due to plugin operations that were failing.
DLPX-86496	Fixed an issue in the interaction between replication and replica retention policy.
DLPX-86497	Fixed the functionality to relink/attach SQL Server Availability Source Group database using the Link dSource dialog.
DLPX-86563	Fixed an issue where if any detached dSources were present then the performance history page would hang.
DLPX-86787	Fixed the GUI un-responsiveness of the Datasets page, after viewing the replication profiles.

Bug number	Description
DLPX-86842	Fixed a failure in the <code>verify upgrade</code> job while upgrading to 12.0.0.0.

3.2.45 Release 12.0.0.0 Changes

3.2.46 Security fixes

Bug number	Bug introduced in	Description	Security bulletin
DLPX-86329	6.0.13.0	Sysadmin can execute shell commands on the underlying Operating System.	TB109

3.2.47 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-86177	Fixed a bug where Accelerated Networking was broken due to missing drivers.

3.2.48 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-44117	Fixed an issue where a null pointer exception is encountered during parsing of an Oracle archive log not present in the Delphix file system.

Bug number	Description
DLPX-59966	Fixed an issue where the Snapsync of an Oracle vCDB may become unresponsive if the Delphix archive log destination is removed or changed, pointing to an invalid location.
DLPX-72422	Reduced VDB downtime on upgrade.
DLPX-82702	Improved error behavior when attempting to expand storage devices with underlying problems.
DLPX-83430	Fixed an issue where the initial configuration of Syslog breaks most of the pre-existing appenders.
DLPX-84611	Fixed an issue allowing environment users that are NOT in the primary group of the primary OS user to monitor the builtin files VDBs.
DLPX-85578	Replaced the Win32_Volume class output with mountvol output to fetch volumeld for Delphix ISCSI mount points.
DLPX-85647	Added a filter to fetch only the IPv4 address for AG cluster nodes.
DLPX-85748	Now displaying the state of enabled services in the Delphix Startup Screen.
DLPX-85857	Fixed an issue where after a Delphix Continuous Data engine upgrade to 10.0.0.0, faults related to listener registration are thrown during source enable.
DLPX-85883	Fixed an issue where a vPDB provision fails when invoked as a non-instance environment user, with standby source and datafile added in the recovery stream.
DLPX-85925	Added a new condition in subquery to uniquely identify filegroup for commvault backup files.
DLPX-86050	Fixed an issue where TDE diagnostics for directory permission fails if the TDE artifact directory has a space in the path or name.
DLPX-86102	Fixed an issue where ASE instance discovery is failing during environment add/refresh when ASE instance is running in multi-process mode with multiple ASE engine.

Bug number	Description
DLPX-86201	Fixed an issue where users are sometimes unable to generate a complete support bundle.
DLPX-86240	Internal services will now restart during a deferred upgrade, enabling the delivery of fixes without requiring a reboot.

3.2.49 Release 11.0.0.0 changes

3.2.50 Security fixes

Bug number	Bug introduced in	Description	Security bulletin
DLPX-85604, DLPX-85606, DLPX-85608	Product Inception	Several input fields in the Self-Service feature are vulnerable to cross site scripting (XSS).	TB104

3.2.51 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-82702	Improved error behavior when attempting to expand storage devices with underlying problems.
DLPX-85526	Eliminate the possibility that a spurious udev event during drive expansion will cause the pool to suspend.

3.2.52 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-86068	Fixed an issue from release 10.0.0.0 where users could not replace certificate chains when using root certificate authorities from Java's default list.
DLPX-85915	Fixed an issue where users were unable to add an environment when part of the host name contained all numeric elements.
DLPX-85752	The icons for the export functionality have been updated to secondary buttons (along with the icon) for clarity.
DLPX-85732	Fixed an issue where provisioning a TDE-enabled vPDB into a new vCDB with "Mask this vPDB" check fails with "ORA-46636: cannot add second keystore to the target keystore".
DLPX-85718	Starting from 7.0.0.0, the URL for "Help Documentation" has been updated.
DLPX-85621	Fixed a UI message saying, "management stack needs restart after replacing certificate", when it did not.
DLPX-85601	Removed weak CBC ciphers from default list.
DLPX-85493	MSSQL: Linking and AttachSource operations will not require unnecessary permissions of source user on the staging host and staging database.
DLPX-85445	Fixed the software version main window issue so that it now updates if a previous version is selected.

Bug number	Description
DLPX-85205	Improved the error message for environment authentication failure by including username.
DLPX-84877	Fixed an issue where adding HPUX environment failed with an Unsatisfied link error.
DLPX-84792	Added new tunable, MSSQL.ROLLBACK_HANDLING_AFTER_FAILED_RESTORE. If this tunable is set to true, the Delphix engine will perform a zfs rollback on DATA LUN right after a restore db failure.
DLPX-84738	Fixed an issue where the environment user public key is not displayed in the CLI/API.
DLPX-84709	Fixed an issue to disallow CLI or API transactions for an Environment user with a null publickey or privatekey.
DLPX-84610	Improved error message to show correct host name and user name in the case of builtin files virtual source status failure.
DLPX-83927	Fixed an issue so that Fluentd/Splunk integration will accept protocol parameter in any case.
DLPX-83897	Fixed an issue with changing port number while configuring Kerberos.
DLPX-83360	Fixed an issue where new authorization would not be granted unless the old one gets removed successfully.
DLPX-81587	DeletionDependency object in API documentation has been updated to reflect that size is Valid for TimeFlowSnapshot and HeldSpace objects.

Bug number	Description
DLPX-82895	Fixed an upgrade verify issue when fs.inotify.max_user_watches exceeds the limit of 16384.
DLPX-80325	Fixed an internal error that appeared in the Oracle dSource upgrade operation while resuming logsync for the dSource.
DLPX-80221	Resolved issues related to incorrect mount path by normalizing the path.
DLPX-79492	Improved the selection of faults and the toggle behavior of "Hide Resolved/Ignored" from the "Verification Result's Faults List" on the Version Upgrade page.
DLPX-78839	Fixed an issue where the NTP server would not validate when configured.
DLPX-77826	Added timeout functionality to JDBC queries made through DSP. Leaked connections due to network issues will be auto-closed after the timeout period. Timeout can be set using the tunable dsp.jdbc.queryTimeout.
DLPX-77386	Fixed a misleading prompted message about host being unavailable.
DLPX-76762	Performance improvement: Enabled unbuffered copy and multithreading options with the robocopy command for vFile operations.
DLPX-75448	Fixed an internal error that appeared when the purgeLogs API was used for timeflows with no snapshots.
DLPX-74905	Fixed an issue where environment refresh and VDB provision/refresh operation will fail with an "internal error" if the target host's filesystem becomes 100% full.

Bug number	Description
DLPX-73058	Fixed an issue where if an environment is disabled, VDB operations like start, stop, rollback, refresh, undo, disable would not be allowed.
DLPX-63076	Fixed upgrade check result messages to make them consistent with the failure's severity level.
DLPX-63425	Delphix will now throw a job warning and raise a critical fault in the Delphix Admin UI if a failure is encountered while backing up the archived logs and LogSync is disabled. In this case, Delphix will invoke an RMAN script to delete the backups.
DLPX-67347	Fixed an exception encounter (paired with an indefinite loading sign in the UI) when an environment addition task was cancelled in between. The environment got deleted in the next attempt but the toolkit folder did not. Added DUE to show the warning for toolkit deletion failure.
DLPX-84981	Improved the error message for null or whitespace timezone registry.
DLPX-85674	Fixed the issue where snapshots were created with the wrong (older) timeflow that led to a failure to enable the linked sources with internal error.
DLPX-85102	Reduced the size of the temporary directory unique name to be backward compatible with the name `_delphix`.

3.2.53 Release 10.0.0.1 changes

3.2.54 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-85760	Addressed an issue that in rare scenarios could lead to data loss during upgrade or reboot of Cloud Engines (Upgrade to a version with the fix is safe).

3.2.55 Release 10.0.0.0 changes

3.2.56 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-85019 (only applicable to initial deployments)	Fixed a bug that causes the management service to fail startup upon initial VM deployment in the cloud, if the DHCP domain name of the VM ends with a period (.).
DLPX-85109 (only applicable to initial deployments)	Fixed a bug that causes the management service to fail startup upon initial VM deployment in the cloud, if the DHCP domain name of the VM contains bad characters (does not belong to [a-zA-Z0-9.-]).
DLPX-84985	Fixed a deadlock which caused iSCSI connections to fail on Windows hosts.
DLPX-84995	Fixed an issue where NFS could cause excessive CPU usage when open files from NFSv4 mounts exceeded 16,384.
DLPX-62215	Fixed a nuance in the CAPACITY_RECLAMATION job.

3.2.57 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-51276	Configuration discovery script fixed to handle Windows host timezone more smoothly.
DLPX-53420	Improved error message for failure in deleting CDB sources with no associated PDBs, but with timeflow dependencies from migrated vPDBs.
DLPX-59162	Fixed failure in connecting to a Compliance engine while running a compliance job as a post-provision hook operation for RAC VDBs.
DLPX-61781	Fixed authentication failures past the first node while adding Kerberized RAC environments.
DLPX-66944	Fixed logsync failures caused by commands exceeding shell limit of 1,024 characters.
DLPX-68327	Certificates in the Truststore are considered for making connections to SMTP servers.
DLPX-74134	Fixed an issue where Oracle provisioning/refresh/rewind operations may fail with error "ORA-01169: DATAFILE number 1 not found. Must be present."
DLPX-76200	To handle unusually demanding workloads, the maximum heap size of the management application can now be increased by system administrators via the maxHeapSizeGb property of the CLI at /system.
DLPX-78673	Fixed an issue related to a message being ignored during the mount check when provisioning virtual databases. The message is not thrown because the provision completes successfully, but it could still be seen in the logs.
DLPX-80925	Fixed an issue of a raised fault due to inconsistent snapshot creation time, due to manual change of Delphix engine time.
DLPX-81874	Fixed an issue that occurred during the discovery of a cluster when adding or refreshing a Windows FCI environment with multiple NICs. The issue involved the use of the IP address of hosts that were already added.

Bug number	Description
DLPX-81982	The Delphix Fluentd logs do not automatically rotate when exceeding their expected maximum size of 100MB.
DLPX-82169	Fixed an issue where provisioning an Oracle TDE-enabled vPDB into a linked CDB with a different patch level than the source CDB will fail leaving the vPDB in a broken state.
DLPX-84108	The validation of RSS on the target host will now only occur when the customer uses an IP address for an environment. This update removes the detection of the RSS property on interfaces that are not relevant.
DLPX-84422	You can now use a single script to copy all transaction log backup files, regardless of whether they were created using native backup or Litespeed backup.
DLPX-84647	The syslog pattern is now fully configurable and can be changed to conform to RFC 5424.
DLPX-84655	A false warning message that listener registration was not successful is posted when enabling a VDB or a vCDB, users can ignore this message.
DLPX-84679	Unable to add Oracle Staging push PDB if the Staging Environment has more than one repository.
DLPX-84686	To address the issue of multiple IP addresses, the validation of RSS on the target host will now only occur when the user uses an IP address for an environment. This update removes the need to find the IP address in the code.
DLPX-84898	Fixed clean-up job failure for V2ASM of a RAC VDB when one of the nodes's DB instance is shutdown.
DLPX-84929	Improved initial load time of datasets page.
DLPX-84944	The Delphix Continuous Data Engine now considers truststore certificates for more connections, including secure connections to proxy and SMTP hosts.
DLPX-85053	PowerShell scripts code enhancement.

Bug number	Description
DLPX-85095	Fixed an issue which caused the vPDB Refresh operation to fail due to vPDB unplug operation timing out in 30 mins.

3.2.58 Release 9.0.0.1 changes

Bug number	Description
DLPX-85176	Fixed a bug that can bring down VDBs using NFSv3.

3.2.59 Release 9.0.0.0 changes

3.2.60 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-85019	Fixed handling of domain names with a terminal period (.) in Terminal.
DLPX-68852	Fixed a bug in out of memory situations that could result in service interruptions.

3.2.61 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-41505	Posted a job warning message when listeners are not registered successfully as part of an Oracle VDB/vPDB provision job.
DLPX-46210	Fixes <code>fault.policy.log.retention.old.snapshot</code> , which is not raised against a PDB snapshot instead of CDB snapshots.
DLPX-57047	For MSSQL, 'Delphix Copy Only Full Backup' is now excluded when synchronizing to most recent backup files.
DLPX-58762	Provides a better action message in Oracle nologging-related faults.
DLPX-65557	Retention no longer removes the previous timeflow until the current timeflow is successful.
DLPX-68852	Fixed an issue that could cause upgrade failures.
DLPX-69790	Fixed an issue where API login with an ambiguous user name returns an incorrect action.
DLPX-70090	The correct exception is now showing when hostname is not resolvable during Environment Validation.
DLPX-79792	If there are any DB snapshots associated with the VDB during creation of a Self-Service bookmark, there will be a message to drop all associated snapshots with the VDB and try again.
DLPX-81260	The CLI error message that appears due to 'invalid primaryAddress value', has been updated to provide better insight on a resolution.
DLPX-83702	Fixed an issue where the environment discovery path was not checked to ensure it is a valid unix path.

Bug number	Description
DLPX-83905	Fixed an issue causing <code>HOST_REFRESH</code> failures when toolkit is on a shared filesystem, with an Oracle RAC configuration.
DLPX-84068	For MSSQL, warning fault raised in case there is a failure while querying instance port.
DLPX-84284	After upgrades, NFSv3 services are automatically disabled if they are no longer required.
DLPX-84339	Fault raised due to inconsistent snapshots creation time, due to manual change of Delphix Engine time.
DLPX-84351	SMTP Test now has a check in the UI to let the user know if the password was unaltered. Save now has a check to not send the password if it was unaltered.
DLPX-84528	Datasets Search bar will now work for the staging push dSource as well.
DLPX-84589	Increased size of ssh key fields to allow for larger key, for environment users.
DLPX-85081	Fixed an NFS issue that could cause NFSv3 services to be disabled even though there were active v3 mounts after an upgrade.

3.2.62 Release 8.0.0.0 changes

3.2.63 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-83859	Fixed a rare deadlock in the kernel that can cause a Delphix Engine to become unresponsive to all management operations.

3.2.64 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-43174	Fixed an issue where Oracle VDB provision job will fail if the "Open database after provision" flag is set to false.
DLPX-48083	Removed the CLI ability to set default user as it was not needed and prevents deletion.
DLPX-52904	After initial server setup, Default Snapshot/Snapsync policies are always in "US/Pacific", regardless of the timezone selected during initial Engine Setup. An admin has to manually change the time zone.
DLPX-53209	Improved error messaging during toolkit preparation (discovery) when there are host problems.
DLPX-59248	Added a fix to throw a critical alert on the last failed attempt to collect the archive log.
DLPX-59308	Added a timeout in the drop database PowerShell script.
DLPX-59689	Fixed an issue where the environment discovery could hang indefinitely when UserLAnd commands hang (i.e. Isnrctl status, ps, etc.).
DLPX-61734	Fixed an issue where the user was unable to provision an Oracle VDB when there is a dollar sign in the Tablespace name.
DLPX-62857	Permits listing users with only the "domainUserType" parameter.
DLPX-64413	Fixed an issue where provisions/refreshes of Oracle VDBs could fail when an obsolete parameter is specified in the VDB config template.
DLPX-72691	Fixed an issue where multiple snapshots were reporting the same time in the Delphix Continuous Data GUI for standby databases.

Bug number	Description
DLPX-72740	Increased users' pubkey support from 10 to 1000.
DLPX-75521	The correct error message will now be displayed in case of a provisioning failure due to waiting for the 'DB STARTUP' process timeout.
DLPX-75605	Fixed an issue where the Security Banner was not displayed after SSH login.
DLPX-77438	Added a fix to disable UNDO operation if any children for the timeflow are present.
DLPX-77792	Fixed a misleading "toolkit inaccessible" error if password expired.
DLPX-78702	Fixed an issue where users with the SYSTEM permission are able to disable any source.
DLPX-78741	For MSSQL, raised a critical fault in case the Validated Sync interval increases to 16 minutes or more.
DLPX-79136	Fixed an issue where canceling an Oracle VDB preprovision job or a vPDB (into linked CDB) provision job leaves the auxiliary database mounted on the target host.
DLPX-79919	Fixed an issue where the Delphix Continuous Data Engine allowed an environment with a duplicate "crs_database_name" to be added.
DLPX-81182	Improved the error message for when the system is out of space.
DLPX-81425	The UI will now show the running jobs up to 60 days old.
DLPX-81497	Added a fix to improve "keystore.merge.required" fault for an Oracle TDE-enabled vPDB.
DLPX-82152	Fixed an issue where navigating resolved faults was slow.

Bug number	Description
DLPX-83575	The port in the connection string for a vPDB in a Linked CDB may be shown incorrectly when it is registered to a non-default listener.
DLPX-83635	Fixed an issue where exporting the TDE encryption keys failed when the keystores root is on ACFS and referenced via a symlink.
DLPX-83788	Suggested action in "exception.ccc.authenticate.failed" no longer references Delphix Connector.
DLPX-83823	The issue where a Oracle PDB dSource snapshot is marked as not provisionable after detaching and re-attaching the PDB to a different CDB using force flag is now resolved
DLPX-83904	Fixed an issue where a provision of an Oracle vPDB may fail during recovery if there are many datafiles that are renamed under a single ORA-01244 error.
DLPX-83954	Package details are no longer revealed during HTTP redirection.
DLPX-83977	Fixed an issue causing inability to add a hook, due to "Duplicate key" error.
DLPX-84103	Persisting total "database_transaction_log_bytes_used" while taking a snapshot, for debugging purposes.
DLPX-84151	The Replication Page performance has been optimized by making network calls efficiently.
DLPX-84255	In a Single Engine Continuous Vault product, adding a new Sybase dSource to a locked group may result in the background environment monitoring process to stop working.
DLPX-84324	Fixed an issue where NFS mounts on a Solaris target could fail after a deferred upgrade.
DLPX-84495	Fixed an issue that causes upgrades from versions < 6.0.17.0 to any version between 6.0.17.0 and 7.0.0.0 on a replication target engine which may fail due to the management services being down, requiring a support call.

3.2.65 Release 7.0.0.0 changes

3.2.66 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-83579	Fixed handling of domain names with a terminal period (.) in Terminal.
DLPX-83611	Fixed a race condition between storage device link creation and the storage pool import process.
DLPX-83701	Added additional diagnosability tracepoints to the kernel unmount code.
DLPX-83697	Fixed a hang in the iSCSI initiator.
DLPX-83675	Fixed an issue that was causing stale entries to be created in a system file.
DLPX-83684	Fixed a crash in the zcache_probe command during upgrades.
DLPX-83916	Fixed cases when zcachedb was opening devices for writing when it should be read-only access.

3.2.67 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-80130	Fixed an issue which may cause the Delphix Engine to hang when doing storage migration.

Bug number	Description
DLPX-83395	Fixed an issue when storage device removal consumes an unexpected high amount of memory upon its completion.
DLPX-83697	Fixed a hang in the iSCSI initiator.

3.2.68 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-66792	Fixed a misleading "toolkit inaccessible" error on VDB Stop/Refresh if password expired.
DLPX-68053	Fixed an issue causing phone home redaction fails when JSON contains management stack errors.
DLPX-71907	Fixed an issue where C drive label gets over-written during mount script execution.
DLPX-74604	For MSSQL, provided a fix to raise warnings in case CommVault restore fails.
DLPX-75278	Fixed display data in Datasets Performance page table.
DLPX-75488	Listeners and Instances for SQL Server AG (Availability Group) will now be shown on the User Interface correctly.
DLPX-77214	Fixed an invalid version status transition when upgrade is cancelled.
DLPX-78014	Automatically disable NFSv3 services when they are no longer required.

Bug number	Description
DLPX-78506	Fixed dSource Database Authentication issue. Now the user is able to edit the credentials of the dSource DB, where authentication is configured using "Domain User with HashiCorp Vault Credentials".
DLPX-80300	Added more error information for Environment discovery failure when ISCSI target port is blocked on network.
DLPX-80473	Fixed an issue where the vPDB unplug operation timed out during disable operation.
DLPX-80512	Fixed pagination on Snapshots tab of Storage Capacity page. Now the user will be able to see all the snapshots using the pagination control at the bottom of the page.
DLPX-81238	DFE caused by policy schedule with a non-recurring quartz cron string.
DLPX-81750	Added a more descriptive message while handling the condition where VDB is renamed outside.
DLPX-81794	For MSSQL, raised a warning fault during environment monitoring in case dlpxrnas is removed. Also, provided fix to propagate the cause of host unavailability while environment refresh.
DLPX-82288	It is now permissible to remove devices after a deferred upgrade from before 6.0.12.0 (multi-device removal support added) to 7.0.0.0 or after.
DLPX-82316	The issue with the failure of the Oracle vPDB provisioning from a standby source and datafile added in the recovery stream is now resolved.
DLPX-82882	Fixed Script: Replacing Self-signed Certificates, on the Delphix Connector.
DLPX-83002	Cron expression handling has been fixed as per quartz cron expressions.
DLPX-83153	Fixed the issue where an invalid fault "fault.oracle.db.connection.failed" was raised during VDB refresh.

Bug number	Description
DLPX-83372	Profiling script code enhanced.
DLPX-83422	Fixed an issue where Oracle move-to-asm script fails due to missing initialization parameter file init.ora in `\$_ORACLE_BASE_CONFIG/dbs`.
DLPX-83434	Upgrade Spring framework to 5.3.20.
DLPX-83564	Users can now perform V2P of dSource and VDB snapshot to root of a Windows drive.
DLPX-83608	Users can now V2P an MSSQL dSource or VDB snapshot to a Mounted volume on a Windows path.
DLPX-83622	Upgrade verify will fail from coming from 6.0.15.0 if a Fluentd plugin other than splunkHec is configured. Support help will be needed to upgrade.
DLPX-83706	Fixed network connectivity issues in cases where the MAC address changes.
DLPX-83783	Implemented a fix to prevent invalid transition after a deferred upgrade.
DLPX-83787	Fixed an edge case issue that could cause an engine to be rebooted after a device has been removed from the storage pool.
DLPX-83789	MountLunData.ps1 script code enhanced.
DLPX-83819	Fixed an issue causing script failure output duplication in debug logs.
DLPX-83824	Fixed an issue where datasets would intermittently going inactive with critical faults.
DLPX-83828	While editing an Environment User, the Password field will be empty by default in order to get the correct password from the end user.

Bug number	Description
DLPX-84073	Fixed an issue where existing TDE-configured vPDBs would fail to enable after upgrading the Delphix Engine from 6.0.14.0 to a later Delphix Engine version.

3.2.69 Release 6.0.17.0 changes

3.2.70 Security fixes

Bug number	Bug introduced in	Description	Security bulletin
DLPX-83043	5.2.0.0	Weak DH 1024 bit exchange key detected by security scanner for the Delphix connector.	TB099

3.2.71 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-75209	Fixed an issue that could cause an AWS EC2 Delphix Engine to be left with no network configuration following a change of instance type.
DLPX-80122	Fixed bug that caused disks with write errors in their history to have degraded performance (activated after optional reboot).
DLPX-81081	Fixed bug that would sometimes cause VMs with a lot of MSSQL VDBs to report issues on reboots (activated after optional reboot).
DLPX-81701	Fixed bug that would sometimes cause OS panics when issuing a reboot (activated after optional reboot).
DLPX-82405	Fixed an issue where the NFS server could fail when restarted (activated after optional reboot).

3.2.72 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-46621	The issue with adding concurrent environment that resulted in <code>exception.executor.object.exists</code> exception is now resolved.
DLPX-56976	The Delphix engine now returns a descriptive error message if Oracle SnapSync or environment monitor fails to connect to the database in the scenario where the value of <code>ORACLE_HOME</code> or <code>ORACLE_BASE</code> is set incorrectly in <code>orabasetab</code> file.
DLPX-57078	The issue that occurred during Oracle provisioning where if a job is canceled during recovery steps, provisioning will continue until the end of recovery before the job is actually cancelled is now resolved.
DLPX-57934	The issue where large text objects inserted into engine metadata caused errors and potentially OutOfMemory is now resolved.
DLPX-59179	Warning fault will no longer be raised when linking is done to a source host running Enterprise Edition SQL Server and a staging host is running Standard Edition SQL Server.
DLPX-60981	Fixed issue that prevented customers from reusing disks from old engines to new ones.
DLPX-63889	For SAP ASE, pre and post validated sync scripts have been removed. Any existing hooks are converted to pre-hooks list and post-hooks list, respectively.
DLPX-64169	For MSSQL, provided a fix to handle registry exceptions for source environment.
DLPX-70817	Fixed issue that prevented customers from using a disk after running the I/O report card on it.
DLPX-71064	Updated the error action for Lua and Platform plugin upgrade validations.
DLPX-73533	Added fix to prevent multiple connector operations' testing for the presence of the same SCRIPT directory.

Bug number	Description
DLPX-78787	For MSSQL, added a retryer to get the FQDN of the host.
DLPX-81043	Added additional guidance while doing Replace Certificate on the Upload Certificate step.
DLPX-81532	Standby files for MSSQL V2P operations are now created in the DATA/db folder.
DLPX-81842	Fixed an issue of Arithmetic overflow while fetching database size.
DLPX-82050	Fixed an issue in the intersection of extended replica retention, chained replication, and an entire timeflow getting deleted on the source engine.
DLPX-82145	Fixed an issue where TDE-enabled RAC vPDB provisions may fail with “ORA-28374: typed master key not found in wallet” when activating the key in the target CDB.
DLPX-82262	Disabled Apollo client DevTools to avoid vulnerabilities.
DLPX-82371	Delphix Engine improvements.
DLPX-82433	Fixed an issue where provisioning or refresh of TDE-enabled vPDBs could fail with an internal error if the <code>tdeKeystoresRootPath</code> contains any special characters.
DLPX-82514	Password field is now initially empty so that users can enter password.
DLPX-82527	Delphix Engine improvements.
DLPX-82686	Rollback during upgrade now works on Cloud Engines.

Bug number	Description
DLPX-82859	Fixed an issue where API clients that close their connections early while getting a list of snapshots could cause an internal resource leak that could make the application unresponsive if a replication job is initiated afterward.
DLPX-82908	Managed Source Data UI page now correctly displays the Type of Data for AppData sources.
DLPX-82972	Provided the capability to override default root squash behavior for mounted filesystem of unstructured files via Tunable: <code>LUA_VFILE_TOOLKIT_ROOT_SQUASH_DISABLE</code> .
DLPX-83103	Fixed an issue of environment refresh failure for Windows host after upgrade to 6.0.16.0 occurred due to iSCSI related registry parameters' monitoring.
DLPX-83105	Fixed an issue following upgrades where SSO entityID changes without user intervention.
DLPX-83148	Fixes environment refresh of an Oracle Live Source environment failure reporting an internal error.
DLPX-83149	From Windows Connector side, while handshaking, stop using the cipher suites which uses Diffie-Hellman key exchange with keys less than 2,048 bits in size.
DLPX-83206	Improved the error message that is displayed when RMAN/sqlplus connection to an Oracle virtual database fails.
DLPX-83359	Delphix Engine improvements.
DLPX-83504	Delphix Engine improvements.
DLPX-83595	The default behavior for VDBs is altered, to disable DBCC CHECKTABLE commands for datafile accessibility.

3.2.73 Release 6.0.16.0 changes

Bug number	Description
DLPX-67753	Fixed an issue causing redirect responses to reveal server type and version when HTTP redirection is enabled.
DLPX-72068	Improved the way volumes are fetched while working on mounts.
DLPX-74396	Fixed an issue that occurred when manually adding a database to an environment which has the same unique name as a database in another environment managed by the same Delphix engine. Previously, Delphix reported an incorrect environment containing the same unique name.
DLPX-80172	Updated the Self-Service refresh warning message.
DLPX-80271	changeArchivelogMode now has an associated job event.
DLPX-80387	Fixed an issue where Oracle move-to-asm script would fail while dropping temp due to tempfiles being in use and unable to be dropped after the database was started.
DLPX-81184	For S3 object store, the "Base URL" input is renamed to "endpoint". The "region" input is now a dropdown for the user to select from a list of standard regions. The endpoint corresponding to that region will now be auto-populated.
DLPX-81692	Fixed an issue where Direct NFS was not being detected for Oracle 21.
DLPX-81996	Fixed an issue where an environment refresh after upgrade did not remove outdated/obsoleted toolkit components in 6.0.014.0 and 6.0.15.0.

Bug number	Description
DLPX-82075	Fixed an issue that prevented the creation of a network route whose gateway is reachable through multiple interfaces.
DLPX-82112	Added checks to prevent using NFSv4 with Direct NFS for some Oracle 19 versions that don't support v4 due to an Oracle bug.
DLPX-82236	Fixed an issue where Speculative Logging was being called out of context and could lead to unbounded consumption of rpool.
DLPX-82308	Fixed an issue where the provision/refresh of an Oracle Key Vault vPDB fails with, "ORA-28365: wallet is not open".
DLPX-82329	Action-based alerts now include the success or failure state of the action, including the reason in case of failure.
DLPX-82334	Enabled the creation of on-link network routes; routes whose destination are directly reachable without a gateway.
DLPX-82381	Improved Replication performance on engines with a lot of objects.
DLPX-82392	Fixed an issue where after editing credential environment variables, the create/provision VDB wizard would fail because the environment variables were missing the password field in the payload. The required password field has now been added.

3.2.74 Release 6.0.15.0 changes

3.2.75 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-80760	Increased the inotify limit to address a defect during upgrade.

3.2.76 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-68240	Fixed an issue where LogSync for an Oracle RAC standby does not set max number of backup tasks correctly.
DLPX-73375	Added granularity in restore job events to mark various phases of Restore Backup process. Added events in Restore Backup job to provide information at the start of the Redo phase of a restore command.
DLPX-75677	Fixed an issue causing auto population of the encryption key when no input is given.
DLPX-78913	Fixed a minor typing issue when deleting a MSSQL database.
DLPX-79228	Fixed a VDB Start Fault after a VDB start job is successful.

Bug number	Description
DLPX-79528	Made improvements in environment monitoring to return the NO_DELPHIX_DATABASE status for Staging Push dSources when they are not managed by Delphix, and avoids monitoring other attributes for such databases.
DLPX-79596	Made a change in the enable flow for Staging Push dSources to always make an attempt at unmounting the DATA storage before dropping the staging database.
DLPX-79780	Mount with local_lock=all on Linux, when mounting VDBs with NFSv3.
DLPX-79999	Use the offset in the time_zone column of msdb.dbo.backupset to convert the timestamp correctly for a backup from a source, and then continue using the staging host timezone to display the time of a snapshot on the UI.
DLPX-80206	Updated MD5 checksums for Oracle 12.1.0.2.0 OJDBC jars.
DLPX-80254	Fixed an issue where Oracle JDBC jar checksum checks are being reported as false positives despite underlying database connection issues.
DLPX-80406	The Spring framework has been updated due to the Spring4Shell vulnerability.
DLPX-80487	Fixed an issue where the Delphix UI would sometimes not render, showing waiting for response.
DLPX-80494	Added an action item to check for support Host and Server Type combination while adding MSSQL environments.
DLPX-80619	This change will introduce the ability to add sporadic failures via tunable: ADDITIONAL_SPORADIC_FAILURES.

Bug number	Description
DLPX-80909	Cross-Site Scripting (Reflected) in /resources/json/delphix/session.
DLPX-81048	Removed the requirement for Linux kernel recover-lost-locks setting when using NFSv4 with Oracle dNFS.
DLPX-81090	Can now enable/disable SNMPv3 vs. v1/v2.
DLPX-81100	Updated the command for checking database files accessibility while fetching the VDBs status with a lighter and less intrusive command, to get relief from VDBs being stopped randomly.
DLPX-81242	Fixed an issue preventing the upgrade of a replication Continuous Vault source with automatic replication.
DLPX-81308	Fixed an issue causing Appdata SnapSync to crash with NullPointerException when a virtual database is not successfully refreshed or rolled back.
DLPX-81358	Fixed the unnecessary alerts of timezone discovery failure that users were facing randomly for the cluster environments.
DLPX-81502	Improved performance of the Replication page.
DLPX-81696	Users should now be able to enable the feature flag AZURE_DATA_BANK.
DLPX-81710	Fixed an issue where an engine could not be setup when objectStorage is enabled.

3.2.77 Release 6.0.14.0 changes

3.2.78 Security fixes

Bug number	Bug introduced in	Description	Security bulletin
DLPX-81059	5.2.2.0	Arbitrary Code Execution may be performed when configuring masking environments	TB098 ⁶²

3.2.79 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-38908	Oracle LogSync should automatically resolve faults for transient issues
DLPX-39193	Null Pointer Exception in Oracle LogSync backup stream handler
DLPX-57078	Job cancel requests during Oracle provisioning are not processed until the end of recovery
DLPX-57405	move-to-asm.sh does not support TDE-enabled databases
DLPX-62343	disable the OPTIONS method for all HTTP(S) requests
DLPX-64386	Oracle LogSync thread may hang when trying to remove temporary RMAN command file from source host toolkit directory

⁶² https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Technical_Bulletins/TB098_Arbitrary_Code_Execution_May_Be_Performed_When_Configuring_Masking_Environments

Bug number	Description
DLPX-65413	Ensure "source-archive" directory is unmounted at start of Oracle Provision
DLPX-66879	Oracle LogSync can create orphaned logs in certain scenarios
DLPX-69453	Provide tunable for Oracle LogSync client timeout
DLPX-69802	Common Toolkit directory is not removed from a mounted shared NFS location when the environment is deleted
DLPX-76382	Force disable should succeed despite environmental problems
DLPX-77840	Fixed an issue on the Setup pane to allow successful completion of an smtp test against a specific email address
DLPX-78412	SCM/Talaria failure reason should be communicated in the Delphix fault warnings
DLPX-78726	Removing windows environment performs cleanup of iSCSI persistent login target
DLPX-78754	Disable operation is prohibited on replicated sources
DLPX-78986	Prevent DSP connections for disabled Oracle RAC cluster nodes
DLPX-79077	Resolved an issue of an infinite spinner when validating BEQ credentials for Oracle dSource with duplicate unique_name. While linking a dSource, credentials are now required when discovering an unknown CDB.
DLPX-79242	Splunk HEC token logged to debug logs during splunkHec test

Bug number	Description
DLPX-79396	Allow users to unset Oracle database user name and credentials through CLI if Simplified Connection Management is enabled.
DLPX-79502	SnapSync fails if more than 1000 tempfiles exist in the whole CDB
DLPX-79591	Changed the NFSv4 minimum supported target Redhat version to 6.4 (was previously 6.3).
DLPX-79742	Unable to provision PostgreSQL VDB to Linux host with processor type of ppc64le
DLPX-79823	Improved the action item for failure to enable/attach the staging push dSource.
DLPX-79942	Improved the action item for failure to enable/attach the staging push dSource.
DLPX-80137	Limit SNMP configuration access to sysadmin
DLPX-80144	Oracle SnapSync crashes with NullPointerException when a PDB dSource is renamed and replaced with a new PDB of the same name
DLPX-80217	Fixed issue with filename conflicts during source backup restore
DLPX-80302	It was necessary to restart the auxiliary CDB during a TDE provision after recreating the autologin keystore
DLPX-80369	Oracle environment monitor triggers fault.oracle.db.connection.failed fault immediately on dataset stop or disable.
DLPX-80415	Fixes long delay in operations such as VDB start/stop when JDBC Thin connection to database fails due to unable to establish network connection.
DLPX-80439	Provide mount location to upgrade scripts during Lua to Python upgrade process if mount specification has not been provided.

Bug number	Description
DLPX-80440	Fixed spinner issue while provisioning a VDB from a SQL Server staging dSource from Provision VDB option in datasets menu
DLPX-80482	TDE-enabled provisions to a RAC target fail with "ORA-28365: wallet is not open" while attempting to reopen the database in start_database.sh in the auxiliary
DLPX-80483	Fix failing TDE-enabled vPDB provisions to a linked RAC container database due to "ORA-28365: wallet is not open" errors
DLPX-80487	Improved performance across dataset and replication related pages.

3.2.80 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-80078	The issue with removing files with complex file permissions on EBS is now fixed

3.2.81 Release 6.0.13.1 changes

3.2.82 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-80818	libc upgrade necessitates PostgreSQL re-index.

3.2.83 Release 6.0.13.0 changes

3.2.84 Security fixes

Bug number	Bug introduced in	Description	Security bulletin
DLPX-79789	5.3.0.0	Arbitrary Code Execution May Be Performed by Engine System Administrators.	TB096 ⁶³

3.2.85 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-7868	The issue with the confusing vPDB error on a snapshot after resetlogs of a linked CDB is now fixed.
DLPX-41671	You can now update the Oracle cluster home through the user interface.
DLPX-43467	When dSource is an Oracle standby in RTA mode, LogSync was raising the fault.oracle.linkedsource.log.conflict error and getting disabled on its own. This issue is now fixed.
DLPX-50309	Users can now change logSyncInterval for Oracle dsources.
DLPX-59757	The count for masking jobs fetched from the Masking Engine is now configurable. By default, it is set to 500.
DLPX-67604	The manual recovery of a database after V2P from a snapshot of dSource was failing with an error. This issue is now fixed.

⁶³ https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Technical_Bulletins/TB096_Arbitrary_Code_Execution_May_Be_Performed_by_Engine_System_Administrators

Bug number	Description
DLPX-68684	The self-signed certificate is now compliant with the requirements for trusted certificates in MacOS 10.15.
DLPX-74613	Oracle VDB migration check needs to be done against the Oracle target host instead of the source. Furthermore, the Error and Action plan provided should include the target hostname.
DLPX-75467	The CLI now returns correct and descriptive error messages when executing unauthorized requests on uninitialized engines.
DLPX-75646	To diagnose BEQ connection failure, this release adds MD5 checksums for ojdbc*.jar for Oracle release versions up to currently supported release version.
DLPX-75878	The issue with the JDBC connection string for an Oracle vPDB not getting updated after an IP address change is now fixed.
DLPX-75989	The issue with the failure of environment discovery of an Oracle Cluster with a NullPointerException error is now fixed.
DLPX-76956	Previously, the Oracle JDBC test connection with the wrong password was increasing the LCOUNT value by more than 1. This issue is now fixed.
DLPX-77140	This release now speeds up metadata that is sent during replication when Extended retention is involved.
DLPX-77231	Previously, when source discontinuity on the dSource was followed by resync on the livesource, one or more livesource workers were failing to start. This prevented livesource status from getting updated and the first snapshot from being taken after resync. This issue is now fixed.
DLPX-77600	This release fixes NPE when Linking dSource with missing backup and unreachable nodes.
DLPX-77880	This release improves scalability for engines with an extremely large number of snapshots that were causing them to run out of memory.
DLPX-78015	Previously, V2P export with absolute data files was failing with an internal error. This issue is now fixed.

Bug number	Description
DLPX-78174	Insecure DES is no longer supported for SNMPv3.
DLPX-78420	This release adds V2P support for Windows server 2022 host machines.
DLPX-78473	This release improves load times for Datasets and Dataset Performance pages for engines with a large number of datasets and containers.
DLPX-78488	Previously, when switching from the backup server to ASE, dump history was not working for dSources configured to use the remote backup server. This issue is now fixed.
DLPX-78594	This release fixes an issue with disabled VDBs not being able to undo a refresh.
DLPX-78688	TLS 1.0 and TLS 1.1 ciphers are no longer available. Any system that is only configured with TLS 1.0 or TLS 1.1 ciphers is switched to use the default cipher set.
DLPX-78693	Invalid sync parameters will not cause DE server unavailability.
DLPX-78696	Switching sync strategy from source sync strategy type to sourceless strategy type is not allowed.
DLPX-79126	VDBs can now be automatically started with the tunables if stopped intermittently because Windows fail to write on the mount (Msg 9001).
DLPX-79292	This release eases restrictions on taking a snapshot of PDBs with encrypted UNDO tablespaces.
DLPX-79344	Previously, Snapsync of a standby PDB in mount mode was failing with the <code>ORA-01109: database not open</code> error message. This issue is now fixed.
DLPX-79422	Previously, clicking on a Replication Profile was resulting in the following error message <code>An error happened while communicating with the server</code> . This issue is now fixed.

Bug number	Description
DLPX-79789	Under certain conditions, arbitrary code execution may be performed by sysadmins.
DLPX-79808	This release fixes failures if the VDB name is more than 68 characters.

3.2.86 Release 6.0.12.1 changes

3.2.87 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-79151	The issue with remote syslog configurations preventing engine upgrades or virtualization service restarts is now fixed.

3.2.88 Release 6.0.12.0 changes

3.2.89 Log4j updates

Based on detailed testing and analysis, all the currently supported products are not susceptible to known log4j vulnerabilities. Please refer to [TB095 Technical Bulletin](#)⁶⁴ for more information. All instances of log4j in currently supported Delphix products are updated to **log4j 2.17.1** as of this release.

Delphix keeps you updated on the latest developments and keeps releasing hotfixes, procedures, and workarounds for such critical vulnerabilities. For more information on how Delphix supports our product and customers in such cases, see [Delphix Product Security](#) (see page 962)

For more information, refer to the following pages:

- [TB095 log4j vulnerabilities](#)⁶⁵

⁶⁴[https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Technical_Bulletins/TB095_log4j_Vulnerabilities_\(CVE-2021-44228%2C_CVE-2021-45046%2C_CVE-2021-45105%2C_CVE-2019-17571%2C_CVE-2021-4104\)](https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Technical_Bulletins/TB095_log4j_Vulnerabilities_(CVE-2021-44228%2C_CVE-2021-45046%2C_CVE-2021-45105%2C_CVE-2019-17571%2C_CVE-2021-4104))

- [Product security \(see page 962\)](#)

3.2.90 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-23068	Validation for target database parameter 'DB_FILES' for single-tenant databases for the following operations: provisioning, refresh, rewind, and converting a dSource to LiveSource is now added. Furthermore, specific error messages for handling ORA-00059 errors are added.
DLPX-44544	The issue with the SnapSync of an Oracle standby dSource in Real-Time Apply mode calculating the snapshot's timestamp incorrectly is now fixed. This issue was resulting in ORA-01194 or ORA-01152 errors when provisioning to a timestamp after the snapshot.
DLPX-56691	The issue with the data files of a VDB getting unmounted when provisioning, refresh, or rollback job is canceled manually is now fixed.
DLPX-57971	The issue with the latest snapshot of a LiveSource taking a long time to show the SCN/ timestamp range on its card in the GUI is now fixed.
DLPX-60320	UI now allows the selection of older dataset repositories (downgrade) in addition to selecting newer ones (upgrade).
DLPX-67069	The issue with the stopped Oracle VDB monitoring by the environment monitor that resulted in connection errors flooding the debug log is now fixed.
DLPX-68132	The issue with the "Copy query to clipboard" SQL copy functionality in the "Managed Source Data" is now fixed to have correct apostrophe characters.
DLPX-72123	The issue with the failure of detaching or deleting an Oracle dSource operation on RAC environments (This issue was occurring due to failure of deletion of RMAN backups on RAC and the operation needs to be retried with a force option) is now fixed.
DLPX-72779	The UI showing enabled or disabled for cluster nodes now uses a grid table. The Enabled column contains a checkmark to show whether the cluster is enabled or disabled. Users are able to select or unselect the checkmark to enable or disable a cluster.

⁶⁶ [https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Support_Policies/Product_Lifecycle_Policies_\(KBA1003\)](https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Support_Policies/Product_Lifecycle_Policies_(KBA1003))

Bug number	Description
DLPX-73975	Critical storage faults should not be ignorable nor manually resolvable
DLPX-74862	This release fixes an issue where the RESUME operation failed without any error thrown to the user on dSources where ENFORCE was still in progress. The fix will make sure that even if RESUME fails, it throws a DUE to the user with suggested actions to resolve the issue.
DLPX-75763	The issue with the failure of refreshing a VDB provisioned as an empty vfiles since there is no parent container to refresh from is now fixed.
DLPX-76266	The issue with the VDB Disable operation that resulted in an error message while connectivity with the host machine can't be established is now fixed.
DLPX-77123	You can now run Upgrade Verify when another upgrade is in progress.
DLPX-77347	This release fixes the difference in time shown for MSSQL snapshot based on different database authentication methods.
DLPX-77638	The issue with the failure of the End Entity Certificate expiration fault is now fixed.
DLPX-77664	The issue with the failure of the Oracle SnapSync with an error message, "RMAN-06183: datafile or datafile copy (file number) larger than MAXSETSIZE" if a datafile resized in the middle of SnapSync is now fixed.
DLPX-77913	The issue with the faults table missing data if there was more than one page of faults is now fixed.
DLPX-77925	The issue with the unsupported Windows release error message is now fixed.
DLPX-78113	MSSQL VDB database size will now be refreshed periodically based on environment_monitor.dynamic_attributes_check_period tunable.
DLPX-78183	The issue with the MSSQL validated sync schedule not getting updated without successful backup restoration is now fixed.

Bug number	Description
DLPX-78244	The issue with the failure of a few operations on self-service containers due to incorrect entries corresponding to the Oracle log metadata on the Delphix engine is now fixed.
DLPX-78258	The issue with the input bug that retained cleared out DB credentials in the dSource linking wizard is now fixed.
DLPX-78263	The issue with the failure of a SnapSync of an Oracle standby dSource in Real-Time Apply mode with an error message, "exception.oracle.snl.linkedsources.current_scn.invalid" if the rate of change in the database is low is now fixed.
DLPX-78265	Offline Oracle bystander PDBs data files can now be optimized leading to improved provision performance.
DLPX-78309	The issue with the CLI being unable to log in to system users when the main virtualization service is down is now fixed.
DLPX-78334	The issue with a large number of missing Oracle archive logs causing an error while viewing dataset is now fixed.
DLPX-78392	Hosts running Windows Server 2022 can now be added as Source and Target environments to the Delphix Engine.
DLPX-78522	SSLv3, TLS 1.0, and TLS 1.1 are no longer configurations options for HTTPS. Any system configured only with these removed options will be automatically set to use TLS 1.2.
DLPX-78791	This release upgrades log4j from 1.2.17 to the latest 2.x in Windows Connector.
DLPX-78938	This release upgrades log4j in virtualization to 2.17.1.

3.2.91 Release 6.0.11.0 changes

3.2.92 Security fixes

Bug number	Bug introduced in	Description	Security bulletin
DLPX-77921	6.0.8.0	Arbitrary Code Execution by Delphix System Administrators may be Performed on Virtualization and Masking Engines	TB094 ⁶⁷

3.2.93 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-53019	The issue with the missing redo alert raised during the environment monitor check has now been resolved.
DLPX-59299	Discovery and monitoring rely on "Connected" in sqlplus output, which may not be the case if NLS_LANG is set to another language (e.g. Japanese). Downstream operations, like linking or provisioning, may then fail due to missing user privileges.
DLPX-59662	The issue with copy-Only Backups failure with Virtual Service Accounts has now been resolved.
DLPX-62706	The issue with the Hostchecker not properly checking /home/delphix permissions has now been resolved.
DLPX-64082	The issue with Oracle Provisioning scripts having hard-coded timeout issues has now been resolved.

⁶⁷https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Technical_Bulletins/TB094_Arbitrary_Code_Execution_by_Delphix_System_Administrators_May_Be_Performed_on_Virtualization_and_Masking_Engines

Bug number	Description
DLPX-6 5729	Added retry functionality to the 'read backup files' operation during a validated sync to an account for an unstable environment.
DLPX-6 9778	SAML response is not logged on successful SSO login.
DLPX-7 2043	The issue where LiteSpeed <code>xp_restore_headeronly</code> stored procedure failure message are displayed when validated sync is active for dSources with LiteSpeed backup has now been resolved.
DLPX-7 2220	A UI issue that occurred while updating the vault when only the private key is changed has now been resolved.
DLPX-7 2225	Admin user created from management UI is no longer showing as 'non-admin' type.
DLPX-7 2237	The 'Verify Credentials' button from the DSP Throughput test page is now removed.
DLPX-7 2369	The dependency on a parent snapshot relying on the latest snapshot is now removed if a parent snapshot does not exist during the VDB enable operation.
DLPX-7 2778	Oracle dSource attach operation with changed DB ID using 'Force' option is now allowed.
DLPX-7 4555	Updated the "no Delphix connector" message while provisioning a Windows source environment.
DLPX-7 4676	Oracle LiveSource LogSync should only catalog valid archive log files.
DLPX-7 4851	In the Add Environment GUI, the mouseover information for "Set Delphix Session Protocol Options (DSP)" has been currentted.
DLPX-7 4896	The race condition issue when running Oracle VDB refresh and dSource snap sync resulting in incorrect engine metadata entry for the parent snapshot of a VDB in the <code>dlpx_timeflow</code> table has now been resolved.

Bug number	Description
DLPX-75335	Added a product name and product version for the Delphix Connector executable so this information can be available before installation.
DLPX-75500	For ag cluster nodes, if the refresh fails due to timezone discovery failure, don't delete the nodes from engine metadata as it doesn't mean we had an issue with the nodes.
DLPX-75952	Database configs will be replicated only if the associated VDB is replicated.
DLPX-75995	The issue causing environment 'Add' or 'Refresh' to fail when PowerShell Transcription is enabled has now been resolved.
DLPX-76244	The issue where TCP fallback connection to database stops responding if the Oracle database instance is down has now been resolved.
DLPX-76290	Databases of UNKNOWN cdb type are now included in the attachment of a non-PDB container.
DLPX-76731	Added Delphix support for <code>WALLET_ROOT</code> and <code>TDE_CONFIGURATION</code> parameters to manage wallets in 19c instead of <code>sqlnet.ora</code> .
DLPX-76759	Added "Response" to faults along with other details when logged in the Admin App.
DLPX-76777	Remove orphaned Oracle logs resulting from archive log fetch timeouts.
DLPX-76793	Added execution timeout for execution of <code>UpdateFileACL.ps1</code> .
DLPX-76974	The issue where a user was unable to change 'from address' of SMTP server to noreply@delphix.com ⁶⁸ in the GUI has now been resolved.
DLPX-77112	The issue where an Oracle VDB cannot be provisioned between different minor versions if the Source is on higher RU has now been resolved.

⁶⁸ <mailto:noreply@delphix.com>

Bug number	Description
DLPX-77284	The issue where after a hotfix was removed due to a successful upgrade, the system would still indicate the hotfix was installed post-upgrade has now been resolved.
DLPX-77345	The issue where provisioning a vVDB fails with <code>java.lang.OutOfMemoryError</code> when sqlplus is used to rename the datafiles has now been resolved.
DLPX-77405	Replicated password vaults will no longer be visible in the UI.
DLPX-77676	The issue where provisioning a vPDB from a PDB dSource fails with "ORA-65114: space usage in container is too high" if PDB <code>max_size/max_pdb_storage</code> is configured has now been resolved.
DLPX-77708	The issue where a refresh/disable/destroy of a VDB using NFSv3 could cause loss of access to other VDBs that were using NFSv3 has now been resolved.
DLPX-77844	The issue where V2P operations from a VDB snapshot would result in the deletion of any production datafiles that exist on specified V2P target directory has now been resolved.
DLPX-77904	Removed 'Factory Reset' for Delphix Engines that are Data Vaults, as the operation is disabled for those engines.
DLPX-77912	The issue that can cause a VDB stop, refresh, or rollback to fail with an internal error has been resolved.
ORB-2465	Removed the requirement that SAML SSO email addresses must match case-sensitively for SSO logins.

3.2.94 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-77577	Increased nvme I/O timeout to prevent storage issues in EC2 (Activated after optional Reboot).

3.2.95 Release 6.0.10.1 changes

3.2.96 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-77467	Loading the setup app dashboard (as sysadmin) was rendering a server error popup with instruction to contact Delphix Support. This 6.0.10.0 error has been known to impair the ability to configure web proxy, PhoneHome, SMTP servers, and other connectivity settings via the GUI. It has now been resolved.

3.2.97 Release 6.0.10.0 changes

3.2.98 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-18438	The issue with provisioning to the latest available time that resulted in generating the <code>exception.oracle.target.point.not_provisionable</code> exception has now been resolved.
DLPX-35480	Previously, static routes were being added using the <code>add</code> command. Now, the same can be added using the <code>create</code> command.
DLPX-57516	The issue with the failure of management service to start after configuring some abbreviated timezones from a picklist in server setup or sysadmin CLI has now been resolved.
DLPX-58133	Previously, the Oracle SnapSync operation was resulting in a warning for BCT usage on editions that do not provide it. This issue has now been resolved.
DLPX-58675	The issue with the deletion of the last snapshot on timeflow by Retention during a failed Oracle DB_SYNC operation has now been resolved.

Bug number	Description
DLPX-6 3003	The issue with memory being exhausted while reading too many snapshots from engine metadata has now been resolved.
DLPX-6 3347	If the staging source has the "Use as Staging" flag set as off, the user was seeing a specific exception while trying to enable a linked dSource to point in the direction of what needs to be done. Any compatibility failure will now have a specific exception.
DLPX-6 3601	Previously, querying the following operation "backupset table" and "whether a database is part of AG or not" was resulting in deadlocks and lock timeouts errors. We have now added retries to resolve the issue.
DLPX-6 4369	The issue with throwing <code>fault.oracle.linkedsource.incomplete.tempfile</code> for physical standby has now been resolved.
DLPX-6 5949	The issue with misleading status in the progress bar while taking a copy-only backup has now been resolved.
DLPX-6 9831	Previously, the Oracle dSource SnapSync operation was not displaying a clear failure message if a dSource <code>db_unique_name</code> is changed. This issue has now been resolved.
DLPX-7 0317	The issue with the restarting of the NFS-server by the reaper thread while deleting a vPDB from a linked CDB with Talaria turned on has now been resolved.
DLPX-7 1018	The issue with UI displaying only the suffix of the device name used by Hyper-V has now been resolved. UI now displays a unique device name for storage in Hyper-V.
DLPX-7 1292	The issue with the allowance of incremental SnapSync after LogSync throws <code>fault.oracle.linkedsource.log.conflict</code> has now been resolved.
DLPX-7 1639	The NFSv4 is now set as the default option when mounting datasets from OS platforms that support it.
DLPX-7 1769	The need to set permissions of <code>\$ORACLE_HOME/dbs</code> subdirectories using STARTUP SPFILE syntax is now removed.
DLPX-7 2011	The issue with the CLI network setup not configuring the first network interface when multiple interfaces exist has now been resolved.

Bug number	Description
DLPX-7 2186	The issue with CDB log file retention working incorrectly if a PDB has multiple time flows pointing to the same CDB timeflow has now been resolved.
DLPX-7 2432	The format of <code>zpool_iostat_60.log</code> has been enhanced in this release. A timestamp is recorded for each sample in the log, making it easier to determine the time for each sample.
DLPX-7 2956	The issue with disabling the Oracle LogSync after running the validated sync job has now been resolved.
DLPX-7 3575	The timezone monitoring is now added for the Windows hosts.
DLPX-7 3590	You can now refresh a VDB whose parent dataset is in a different group without needing authorization on the parent or its group.
DLPX-7 3800	The issue with the failure of <code>olsnodes</code> when run as a non-Oracle user has now been resolved.
DLPX-7 4504	The issue with throwing a new DUE and <code>NotFoundException</code> when <code>ojdbc</code> libs cannot be read has now been resolved.
DLPX-7 4945	UI now displays a detailed error message for transaction log-chain break fault.
DLPX-7 4992	The issue with the failure of SnapSync operation when Database incarnation reset-logs end time is changed from "2021-03-13 22:03:07.0" to "2021-03-13 21:03:07.0" for virtual pluggable database " " has="" now="" been="">">
DLPX-7 5389	The issue with the recording of the insufficient details by Logsync when <code>dbid</code> change was detected has now been resolved.
DLPX-7 5517	The issue with the failure of the Oracle vPDB provisioning with the "ORA-00959: tablespace 'TEMP' does not exist" error has now been resolved.
DLPX-7 5721	The issue with the failure of an Environment discovery with the "DelphixFatalException: Unknown Oracle Database status: REFRESHING" error has now been resolved.

Bug number	Description
DLPX-7 5737	The issue with saving unnecessary logs by Retention if bookmark falls exactly on a snapshot end SCN or snapshot end timestamp has now been resolved.
DLPX-7 5897	Previously, failure to start I/O services after the upgrade operation was resulting in a stack restart loop. This issue has now been resolved.
DLPX-7 5951	The internal error being signaled during VDB SnapSync by <code>removeUnneededZFSFiles</code> when a data file is physically removed during processing by an external cause has now been resolved.
DLPX-7 6288	The NFS latency for workloads involving a lot of parallel I/O (e.g. Oracle VDBs with concurrent accesses to many data files) is now improved.
DLPX-7 6388	Previously, entering key pairs directly into hook environment variables, as opposed to via a vault or as passwords were resulting in an internal error. This issue has now been resolved.
DLPX-7 6406	The issue with NFS-based VDBs becoming unresponsive has now been resolved.
DLPX-7 6447	The issue with the V2P Functionality to customize target directory structure for exporting database files to separate file systems not working as documented has now been resolved.
DLPX-7 6613	The issue with the unnecessary accumulation of heap when validated sync is active for dSources using an environment user that eventually can cause out of memory issues has now been resolved.
DLPX-7 6690	The issue with the removal of extraneous Oracle data files while creating snapshots has now been resolved. The extraneous Oracle data files are now removed during the provisioning operation.
DLPX-7 6692	For V2P operation, we now use the unbuffered copy method for better performance.
DLPX-7 6718	The issue with the creation of the extraneous Self-Service branch segments during the replication operation has now been resolved.
DLPX-7 6760	Environment clusters will now show faults from their child nodes.

Bug number	Description
DLPX-76802	Previously, the engines that are in the DEFERRED upgrade state were resulting in the "Large Receive Offload" option turned off which was leading to performance degradation in network transfers. This issue has now been resolved. Upgrading the engines that are in the DEFERRED state will also resolve the issue. Screen reader support is now enabled.
DLPX-76891	CRON expression labels now ask for Quartz format on the user interface.

3.2.99 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-76619	The NFS reliance on DNS to prevent VDB unresponsiveness related to DNS unreliability is now reduced.
DLPX-76203	The NFS latency for engines with many Oracle dNFS clients is now improved.
DLPX-76119	The issue with the Delphix Engine crashing or becoming unresponsive when canceling a replication job has now been resolved.
DLPX-76991	Optimized in-memory cache eviction by making minor improvements to I/O performance.

3.2.100 Release 6.0.9.0 changes

3.2.101 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-28435	MS SQL instances PatchLevel will be displayed in preference to the version on the UI.
DLPX-40005	Improved the error message that is displayed when a JDBC connection cannot be established or the Oracle database Instance is unavailable.
DLPX-48080	Oracle Home Check may generate spurious faults if Oracle Home entry does not exist in /etc/oratab.
DLPX-55951	Attempting to provision a plugin-based VDB onto an incompatible OS (Windows to Linux or vice versa) is possible in the UI, and would fail with a crash requiring a restart. Now an informative error message is shown after the attempt is made.
DLPX-59613	Fixed creation of retention policies workers on replica objects after failover.
DLPX-64307	Environment refresh should ignore cluster discovery for Oracle VDBs.
DLPX-66191	Fixed the side-effects of the native Windows "Recent Files" behavior, when large numbers of PowerShell operations are being run concurrently.
DLPX-67537	Domain administrators can now create, view, and edit the alert profiles of other domain users.
DLPX-69605	Poor error message when selecting Timeflow range.
DLPX-70502	On detaching a dSource, delete backup server entry from engine metadata and related ones if the backup server is unused.

Bug number	Description
DLPX-7 1002	In case we have null values coming for recovery_model from msdb.dbo.backupset table, the user will see a generic exception for manual sync and a fault for validated sync.
DLPX-7 1908	Users will now see a warning when they remove any object from the replication specification list.
DLPX-7 2012	Prevents the same IP address from being configured on more than one network interface.
DLPX-7 2411	Environment names for Windows and Oracle Clusters are once again editable by users.
DLPX-7 2609	When we do MSSQL standalone environment discovery, the user will see a warning for databases attached to AG that are present and will not be discovered unless cluster environment discovery is selected.
DLPX-7 2695	Improved Oracle SnapSync performance by eliminating unnecessary calls to getTotalHoleBlocks.
DLPX-7 3409	Duplicate listener entry gets generated in engine metadata if Oracle listener is manually started with a non-uppercase name.
DLPX-7 3586	Fixed a display error of some snapshot names in the command line interface which showed references instead of actual names.
DLPX-7 3720	Provisioning an Oracle vPDB fails with "ORA-65149: PDB name conflicts with existing service name in the CDB or the PDB" if the PDB and CDB names are the same.
DLPX-7 4050	Environment names for Windows and Oracle Clusters are once again editable by users.
DLPX-7 4078	The Target Directory path is combined with other directories such as Data Directory, Archive Directory, Temp Directory, etc to build the full path for data files, archive logs, temp files, etc. As long as the combined paths are valid the V2P job proceeds.
DLPX-7 4197	Fixes a misleading warning about insufficient space on a replication target.

Bug number	Description
DLPX-7 4201	Snapshots created as a result of refresh or rewind operations will now be labeled as just "Snapshot" to avoid confusion. Users are advised to look at the Timeflow markers to know when the Timeflow operation was performed.
DLPX-7 4367	Delphix Engine repeatedly reports "Failed to parse logfile".
DLPX-7 4377	Improved diagnostics information for the case when Delphix Engine fails to connect to the Windows host.
DLPX-7 4387	fix an issue that causes the management service to crash under heavy CPU load.
DLPX-7 4398	Added handling of dangling nodes during Windows cluster environment add and refresh operations.
DLPX-7 4486	Delphix OS users cannot provision 12.2 TDE vPDB due to directory permissions in the default wallet location.
DLPX-7 4495	Enabled more logging in Delphix connector logs for timeouts.
DLPX-7 4681	During RAC vPDB provision, Oracle 19.9 target CDB crashes with ORA-00600 [krccfl_chunk] when BCT is enabled.
DLPX-7 4806	Improved error message displayed when the storage device initialization fails unexpectedly.
DLPX-7 4860	Provisioning the 2nd generation VDB fails if the dSource has imported read-only transportable tablespaces fails.
DLPX-7 4975	Allow adding invalid or unreachable paths as a shared backup location for dSources.
DLPX-7 5026	Invalid JDBC connections are not purged from the connection pool when the home is changed.

Bug number	Description
DLPX-7 5134	Improved performance for the Environment Databases pages when there are a lot of databases.
DLPX-7 5363	Update exception description is seen when the SnapSync fails for ASE encrypted database.
DLPX-7 5401	local listener set to null if oracle.lsnr.protocol_registration_order is quoted.
DLPX-7 5506	Fix a bug that can cause Oracle RAC VDBs to fail with stale NFSv3 mounts if NFSv4 is also enabled.
DLPX-7 5532	Insufficient heap memory settings on AIX cause connector and SnapSync to hang or crash.
DLPX-7 5663	FIPS compliant algorithms will be used while merging the old and new toolkit directories during environment refresh.
DLPX-7 5716	Delphix may remove Oracle VDB temp tablespaces during Snapsync.
DLPX-7 5735	Fixed creation of retention policies workers on replica objects after failover.
DLPX-7 5834	Rearranged Syslog configuration dialog inputs to avoid confusion and have a more consistent user experience.
DLPX-7 5858	BEQ processes can hold on to file descriptors leading to hook scripts hanging after upgrading to 6.0.7.0.
DLPX-7 6018	Remove hardcoded 5-minute timeout for doDropPDBKeepDatafiles.sh.
DLPX-7 6140	TDE SnapSync should ignore WARNING plugin violations.

3.2.102 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-71980	Fix a bug that was causing the Delphix Engine storage pool to fail to import on boot under certain circumstances.

3.2.103 Release 6.0.8.1 changes

3.2.104 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-75804	Some Delphix operations may fail if mount and umount commands, on staging or target hosts, are setup to run as sudo and if sudo rules prohibit these commands from running with unrecognized options. The issue is fixed now after removing "-v" added in 6.0.8.0.

3.2.105 Release 6.0.8.0 changes

3.2.106 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-49694	Skip parsing of DBCC when code 0 is not present in the DBCC page output. In case the DBCC page has code 0 but not dbid, use bdbid (present in the buffer section).
DLPX-68764	VDB SnapShot does not progress if ASE database devices are not on Delphix storage, environment monitoring raises a fault. Subsequent VDB operations like enable, disable, start, stop, delete, snapshot, or refresh will fail.

Bug number	Description
DLPX-70793	Delphix Engine should not allow linking Oracle DB with null <code>db_unique_name</code> .
DLPX-71300	For newer ASE versions (>= 15.7 SP138 and 16.0 SP02 PL05 and ASE 16.0 SP03), do not run DBCC PAGE anymore, as it was an identifier for DBCC CHECKALLOC that is already not run.
DLPX-71471	Error message asking user to manually perform disable/enable operation or correctly rename the target database back will be displayed during Start VDB, if VDB does not exist.
DLPX-71687	Provide a mechanism to enable VDBs up to filesystem mount point.
DLPX-71875	Fixed a bug that results in a memory reservation not being represented correctly in the Delphix API.
DLPX-72046	Deletion of vPDB in a vCDB shows this warning, "Encountered an error while shutting down and cleaning up Oracle files."
DLPX-72209	Downloading a support bundle is not supported at the same time that an upload of an upgrade image has been initiated by the same Delphix user.
DLPX-72319	Fixed an issue where some error dialogs would freeze in Internet Explorer 11.
DLPX-72705	Connection timeout when deleting remote shipper script can cause a timeout in LogSync client.
DLPX-72757	ASE sync using Dump History fails for large dump history files.
DLPX-72780	Timezone is set incorrectly for snapshots of Solaris 10 dSources and VDBs.
DLPX-72904	Storage capacity now includes usage from all file system objects, not just snapshots.
DLPX-73143	Fixed an issue where the support bundle dialog showed a loading spinner intermittently while jobs were running.

Bug number	Description
DLPX-73354	Traverse all shared backup locations while syncing, even if some of the paths are invalid or not reachable.
DLPX-73489	Fixed bug where adding or editing a parameter using the UI VDB Config Template "Text" tab was truncating the parameter's value.
DLPX-73602	Incorrect mount options used when a single instance RAC is linked as a standalone single instance.
DLPX-73607	Added paging for days with large numbers of snapshots to prevent slowdown.
DLPX-73623	Fixed an out-of-memory condition that occurs in SSH tunneling for encrypted log-syncs when storage latencies are high.
DLPX-73627	The help text on upgrade replication warnings have been updated to avoid confusion between Ignored and Resolved.
DLPX-73668	Fixed Missing security headers.
DLPX-73669	Cross-site request forgery (CSRF) issue in management UI.
DLPX-73727	Fixed an issue where the faults table was unable to navigate to other pages.
DLPX-73797	Fixed VDB refresh failures due to SQL Server Error 924 after setting VDB to single user mode.
DLPX-74025	Implemented logic to retry offline database along with a drop database to overcome deadlocks while off-lining or dropping the database.
DLPX-74029	VMware Hot-Add memory is not immediately reflected in the system API.
DLPX-74057	Fixed a typo in "Download Support Bundle" UI component where the word "suport" was missing a "p".

Bug number	Description
DLPX-74254	Ownership of files inside VDB now matches new owner when VDB owner is changed.
DLPX-74298	Fixed an issue where the user could not upload a keystore with a blank keystore passcode.
DLPX-74362	Fixes an issue with namespace deletion when the replication receive jobs have been cleaned up.
DLPX-74442	VDB Enable with attemptStart=false will now mount the datasets so that VDB can be started.
DLPX-74457	Cluster discovery for Oracle RAC clusters are partially failing on Solaris 10.
DLPX-74529	Fixed a bug so that an upgrade completes even when jobs fail.
DLPX-74542	Fixed a bug so that upgrade completion is properly handled after kernel upgrades.
DLPX-74645	Delphix Engine uses the uptime command to keep track of a target host reboot and auto start VDBs on the host. In some cases, the output of this command is not what is expected and causes unintended restart of a stopped VDB. This issue is now fixed.
DLPX-74656	Oracle errors during doCreateSPFile.sh are not captured.
DLPX-74704	Fixed a bug where the Dataset scroll does not extend to the bottom of a dataset list, thus truncating the status of the last dataset in the expanded group.
DLPX-74883	Prevent support bundle collection from cancelling replication.
DLPX-74911	Talaria TCP fallback fault may be misconstrued if an Oracle RAC node is down.

Bug number	Description
DLPX-74997	Prevent granting replicated roles to users.
DLPX-75083	Post upgrade cleanup task may become unresponsive while attempting a migration from 5.3.x to 6.0.x due to several threads stuck in WAITING state.
DLPX-75095	Provisioning an Oracle VDB fails if change-archivelog-mode.sh takes longer than 5 minutes.
DLPX-75134	Improved performance of the Environment Databases page under certain conditions.
DLPX-75188	Fixed "out of memory" issue when processing a large number of objects on the Target engine.
DLPX-75204	Addressed a performance issue on the Target engine when receiving large number of replicated objects.
DLPX-75208	Snapshot names are incorrectly redacted in the engine metadata dlpx_action table in support bundles.
DLPX-75416	Fixed a replication issue when there are sources with TLS enabled.

3.2.107 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-72065	Fixed a bug that can cause a Windows iSCSI initiator to fail connect to the Delphix Engine.
DLPX-72681	Console Delphix status screen shows a Python stack trace if the system is configured with a static IP address.

Bug number	Description
DLPX-73423	Console Delphix status screen shows a Python stack trace if the system has no default route.
DLPX-74216	Fixed an issue that causes management service failures in low memory situations.
DLPX-74622	Fixed a bug that can cause a replication job to fail with an internal error.
DLPX-75089	Fixed a bug that can cause NFSv3 clients to lose locks during upgrade verification.
DLPX-75524	Fixed a bug that can lead to Oracle data corruption when running VDBs on Oracle 19c with dNFS.

3.2.108 Release 6.0.7.0 changes

3.2.109 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-39006	LogSync failed with "Cannot read archived log due to failure of log shipping script".
DLPX-39245	Fixed a bug that caused the management service to become inaccessible if the storage pool ran out of space.
DLPX-59155	Provisioning a VDB or vPDB failed with unclear error message 'A database with the name "xxx" already exists'.
DLPX-60317	Fixed Out of Memory issue when replicating a large number of objects.

Bug number	Description
DLPX-60947	Replica VDBs will be updated when performing a point-in-time restore.
DLPX-62805	vPDB provision did not raise an error when a non-provisionable target point-in-time was provided.
DLPX-62969	Fixed Out of Memory issue when receiving large number of replicated objects.
DLPX-64600	Skipped connecting to ASE dSources during SnapSync policy runs as it is not applicable for them, hence prevent recurrent faults that the policy throws for connectivity issues.
DLPX-67363	Maximum identify provider authentication time age can be customized for single sign-on.
DLPX-67607	Fix to make Snapsync throw exception if manifest file is missing or of 0 bytes instead of internal error with null pointer exception.
DLPX-67767	Fixed a bug that caused the upgrade to hang, while waiting for running jobs to finish.
DLPX-70821	Allow the entity id for SAML single sign-on to be a URL for compatibility with Azure AD.
DLPX-71783	doRenameDatafiles cleanup of extra files fails due to file permissions mismatch.
DLPX-72010	Fixed an issue that prevents changing the default gateway using the network setup CLI.
DLPX-72075	Maximum SAML response time skew can be customized for single sign-on.
DLPX-72191	Oracle privilege discovery not performed for all homes if an invalid home exists.
DLPX-72351	When a user tries to change credentials for a dSource, validating the credentials before updating them. In case of invalid credentials, showing user an error message about it.

Bug number	Description
DLPX-7 2545	Initial ORA-65294 error not reported to user when vPDB provision fails due to compatible parameter mismatch.
DLPX-7 2652	Fix and issue that prevents use of the NFSv4 on some versions of SUSE Linux targets.
DLPX-7 2698	Patching Oracle 19C vCDB leads to ORA-25153 as described in 2285159.1.
DLPX-7 2807	Fixed issue with SQL Server 2014 dSources with filestreams where sync failed in merging filestream directories due to long path names.
DLPX-7 2882	Datasets hooks script editor properly displays multiline scripts instead of as one long line on non-Chrome browsers.
DLPX-7 2916	Empty string in SNMPv3 USM username creation no longer throws fatal error.
DLPX-7 3048	Non-sys user credentials for Oracle sources cannot use password vault.
DLPX-7 3108	Fix a bug that prevents the API from displaying the correct number of CPUs or amount of memory assigned to a Delphix Engine after a hot-add operation.
DLPX-7 3201	Fix an issue that prevents the configuration of additional NICs on Azure Delphix Engines.
DLPX-7 3202	Fix a bug that can cause a VDB to fail to mount while other VDBs are being stopped.
DLPX-7 3424	Fix a bug that prevents the sysadmin from deleting a default route.
DLPX-7 3527	SnapSync job fails with 'internal error during execution' due to ONS/FanManager errors.
DLPX-7 3528	Fixed a bug that prevented accessing SDD specs from CLI.

Bug number	Description
DLPX-73611	Kerberos ticket expiration date parsing is incorrect after migration from Illumos to Linux.
DLPX-73742	Provisioning an Oracle TDE-enabled vPDB fails with the error "ORA-28367: wallet does not exist" if the TDE wallet for the target linked CDB is stored on ASM storage.
DLPX-73765	Fix a file descriptor leak that causes the management service to crash over time.
DLPX-73789	Auxiliary CDB instance uses dSource keystore location if WALLET_ROOT is configured in dSource.
DLPX-74030	CDB database password may be leaked as part of environment monitor checks that launch sqlplus command on the source or target host.
DLPX-74043	Delphix OS user cannot provision TDE-enabled vPDB due to directory permissions in the default wallet location.
DLPX-74044	Delphix OS user cannot provision TDE-enabled vPDB in Delphix-writable keystore location due to directory permissions.
DLPX-74119	Drop database fails if default database is set to any other than master.
DLPX-74164	Sync fails with db.aselb.source.dump_history.incomplete_stripes after dump history file is purged and Use dump history is enabled for the dSource.
DLPX-74233	During failover of a namespace, if there is a collision between an environment in the namespace with one on the target engine, the namespace environment will get renamed if its host does not match that of the environment on the target.

3.2.110 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-73390	Improve replication receive throughput.
DLPX-73393	Improve write performance under extreme disk fragmentation.
DLPX-73280	Improve write performance under extreme disk fragmentation.

3.2.111 Release 6.0.6.1 changes

3.2.112 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-73848	Fixed an issue that can cause the management service to fail to start after upgrade on systems that have had SNMP enabled.
DLPX-73859	Fixed a file descriptor leak triggered by faults and alerts that can cause the management service to fail.

3.2.113 Release 6.0.6.0 changes

3.2.114 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-47065	VDB recovery failed when files other than archive logs were detected by Oracle.
DLPX-47493	Fixed the bug where VDB directory under the DelphixConnector directory was not being removed from the target host on MSSQL VDB deletion.
DLPX-48046	Added sorting parameter to network test APIs.
DLPX-61405	Replication may send more data than expected if masking involves dropping large DBF files.
DLPX-61525	The height of the storage configuration list was limited to show 3 disks at a time. It will now dynamically grow with the number of disks.
DLPX-63603	Increased connector timeout from 10 minutes to 30 minutes to avoid unnecessary faults due to timeout during Validated Sync operation.
DLPX-67368	Delphix Engine hostname change is now immediately reflected in Splunk events.
DLPX-67593	Fixed an issue that caused the management service to remain offline following an out-of-space condition.
DLPX-68531	Introduced better handling of UniversalConnectionPoolException errors during SnapSync.
DLPX-69759	Oracle environment discovery failed due to an unhandled exception occurring at insert into dlp_x_faults.
DLPX-69852	Fixed a bug that caused network configuration problems when removing and adding additional NICs.

Bug number	Description
DLPX-70426	Redaction of usernames took forever on tables with millions of entries.
DLPX-70583	move-to-asm.sh fails if timing is set in glogin.sql.
DLPX-70638	Removed Failed Actions section of Actions sidebar, in favor of manually dismissing from Running Actions and falling to Finished Actions section.
DLPX-70653	Removal of all instances in a RAC VDB should not be allowed.
DLPX-70808	Fixed issue related to the creation of empty DisableBroker.sql on the Windows machine in case DisableBroker.sql execution fails in the first attempt.
DLPX-70896	Added more detailed error message for when the Delphix Engine fails to push a script to Windows host.
DLPX-70919	Fixed an issue that causes job progress to not update in Self-Service.
DLPX-70928	Fixed a bug that results in a Delphix Engine remaining powered on following a shutdown from the user interface.
DLPX-71093	For AG databases, a full backup is not required even recovery fork guid changed but the LSN chain didn't break because of transactional log backups.
DLPX-71097	Unable to ignore snl.bct.needed warnings if Block Change Tracking is legitimately disabled on an Oracle dSource.
DLPX-71153	Recovery of PDB should fail if the database is down after offlining datafiles.
DLPX-71370	While deleting initiator in Windows environment deletion operation, delete all the views as well for that initiator.
DLPX-71685	VDB is auto disabled if the hook fails.

Bug number	Description
DLPX-71865	Reduced the size of support bundles.
DLPX-71961	When a PDB is selected for replication, its CDB and all other PDBs in the parent CDB get automatically selected for replication. Going forward, in the above scenario, while the CDB will get selected, its other PDBs will no longer get selected.
DLPX-72031	Fixed VDB refresh operations failures due to 'DB STARTUP' background process spid greater than 50.
DLPX-72066	Migrate VDB verifies against the old configuration, rather than new.
DLPX-72083	Fix an issue that causes a fully-qualified hostname to be changed on upgrade from 5.3 to 6.0.
DLPX-72131	Added namespace support for HashiCorp password vaults.
DLPX-72265	doCreateTempfiles.sh.template exits with code 0 on failure.
DLPX-72340	Incomplete recovery not detected during provisioning.
DLPX-72386	Unlock Solaris x86 Solaris -> Linux x86 provisioning.
DLPX-72452	For clusters with long hostnames, vPDB sync fails with exception.oracle.accessor.instances.missing.
DLPX-72495	Fixed a bug that prevents the application from coming up after an upgrade
DLPX-72686	Delphix no longer logs environment variables in logs on connected hosts since this could leak sensitive information such as passwords that are sometimes stored as environment variables on database hosts such as for the ASE database.

Bug number	Description
DLPX-72730	Fixed a Snapsync performance issue.
DLPX-72790	SnapSync job fails with 'internal error during execution' due to ORA-01652.
DLPX-72862	The scenario which was causing the null pointer has been fixed now.
DLPX-73300	Validation of connection to a container for PDBs should allow connecting to CDB\$ROOT.
DLPX-73311	Added platform detection for ESX 7.0u1.
DLPX-73449	Replication of policies between two engines, in a loop, could lead to OOM exceptions.

3.2.115 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-72990	Addressed a minor CVSS 5.9 security issue with no known attack vectors.
DLPX-73067	Fix for CVE-2020-10753.
DLPX-73069	Fix for CVE-2020-12059.
DLPX-73070	Fix for CVE-2020-1760.

3.2.116 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-71924	Fixed a bug that causes support bundle collection to fail with an internal error.
DLPX-72918	Fixed a system crash that can happen when replicating a masked VDB using SDD.
DLPX-73147	Fixed a bug that can cause a replication source to crash if it had run replication while running on 5.0.

3.2.117 Release 6.0.5.0 changes

3.2.118 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-23360	The unistallation of the Delphix Connector installer should succeed even if one of the component connector services doesn't exist.
DLPX-69155	Reduced the time taken to generate support bundles in some cases.
DLPX-67316	Recreating a controlfile against an Oracle source may yield misleading error during snapshot.
DLPX-70766	JDBC driver updated to resolve intermittent JDBC connection failures due to JDBC SSL bug.
DLPX-70785	Options passed to VDB mounts on target AIX hosts did not include read and write size values. This fix adds the rsize and wsize parameters to mount command depending on the maximum values host is configured to support.

Bug number	Description
DLPX-7 0741	Enabling Validated Sync while SAP ASE SnapSync job is running leaves staging database unrecoverable.
DLPX-6 9865	Fixed a bug that causes a network interface to become unconfigured if its MAC address changes.
DLPX-7 1233	If LogSync is suspended when performing SnapSync of a standby database in real-time apply, SnapSync attempts to backup the archived logs which can cause SnapSync to become unresponsive.
DLPX-6 9800	UEM/Hostchecker directory ownership checks fail on HPUX environment with long usernames.
DLPX-6 9807	Provided mechanism for the user to bypass corrupted/incomplete jdbc libraries.
DLPX-6 6585	Bundle ID "fault.environment.configuration.file.owner" reports insufficient host address.
DLPX-6 5739	createDelphixDBUser.sh fails when "@" used in the password.
DLPX-7 0973	SAP ASE database provisioning fails if the source database has holes in log fragments.
DLPX-7 1532	Improved error handling for Oracle memory configuration errors.
DLPX-6 2987	Allowed assigning privileges over replicated objects through the UI.
DLPX-7 1593	TIMEFLOW_REPAIR incorrectly skips a log because of "wrong database".
DLPX-7 1751	Added NFSv4 support on AIX for Oracle and SAP ASE.

Bug number	Description
DLPX-7 1736	Dynamically disable RPC services if NFSv3 is no longer in use.
DLPX-7 1772	Network DSP Test between versions 5.3 and (6.0.3, 6.0.4) is fixed.
DLPX-7 1513	Replicate non-data objects like delphix engine users, authorizations, roles, permissions, policies and DB config templates.
DLPX-7 1305	Unable to load dummy recovery database dump due to SAP ASE error 15728.
DLPX-7 1172	Enabling SAP ASE dump history causes IllegalStateException in getDumpListFromLastRestoreDateAndFiles due to timestamp mismatch because of TZ.
DLPX-7 1178	SAP ASE internal error raised when dump history file is purged using sp_dump_history.
DLPX-6 5101	Fixed a race condition between a DB_DELETE job and the Oracle retention policy worker for the same container that can lead to a deadlock between the job and the worker.
DLPX-7 1918	Fixed an issue that causes the Delphix Engine UUID to change upon rebooting in IBM Cloud.
DLPX-7 1141	Fixed an issue where upgrading an Oracle dSource or changing the environment user in a linked Oracle dSource fails with the error "SOURCE_UPGRADE job for xxx failed due to an internal error during execution."
DLPX-7 1611	Updated UI time zone library to IANA 2020a.
DLPX-7 0349	Fixed a memory leak during incremental replication.
DLPX-7 2038	Fixed an issue that prevents 5.3.x - 6.0.x upgrade if a static route exists that goes over a DHCP interface.

Bug number	Description
DLPX-7 2148	Fixed a bug of always order hooks alphabetically rather than the running order set by users.
DLPX-7 1971	Allowed Enable/Disable of VDB if its current Timeflow has at least one snapshot.
DLPX-7 2115	Changed the Time Point field on a VDB back to reflecting the point on the parent the VDB was created from, but displayed in the timezone of the parent.
DLPX-7 1995	6.0.4.0 can no longer interact with 5.3.x remote Masking Engines.

3.2.119 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-7 0675	Fixed a bug that causes the system to become unresponsive after expanding multiple storage devices.

3.2.120 Release 6.0.4.2 changes

3.2.121 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-7 2155	Fixed an issue that can render a Delphix Engine unbootable if a reboot occurs after upgrade verification but before the upgrade is applied.

Bug number	Description
DLPX-71141	Fixed an issue where upgrading an Oracle dSource or changing the environment user in a linked Oracle dSource fails with the error "SOURCE_UPGRADE job for xxx failed due to an internal error during execution."

3.2.122 Release 6.0.4.1 changes

3.2.123 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-71930	Fix a bug that causes feature flags to be disabled when upgrading to 6.0.4.0.

3.2.124 Release 6.0.4.0 changes

3.2.125 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-68173	Resolved an issue where temporary database backup/device files created for cleaning up the target database were not being deleted.
DLPX-68773	The management stack runs out of memory as the environment monitor does not purge stale objects.
DLPX-69573	Allow linking an Oracle PDB with a lowercase name.

Bug number	Description
DLPX-69634	Allow provisioning an Oracle PDB with a lowercase name.
DLPX-69962	After detaching a PDB, perform unplug/plugin, and attach again, if disabled is performed before SnapSync, the PDB can no longer be enabled.
DLPX-66045	Prevent Self-Service Container branches getting into an unusable state by blocking deleting the last segment of branches.
DLPX-7037	Snapsync performs an unnecessary checkpoint.
DLPX-68277	Users will see the detailed error message upon connection failure to Delphix connector during OS user validation and there will also be a "More" button with an error message which will open an error popup with all error details.
DLPX-70288	On the "Add Environment" screen when OS user validation will get fail, they will see the "More" button along with the error message. When the user clicks the button, an error popup opens with all details of the error and suggested action.
DLPX-70832	NFSv4 support for appdata sources running on AIX.
DLPX-68495	Fixed GUI reporting conflict information when creating a Retention Policy.
DLPX-70788	Added Environment User field for MSSQL sources in Datasets -> Configuration -> Source tab -> Staging Environment section.
DLPX-58047	Fixed bug where the sort sequence was incorrect. Fixed in Hook Operation Templates.
DLPX-67931	Provision against VPDB after create/drop a new tablespace failed with exception.oracle.targetscripts.rename.datafiles.
DLPX-59910	Comps.xml associated with Oracle Homes are marked as unparseable if they are longer than 65535 characters.

Bug number	Description
DLPX-55476	CLI provisioning fails when the mount point provided includes quotes around the path.
DLPX-71168	Changed type to text and spaced "Secret Key" and "Username Key".
ORB-3285	Support using <code>api.delphix.com</code> as a proxy for verifying the Cloud Agent binary's code signature certificate.
DLPX-71006	Allow provisioning across patch versions for Oracle versions on or after 18.X.
DLPX-71334	Migrate NTP configuration when upgrading between 5.3 and 6.0.
ORB-3286	Communication with Central management servers is now routed through the web proxy when one is configured for the Engine.
ORB-3117	Summary: Increase an action's failure message size to 256 characters so users can view large failure messages.

3.2.126 Release 6.0.3.1 changes

3.2.127 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-71339	Fixed an issue that can cause the Virtualization Management service to become inaccessible when the system memory became highly fragmented.

3.2.128 Release 6.0.3.0 changes

3.2.129 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-63192	More details will be displayed in the error message in case DB_SYNC fail due to missing SELECT permission on database 'msdb'.
DLPX-67708	Removed unnecessary Source Continuity source-archive file system.
DLPX-66878	A meaningful error message will be displayed in case the user is missing 'VIEW ANY DEFINITION' and 'VIEW SERVER STATE' permissions on AG Instance and linking is performed.
DLPX-68668	Fixed the issue when Environment discovery fails with Internal Error when Oracle DB instance name is > 15 characters.
DLPX-68539	Added support for Read-Only Oracle homes.
DLPX-62027	Fixed a bug that causes factory reset to fail when there are provisioned VDBs.
DLPX-67830	Eliminated a virtualization management service crash caused by egregious use of memory by environment monitoring.
DLPX-69067	Enabled NFSv4 support for older RedHat NFS clients.
DLPX-68491	Fixed an issue when SCAN Listener is not discovered for Oracle 19c Cluster Environment.
DLPX-68931	Improved replication throughput by parallelizing data streams.

DLPX-69350	Fixed an issue where in some cases a VDB's Time Point would not appear.
DLPX-62602	Prevented a full snapsync after detecting an incarnation change of and reverting to a previous incarnation of an Oracle database.
DLPX-69579	Resolved the issue of intermittent failure of DB_SYNC for source database full backups containing in-memory tables which were caused due to improper merging of filestream folders.
DLPX-69104	Fixed an issue when Environment Monitor task monitors replicated entities could lead to Out of Memory.
DLPX-58561	Increased online Redo Log size when using VDB Provisioning defaults from 50mb to 1024mb.
DLPX-68831	Storage is removed even when the drop database fails, causing ASE error 823.
DLPX-68323	Linking will not fail in case a slash is used as the path delimiter on the source database.
DLPX-69561	Allowed NoLogging Diagnosis to be shown and edited for Oracle CDBs.
DLPX-69625	Fixed an issue that causes the CLI to hang when deleting an object.
DLPX-65357	Source Environment selection in Attach dSource dialog is now alphabetically sorted.
DLPX-65215	Fixed an issue where Hotfixes aren't listed until after management service restarts.
DLPX-57988	The increased timeout of doShutdownOracleInstance.sh script from 20 seconds to 10 minutes.
DLPX-70018	Resolved the issue where during validated sync, fault "fault.mssql.source.next.backup.missing" was caused due to backupsets with similar first and last lsn.
DLPX-66671	dSource selection in dSource Linking Wizard is now alphabetically sorted.

DLPX-65723	MSSQL server cluster address is now editable through the Environments GUI.
DLPX-69514	Gracefully handle accelerated networking on Azure.
DLPX-68942	Implemented retries with some time delay in case of a failure while switching database user mode.
DLPX-56626	Some orcl_log_info entries have a very large and incorrect end_scn (281474976710655).
DLPX-67579	Deleted users' actions should be included in the action/audit log API results.
DLPX-69863	Enhanced instruction text relating to SSH when editing environment users.
DLPX-70081	Removed excessive debug logging for DSP connections which results in fast rollover of debug logs.
DLPX-66203	CLI / API calls to refresh/rewind vCDB directly should be disallowed.
DLPX-67194	RHEL 7.6 connector log shows Unidentifiable version string: RedHatEnterpriseServer 7.6.
DLPX-66754	When VDB is disabled, environment configuration can now be edited in the UI.
DLPX-62095	A wrong certificate is identified as an issuer of a self-signed certificate in rare cases.
DLPX-69243	Do not require an issuer to be present or keep the full chain intact on Truststore operations.
DLPX-59331	Permit non-CA certs in user Truststore.
DLPX-60779	Changed error message when there are no compatible installations on provisioning.

DLPX-69518	Provisioning failures due to BitLocker encryption will be identified and a proper error message will be displayed.
DLPX-64797	Fixing memory leak in hk2 library.
DLPX-70039	Password vault migration nullifies ASE linked source dump credentials.
DLPX-70089	Protection against a variant of billion laughs attack (XML entity expansion).
DLPX-64207	Added API support to revert from static to DHCP DNS settings.
DLPX-68857	Faults reported for Oracle Home missing where the Central Inventory does not show this Oracle Home present.
DLPX-64435	Exclusively specifying 'required' parameters to discover Oracle cluster via CLI results in an exception.
DLPX-69604	Alerts & Faults are reported for hosts in a namespace that can cause Out of Memory issue.
DLPX-39882	Prevented cloning of Tiimeflow storage for Oracle source continuity.
DLPX-67425	Resolved an issue when validated sync (with full/diff) restored multiple backupsets and a restore failed with a SQL server transient issue after a source continuity reset event resulting in a state where no operations could be performed on the dSource.
DLPX-70433	"DLPX_EXECUTE_SQL_CLEANUP_RETRY" will also print nested SQL error messages in case of command failure.
DLPX-68582	Customers now have access to an API to display the Engine License information.
DLPX-61335	Displayed in confirmation dialog the name of the user being deleted.
DLPX-70639	Resolved output buffer issue while identifying BitLocker encryption during provisioning on Win19.

DLPX-66259	Updated messages on the upgrade page when the operation fails.
DLPX-70782	Bumped up connector version for NET 4x installer as shipped OpenJDK version had been upgraded.

3.2.130 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-68995	Improved performance of dataset deletion.
DLPX-68997 DLPX-68999	Improved single connection replication throughput.
DLPX-70697 DLPX-70703	Addressed an issue that causes long periods of I/O unresponsiveness.
DLPX-69953	Fixed a bug that can cause a Windows iSCSI initiator to fail to connect to the Delphix Engine.
DLPX-70512	Fix a hang in the I/O subsystem that can cause the Delphix Engine to become unresponsive.

3.2.131 Release 6.0.2.1 changes

3.2.132 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-70065	Provisioning a VDB from a dSource or another VDB will fail if the following conditions are met: <ul style="list-style-type: none"> • Delphix Engine has at least one dSource and a VDB created using a Python plugin prior to the upgrade • Delphix Engine was upgraded to 6.0.2 • Provisioning was attempted from the UI after the completion of the upgrade
DLPX-69350	Fixed an issue that the time point attribute of a VDB is not shown.

3.2.133 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-69864	Fixed an issue that causes MSSQL operations to hang after the reception of an iSCSI LUN reset.

3.2.134 Release 6.0.2.0 changes

3.2.135 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-62806	Fixed an issue where provision against PDB after unplug/replug against the same linked PDB fails with exception.oracle.targetscripts.controlfile.create.
DLPX-67567	Oracle Source Continuity creates an unnecessary source-archive file system on zfs.
DLPX-27807	LogSync may fall behind when connected to an Oracle physical standby database in Real-Time Apply mode.
DLPX-68385	Customer provided Oracle Java missing in the search path for Java on hosts.
DLPX-62782	Reducing the number of nodes for RAC VDB and VDB in NOARCHIVELOG mode may result in ORA-00258 errors during VDB enable operation.
DLPX-62738	Better error message when plugins are uploaded out of sequence.
DLPX-68722	The product now recognizes VMware with BIOS date of 12/12/2018 as VMware 6.7.0u2.
DLPX-68579	SnapSync of Oracle 19c DB with encrypted tablespace fails with fatal exception "Block header 91 is not empty".
DLPX-68689	Fixed the issue where a huge number of error messages from ASE caused OutOfMemory Error.
DLPX-68957	Always On AG discovery will not fail in a multi-subnet environment.
DLPX-63088	Can now recover multiple Self-Service containers at the same time.

Bug number	Description
DLPX-47977	Improved handling of snapshot standby.
DLPX-64125	SnapSync failed with exception.oracle.dsource.sync.no_hosts.rac on RAC clusters with very long hostnames.
DLPX-62584	PDB enable failed after migration if mountBase has a trailing slash.
DLPX-68657	Virtualization can now fetch jobs from Masking engines configured with HTTP redirection.
DLPX-69121	It is no longer mandatory to have at least one enabled system administrator with local credentials.
DLPX-68167	Fixed an issue where too many requests were being sent for Faults from the Datasets pages.
DLPX-69082	Large stderr produced by failed rsync jobs are truncated to prevent Java OutOfMemory errors.
DLPX-58600	Datasets filter updated so that all items within a group that matches the filter string are displayed, even if the items contained in the group do not match the filter string.
DLPX-65896	VDB deletion failed due to the inability to delete LogSync worker.
DLPX-57903	Improved diagnosability of PDB discovery issues.
DLPX-68878	Fixed issue where start/stop buttons were not being displayed in the RAC instances configuration table.
DLPX-69271	Enabled replication smart failover by default.
DLPX-66715	The user-visible name for Oracle cluster objects is being replaced with the Oracle cluster name. For Windows clusters, the user-visible name is being replaced with the cluster address.

Bug number	Description
DLPX-68929	Changed default replication settings for better out of the box performance.
DLPX-68930	Improved replication throughput when sending multiple timeflows.
DLPX-69245	Fixed a memory leak that occurs when experiencing connectivity errors.
DLPX-69377	At least one non LDAP system user should be enabled when the LDAP server is being disabled.
DLPX-68575	LDAP principal fields were not being redacted in phone-home bundles.
DLPX-68528	Self Service Recover operation failed due to missing Timeflow.

3.2.136 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-66808	Re-introduced console splash screen with IP address and service states.

3.2.137 Release 6.0.1.1 changes

3.2.138 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-69203	Improved synchronous write performance over iSCSI.
DLPX-69167	Improved SQL Server data ingestion performance by leveraging asynchronous writes on underlying storage.
DLPX-69298	Eliminated possible data corruption on SQL server and vFiles over iSCSI that can occur when a Delphix Engine reboots.

3.2.139 Release 6.0.1.0 changes

3.2.140 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-60689	For SAP ASE, instead of using the DBCC CHECKALLOC command to fix DBID mismatch issue, the MOUNT command with FIXDBID and ALLOW_DBID_MISMATCH clauses will be used, to improve performance.
DLPX-65831	VDB snapshots need to clean unneeded ZFS datafiles.
DLPX-63949	Improved boot time after 5.3 to 6.0 migration by optimizing metadata indexing.
DLPX-66261	Upgrades to 6.0.0.0 will only be supported from a release greater than or equal to 5.3.6.0.

Bug number	Description
DLPX-66486	Snapshot of a linked database can end up with extra datafiles that do not belong to the database which might cause VDB on VDB provision to fail during rename of datafiles.
DLPX-66558	Cluster environment discovery was incomplete if the host locale was not English.
DLPX-66804	DB_LINK using incorrect user when RAC node also configured as a standalone environment.
DLPX-66768	vPDB save state lead to rollback or child provisioning failures.
DLPX-66823	Unable to link database with CL8MSWIN1251 charset.
DLPX-64538	Fixed a bug causing the timezone selector to only be visible when manually setting the time.
DLPX-66809	Removed the Windows Diagnostics Files and Directories on successful Diagnostics upload.
DLPX-67279	Provision failed when the source was from a RAC Oracle Standard Edition database and the target was Oracle Standard Edition.
DLPX-67451	Fixed an issue that sporadically caused replication to fail with an internal error.
DLPX-67454	Delphix Engine should select the highest version ojdbc driver available at ORACLE_HOME/odbc/lib.
DLPX-66077	Ensures child worker threads are gracefully exited when parent linked source sync job has completed/terminated.
DLPX-45983	MSSQL Validated sync will resume when storage usage falls below the threshold if storage threshold enforcement failed in the past.
DLPX-67560	Fixed an issue where MT provision may result in ORA-02058 due to un-purged or inflight 2PC transactions on dSource.

Bug number	Description
DLPX-67594	Old timeflows and snapshots are not getting removed by snapshot retention.
LX-2020	Report the correct amount of memory allocated to EC2 Nitro instances.
DLPX-67413	Fixed an issue where VDB point in time provisioning might fail if Oracle database environment is configured in a non-English locale.
DLPX-67684	PDB provisioning failed if the source had shutdown triggers.
DLPX-67575	Fixed failure during point in time 'Virtual to Physical' provisioning.
DLPX-67668	After setting the database online give it some extra time to startup completely, before doing any further operation on it.
DLPX-67759	Redact sensitive information from phone-home data.
DLPX-64638	Validated sync stops working if Delphix cannot connect to the backup server.
DLPX-65559	Even when the staging instance is down, attempt counter to detect backup files keeps on increasing and eventually, it stops detecting backups.
DLPX-56537	When a target host is used by a large number of dSources for staging or has a large number of objects, the performance of Delphix operations like validated sync, refresh, rewind, etc can be slow due to Powershell processes being serialized.
DLPX-67894	Removing cluster resource without removing its dependency can result in cluster failure. So, added retryer logic while fetching the resource dependencies (Get-ClusterResourceDependency) and ultimately fail the operation after all the retries.
DLPX-67813	Unsupported SQL server backup type gets picked while validated sync and the operation fails while looking for the backup. So, introduced a tunable filter to automatically skip SQL backups taken by backup software not supported by yet Delphix.

Bug number	Description
DLPX-67925	Added env host connectivity toolkit support for SLES on Power9.
DLPX-67934	Retries to fetch image identifiers during Netbackup restore if there is a mismatch between MSDB and Netbackup Master.
DLPX-67655	Fixed an issue where retention enforcement can generate user-visible errors while attempting to delete snapshots with dependencies after PDB migration to new CDB.
LX-1944	EBS NVMe devices can now be used in Delphix Engines.
DLPX-68022	Fixed an issue where hostchecker 'Check Oracle DB Instance' fails on HPUX and AIX.
DLPX-68124	PDBs with lower/mixed case names will not enable after an upgrade.
DLPX-68126	Fixed a bug that limits the number of disks that can be added in GCP.
DLPX-67421	Update the primary db file names in a transaction with the Timeflow creation to make sure whenever a Timeflow is created successfully we have its primary file information.
DLPX-67440	Skip VDBs having its current Timeflow as null from 'PrimaryDbFileAvailabilityCheck' as these VDBs doesn't undergo quiescing and are recoverable by refreshing them.
DLPX-61818	Linking wizard - Target Environment step - Privileged Credentials authenticates on the selected target now.
DLPX-68117	Some non-Admin users, lack all permissions, are unable to login to upgraded engine.
DLPX-67290	A wrong version input by user while manually adding a SQL Server instance, created issues in provisioning VDBs. SQL Server version will now be auto-discovered for manually added instances on adding or refreshing the environment.

Bug number	Description
DLPX-66238	Updated error message to let know user that non discovered CDBs are filtered out from the list when linking a detached source.
DLPX-68457	When a target host is used by a large number of dSources for staging or has a large number of objects, the performance of Delphix operations like validated sync, refresh, rewind, etc can be slow due to Powershell processes being serialized.
DLPX-68484	Fixed the issue where 'lstart' column value of sysusages table was beyond the range of Integer data type by taking the Long data type to store the lstart value.
DLPX-68500	Fixed an issue where the NTP service is not started following a reboot.
DLPX-68290	Support bundle generation can be time-consuming if the engine has a large number of snapshots to process.
DLPX-67792	Fixed issue in grids in which the selection checkbox was unclickable.
DLPX-67555	Provision vPDB/vCDB fails with ORA-45900 if the parameter enable_pluggable_database is omitted when specifying database parameters for new vCDB.

3.2.141 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-67782	Engines running 5.3 on EC2 i3 can now be migrated to 6.0.
DLPX-67961	Fixed an issue that prevents ssh access after switching to a static IP address.
DLPX-65948	Fixed a bug that could cause replication jobs to fail with internal errors

Bug number	Description
DLPX-68025	Improved boot time after 5.3 to 6.0 upgrade by reducing the overhead of setting ZFS properties.
DLPX-67868	Fixed a bug that can cause the management service to run out of memory when disabling the Splunk integration.

3.2.142 Release 6.0.0.0 changes

3.2.143 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-27433	The analytics GUI network graph shows newly added NIC information without requiring a management service restart.
DLPX-33998	If you add a hook script via the CLI, newlines are removed erroneously.
DLPX-40094	Correctly set the default type for the parameters to all operations in the CLI according to the container type.
DLPX-43215	Exclude sybsecurity from the list of auto-discovered databases.
DLPX-48712	Java 6 packages are no longer included in the product image.
DLPX-48280	When a user is set with the Provisioner role the 'provision' button does not appear, meaning anyone set with this role only is unable to provision VDBs.
DLPX-53996	The Delphix Engine does not provide instructions to browsers to avoid caching HTTP responses (pages).

Bug number	Description
DLPX-54740	Ensure Windows mount points are always unmounted as part VDB refreshes to prevent future VDB refreshes from failing due to "ERROR_ASSIGN_MOUNTPATH: failed to assign mount path for disk at="">>, error="">>
DLPX-55282	In environments where the vPDB has been provisioned using a Delphix provisioned virtual CDB, shutting down the virtual PDB causes it to get into an incorrect "Cannot monitor" state, this has now been fixed to show the correct "Stopped" state.
DLPX-55598	Fixed an issue where vPDB refresh/rollback triggers spurious vCDB restart jobs, after vPDB+vCDB auto-restart.
DLPX-55829	Validated Sync can fail when monitoring ASE backup servers started by using the \$DSLISEN environment variable instead of the "-S" argument. This can be worked around by accessing \$DSLISEN in the RUN_xxxxx script and pass it down as -S.
DLPX-55958	VDBs with no snapshots failed to re-enable after a Delphix Engine upgrade, this has now been fixed.
DLPX-57454	Display underlying ssh error when environment host connections fail.
DLPX-58519	Enable Oracle LiveSource when LiveSource is in RESYNC_NEEDED state currently re-start Oracle Redo Apply. Oracle Redo Apply should not be restarted in this state.
DLPX-58760	Fixed a TCP port leak in the network throughput test feature.
DLPX-58845	Provisioning vFiles to the same host using different OS Environment Users no longer fails.
DLPX-59772	The API to list all snapshots consumes a significant amount of memory when there are more than 100,000 snapshots on the engine.
DLPX-60356	Fixed an issue where Oracle remote listener registration fails if set to empty string.
DLPX-60603	Network settings dialog now displays actual MTU value rather than a checkbox.

Bug number	Description
DLPX-60907	Fixed an issue where the Environment Monitor on Redhat 6.9 and 6.10 might throw unidentified version errors.
DLPX-60979	When user configures connection strings manually, these connect strings can end up connecting to incorrect PDBs/CDBs causing invalid snapshots. Verify that each connection to a PDB/CDB connects to the expected PDB/CDB.
DLPX-60993	Delphix backups create controlfile records; in rare circumstances, these records can cause invalid snapshots. To avoid this problem, remove Delphix backups control file records when using SCN-based SnapSyncs once a SnapSync completes successfully.
DLPX-62094	Allow certificates to expire after issuer certificate expiration.
DLPX-62241	Reduce SSH connections by temporarily preserving and reusing existing Delphix<->host connections where possible.
DLPX-62781	Spurious job event "DISCOVERED_TO_MANUAL_ORACLE_CLUSTER_NODES" no longer shows up for non-Oracle RAC environment refreshes.
DLPX-62892	In Oracle versions 18c and 19c, an Oracle bug can prevent the datafile headers from being updated for a standby database when managed recovery is running, resulting in failed SnapSync operations. Alert the user that an Oracle patch might be needed.
DLPX-62962	Removed unneeded EMPTY_RENEGOTIATION cipher
DLPX-62998	Fixed an issue where stale file mounts may be leftover when vPDB provision fails.
DLPX-63469	Initial setup now fails if the system was not provisioned with enough storage.
DLPX-63600	Network settings dialog now displays actual MTU value rather than a checkbox.
DLPX-64641	Fixed an issue where the last snapshot of a vPDB Timeflow can be deleted after the vPDB has been disabled, thus leaving the vPDB in a state with no provisionable snapshots.

Bug number	Description
DLPX-64711	Allow provisioning to complete when source CDB includes PDBs in a broken state.
DLPX-66020	Provision should remove files present in datafile filesystem that are not part of the database when provisioning a VDB from a VDB.
DLPX-67299	ASE environment discovery will not fail if there is a mismatch of "dataserver name argument" and value of "@@servername".

3.2.144 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-67753	Fixed an issue causing redirect responses to reveal server type and version when HTTP redirection is enabled.
DLPX-72068	Improved the way volumes are fetched while working on mounts.
DLPX-74396	Fixed an issue that occurred when manually adding a database to an environment which has the same unique name as a database in another environment managed by the same Delphix engine. Previously, Delphix reported an incorrect environment containing the same unique name.
DLPX-80172	Updated the Self-Service refresh warning message.
DLPX-80271	changeArchivelogMode now has an associated job event.
DLPX-80387	Fixed an issue where Oracle move-to-asm script would fail while dropping temp due to tempfiles being in use and unable to be dropped after the database was started.
DLPX-81184	For S3 object store, the "Base URL" input is renamed to "endpoint". The "region" input is now a dropdown for the user to select from a list of standard regions. The endpoint corresponding to that region will now be auto-populated.

Bug number	Description
DLPX-81692	Fixed an issue where Direct NFS was not being detected for Oracle 21.
DLPX-81996	Fixed an issue where an environment refresh after upgrade did not remove outdated/obsoleted toolkit components in 6.0.014.0 and 6.0.15.0.
DLPX-82075	Fixed an issue that prevented the creation of a network route whose gateway is reachable through multiple interfaces.
DLPX-82112	Added checks to prevent using NFSv4 with Direct NFS for some Oracle 19 versions that don't support v4 due to an Oracle bug.
DLPX-82236	Fixed an issue where Speculative Logging was being called out of context and could lead to unbounded consumption of rpool.
DLPX-82308	Fixed an issue where the provision/refresh of an Oracle Key Vault vPDB fails with, "ORA-28365: wallet is not open".
DLPX-82329	Action-based alerts now include the success or failure state of the action, including the reason in case of failure.
DLPX-82334	Enabled the creation of on-link network routes; routes whose destination are directly reachable without a gateway.
DLPX-82381	Improved Replication performance on engines with a lot of objects.
DLPX-82392	Fixed an issue where after editing credential environment variables, the create/provision VDB wizard would fail because the environment variables were missing the password field in the payload. The required password field has now been added.

3.2.145 Release 6.0.15.0 changes

3.2.146 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-80760	Increased the inotify limit to address a defect during upgrade.

3.2.147 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-68240	Fixed an issue where LogSync for an Oracle RAC standby does not set max number of backup tasks correctly.
DLPX-73375	Added granularity in restore job events to mark various phases of Restore Backup process. Added events in Restore Backup job to provide information at the start of the Redo phase of a restore command.
DLPX-75677	Fixed an issue causing auto population of the encryption key when no input is given.
DLPX-78913	Fixed a minor typing issue when deleting a MSSQL database.
DLPX-79228	Fixed a VDB Start Fault after a VDB start job is successful.
DLPX-79528	Made improvements in environment monitoring to return the NO_DELPHIX_DATABASE status for Staging Push dSources when they are not managed by Delphix, and avoids monitoring other attributes for such databases.

Bug number	Description
DLPX-79596	Made a change in the enable flow for Staging Push dSources to always make an attempt at unmounting the DATA storage before dropping the staging database.
DLPX-79780	Mount with local_lock=all on Linux, when mounting VDBs with NFSv3.
DLPX-79999	Use the offset in the time_zone column of msdb.dbo.backupset to convert the timestamp correctly for a backup from a source, and then continue using the staging host timezone to display the time of a snapshot on the UI.
DLPX-80206	Updated MD5 checksums for Oracle 12.1.0.2.0 OJDBC jars.
DLPX-80254	Fixed an issue where Oracle JDBC jar checksum checks are being reported as false positives despite underlying database connection issues.
DLPX-80406	The Spring framework has been updated due to the Spring4Shell vulnerability.
DLPX-80487	Fixed an issue where the Delphix UI would sometimes not render, showing waiting for response.
DLPX-80494	Added an action item to check for support Host and Server Type combination while adding MSSQL environments.
DLPX-80619	This change will introduce the ability to add sporadic failures via tunable: ADDITIONAL_SPORADIC_FAILURES.
DLPX-80909	Cross-Site Scripting (Reflected) in /resources/json/delphix/session.
DLPX-81048	Removed the requirement for Linux kernel recover-lost-locks setting when using NFSv4 with Oracle dNFS.
DLPX-81090	Can now enable/disable SNMPv3 vs. v1/v2.

Bug number	Description
DLPX-81100	Updated the command for checking database files accessibility while fetching the VDBs status with a lighter and less intrusive command, to get relief from VDBs being stopped randomly.
DLPX-81242	Fixed an issue preventing the upgrade of a replication Continuous Vault source with automatic replication.
DLPX-81308	Fixed an issue causing Appdata SnapSync to crash with NullPointerException when a virtual database is not successfully refreshed or rolled back.
DLPX-81358	Fixed the unnecessary alerts of timezone discovery failure that users were facing randomly for the cluster environments.
DLPX-81502	Improved performance of the Replication page.
DLPX-81696	Users should now be able to enable the feature flag AZURE_DATA_BANK.
DLPX-81710	Fixed an issue where an engine could not be setup when objectStorage is enabled.

3.2.148 Release 6.0.14.0 changes

3.2.149 Security fixes

Bug number	Bug introduced in	Description	Security Bulletin
DLPX-81059	5.2.2.0	Arbitrary Code Execution may be performed when configuring masking environments	TB098 ⁶⁹

⁶⁹ https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Technical_Bulletins/TB098_Arbitrary_Code_Execution_May_Be_Performed_When_Configuring_Masking_Environments

3.2.150 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-38908	Oracle LogSync should automatically resolve faults for transient issues
DLPX-39193	Null Pointer Exception in Oracle LogSync backup stream handler
DLPX-57078	Job cancel requests during Oracle provisioning are not processed until the end of recovery
DLPX-57405	move-to-asm.sh does not support TDE-enabled databases
DLPX-62343	disable the OPTIONS method for all HTTP(S) requests
DLPX-64386	Oracle LogSync thread may hang when trying to remove temporary RMAN command file from source host toolkit directory
DLPX-65413	Ensure "source-archive" directory is unmounted at start of Oracle Provision
DLPX-66879	Oracle LogSync can create orphaned logs in certain scenarios
DLPX-69453	Provide tunable for Oracle LogSync client timeout
DLPX-69802	Common Toolkit directory is not removed from a mounted shared NFS location when the environment is deleted
DLPX-76382	Force disable should succeed despite environmental problems

Bug number	Description
DLPX-77840	Fixed an issue on the Setup pane to allow successful completion of an smtp test against a specific email address
DLPX-78412	SCM/Talaria failure reason should be communicated in the Delphix fault warnings
DLPX-78726	Removing windows environment performs cleanup of iSCSI persistent login target
DLPX-78754	Disable operation is prohibited on replicated sources
DLPX-78986	Prevent DSP connections for disabled Oracle RAC cluster nodes
DLPX-79077	Resolved an issue of an infinite spinner when validating BEQ credentials for Oracle dSource with duplicate unique_name. While linking a dSource, credentials are now required when discovering an unknown CDB.
DLPX-79242	Splunk HEC token logged to debug logs during splunkHec test
DLPX-79396	Allow users to unset Oracle database user name and credentials through CLI if Simplified Connection Management is enabled.
DLPX-79502	SnapSync fails if more than 1000 tempfiles exist in the whole CDB
DLPX-79591	Changed the NFSv4 minimum supported target Redhat version to 6.4 (was previously 6.3).
DLPX-79742	Unable to provision PostgreSQL VDB to Linux host with processor type of ppc64le
DLPX-79823	Improved the action item for failure to enable/attach the staging push dSource.

Bug number	Description
DLPX-79942	Improved the action item for failure to enable/attach the staging push dSource.
DLPX-80137	Limit SNMP configuration access to sysadmin
DLPX-80144	Oracle SnapSync crashes with NullPointerException when a PDB dSource is renamed and replaced with a new PDB of the same name
DLPX-80217	Fixed issue with filename conflicts during source backup restore
DLPX-80302	It was necessary to restart the auxiliary CDB during a TDE provision after recreating the autologin keystore
DLPX-80369	Oracle environment monitor triggers fault.oracle.db.connection.failed fault immediately on dataset stop or disable.
DLPX-80415	Fixes long delay in operations such as VDB start/stop when JDBC Thin connection to database fails due to unable to establish network connection.
DLPX-80439	Provide mount location to upgrade scripts during Lua to Python upgrade process if mount specification has not been provided.
DLPX-80440	Fixed spinner issue while provisioning a VDB from a SQL Server staging dSource from Provision VDB option in datasets menu
DLPX-80482	TDE-enabled provisions to a RAC target fail with "ORA-28365: wallet is not open" while attempting to reopen the database in start_database.sh in the auxiliary
DLPX-80483	Fix failing TDE-enabled vPDB provisions to a linked RAC container database due to "ORA-28365: wallet is not open" errors
DLPX-80487	Improved performance across dataset and replication related pages.

3.2.151 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-80078	The issue with removing files with complex file permissions on EBS is now fixed

3.2.152 Release 6.0.13.1 changes

3.2.153 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-80818	libc upgrade necessitates PostgreSQL re-index.

3.2.154 Release 6.0.13.0 changes

3.2.155 Security fixes

Bug number	Bug introduced in	Description	Security Bulletin
DLPX-79789	5.3.0.0	Arbitrary Code Execution May Be Performed by Engine System Administrators.	TB096 ⁷⁰

⁷⁰ https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Technical_Bulletins/TB096_Arbitrary_Code_Execution_May_Be_Performed_by_Engine_System_Administrators

3.2.156 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-7868	The issue with the confusing vPDB error on a snapshot after resetlogs of a linked CDB is now fixed.
DLPX-41671	You can now update the Oracle cluster home through the user interface.
DLPX-43467	When dSource is an Oracle standby in RTA mode, LogSync was raising the fault.oracle.linkedsources.log.conflict error and getting disabled on its own. This issue is now fixed.
DLPX-50309	Users can now change logSyncInterval for Oracle dsources.
DLPX-59757	The count for masking jobs fetched from the Masking Engine is now configurable. By default, it is set to 500.
DLPX-67604	The manual recovery of a database after V2P from a snapshot of dSource was failing with an error. This issue is now fixed.
DLPX-68684	The self-signed certificate is now compliant with the requirements for trusted certificates in MacOS 10.15.
DLPX-74613	Oracle VDB migration check needs to be done against the Oracle target host instead of the source. Furthermore, the Error and Action plan provided should include the target hostname.
DLPX-75467	The CLI now returns correct and descriptive error messages when executing unauthorized requests on uninitialized engines.
DLPX-75646	To diagnose BEQ connection failure, this release adds MD5 checksums for ojdbc*.jar for Oracle release versions up to currently supported release version.
DLPX-75878	The issue with the JDBC connection string for an Oracle vPDB not getting updated after an IP address change is now fixed.

Bug number	Description
DLPX-75989	The issue with the failure of environment discovery of an Oracle Cluster with a NullPointerException error is now fixed.
DLPX-76956	Previously, the Oracle JDBC test connection with the wrong password was increasing the LCOUNT value by more than 1. This issue is now fixed.
DLPX-77140	This release now speeds up metadata that is sent during replication when Extended retention is involved.
DLPX-77231	Previously, when source discontinuity on the dSource was followed by resync on the livesource, one or more livesource workers were failing to start. This prevented livesource status from getting updated and the first snapshot from being taken after resync. This issue is now fixed.
DLPX-77600	This release fixes NPE when Linking dSource with missing backup and unreachable nodes.
DLPX-77880	This release improves scalability for engines with an extremely large number of snapshots that were causing them to run out of memory.
DLPX-78015	Previously, V2P export with absolute data files was failing with an internal error. This issue is now fixed.
DLPX-78174	Insecure DES is no longer supported for SNMPv3.
DLPX-78420	This release adds V2P support for Windows server 2022 host machines.
DLPX-78473	This release improves load times for Datasets and Dataset Performance pages for engines with a large number of datasets and containers.
DLPX-78488	Previously, when switching from the backup server to ASE, dump history was not working for dSources configured to use the remote backup server. This issue is now fixed.
DLPX-78594	This release fixes an issue with disabled VDBs not being able to undo a refresh.

Bug number	Description
DLPX-78688	TLS 1.0 and TLS 1.1 ciphers are no longer available. Any system that is only configured with TLS 1.0 or TLS 1.1 ciphers is switched to use the default cipher set.
DLPX-78693	Invalid sync parameters will not cause DE server unavailability.
DLPX-78696	Switching sync strategy from source sync strategy type to sourceless strategy type is not allowed.
DLPX-79126	VDBs can now be automatically started with the tunables if stopped intermittently because Windows fail to write on the mount (Msg 9001).
DLPX-79292	This release eases restrictions on taking a snapshot of PDBs with encrypted UNDO tablespaces.
DLPX-79344	Previously, Snapsync of a standby PDB in mount mode was failing with the <code>ORA-01109: database not open</code> error message. This issue is now fixed.
DLPX-79422	Previously, clicking on a Replication Profile was resulting in the following error message <code>An error happened while communicating with the server</code> . This issue is now fixed.
DLPX-79789	Under certain conditions, arbitrary code execution may be performed by sysadmins.
DLPX-79808	This release fixes failures if the VDB name is more than 68 characters.

3.2.157 Release 6.0.12.1 changes

3.2.158 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-79151	The issue with remote syslog configurations preventing engine upgrades or virtualization service restarts is now fixed.

3.2.159 Release 6.0.12.0 changes

3.2.160 Log4j updates

Based on detailed testing and analysis, all the currently supported products are not susceptible to known log4j vulnerabilities. Please refer to [TB095 Technical Bulletin](#)⁷¹ for more information. All instances of log4j in currently supported Delphix products are updated to **log4j 2.17.1** as of this release.

Delphix keeps you updated on the latest developments and keeps releasing hotfixes, procedures, and workarounds for such critical vulnerabilities. For more information on how Delphix supports our product and customers in such cases, see [Delphix Product Security](#) (see page 962)

For more information, refer to the following pages:

- [TB095 log4j vulnerabilities](#)⁷²
- [Uninstalling the delphix connector service from the target database servers](#) (see page 2166)
- [Delphix product lifecycle policies](#)⁷³
- [Product security](#) (see page 962)

⁷¹ [https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Technical_Bulletins/TB095_log4j_Vulnerabilities_\(CVE-2021-44228%2C_CVE-2021-45046%2C_CVE-2021-45105%2C_CVE-2019-17571%2C_CVE-2021-4104\)](https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Technical_Bulletins/TB095_log4j_Vulnerabilities_(CVE-2021-44228%2C_CVE-2021-45046%2C_CVE-2021-45105%2C_CVE-2019-17571%2C_CVE-2021-4104))

⁷³ [https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Support_Policies/Product_Lifecycle_Policies_\(KBA1003\)](https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Support_Policies/Product_Lifecycle_Policies_(KBA1003))

3.2.161 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-23068	Validation for target database parameter 'DB_FILES' for single-tenant databases for the following operations: provisioning, refresh, rewind, and converting a dSource to LiveSource is now added. Furthermore, specific error messages for handling ORA-00059 errors are added.
DLPX-44544	The issue with the SnapSync of an Oracle standby dSource in Real-Time Apply mode calculating the snapshot's timestamp incorrectly is now fixed. This issue was resulting in ORA-01194 or ORA-01152 errors when provisioning to a timestamp after the snapshot.
DLPX-56691	The issue with the data files of a VDB getting unmounted when provisioning, refresh, or rollback job is canceled manually is now fixed.
DLPX-57971	The issue with the latest snapshot of a LiveSource taking a long time to show the SCN/ timestamp range on its card in the GUI is now fixed.
DLPX-60320	UI now allows the selection of older dataset repositories (downgrade) in addition to selecting newer ones (upgrade).
DLPX-67069	The issue with the stopped Oracle VDB monitoring by the environment monitor that resulted in connection errors flooding the debug log is now fixed.
DLPX-68132	The issue with the "Copy query to clipboard" SQL copy functionality in the "Managed Source Data" is now fixed to have correct apostrophe characters.
DLPX-72123	The issue with the failure of detaching or deleting an Oracle dSource operation on RAC environments (This issue was occurring due to failure of deletion of RMAN backups on RAC and the operation needs to be retried with a force option) is now fixed.
DLPX-72779	The UI showing enabled or disabled for cluster nodes now uses a grid table. The Enabled column contains a checkmark to show whether the cluster is enabled or disabled. Users are able to select or unselect the checkmark to enable or disable a cluster.
DLPX-73975	Critical storage faults should not be ignorable nor manually resolvable

Bug number	Description
DLPX-74862	This release fixes an issue where the RESUME operation failed without any error thrown to the user on dSources where ENFORCE was still in progress. The fix will make sure that even if RESUME fails, it throws a DUE to the user with suggested actions to resolve the issue.
DLPX-75763	The issue with the failure of refreshing a VDB provisioned as an empty vfiles since there is no parent container to refresh from is now fixed.
DLPX-76266	The issue with the VDB Disable operation that resulted in an error message while connectivity with the host machine can't be established is now fixed.
DLPX-77123	You can now run Upgrade Verify when another upgrade is in progress.
DLPX-77347	This release fixes the difference in time shown for MSSQL snapshot based on different database authentication methods.
DLPX-77638	The issue with the failure of the End Entity Certificate expiration fault is now fixed.
DLPX-77664	The issue with the failure of the Oracle SnapSync with an error message, "RMAN-06183: datafile or datafile copy (file number) larger than MAXSETSIZE" if a datafile resized in the middle of SnapSync is now fixed.
DLPX-77913	The issue with the faults table missing data if there was more than one page of faults is now fixed.
DLPX-77925	The issue with the unsupported Windows release error message is now fixed.
DLPX-78113	MSSQL VDB database size will now be refreshed periodically based on environment_monitor.dynamic_attributes_check_period tunable.
DLPX-78183	The issue with the MSSQL validated sync schedule not getting updated without successful backup restoration is now fixed.
DLPX-78244	The issue with the failure of a few operations on self-service containers due to incorrect entries corresponding to the Oracle log metadata on the Delphix engine is now fixed.

Bug number	Description
DLPX-78258	The issue with the input bug that retained cleared out DB credentials in the dSource linking wizard is now fixed.
DLPX-78263	The issue with the failure of a SnapSync of an Oracle standby dSource in Real-Time Apply mode with an error message, "exception.oracle.snل.linkedsource.current_scn.invalid" if the rate of change in the database is low is now fixed.
DLPX-78265	Offline Oracle bystander PDBs data files can now be optimized leading to improved provision performance.
DLPX-78309	The issue with the CLI being unable to log in to system users when the main virtualization service is down is now fixed.
DLPX-78334	The issue with a large number of missing Oracle archive logs causing an error while viewing dataset is now fixed.
DLPX-78392	Hosts running Windows Server 2022 can now be added as Source and Target environments to the Delphix Engine.
DLPX-78522	SSLv3, TLS 1.0, and TLS 1.1 are no longer configurations options for HTTPS. Any system configured only with these removed options will be automatically set to use TLS 1.2.
DLPX-78791	This release upgrades log4j from 1.2.17 to the latest 2.x in Windows Connector.
DLPX-78938	This release upgrades log4j in virtualization to 2.17.1.

3.2.162 Release 6.0.11.0 changes

3.2.163 Security fixes

Bug number	Bug introduced in	Description	Security bulletin
DLPX-77921	6.0.8.0	Arbitrary Code Execution by Delphix System Administrators may be Performed on Virtualization and Masking Engines	TB094 ⁷⁴

3.2.164 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-53019	The issue with the missing redo alert raised during the environment monitor check has now been resolved.
DLPX-59299	Discovery and monitoring rely on "Connected" in sqlplus output, which may not be the case if NLS_LANG is set to another language (e.g. Japanese). Downstream operations, like linking or provisioning, may then fail due to missing user privileges.
DLPX-59662	The issue with copy-Only Backups failure with Virtual Service Accounts has now been resolved.
DLPX-62706	The issue with the Hostchecker not properly checking /home/delphix permissions has now been resolved.
DLPX-64082	The issue with Oracle Provisioning scripts having hard-coded timeout issues has now been resolved.

⁷⁴https://support.delphix.com/Support_Policies_and_Technical_Bulletins/Technical_Bulletins/TB094_Arbitrary_Code_Execution_by_Delphix_System_Administrators_May_Be_Performed_on_Virtualization_and_Masking_Engines

Bug number	Description
DLPX-65729	Added retry functionality to the 'read backup files' operation during a validated sync to an account for an unstable environment.
DLPX-69778	SAML response is not logged on successful SSO login.
DLPX-72043	The issue where LiteSpeed <code>xp_restore_headeronly</code> stored procedure failure message are displayed when validated sync is active for dSources with LiteSpeed backup has now been resolved.
DLPX-72220	A UI issue that occurred while updating the vault when only the private key is changed has now been resolved.
DLPX-72225	Admin user created from management UI is no longer showing as 'non-admin' type.
DLPX-72237	The 'Verify Credentials' button from the DSP Throughput test page is now removed.
DLPX-72369	The dependency on a parent snapshot relying on the latest snapshot is now removed if a parent snapshot does not exist during the VDB enable operation.
DLPX-72778	Oracle dSource attach operation with changed DB ID using 'Force' option is now allowed.
DLPX-74555	Updated the "no Delphix connector" message while provisioning a Windows source environment.
DLPX-74676	Oracle LiveSource LogSync should only catalog valid archive log files.
DLPX-74851	In the Add Environment GUI, the mouseover information for "Set Delphix Session Protocol Options (DSP)" has been currentted.
DLPX-74896	The race condition issue when running Oracle VDB refresh and dSource snap sync resulting in incorrect engine metadata entry for the parent snapshot of a VDB in the <code>dlpx_timeflow</code> table has now been resolved.

Bug number	Description
DLPX-75335	Added a product name and product version for the Delphix Connector executable so this information can be available before installation.
DLPX-75500	For ag cluster nodes, if the refresh fails due to timezone discovery failure, don't delete the nodes from engine metadata as it doesn't mean we had an issue with the nodes.
DLPX-75952	Database configs will be replicated only if the associated VDB is replicated.
DLPX-75995	The issue causing environment 'Add' or 'Refresh' to fail when PowerShell Transcription is enabled has now been resolved.
DLPX-76244	The issue where TCP fallback connection to database stops responding if the Oracle database instance is down has now been resolved.
DLPX-76290	Databases of UNKNOWN cdb type are now included in the attachment of a non-PDB container.
DLPX-76731	Added Delphix support for <code>WALLET_ROOT</code> and <code>TDE_CONFIGURATION</code> parameters to manage wallets in 19c instead of sqlnet.ora.
DLPX-76759	Added "Response" to faults along with other details when logged in the Admin App.
DLPX-76777	Remove orphaned Oracle logs resulting from archive log fetch timeouts.
DLPX-76793	Added execution timeout for execution of <code>UpdateFileACL.ps1</code> .
DLPX-76974	The issue where a user was unable to change 'from address' of SMTP server to noreply@delphix.com ⁷⁵ in the GUI has now been resolved.
DLPX-77112	The issue where an Oracle VDB cannot be provisioned between different minor versions if the Source is on higher RU has now been resolved.

⁷⁵ <mailto:noreply@delphix.com>

Bug number	Description
DLPX-77284	The issue where after a hotfix was removed due to a successful upgrade, the system would still indicate the hotfix was installed post-upgrade has now been resolved.
DLPX-77345	The issue where provisioning a vVDB fails with <code>java.lang.OutOfMemoryError</code> when sqlplus is used to rename the datafiles has now been resolved.
DLPX-77405	Replicated password vaults will no longer be visible in the UI.
DLPX-77676	The issue where provisioning a vPDB from a PDB dSource fails with "ORA-65114: space usage in container is too high" if PDB <code>max_size/max_pdb_storage</code> is configured has now been resolved.
DLPX-77708	The issue where a refresh/disable/destroy of a VDB using NFSv3 could cause loss of access to other VDBs that were using NFSv3 has now been resolved.
DLPX-77844	The issue where V2P operations from a VDB snapshot would result in the deletion of any production datafiles that exist on specified V2P target directory has now been resolved.
DLPX-77904	Removed 'Factory Reset' for Delphix Engines that are Data Vaults, as the operation is disabled for those engines.
DLPX-77912	The issue that can cause a VDB stop, refresh, or rollback to fail with an internal error has been resolved.
ORB-2465	Removed the requirement that SAML SSO email addresses must match case-sensitively for SSO logins.

3.2.165 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-77577	Increased nvme I/O timeout to prevent storage issues in EC2 (Activated after optional Reboot).

3.2.166 Release 6.0.10.1 changes

3.2.167 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-77467	Loading the setup app dashboard (as sysadmin) was rendering a server error popup with instruction to contact Delphix Support. This 6.0.10.0 error has been known to impair the ability to configure web proxy, PhoneHome, SMTP servers, and other connectivity settings via the GUI. It has now been resolved.

3.2.168 Release 6.0.10.0 changes

3.2.169 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-18438	The issue with provisioning to the latest available time that resulted in generating the <code>exception.oracle.target.point.not_provisionable</code> exception has now been resolved.
DLPX-35480	Previously, static routes were being added using the add command. Now, the same can be added using the create command.
DLPX-57516	The issue with the failure of management service to start after configuring some abbreviated timezones from a picklist in server setup or sysadmin CLI has now been resolved.
DLPX-58133	Previously, the Oracle SnapSync operation was resulting in a warning for BCT usage on editions that do not provide it. This issue has now been resolved.
DLPX-58675	The issue with the deletion of the last snapshot on timeflow by Retention during a failed Oracle DB_SYNC operation has now been resolved.

Bug number	Description
DLPX-63003	The issue with memory being exhausted while reading too many snapshots from engine metadata has now been resolved.
DLPX-63347	If the staging source has the "Use as Staging" flag set as off, the user was seeing a specific exception while trying to enable a linked dSource to point in the direction of what needs to be done. Any compatibility failure will now have a specific exception.
DLPX-63601	Previously, querying the following operation "backupset table" and "whether a database is part of AG or not" was resulting in deadlocks and lock timeouts errors. We have now added retries to resolve the issue.
DLPX-64369	The issue with throwing <code>fault.oracle.linkedsource.incomplete.tempfile</code> for physical standby has now been resolved.
DLPX-65949	The issue with misleading status in the progress bar while taking a copy-only backup has now been resolved.
DLPX-69831	Previously, the Oracle dSource SnapSync operation was not displaying a clear failure message if a dSource <code>db_unique_name</code> is changed. This issue has now been resolved.
DLPX-70317	The issue with the restarting of the NFS-server by the reaper thread while deleting a vPDB from a linked CDB with Talaria turned on has now been resolved.
DLPX-71018	The issue with UI displaying only the suffix of the device name used by Hyper-V has now been resolved. UI now displays a unique device name for storage in Hyper-V.
DLPX-71292	The issue with the allowance of incremental SnapSync after LogSync throws <code>fault.oracle.linkedsource.log.conflict</code> has now been resolved.
DLPX-71639	The NFSv4 is now set as the default option when mounting datasets from OS platforms that support it.
DLPX-71769	The need to set permissions of <code>\$ORACLE_HOME/dbs</code> subdirectories using STARTUP SPFILE syntax is now removed.
DLPX-72011	The issue with the CLI network setup not configuring the first network interface when multiple interfaces exist has now been resolved.

Bug number	Description
DLPX-72186	The issue with CDB log file retention working incorrectly if a PDB has multiple time flows pointing to the same CDB timeflow has now been resolved.
DLPX-72432	The format of <code>zpool_iostat_60.log</code> has been enhanced in this release. A timestamp is recorded for each sample in the log, making it easier to determine the time for each sample.
DLPX-72956	The issue with disabling the Oracle LogSync after running the validated sync job has now been resolved.
DLPX-73575	The timezone monitoring is now added for the Windows hosts.
DLPX-73590	You can now refresh a VDB whose parent dataset is in a different group without needing authorization on the parent or its group.
DLPX-73800	The issue with the failure of <code>olsnodes</code> when run as a non-Oracle user has now been resolved.
DLPX-74504	The issue with throwing a new DUE and <code>NotFoundException</code> when <code>ojdbc</code> libs cannot be read has now been resolved.
DLPX-74945	UI now displays a detailed error message for transaction log-chain break fault.
DLPX-74992	The issue with the failure of SnapSync operation when Database incarnation reset-logs end time is changed from "2021-03-13 22:03:07.0" to "2021-03-13 21:03:07.0" for virtual pluggable database " " has="" now="" been="">">
DLPX-75389	The issue with the recording of the insufficient details by Logsync when <code>dbid</code> change was detected has now been resolved.
DLPX-75517	The issue with the failure of the Oracle vPDB provisioning with the "ORA-00959: tablespace 'TEMP' does not exist" error has now been resolved.
DLPX-75721	The issue with the failure of an Environment discovery with the "DelphixFatalException: Unknown Oracle Database status: REFRESHING" error has now been resolved.

Bug number	Description
DLPX-75737	The issue with saving unnecessary logs by Retention if bookmark falls exactly on a snapshot end SCN or snapshot end timestamp has now been resolved.
DLPX-75897	Previously, failure to start I/O services after the upgrade operation was resulting in a stack restart loop. This issue has now been resolved.
DLPX-75951	The internal error being signaled during VDB SnapSync by <code>removeUnneededZFSFiles</code> when a data file is physically removed during processing by an external cause has now been resolved.
DLPX-76288	The NFS latency for workloads involving a lot of parallel I/O (e.g. Oracle VDBs with concurrent accesses to many data files) is now improved.
DLPX-76388	Previously, entering key pairs directly into hook environment variables, as opposed to via a vault or as passwords were resulting in an internal error. This issue has now been resolved.
DLPX-76406	The issue with NFS-based VDBs becoming unresponsive has now been resolved.
DLPX-76447	The issue with the V2P Functionality to customize target directory structure for exporting database files to separate file systems not working as documented has now been resolved.
DLPX-76613	The issue with the unnecessary accumulation of heap when validated sync is active for dSources using an environment user that eventually can cause out of memory issues has now been resolved.
DLPX-76690	The issue with the removal of extraneous Oracle data files while creating snapshots has now been resolved. The extraneous Oracle data files are now removed during the provisioning operation.
DLPX-76692	For V2P operation, we now use the unbuffered copy method for better performance.
DLPX-76718	The issue with the creation of the extraneous Self-Service branch segments during the replication operation has now been resolved.
DLPX-76760	Environment clusters will now show faults from their child nodes.

Bug number	Description
DLPX-76802	<p>Previously, the engines that are in the DEFERRED upgrade state were resulting in the "Large Receive Offload" option turned off which was leading to performance degradation in network transfers. This issue has now been resolved. Upgrading the engines that are in the DEFERRED state will also resolve the issue.</p> <p>Screen reader support is now enabled.</p>
DLPX-76891	CRON expression labels now ask for Quartz format on the user interface.

3.2.170 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-76619	The NFS reliance on DNS to prevent VDB unresponsiveness related to DNS unreliability is now reduced.
DLPX-76203	The NFS latency for engines with many Oracle dNFS clients is now improved.
DLPX-76119	The issue with the Delphix Engine crashing or becoming unresponsive when canceling a replication job has now been resolved.
DLPX-76991	Optimized in-memory cache eviction by making minor improvements to I/O performance.

3.2.171 Release 6.0.9.0 changes

3.2.172 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-28435	MS SQL instances PatchLevel will be displayed in preference to the version on the UI.
DLPX-40005	Improved the error message that is displayed when a JDBC connection cannot be established or the Oracle database Instance is unavailable.
DLPX-48080	Oracle Home Check may generate spurious faults if Oracle Home entry does not exist in /etc/oratab.
DLPX-55951	Attempting to provision a plugin-based VDB onto an incompatible OS (Windows to Linux or vice versa) is possible in the UI, and would fail with a crash requiring a restart. Now an informative error message is shown after the attempt is made.
DLPX-59613	Fixed creation of retention policies workers on replica objects after failover.
DLPX-64307	Environment refresh should ignore cluster discovery for Oracle VDBs.
DLPX-66191	Fixed the side-effects of the native Windows "Recent Files" behavior, when large numbers of PowerShell operations are being run concurrently.
DLPX-67537	Domain administrators can now create, view, and edit the alert profiles of other domain users.
DLPX-69605	Poor error message when selecting Timeflow range.
DLPX-70502	On detaching a dSource, delete backup server entry from engine metadata and related ones if the backup server is unused.

Bug number	Description
DLPX-71002	In case we have null values coming for recovery_model from msdb.dbo.backupset table, the user will see a generic exception for manual sync and a fault for validated sync.
DLPX-71908	Users will now see a warning when they remove any object from the replication specification list.
DLPX-72012	Prevents the same IP address from being configured on more than one network interface.
DLPX-72411	Environment names for Windows and Oracle Clusters are once again editable by users.
DLPX-72609	When we do MSSQL standalone environment discovery, the user will see a warning for databases attached to AG that are present and will not be discovered unless cluster environment discovery is selected.
DLPX-72695	Improved Oracle SnapSync performance by eliminating unnecessary calls to getTotalHoleBlocks.
DLPX-73409	Duplicate listener entry gets generated in engine metadata if Oracle listener is manually started with a non-uppercase name.
DLPX-73586	Fixed a display error of some snapshot names in the command line interface which showed references instead of actual names.
DLPX-73720	Provisioning an Oracle vPDB fails with "ORA-65149: PDB name conflicts with existing service name in the CDB or the PDB" if the PDB and CDB names are the same.
DLPX-74050	Environment names for Windows and Oracle Clusters are once again editable by users.
DLPX-74078	The Target Directory path is combined with other directories such as Data Directory, Archive Directory, Temp Directory, etc to build the full path for data files, archive logs, temp files, etc. As long as the combined paths are valid the V2P job proceeds.
DLPX-74197	Fixes a misleading warning about insufficient space on a replication target.

Bug number	Description
DLPX-74201	Snapshots created as a result of refresh or rewind operations will now be labeled as just "Snapshot" to avoid confusion. Users are advised to look at the Timeflow markers to know when the Timeflow operation was performed.
DLPX-74367	Delphix Engine repeatedly reports "Failed to parse logfile".
DLPX-74377	Improved diagnostics information for the case when Delphix Engine fails to connect to the Windows host.
DLPX-74387	fix an issue that causes the management service to crash under heavy CPU load.
DLPX-74398	Added handling of dangling nodes during Windows cluster environment add and refresh operations.
DLPX-74486	Delphix OS users cannot provision 12.2 TDE vPDB due to directory permissions in the default wallet location.
DLPX-74495	Enabled more logging in Delphix connector logs for timeouts.
DLPX-74681	During RAC vPDB provision, Oracle 19.9 target CDB crashes with ORA-00600 [krccfl_chunk] when BCT is enabled.
DLPX-74806	Improved error message displayed when the storage device initialization fails unexpectedly.
DLPX-74860	Provisioning the 2nd generation VDB fails if the dSource has imported read-only transportable tablespaces fails.
DLPX-74975	Allow adding invalid or unreachable paths as a shared backup location for dSources.
DLPX-75026	Invalid JDBC connections are not purged from the connection pool when the home is changed.

Bug number	Description
DLPX-75134	Improved performance for the Environment Databases pages when there are a lot of databases.
DLPX-75363	Update exception description is seen when the SnapSync fails for ASE encrypted database.
DLPX-75401	local listener set to null if oracle.lsnr.protocol_registration_order is quoted.
DLPX-75506	Fix a bug that can cause Oracle RAC VDBs to fail with stale NFSv3 mounts if NFSv4 is also enabled.
DLPX-75532	Insufficient heap memory settings on AIX cause connector and SnapSync to hang or crash.
DLPX-75663	FIPS compliant algorithms will be used while merging the old and new toolkit directories during environment refresh.
DLPX-75716	Delphix may remove Oracle VDB temp tablespaces during Snapsync.
DLPX-75735	Fixed creation of retention policies workers on replica objects after failover.
DLPX-75834	Rearranged Syslog configuration dialog inputs to avoid confusion and have a more consistent user experience.
DLPX-75858	BEQ processes can hold on to file descriptors leading to hook scripts hanging after upgrading to 6.0.7.0.
DLPX-76018	Remove hardcoded 5-minute timeout for doDropPDBKeepDatafiles.sh.
DLPX-76140	TDE SnapSync should ignore WARNING plugin violations.

3.2.173 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-71980	Fix a bug that was causing the Delphix Engine storage pool to fail to import on boot under certain circumstances.

3.2.174 Release 6.0.8.1 changes**3.2.175 Fixes that take effect immediately after upgrading**

Bug number	Description
DLPX-75804	Some Delphix operations may fail if mount and umount commands, on staging or target hosts, are setup to run as sudo and if sudo rules prohibit these commands from running with unrecognized options. The issue is fixed now after removing "-v" added in 6.0.8.0.

3.2.176 Release 6.0.8.0 changes**3.2.177 Fixes that take effect immediately after upgrading**

Bug number	Description
DLPX-49694	Skip parsing of DBCC when code 0 is not present in the DBCC page output. In case the DBCC page has code 0 but not dbid, use bdbid (present in the buffer section).

Bug number	Description
DLPX-68764	VDB SnapShot does not progress if ASE database devices are not on Delphix storage, environment monitoring raises a fault. Subsequent VDB operations like enable, disable, start, stop, delete, snapshot, or refresh will fail.
DLPX-70793	Delphix Engine should not allow linking Oracle DB with null <code>db_unique_name</code> .
DLPX-71300	For newer ASE versions (\geq 15.7 SP138 and 16.0 SP02 PL05 and ASE 16.0 SP03), do not run DBCC PAGE anymore, as it was an identifier for DBCC CHECKALLOC that is already not run.
DLPX-71471	Error message asking user to manually perform disable/enable operation or correctly rename the target database back will be displayed during Start VDB, if VDB does not exist.
DLPX-71687	Provide a mechanism to enable VDBs up to filesystem mount point.
DLPX-71875	Fixed a bug that results in a memory reservation not being represented correctly in the Delphix API.
DLPX-72046	Deletion of vPDB in a vCDB shows this warning, "Encountered an error while shutting down and cleaning up Oracle files."
DLPX-72209	Downloading a support bundle is not supported at the same time that an upload of an upgrade image has been initiated by the same Delphix user.
DLPX-72319	Fixed an issue where some error dialogs would freeze in Internet Explorer 11.
DLPX-72705	Connection timeout when deleting remote shipper script can cause a timeout in LogSync client.

Bug number	Description
DLPX-72757	ASE sync using Dump History fails for large dump history files.
DLPX-72780	Timezone is set incorrectly for snapshots of Solaris 10 dSources and VDBs.
DLPX-72904	Storage capacity now includes usage from all file system objects, not just snapshots.
DLPX-73143	Fixed an issue where the support bundle dialog showed a loading spinner intermittently while jobs were running.
DLPX-73354	Traverse all shared backup locations while syncing, even if some of the paths are invalid or not reachable.
DLPX-73489	Fixed bug where adding or editing a parameter using the UI VDB Config Template "Text" tab was truncating the parameter's value.
DLPX-73602	Incorrect mount options used when a single instance RAC is linked as a standalone single instance.
DLPX-73607	Added paging for days with large numbers of snapshots to prevent slowdown.
DLPX-73623	Fixed an out-of-memory condition that occurs in SSH tunneling for encrypted log-syncs when storage latencies are high.
DLPX-73627	The help text on upgrade replication warnings have been updated to avoid confusion between Ignored and Resolved.

Bug number	Description
DLPX-73668	Fixed Missing security headers.
DLPX-73669	Cross-site request forgery (CSRF) issue in management UI.
DLPX-73727	Fixed an issue where the faults table was unable to navigate to other pages.
DLPX-73797	Fixed VDB refresh failures due to SQL Server Error 924 after setting VDB to single user mode.
DLPX-74025	Implemented logic to retry offline database along with a drop database to overcome deadlocks while off-lining or dropping the database.
DLPX-74029	VMware Hot-Add memory is not immediately reflected in the system API.
DLPX-74057	Fixed a typo in "Download Support Bundle" UI component where the word "suport" was missing a "p".
DLPX-74254	Ownership of files inside VDB now matches new owner when VDB owner is changed.
DLPX-74298	Fixed an issue where the user could not upload a keystore with a blank keystore passcode.
DLPX-74362	Fixes an issue with namespace deletion when the replication receive jobs have been cleaned up.

Bug number	Description
DLPX-7444 2	VDB Enable with attemptStart=false will now mount the datasets so that VDB can be started.
DLPX-7445 7	Cluster discovery for Oracle RAC clusters are partially failing on Solaris 10.
DLPX-7452 9	Fixed a bug so that an upgrade completes even when jobs fail.
DLPX-7454 2	Fixed a bug so that upgrade completion is properly handled after kernel upgrades.
DLPX-7464 5	Delphix Engine uses the uptime command to keep track of a target host reboot and auto start VDBs on the host. In some cases, the output of this command is not what is expected and causes unintended restart of a stopped VDB. This issue is now fixed.
DLPX-7465 6	Oracle errors during doCreateSPFile.sh are not captured.
DLPX-7470 4	Fixed a bug where the Dataset scroll does not extend to the bottom of a dataset list, thus truncating the status of the last dataset in the expanded group.
DLPX-7488 3	Prevent support bundle collection from cancelling replication.
DLPX-7491 1	Talaria TCP fallback fault may be misconstrued if an Oracle RAC node is down.
DLPX-7499 7	Prevent granting replicated roles to users.

Bug number	Description
DLPX-75083	Post upgrade cleanup task may become unresponsive while attempting a migration from 5.3.x to 6.0.x due to several threads stuck in WAITING state.
DLPX-75095	Provisioning an Oracle VDB fails if change-archivelog-mode.sh takes longer than 5 minutes.
DLPX-75134	Improved performance of the Environment Databases page under certain conditions.
DLPX-75188	Fixed "out of memory" issue when processing a large number of objects on the Target engine.
DLPX-75204	Addressed a performance issue on the Target engine when receiving large number of replicated objects.
DLPX-75208	Snapshot names are incorrectly redacted in the engine metadata dlpx_action table in support bundles.
DLPX-75416	Fixed a replication issue when there are sources with TLS enabled.

3.2.178 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-72065	Fixed a bug that can cause a Windows iSCSI initiator to fail connect to the Delphix Engine.

Bug number	Description
DLPX-72681	Console Delphix status screen shows a Python stack trace if the system is configured with a static IP address.
DLPX-73423	Console Delphix status screen shows a Python stack trace if the system has no default route.
DLPX-74216	Fixed an issue that causes management service failures in low memory situations.
DLPX-74622	Fixed a bug that can cause a replication job to fail with an internal error.
DLPX-75089	Fixed a bug that can cause NFSv3 clients to lose locks during upgrade verification.
DLPX-75524	Fixed a bug that can lead to Oracle data corruption when running VDBs on Oracle 19c with dNFS.

3.2.179 Release 6.0.7.0 changes

3.2.180 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-39006	LogSync failed with "Cannot read archived log due to failure of log shipping script".
DLPX-39245	Fixed a bug that caused the management service to become inaccessible if the storage pool ran out of space.
DLPX-59155	Provisioning a VDB or vPDB failed with unclear error message 'A database with the name "xxx" already exists'.

Bug number	Description
DLPX-60317	Fixed Out of Memory issue when replicating a large number of objects.
DLPX-60947	Replica VDBs will be updated when performing a point-in-time restore.
DLPX-62805	vPDB provision did not raise an error when a non-provisionable target point-in-time was provided.
DLPX-62969	Fixed Out of Memory issue when receiving large number of replicated objects.
DLPX-64600	Skipped connecting to ASE dSources during SnapSync policy runs as it is not applicable for them, hence prevent recurrent faults that the policy throws for connectivity issues.
DLPX-67363	Maximum identify provider authentication time age can be customized for single sign-on.
DLPX-67607	Fix to make Snapsync throw exception if manifest file is missing or of 0 bytes instead of internal error with null pointer exception.
DLPX-67767	Fixed a bug that caused the upgrade to hang, while waiting for running jobs to finish.
DLPX-70821	Allow the entity id for SAML single sign-on to be a URL for compatibility with Azure AD.
DLPX-71783	doRenameDatafiles cleanup of extra files fails due to file permissions mismatch.
DLPX-72010	Fixed an issue that prevents changing the default gateway using the network setup CLI.
DLPX-72075	Maximum SAML response time skew can be customized for single sign-on.
DLPX-72191	Oracle privilege discovery not performed for all homes if an invalid home exists.

Bug number	Description
DLPX-72351	When a user tries to change credentials for a dSource, validating the credentials before updating them. In case of invalid credentials, showing user an error message about it.
DLPX-72545	Initial ORA-65294 error not reported to user when vPDB provision fails due to compatible parameter mismatch.
DLPX-72652	Fix and issue that prevents use of the NFSv4 on some versions of SUSE Linux targets.
DLPX-72698	Patching Oracle 19C vCDB leads to ORA-25153 as described in 2285159.1.
DLPX-72807	Fixed issue with SQL Server 2014 dSources with filestreams where sync failed in merging filestream directories due to long path names.
DLPX-72882	Datasets hooks script editor properly displays multiline scripts instead of as one long line on non-Chrome browsers.
DLPX-72916	Empty string in SNMPv3 USM username creation no longer throws fatal error.
DLPX-73048	Non-sys user credentials for Oracle sources cannot use password vault.
DLPX-73108	Fix a bug that prevents the API from displaying the correct number of CPUs or amount of memory assigned to a Delphix Engine after a hot-add operation.
DLPX-73201	Fix an issue that prevents the configuration of additional NICs on Azure Delphix Engines.
DLPX-73202	Fix a bug that can cause a VDB to fail to mount while other VDBs are being stopped.
DLPX-73424	Fix a bug that prevents the sysadmin from deleting a default route.
DLPX-73527	SnapSync job fails with 'internal error during execution' due to ONS/FanManager errors.

Bug number	Description
DLPX-73528	Fixed a bug that prevented accessing SDD specs from CLI.
DLPX-73611	Kerberos ticket expiration date parsing is incorrect after migration from Illumos to Linux.
DLPX-73742	Provisioning an Oracle TDE-enabled vPDB fails with the error "ORA-28367: wallet does not exist" if the TDE wallet for the target linked CDB is stored on ASM storage.
DLPX-73765	Fix a file descriptor leak that causes the management service to crash over time.
DLPX-73789	Auxiliary CDB instance uses dSource keystore location if WALLET_ROOT is configured in dSource.
DLPX-74030	CDB database password may be leaked as part of environment monitor checks that launch sqlplus command on the source or target host.
DLPX-74043	Delphix OS user cannot provision TDE-enabled vPDB due to directory permissions in the default wallet location.
DLPX-74044	Delphix OS user cannot provision TDE-enabled vPDB in Delphix-writable keystore location due to directory permissions.
DLPX-74119	Drop database fails if default database is set to any other than master.
DLPX-74164	Sync fails with db.aselddb.source.dump_history.incomplete_stripes after dump history file is purged and Use dump history is enabled for the dSource.
DLPX-74233	During failover of a namespace, if there is a collision between an environment in the namespace with one on the target engine, the namespace environment will get renamed if its host does not match that of the environment on the target.

3.2.181 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-73390	Improve replication receive throughput.
DLPX-73393	Improve write performance under extreme disk fragmentation.
DLPX-73280	Improve write performance under extreme disk fragmentation.

3.2.182 Release 6.0.6.1 changes

3.2.183 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-73848	Fixed an issue that can cause the management service to fail to start after upgrade on systems that have had SNMP enabled.
DLPX-73859	Fixed a file descriptor leak triggered by faults and alerts that can cause the management service to fail.

3.2.184 Release 6.0.6.0 changes

3.2.185 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-47065	VDB recovery failed when files other than archive logs were detected by Oracle.
DLPX-47493	Fixed the bug where VDB directory under the DelphixConnector directory was not being removed from the target host on MSSQL VDB deletion.
DLPX-48046	Added sorting parameter to network test APIs.
DLPX-61405	Replication may send more data than expected if masking involves dropping large DBF files.
DLPX-61525	The height of the storage configuration list was limited to show 3 disks at a time. It will now dynamically grow with the number of disks.
DLPX-63603	Increased connector timeout from 10 minutes to 30 minutes to avoid unnecessary faults due to timeout during Validated Sync operation.
DLPX-67368	Delphix Engine hostname change is now immediately reflected in Splunk events.
DLPX-67593	Fixed an issue that caused the management service to remain offline following an out-of-space condition.
DLPX-68531	Introduced better handling of UniversalConnectionPoolException errors during SnapSync.
DLPX-69759	Oracle environment discovery failed due to an unhandled exception occurring at insert into dlp_x_faults.
DLPX-69852	Fixed a bug that caused network configuration problems when removing and adding additional NICs.

Bug number	Description
DLPX-70426	Redaction of usernames took forever on tables with millions of entries.
DLPX-70583	move-to-asm.sh fails if timing is set in glogin.sql.
DLPX-70638	Removed Failed Actions section of Actions sidebar, in favor of manually dismissing from Running Actions and falling to Finished Actions section.
DLPX-70653	Removal of all instances in a RAC VDB should not be allowed.
DLPX-70808	Fixed issue related to the creation of empty DisableBroker.sql on the Windows machine in case DisableBroker.sql execution fails in the first attempt.
DLPX-70896	Added more detailed error message for when the Delphix Engine fails to push a script to Windows host.
DLPX-70919	Fixed an issue that causes job progress to not update in Self-Service.
DLPX-70928	Fixed a bug that results in a Delphix Engine remaining powered on following a shutdown from the user interface.
DLPX-71093	For AG databases, a full backup is not required even recovery fork guid changed but the LSN chain didn't break because of transactional log backups.
DLPX-71097	Unable to ignore snl.bct.needed warnings if Block Change Tracking is legitimately disabled on an Oracle dSource.
DLPX-71153	Recovery of PDB should fail if the database is down after offlining datafiles.
DLPX-71370	While deleting initiator in Windows environment deletion operation, delete all the views as well for that initiator.
DLPX-71685	VDB is auto disabled if the hook fails.

Bug number	Description
DLPX-71865	Reduced the size of support bundles.
DLPX-71961	When a PDB is selected for replication, its CDB and all other PDBs in the parent CDB get automatically selected for replication. Going forward, in the above scenario, while the CDB will get selected, its other PDBs will no longer get selected.
DLPX-72031	Fixed VDB refresh operations failures due to 'DB STARTUP' background process spid greater than 50.
DLPX-72066	Migrate VDB verifies against the old configuration, rather than new.
DLPX-72083	Fix an issue that causes a fully-qualified hostname to be changed on upgrade from 5.3 to 6.0.
DLPX-72131	Added namespace support for HashiCorp password vaults.
DLPX-72265	doCreateTempfiles.sh.template exits with code 0 on failure.
DLPX-72340	Incomplete recovery not detected during provisioning.
DLPX-72386	Unlock Solaris x86 Solaris -> Linux x86 provisioning.
DLPX-72452	For clusters with long hostnames, vPDB sync fails with exception.oracle.accessor.instances.missing.
DLPX-72495	Fixed a bug that prevents the application from coming up after an upgrade
DLPX-72686	Delphix no longer logs environment variables in logs on connected hosts since this could leak sensitive information such as passwords that are sometimes stored as environment variables on database hosts such as for the ASE database.

Bug number	Description
DLPX-72730	Fixed a Snapsync performance issue.
DLPX-72790	SnapSync job fails with 'internal error during execution' due to ORA-01652.
DLPX-72862	The scenario which was causing the null pointer has been fixed now.
DLPX-73300	Validation of connection to a container for PDBs should allow connecting to CDB\$ROOT.
DLPX-73311	Added platform detection for ESX 7.0u1.
DLPX-73449	Replication of policies between two engines, in a loop, could lead to OOM exceptions.

3.2.186 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-72990	Addressed a minor CVSS 5.9 security issue with no known attack vectors.
DLPX-73067	Fix for CVE-2020-10753.
DLPX-73069	Fix for CVE-2020-12059.
DLPX-73070	Fix for CVE-2020-1760.

3.2.187 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-71924	Fixed a bug that causes support bundle collection to fail with an internal error.
DLPX-72918	Fixed a system crash that can happen when replicating a masked VDB using SDD.
DLPX-73147	Fixed a bug that can cause a replication source to crash if it had run replication while running on 5.0.

3.2.188 Release 6.0.5.0 changes

3.2.189 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-23360	The unistallation of the Delphix Connector installer should succeed even if one of the component connector services doesn't exist.
DLPX-69155	Reduced the time taken to generate support bundles in some cases.
DLPX-67316	Recreating a controlfile against an Oracle source may yield misleading error during snapshot.
DLPX-70766	JDBC driver updated to resolve intermittent JDBC connection failures due to JDBC SSL bug.
DLPX-70785	Options passed to VDB mounts on target AIX hosts did not include read and write size values. This fix adds the rsize and wsize parameters to mount command depending on the maximum values host is configured to support.

Bug number	Description
DLPX-70741	Enabling Validated Sync while SAP ASE SnapSync job is running leaves staging database unrecoverable.
DLPX-69865	Fixed a bug that causes a network interface to become unconfigured if its MAC address changes.
DLPX-71233	If LogSync is suspended when performing SnapSync of a standby database in real-time apply, SnapSync attempts to backup the archived logs which can cause SnapSync to become unresponsive.
DLPX-69800	UEM/Hostchecker directory ownership checks fail on HPUX environment with long usernames.
DLPX-69807	Provided mechanism for the user to bypass corrupted/incomplete jdbc libraries.
DLPX-66585	Bundle ID "fault.environment.configuration.file.owner" reports insufficient host address.
DLPX-65739	createDelphixDBUser.sh fails when "@" used in the password.
DLPX-70973	SAP ASE database provisioning fails if the source database has holes in log fragments.
DLPX-71532	Improved error handling for Oracle memory configuration errors.
DLPX-62987	Allowed assigning privileges over replicated objects through the UI.
DLPX-71593	TIMEFLOW_REPAIR incorrectly skips a log because of "wrong database".
DLPX-71751	Added NFSv4 support on AIX for Oracle and SAP ASE.

Bug number	Description
DLPX-71736	Dynamically disable RPC services if NFSv3 is no longer in use.
DLPX-71772	Network DSP Test between versions 5.3 and (6.0.3, 6.0.4) is fixed.
DLPX-71513	Replicate non-data objects like delphix engine users, authorizations, roles, permissions, policies and DB config templates.
DLPX-71305	Unable to load dummy recovery database dump due to SAP ASE error 15728.
DLPX-71172	Enabling SAP ASE dump history causes IllegalStateException in getDumpListFromLastRestoreDateAndFiles due to timestamp mismatch because of TZ.
DLPX-71178	SAP ASE internal error raised when dump history file is purged using sp_dump_history.
DLPX-65101	Fixed a race condition between a DB_DELETE job and the Oracle retention policy worker for the same container that can lead to a deadlock between the job and the worker.
DLPX-71918	Fixed an issue that causes the Delphix Engine UUID to change upon rebooting in IBM Cloud.
DLPX-71141	Fixed an issue where upgrading an Oracle dSource or changing the environment user in a linked Oracle dSource fails with the error "SOURCE_UPGRADE job for xxx failed due to an internal error during execution."
DLPX-71611	Updated UI time zone library to IANA 2020a.
DLPX-70349	Fixed a memory leak during incremental replication.
DLPX-72038	Fixed an issue that prevents 5.3.x - 6.0.x upgrade if a static route exists that goes over a DHCP interface.

Bug number	Description
DLPX-72148	Fixed a bug of always order hooks alphabetically rather than the running order set by users.
DLPX-71971	Allowed Enable/Disable of VDB if its current Timeflow has at least one snapshot.
DLPX-72115	Changed the Time Point field on a VDB back to reflecting the point on the parent the VDB was created from, but displayed in the timezone of the parent.
DLPX-71995	6.0.4.0 can no longer interact with 5.3.x remote Masking Engines.

3.2.190 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-70675	Fixed a bug that causes the system to become unresponsive after expanding multiple storage devices.

3.2.191 Release 6.0.4.2 changes

3.2.192 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-72155	Fixed an issue that can render a Delphix Engine unbootable if a reboot occurs after upgrade verification but before the upgrade is applied.
DLPX-71141	Fixed an issue where upgrading an Oracle dSource or changing the environment user in a linked Oracle dSource fails with the error "SOURCE_UPGRADE job for xxx failed due to an internal error during execution."

3.2.193 Release 6.0.4.1 changes

3.2.194 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-71930	Fix a bug that causes feature flags to be disabled when upgrading to 6.0.4.0.

3.2.195 Release 6.0.4.0 changes

3.2.196 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-68173	Resolved an issue where temporary database backup/device files created for cleaning up the target database were not being deleted.
DLPX-68773	The management stack runs out of memory as the environment monitor does not purge stale objects.
DLPX-69573	Allow linking an Oracle PDB with a lowercase name.
DLPX-69634	Allow provisioning an Oracle PDB with a lowercase name.
DLPX-69962	After detaching a PDB, perform unplug/plugin, and attach again, if disabled is performed before SnapSync, the PDB can no longer be enabled.
DLPX-66045	Prevent Self-Service Container branches getting into an unusable state by blocking deleting the last segment of branches.

Bug number	Description
DLPX-7037	Snapsync performs an unnecessary checkpoint.
DLPX-68277	Users will see the detailed error message upon connection failure to Delphix connector during OS user validation and there will also be a "More" button with an error message which will open an error popup with all error details.
DLPX-70288	On the "Add Environment" screen when OS user validation will get fail, they will see the "More" button along with the error message. When the user clicks the button, an error popup opens with all details of the error and suggested action.
DLPX-70832	NFSv4 support for appdata sources running on AIX.
DLPX-68495	Fixed GUI reporting conflict information when creating a Retention Policy.
DLPX-70788	Added Environment User field for MSSQL sources in Datasets -> Configuration -> Source tab -> Staging Environment section.
DLPX-58047	Fixed bug where the sort sequence was incorrect. Fixed in Hook Operation Templates.
DLPX-67931	Provision against VPDB after create/drop a new tablespace failed with exception.oracle.targetscripts.rename.datafiles.
DLPX-59910	Comps.xml associated with Oracle Homes are marked as unparseable if they are longer than 65535 characters.
DLPX-55476	CLI provisioning fails when the mount point provided includes quotes around the path.
DLPX-71168	Changed type to text and spaced "Secret Key" and "Username Key".
ORB-3285	Support using <code>api.delphix.com</code> as a proxy for verifying the Cloud Agent binary's code signature certificate.

Bug number	Description
DLPX-71006	Allow provisioning across patch versions for Oracle versions on or after 18.X.
DLPX-71334	Migrate NTP configuration when upgrading between 5.3 and 6.0.
ORB-3286	Communication with Central management servers is now routed through the web proxy when one is configured for the Engine.
ORB-3117	Summary: Increase an action's failure message size to 256 characters so users can view large failure messages.

3.2.197 Release 6.0.3.1 changes

3.2.198 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-71339	Fixed an issue that can cause the Virtualization Management service to become inaccessible when the system memory became highly fragmented.

3.2.199 Release 6.0.3.0 changes

3.2.200 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-68995	Improved performance of dataset deletion.

Bug number	Description
DLPX-68997 DLPX-68999	Improved single connection replication throughput.
DLPX-70697 DLPX-70703	Addressed an issue that causes long periods of I/O unresponsiveness.
DLPX-69953	Fixed a bug that can cause a Windows iSCSI initiator to fail to connect to the Delphix Engine.
DLPX-70512	Fix a hang in the I/O subsystem that can cause the Delphix Engine to become unresponsive.

3.2.201 Release 6.0.2.1 changes

3.2.202 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-70065	Provisioning a VDB from a dSource or another VDB will fail if the following conditions are met: <ul style="list-style-type: none"> • Delphix Engine has at least one dSource and a VDB created using a Python plugin prior to the upgrade • Delphix Engine was upgraded to 6.0.2 • Provisioning was attempted from the UI after the completion of the upgrade
DLPX-69350	Fixed an issue that the time point attribute of a VDB is not shown.

3.2.203 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-69864	Fixed an issue that causes MSSQL operations to hang after the reception of an iSCSI LUN reset.

3.2.204 Release 6.0.2.0 changes

3.2.205 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-62806	Fixed an issue where provision against PDB after unplug/replug against the same linked PDB fails with exception.oracle.targetscripts.controlfile.create.
DLPX-67567	Oracle Source Continuity creates an unnecessary source-archive file system on zfs.
DLPX-27807	LogSync may fall behind when connected to an Oracle physical standby database in Real-Time Apply mode.
DLPX-68385	Customer provided Oracle Java missing in the search path for Java on hosts.
DLPX-62782	Reducing the number of nodes for RAC VDB and VDB in NOARCHIVELOG mode may result in ORA-00258 errors during VDB enable operation.
DLPX-62738	Better error message when plugins are uploaded out of sequence.
DLPX-68722	The product now recognizes VMware with BIOS date of 12/12/2018 as VMware 6.7.0u2.

Bug number	Description
DLPX-68579	SnapSync of Oracle 19c DB with encrypted tablespace fails with fatal exception "Block header 91 is not empty".
DLPX-68689	Fixed the issue where a huge number of error messages from ASE caused OutOfMemory Error.
DLPX-68957	Always On AG discovery will not fail in a multi-subnet environment.
DLPX-63088	Can now recover multiple Self-Service containers at the same time.
DLPX-47977	Improved handling of snapshot standby.
DLPX-64125	SnapSync failed with exception.oracle.dsource.sync.no_hosts.rac on RAC clusters with very long hostnames.
DLPX-62584	PDB enable failed after migration if mountBase has a trailing slash.
DLPX-68657	Virtualization can now fetch jobs from Masking engines configured with HTTP redirection.
DLPX-69121	It is no longer mandatory to have at least one enabled system administrator with local credentials.
DLPX-68167	Fixed an issue where too many requests were being sent for Faults from the Datasets pages.
DLPX-69082	Large stderr produced by failed rsync jobs are truncated to prevent Java OutOfMemory errors.
DLPX-58600	Datasets filter updated so that all items within a group that matches the filter string are displayed, even if the items contained in the group do not match the filter string.
DLPX-65896	VDB deletion failed due to the inability to delete LogSync worker.

Bug number	Description
DLPX-57903	Improved diagnosability of PDB discovery issues.
DLPX-68878	Fixed issue where start/stop buttons were not being displayed in the RAC instances configuration table.
DLPX-69271	Enabled replication smart failover by default.
DLPX-66715	The user-visible name for Oracle cluster objects is being replaced with the Oracle cluster name. For Windows clusters, the user-visible name is being replaced with the cluster address.
DLPX-68929	Changed default replication settings for better out of the box performance.
DLPX-68930	Improved replication throughput when sending multiple timeflows.
DLPX-69245	Fixed a memory leak that occurs when experiencing connectivity errors.
DLPX-69377	At least one non LDAP system user should be enabled when the LDAP server is being disabled.
DLPX-68575	LDAP principal fields were not being redacted in phone-home bundles.
DLPX-68528	Self Service Recover operation failed due to missing Timeflow.

3.2.206 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-66808	Re-introduced console splash screen with IP address and service states.

3.2.207 Release 6.0.1.1 changes**3.2.208 Fixes that take effect after upgrading and rebooting (optional)**

Bug number	Description
DLPX-69203	Improved synchronous write performance over iSCSI.
DLPX-69167	Improved SQL Server data ingestion performance by leveraging asynchronous writes on underlying storage.
DLPX-69298	Eliminated possible data corruption on SQL server and vFiles over iSCSI that can occur when a Delphix Engine reboots.

3.2.209 Release 6.0.1.0 changes

3.2.210 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-60689	For SAP ASE, instead of using the DBCC CHECKALLOC command to fix DBID mismatch issue, the MOUNT command with FIXDBID and ALLOW_DBID_MISMATCH clauses will be used, to improve performance.
DLPX-65831	VDB snapshots need to clean unneeded ZFS datafiles.
DLPX-63949	Improved boot time after 5.3 to 6.0 migration by optimizing metadata indexing.
DLPX-66261	Upgrades to 6.0.0.0 will only be supported from a release greater than or equal to 5.3.6.0.
DLPX-66486	Snapshot of a linked database can end up with extra datafiles that do not belong to the database which might cause VDB on VDB provision to fail during rename of datafiles.
DLPX-66558	Cluster environment discovery was incomplete if the host locale was not English.
DLPX-66804	DB_LINK using incorrect user when RAC node also configured as a standalone environment.
DLPX-66768	vPDB save state lead to rollback or child provisioning failures.
DLPX-66823	Unable to link database with CL8MSWIN1251 charset.
DLPX-64538	Fixed a bug causing the timezone selector to only be visible when manually setting the time.

Bug number	Description
DLPX-66809	Removed the Windows Diagnostics Files and Directories on successful Diagnostics upload.
DLPX-67279	Provision failed when the source was from a RAC Oracle Standard Edition database and the target was Oracle Standard Edition.
DLPX-67451	Fixed an issue that sporadically caused replication to fail with an internal error.
DLPX-67454	Delphix Engine should select the highest version ojdbc driver available at ORACLE_HOME/ojdbc/lib.
DLPX-66077	Ensures child worker threads are gracefully exited when parent linked source sync job has completed/terminated.
DLPX-45983	MSSQL Validated sync will resume when storage usage falls below the threshold if storage threshold enforcement failed in the past.
DLPX-67560	Fixed an issue where MT provision may result in ORA-02058 due to un-purged or inflight 2PC transactions on dSource.
DLPX-67594	Old timeflows and snapshots are not getting removed by snapshot retention.
LX-2020	Report the correct amount of memory allocated to EC2 Nitro instances.
DLPX-67413	Fixed an issue where VDB point in time provisioning might fail if Oracle database environment is configured in a non-English locale.
DLPX-67684	PDB provisioning failed if the source had shutdown triggers.
DLPX-67575	Fixed failure during point in time 'Virtual to Physical' provisioning.
DLPX-67668	After setting the database online give it some extra time to startup completely, before doing any further operation on it.

Bug number	Description
DLPX-67759	Redact sensitive information from phone-home data.
DLPX-64638	Validated sync stops working if Delphix cannot connect to the backup server.
DLPX-65559	Even when the staging instance is down, attempt counter to detect backup files keeps on increasing and eventually, it stops detecting backups.
DLPX-56537	When a target host is used by a large number of dSources for staging or has a large number of objects, the performance of Delphix operations like validated sync, refresh, rewind, etc can be slow due to Powershell processes being serialized.
DLPX-67894	Removing cluster resource without removing its dependency can result in cluster failure. So, added retryer logic while fetching the resource dependencies (Get-ClusterResourceDependency) and ultimately fail the operation after all the retries.
DLPX-67813	Unsupported SQL server backup type gets picked while validated sync and the operation fails while looking for the backup. So, introduced a tunable filter to automatically skip SQL backups taken by backup software not supported by yet Delphix.
DLPX-67925	Added env host connectivity toolkit support for SLES on Power9.
DLPX-67934	Retries to fetch image identifiers during Netbackup restore if there is a mismatch between MSDB and Netbackup Master.
DLPX-67655	Fixed an issue where retention enforcement can generate user-visible errors while attempting to delete snapshots with dependencies after PDB migration to new CDB.
LX-1944	EBS NVMe devices can now be used in Delphix Engines.
DLPX-68022	Fixed an issue where hostchecker 'Check Oracle DB Instance' fails on HPUX and AIX.
DLPX-68124	PDBs with lower/mixed case names will not enable after an upgrade.

Bug number	Description
DLPX-68126	Fixed a bug that limits the number of disks that can be added in GCP.
DLPX-67421	Update the primary db file names in a transaction with the Timeflow creation to make sure whenever a Timeflow is created successfully we have its primary file information.
DLPX-67440	Skip VDBs having its current Timeflow as null from 'PrimaryDbFileAvailabilityCheck' as these VDBs doesn't undergo queisceing and are recoverable by refreshing them.
DLPX-61818	Linking wizard - Target Environment step - Privileged Credentials authenticates on the selected target now.
DLPX-68117	Some non-Admin users, lack all permissions, are unable to login to upgraded engine.
DLPX-67290	A wrong version input by user while manually adding a SQL Server instance, created issues in provisioning VDBs. SQL Server version will now be auto-discovered for manually added instances on adding or refreshing the environment.
DLPX-66238	Updated error message to let know user that non discovered CDBs are filtered out from the list when linking a detached source.
DLPX-68457	When a target host is used by a large number of dSources for staging or has a large number of objects, the performance of Delphix operations like validated sync, refresh, rewind, etc can be slow due to Powershell processes being serialized.
DLPX-68484	Fixed the issue where 'lstart' column value of sysusages table was beyond the range of Integer data type by taking the Long data type to store the lstart value.
DLPX-68500	Fixed an issue where the NTP service is not started following a reboot.
DLPX-68290	Support bundle generation can be time-consuming if the engine has a large number of snapshots to process.
DLPX-67792	Fixed issue in grids in which the selection checkbox was unclickable.

Bug number	Description
DLPX-67555	Provision vPDB/vCDB fails with ORA-45900 if the parameter enable_pluggable_database is omitted when specifying database parameters for new vCDB.

3.2.211 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-67782	Engines running 5.3 on EC2 i3 can now be migrated to 6.0.
DLPX-67961	Fixed an issue that prevents ssh access after switching to a static IP address.
DLPX-65948	Fixed a bug that could cause replication jobs to fail with internal errors
DLPX-68025	Improved boot time after 5.3 to 6.0 upgrade by reducing the overhead of setting ZFS properties.
DLPX-67868	Fixed a bug that can cause the management service to run out of memory when disabling the Splunk integration.

3.2.212 Release 6.0.0.0 changes

3.2.213 Fixes that take effect immediately after upgrading

Bug number	Description
DLPX-27433	The analytics GUI network graph shows newly added NIC information without requiring a management service restart.

Bug number	Description
DLPX-33998	If you add a hook script via the CLI, newlines are removed erroneously.
DLPX-40094	Correctly set the default type for the parameters to all operations in the CLI according to the container type.
DLPX-43215	Exclude sybsecurity from the list of auto-discovered databases.
DLPX-48712	Java 6 packages are no longer included in the product image.
DLPX-48280	When a user is set with the Provisioner role the 'provision' button does not appear, meaning anyone set with this role only is unable to provision VDBs.
DLPX-53996	The Delphix Engine does not provide instructions to browsers to avoid caching HTTP responses (pages).
DLPX-54740	Ensure Windows mount points are always unmounted as part VDB refreshes to prevent future VDB refreshes from failing due to "ERROR_ASSIGN_MOUNTPATH: failed to assign mount path for disk at="">>, error="">>
DLPX-55282	In environments where the vPDB has been provisioned using a Delphix provisioned virtual CDB, shutting down the virtual PDB causes it to get into an incorrect "Cannot monitor" state, this has now been fixed to show the correct "Stopped" state.
DLPX-55598	Fixed an issue where vPDB refresh/rollback triggers spurious vCDB restart jobs, after vPDB+vCDB auto-restart.
DLPX-55829	Validated Sync can fail when monitoring ASE backup servers started by using the \$DSLISEN environment variable instead of the "-S" argument. This can be worked around by accessing \$DSLISEN in the RUN_xxxxx script and pass it down as -S.
DLPX-55958	VDBs with no snapshots failed to re-enable after a Delphix Engine upgrade, this has now been fixed.
DLPX-57454	Display underlying ssh error when environment host connections fail.

Bug number	Description
DLPX-58519	Enable Oracle LiveSource when LiveSource is in RESYNC_NEEDED state currently re-start Oracle Redo Apply. Oracle Redo Apply should not be restarted in this state.
DLPX-58760	Fixed a TCP port leak in the network throughput test feature.
DLPX-58845	Provisioning vFiles to the same host using different OS Environment Users no longer fails.
DLPX-59772	The API to list all snapshots consumes a significant amount of memory when there are more than 100,000 snapshots on the engine.
DLPX-60356	Fixed an issue where Oracle remote listener registration fails if set to empty string.
DLPX-60603	Network settings dialog now displays actual MTU value rather than a checkbox.
DLPX-60907	Fixed an issue where the Environment Monitor on Redhat 6.9 and 6.10 might throw unidentified version errors.
DLPX-60979	When user configures connection strings manually, these connect strings can end up connecting to incorrect PDBs/CDBs causing invalid snapshots. Verify that each connection to a PDB/CDB connects to the expected PDB/CDB.
DLPX-60993	Delphix backups create controlfile records; in rare circumstances, these records can cause invalid snapshots. To avoid this problem, remove Delphix backups control file records when using SCN-based SnapSyncs once a SnapSync completes successfully.
DLPX-62094	Allow certificates to expire after issuer certificate expiration.
DLPX-62241	Reduce SSH connections by temporarily preserving and reusing existing Delphix<->host connections where possible.
DLPX-62781	Spurious job event "DISCOVERED_TO_MANUAL_ORACLE_CLUSTER_NODES" no longer shows up for non-Oracle RAC environment refreshes.

Bug number	Description
DLPX-62892	In Oracle versions 18c and 19c, an Oracle bug can prevent the datafile headers from being updated for a standby database when managed recovery is running, resulting in failed SnapSync operations. Alert the user that an Oracle patch might be needed.
DLPX-62962	Removed unneeded EMPTY_RENEGOTIATION cipher
DLPX-62998	Fixed an issue where stale file mounts may be leftover when vPDB provision fails.
DLPX-63469	Initial setup now fails if the system was not provisioned with enough storage.
DLPX-63600	Network settings dialog now displays actual MTU value rather than a checkbox.
DLPX-64641	Fixed an issue where the last snapshot of a vPDB Timeflow can be deleted after the vPDB has been disabled, thus leaving the vPDB in a state with no provisionable snapshots.
DLPX-64711	Allow provisioning to complete when source CDB includes PDBs in a broken state.
DLPX-66020	Provision should remove files present in datafile filesystem that are not part of the database when provisioning a VDB from a VDB.
DLPX-67299	ASE environment discovery will not fail if there is a mismatch of "dataserver name argument" and value of "@@servername".

3.2.214 Fixes that take effect after upgrading and rebooting (optional)

Bug number	Description
DLPX-57384	Fixed a system hang caused by a deadlock in ZFS.

3.3 Known issues

3.3.1 Version 28.0.0.0

Key	Summary	Workaround
DLPX-90568	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-88930	An “Apply Now” upgrade from 18.0.0.x to 19.0.0.x+ will log the user out due to the <code>delphix-mgmt</code> service restarting. The upgrade may still be in progress (e.g. quiesce jobs). To view the upgrade progress, login to Setup as a sysadmin to see the running actions.	None

3.3.2 Version 27.0.0.0

Key	Summary	Workaround
DLPX-90568	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-92005	The option to repave back to the source engine is not supported on Elastic Data Engines.	None
DLPX-88930	An “Apply Now” upgrade from 18.0.0.x to 19.0.0.x+ will log the user out due to the <code>delphix-mgmt</code> service restarting. The upgrade may still be in progress (e.g. quiesce jobs). To view the upgrade progress, login to Setup as a sysadmin to see the running actions.	None

3.3.3 Version 26.0.0.0

Key	Summary	Workaround
DLPX-90568	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-88930	An “Apply Now” upgrade from 18.0.0.x to 19.0.0.x+ will log the user out due to the <code>delphix-mgmt</code> service restarting. The upgrade may still be in progress (e.g. quiesce jobs). To view the upgrade progress, login to Setup as a sysadmin to see the running actions.	None

3.3.4 Version 25.0.0.0

Key	Summary	Workaround
DLPX-58185	Changing a custom policy while it is running on an object can cause the policy execution to fail.	None
DLPX-88930	An “Apply Now” upgrade from 18.0.0.x to 19.0.0.x+ will log the user out due to the <code>delphix-mgmt</code> service restarting. The upgrade may still be in progress (e.g. quiesce jobs). To view the upgrade progress, login to Setup as a sysadmin to see the running actions.	None
DLPX-90568	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-91737	Provisioning an Oracle vPDB fails with <code>exception.oracle.targetscripts.db.pdb.temp</code> during temporary file creation if the source PDB is created with <code>CREATE_FILE_DEST</code> option.	None

3.3.5 Version 24.0.0.0

Key	Summary	Workaround
DLPX-58185	Changing a custom policy while it is running on an object can cause the policy execution to fail.	None
DLPX-88930	An “Apply Now” upgrade from 18.0.0.x to 19.0.0.x+ will log the user out due to the <code>delphix-mgmt</code> service restarting. The upgrade may still be in progress (e.g. quiesce jobs). To view the upgrade progress, login to Setup as a sysadmin to see the running actions.	None
DLPX-90491	SnapSync of a standby Oracle PDB might fail with <code>exception.oracle.sql.snapsync.mounted.pdb.not.consistent</code> during the initial load/full backup if PDB SnapSync is not completed without interruption.	Remove the dSource for the initial load and ensure the PDB SnapSync completes without interruption. For a full backup after the initial, a new full backup with the “Do Not Resume” option will need to be taken, which should complete without interruption.
DLPX-90568	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-90596	Enabling an operation on an Oracle vPDB fails after the vPDB is exported to ASM using an in-place V2ASM operation, followed by a migrate operation.	Provision a new vPDB from the original vPDBs latest point in time and then delete the original vPDB.

Key	Summary	Workaround
DLPX-91299	Having a custom definition of <code>PATH</code> or <code>ORACLE_HOME</code> in <code>.bashrc</code> or <code>.bash_profile</code> in a Linux host may lead to failure of VDB refresh and other VDB Operations.	<p>Remove the following variables from the <code>.bashrc</code> and <code>.bash_profile</code> files for the user profile used by Delphix engine to connect to the host:</p> <ul style="list-style-type: none"> • <code>ORACLE_HOME</code> , <code>ORACLE_SID</code> , <code>ORACLE_BASE</code> , <code>ORACLE_UNQNAME</code> , <code>LD_LIBRARY_PATH</code> , <code>LIBPATH</code> , <code>TNS_ADMIN</code> , <code>NLS_LANG</code> , <code>NLS_DATE_FORMAT</code> . • If <code>PATH</code> is required, ensure it is configured with the existing path prepended, rather than appended or: <ul style="list-style-type: none"> • Consider using a different or dedicated user for Delphix operations to keep the <code>.bashrc</code> and <code>.bash_profile</code> files clean. • Move or clean these files.
DLPX-91506	Network setup will fail on a fresh engine install on VMware if the environment does not contain a DHCP server. Modifications to DNS or MTU will fail on fresh installs regardless of the platform the engine is running on.	None
DLPX-91737	Provisioning an Oracle vPDB fails with <code>exception.oracle.targetscripts.db.pdb.temp</code> during temporary file creation if the source PDB is created with <code>CREATE_FILE_DEST</code> option.	None

3.3.6 Version 23.0.0.0

Key	Summary	Workaround
DLPX-58185	Changing a custom policy while it is running on an object can cause the policy execution to fail.	None
DLPX-88930	An “Apply Now” upgrade from 18.0.0.x to 19.0.0.x+ will log the user out due to the <code>delphix-mgmt</code> service restarting. The upgrade may still be in progress (e.g. quiesce jobs). To view the upgrade progress, login into Setup as a sysadmin to see the running actions.	None
DLPX-89128	<code>/var/crash</code> cleanup should include <code>hprof</code> files in this directory.	None
DLPX-90491	SnapSync of a standby Oracle PDB might fail with <code>exception.oracle.sql.snapsync.mounted.pdb.not.consistent</code> during initial load/full backup if PDB SnapSync is not completed without interruption.	Remove the dSource for initial load and ensure the PDB SnapSync completes without interruption. For a full backup after the initial, a new full backup with the “Do Not Resume” option will need to be taken, which should complete without interruption.
DLPX-90568	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-90596	Enabling an operation on an Oracle vPDB fails after the vPDB is exported to ASM using an in-place V2ASM operation, followed by a migrate operation.	Provision a new vPDB from the original vPDB's latest point in time and then delete the original vPDB.

Key	Summary	Workaround
DLPX-91299	Having custom definition of PATH or ORACLE_HOME in .bashrc or .bash_profile in a linux host may lead to failure of VDB refresh and other VDB Operations.	<p>Remove the following variables from the .bashrc and .bash_profile files for the user profile used by Delphix engine to connect to the host:</p> <ul style="list-style-type: none"> • ORACLE_HOME, ORACLE_SID, ORACLE_BASE, ORACLE_UNQNAME, LD_LIBRARY_PATH, LIBPATH, TNS_ADMIN, NLS_LANG, NLS_DATE_FORMAT • If PATH is required, ensure it is configured with the existing path prepended, rather than appended. <p>or</p> <p>Consider using a different or dedicated user for Delphix operations to keep the .bashrc and .bash_profile files clean.</p> <p>or</p> <p>Move or clean these files.</p>

3.3.7 Version 22.0.0.0

Key	Summary	Workaround
DLPX-58185	Changing a custom policy while it is running on an object can cause the policy execution to fail.	None
DLPX-88930	An “Apply Now” upgrade from 18.0.0.x to 19.0.0.x+ will log the user out due to the <code>delphix-mgmt</code> service restarting. The upgrade may still be in progress (e.g. quiesce jobs). To view the upgrade progress, login into Setup as a sysadmin to view the running actions.	None
DLPX-89128	<code>/var/crash</code> cleanup should include hprof files in this directory.	None

Key	Summary	Workaround
DLPX-90491	SnapSync of a standby Oracle PDB might fail with <code>exception.oracle.sql.snapsync.mounted.pdb.not.consistent</code> during initial load/full backup if PDB SnapSync is not completed without interruption.	Remove the dSource for initial load and ensure the PDB SnapSync completes without interruption. For a full backup after initial, a new full backup with “Do Not Resume” option will need to be taken, and this should complete without interruption.
DLPX-90568	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-90596	Enable operation on an Oracle vPDB fails after the vPDB is exported to ASM using an in-place V2ASM operation followed by a migrate operation.	Provision a new vPDB from the original vPDB's latest point in time and then delete the original vPDB.
DLPX-90748	Failed to proxy-enable a vPDB when its vCDB's name has same prefix as another vCDB.	Enable the vCDB first and then it's corresponding vPDB.
DLPX-90785	SnapSync operation for Oracle Staging Push dSources will fail with <code>exception.oracle.dsource.stagingdb.datafile.checkpoint_scn.not.matching</code> if the production database has read-only tablespaces.	No workaround.
DLPX-90805	ZFS filesystems are created with 128k block size for Oracle Staging Push dSources resulting in high CPU usage and NFS latency.	No workaround.

Key	Summary	Workaround
DLPX-91299	Having custom definition of PATH or ORACLE_HOME in .bashrc or .bash_profile in a linux host may lead to failure of VDB refresh and other VDB Operations.	<p>Remove the following variables from the .bashrc and .bash_profile files for the user profile used by Delphix engine to connect to the host:</p> <ul style="list-style-type: none"> ORACLE_HOME, ORACLE_SID, ORACLE_BASE, ORACLE_UNQNAME, LD_LIBRARY_PATH, LIBPATH, TNS_ADMIN, NLS_LANG, NLS_DATE_FORMAT If PATH is required, ensure it is configured with the existing path prepended, rather than appended. <p>or</p> <p>Consider using a different or dedicated user for Delphix operations to keep the .bashrc and .bash_profile files clean.</p> <p>or</p> <p>Move or clean these files.</p>

3.3.8 Version 21.0.0.0

Key	Summary	Workaround
DLPX-58185	Changing a custom policy while it is running on an object can cause the policy execution to fail.	None
DLPX-78589	During an upgrade, when the Continuous Data Engine tries to run the ASE UNMOUNT command while also trying to quiesce VDBs, the UNMOUNT command gets stuck (this command does not run under a timeout). Due to this, the upgrade job is stalled.	When the ASE UNMOUNT command is hung, the ASE instance must be restarted.

Key	Summary	Workaround
DLPX-86181	Provision, refresh, rewind, or start operations on a virtual database, on a Solaris host with NFSv4 enabled, may become stuck indefinitely due to the mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Delphix Continuous Data Engine CLI, manually terminate the stuck mount processes on the Solaris host, then re-attempt the failed operation.
DLPX-88930	An “Apply Now” upgrade from 18.0.0.x to 19.0.0.x+ will log the user out due to the delphix-mgmt service restarting. The upgrade may still be in progress (e.g. quiesce jobs). To view the upgrade progress, login into Setup as a sysadmin to view the running actions.	None
DLPX-89128	<code>/var/crash</code> cleanup should include hprof files in this directory.	None
DLPX-89562	Self-Service Refresh can still get an <code>IllegalStateException</code> while running the reprovision, because of retries for reprovision.	<p>The default <code>retryAttempts</code> is 1 for Self-Service operations. Thus, if a Self-Service operation like deprovision/reprovision failed during a refresh, Delphix will retry the operation (deprovision/reprovision) again. To stop retrying the operation, set the <code>retryAttempts</code> to 0 to get the real error, instead of an internal error. This will enable Delphix to analyze the actual error for the failed scenario.</p> <pre> ip-10-110-195-124 selfservice config update *> ip-10-110-195-124 selfservice config update *> set retryAttempts=0 ip-10-110-195-124 selfservice config update *> commit; ip-10-110-195-124 selfservice config> </pre>

Key	Summary	Workaround
DLPX-89696	The start of an Oracle RAC virtual PDB in a virtual CDB, fails with an <code>exception.oracle.targetscripts.pdb.open</code> error if the virtual PDB is already running.	<p>Start the vCDB instances manually (one at a time) from the CLI on all the nodes where the vPDB instance is not running as follows:</p> <ol style="list-style-type: none"> 1. Stop the vCDB instance on the node first if its already running: <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <pre>source → select vcdb → stop; set instances.0=<i>instance number>; commit</pre> </div> 2. Start the vCDB instance on the node: <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <pre>source → select → start; set instances.0=<i>instance number>; commit</pre> </div> 3. Start the vPDB from the Delphix UI.
DLPX-90596	Enable operation on a vPDB fails after the vPDB is exported to ASM using an in-place V2ASM operation followed by a migrate operation.	Provision a new vPDB from the original vPDB's latest point in time and then delete the original vPDB.

3.3.9 Version 20.0.0.0

Key	Summary	Workaround
DLPX-58185	Changing a custom policy while it is running on an object can cause the policy execution to fail.	None
DLPX-78589	During an upgrade, when the Continuous Data Engine tries to run the ASE <code>UNMOUNT</code> command while also trying to quiesce VDBs, the <code>UNMOUNT</code> command gets stuck (this command does not run under a timeout). Due to this, the upgrade job is stalled.	When the ASE <code>UNMOUNT</code> command is hung, the ASE instance must be restarted.

Key	Summary	Workaround
DLPX-84598	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-86181	Provision, refresh, rewind, or start operations on a virtual database, on a Solaris host with NFSv4 enabled, may become stuck indefinitely due to the mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Delphix Continuous Data Engine CLI, manually terminate the stuck mount processes on the Solaris host, then re-attempt the failed operation.
DLPX-87213	When relocating multiple terabytes of data either via block to object storage migration or device removal, management of the engine can become unresponsive for a lengthy period of time (e.g. 30+ mins), dependent on the dataset size and workload.	None, the data relocation and concurrent IO workloads will continue in the background. If the engine cannot be accessed after one hour, contact Delphix Support for corrective actions.
DLPX-88930	An Apply Now upgrade from 18.0.0.x to 19.0+ will log the user out due to the delphix-mgmt service restarting. The upgrade may still be in progress (e.g. quiesce jobs). To view the upgrade progress, login into Setup as a sysadmin to view the running actions.	None
DLPX-89128	/var/crash cleanup should include hprof files in this directory.	None

Key	Summary	Workaround
<p>DLPX-89562</p>	<p>Self-service refresh can still get an <code>IllegalStateException</code> while running the reprovision, because of retries for reprovision.</p>	<p>The default <code>retryAttempts</code> is 1 for Self-Service operations. Thus, if a Self-Service operation like deprovision/reprovision failed during a refresh, Delphix will retry the operation (deprovision/reprovision) again. Start the vCDB instance on the node: <div data-bbox="991 853 1423 1003" style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <pre>source → select → start; set instances.0=<i nstance number>; commit</pre> </div> 3. Start the vPDB from the Delphix UI.

3.3.10 Version 19.0.0.0

Key	Summary	Workaround
DLPX-58185	Changing a Custom Policy while it is running on an object can cause the Policy execution to fail.	None
DLPX-78589	During an upgrade, when the engine tries to run the ASE <code>UNMOUNT</code> command while also trying to quiesce VDBs, the <code>UNMOUNT</code> command gets stuck (this command does not run under a timeout). Due to this, the upgrade job is stalled.	When the ASE <code>UNMOUNT</code> command is hung, the ASE instance must be restarted.
DLPX-84598	A sysadmin user cannot view actions initiated by a different sysadmin user.	None

Key	Summary	Workaround
DLPX-84710	Improved handling of missing networking devices after instance type migration.	None
DLPX-86181	Provision, refresh, rewind, or start operations on a virtual database on a Solaris host with NFSv4 enabled may become stuck indefinitely due to mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Delphix Continuous Data Engine CLI, manually terminate the stuck mount processes on the Solaris host, then re-attempt the failed operation.
DLPX-87213	When relocating multiple terabytes of data either via block-to-object storage migration or device removal, management of the engine can become unresponsive for a lengthy period of time (i.e. 30+ mins), dependent on the dataset size and workload.	None, the data relocation and concurrent IO workloads will continue in the background. If the engine cannot be accessed after one hour, contact Delphix Support for corrective actions.
DLPX-88930	An 'Apply Now' upgrade from 18.0.0.x to 19.0.0.x will logout the user due to the delphix-mgmt service restarting. The upgrade may still be in progress (e.g. quiesce jobs). To view the upgrade progress, login into Setup as sysadmin to view the Running Actions.	None
DLPX-89128	<code>/var/crash</code> cleanup should include hprof files in this directory.	None
DLPX-89817	Software keystore TDE-enabled provisioning fails after upgrading to 19.0.0.0	Refresh the source environment after the Delphix engine upgrade and re-attempt the provision.

3.3.11 Version 18.0.0.0

Key	Summary	Workaround
DLPX-58185	Changing a Custom Policy while it is running on an object can cause the Policy execution to fail.	None

Key	Summary	Workaround
DLPX-78589	During an upgrade, when the engine tries to run the ASE UNMOUNT command while also trying to quiesce VDBs, the UNMOUNT command gets stuck (this command does not run under a timeout). Due to this, the upgrade job is stalled.	When the ASE UNMOUNT command is stuck, the ASE instance must be restarted.
DLPX-82158	When discovering an Oracle RAC cluster, the engine automatically assigns instance numbers starting with 1, resulting in SnapSync failures.	Manually update the RAC instance number through the Delphix CLI after an environment refresh.
DLPX-84598	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-84710	Improved handling of missing networking devices after instance type migration.	None
DLPX-86181	Provision, refresh, rewind, or start operations on a virtual database on a Solaris host with NFSv4 enabled may become stuck indefinitely due to mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Delphix Continuous Data Engine CLI, manually terminate the stuck mount processes on the Solaris host, then re-attempt the failed operation.
DLPX-87213	When relocating multiple terabytes of data either via block-to-object storage migration or device removal, management of the engine can become unresponsive for a lengthy period of time (i.e. 30+ mins), dependent on the dataset size and workload.	None, the data relocation and concurrent IO workloads will continue in the background. If the engine cannot be accessed after one hour, contact Delphix Support for corrective actions.
DLPX-88322	If a datafile is added when a SnapSync job is running, provision or refresh to the snapshot generated by the SnapSync job will fail.	Take a new source snapshot (incremental is fine) and refresh the vPDB from the new snapshot.

3.3.12 Version 17.0.0.0

Key	Summary	Workaround
DLPX-56944	In Solaris 5.11 environments where the Delphix OS user shell is set to <code>csh</code> , host parameters may be improperly parsed, leading to environment refresh and other job failures.	Contact Delphix Support for corrective actions.
DLPX-58185	Changing a custom policy while it is running on an object can cause the policy execution to fail.	None
DLPX-66155	Restarting a Delphix Continuous Data Engine during a network throughput test is not recommended, as it may lead to a system hang.	None
DLPX-78589	During an upgrade, when the Continuous Compliance Engine attempts to run the ASE <code>UNMOUNT</code> command while trying to quiesce VDBs, the <code>UNMOUNT</code> command hangs up because that command does not run under a timeout. Due to this, the upgrade job stalls.	When the ASE <code>UNMOUNT</code> command hangs, the ASE instance must be restarted.
DLPX-82158	When discovering an Oracle RAC cluster, Delphix automatically assigns instance numbers starting with 1, resulting in SnapSync failures	Manually update the RAC instance number through the Delphix CLI after an environment refresh.
DLPX-84598	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-84710	Improving the handling of missing networking devices after instance type migration.	None
DLPX-86181	Provision, refresh, rewind, or start operations on a Solaris-hosted VDB with NFSv4 enabled may get stuck indefinitely, due to the mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Delphix Continuous Data Engine CLI, manually terminate the stuck mount processes on the Solaris host, then re-attempt the failed Delphix operation.

Key	Summary	Workaround
DLPX-87213	When relocating multiple terabytes of data (either via block-to-object storage migration or device removal), management of the engine can become unresponsive for a lengthy period of time (30+ mins), dependent on the dataset size and workload.	None, the data relocation and concurrent IO workloads will continue in the background. If the engine cannot be accessed after one hour, contact Delphix Support for corrective actions.
DLPX-88322	If a datafile is added when a SnapSync job is running, provision or refresh to the snapshot generated by the SnapSync job will fail.	Take a new source snapshot (incremental is fine) and refresh the vPDB from the new snapshot.

3.3.13 Version 16.0.0.0

Key	Summary	Workaround
DLPX-56944	In Solaris 5.11 environments where the Delphix OS user shell is set to <code>csh</code> , host parameters may be improperly parsed, leading to environment refresh and other job failures.	Contact Delphix Support for corrective actions.
DLPX-56978	Certain usernames are not available for use, as they are reserved system words (e.g. "root", "postgres", "delphix").	None
DLPX-56979	LDAP server test fails if authentication is set to DIGEST-MD5, but setup still works correctly.	None
DLPX-57142	The Job dashboard does not display the user that invoked each Job.	None
DLPX-57412	CLI parameters must be used exactly as described in documentation, including spelling and capitalization, or they are ignored.	None
DLPX-57673	Support bundle generation can be time consuming if the engine has a large number of core files to process.	None
DLPX-57823	Changing the Compliance Engine used by a VDB's masking job can lead to an internal error.	None

Key	Summary	Workaround
DLPX-58185	Changing a custom policy while it is running on an object can cause the policy execution to fail.	None
DLPX-59473	It is not possible to set a password policy that prevents an administrator from re-using a previous password, though this can be set for other users.	None
DLPX-66155	Restarting a Data Engine during a network throughput test is not recommended, as it may lead to a system stall.	None
DLPX-77986	On a Sybase host with multiple Sybase instances, if access to the first instance picked up for discovery fails due to invalid credentials, the discovery job will exit immediately – preventing discovery of the remaining instances.	Fix any credential failures.
DLPX-78589	During an upgrade, when the Data Engine tries to run the ASE <code>UNMOUNT</code> command while trying to quiesce VDBs, the <code>UNMOUNT</code> command hangs; this command doesn't run under a timeout and due to this, the upgrade job stalled.	When the ASE <code>UNMOUNT</code> command hangs, the ASE instance must be restarted.
DLPX-81478	If a transaction log is taken using the <code>standby_access</code> option for a SAP ASE database, the validated sync worker will not be able to restore that log, and will fail with a fatal exception (as Delphix does not currently support this option).	Change the backup script creating transaction logs to ingest FULL backups.
DLPX-81559	After upgrading an Oracle VDB from 12c to 19c, VDB refresh fails with "Failed to mount database instance" due to ORA-01130 or ORA-00201 errors.	Update the VDB parameters (either directly or via a VDB Config Template). See this knowledge base article.
DLPX-84598	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-84710	Improved handling of missing networking devices after instance type migration.	None

Key	Summary	Workaround
DLPX-86181	Provision, refresh, rewind or start operations on a virtual database, on a Solaris host with NFSv4 enabled, may become stuck indefinitely due to the mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Data Engine CLI, manually terminate the stuck mount processes on the Solaris host, and re-attempt the failed Delphix operation.
DLPX-87213	When relocating multiple terabytes of data, either via block to object storage migration or device removal, management of the engine can become unresponsive for a lengthy period of time (e.g. 30+ mins), dependent on the dataset size and workload.	None, the data relocation and concurrent IO workloads will continue in the background. If the engine cannot be accessed after one hour, contact Delphix Support for corrective actions.
DLPX-88040	Steps have been taken to make the users understand the reason of disabling some datasets during SDD Replication.	None
DLPX-88322	Provisioning or refreshing from a snapshot of an Oracle vPDB may fail during the renaming the data files stage if a data file is added during a SnapSync job.	Take a new source snapshot (incremental is fine) and refresh the vPDB from the new snapshot.

3.3.14 Version 15.0.0.0

Key	Summary	Workaround
DLPX-56944	In Solaris 5.11 Environments where Delphix OS user shell is set to csh, host parameters may be improperly parsed leading to Environment refresh and other job failures.	Contact Delphix Support for corrective actions.
DLPX-56978	Certain usernames are not available for use as they are reserved system words (e.g. "root", "postgres", "delphix").	None
DLPX-56979	LDAP server test fails if authentication is set to DIGEST-MD5, but setup still works correctly.	None
DLPX-57142	The Job dashboard does not display the user that invoked each Job.	None

Key	Summary	Workaround
DLPX-57412	CLI parameters must be used exactly as described in documentation, including spelling and capitalization, or they are ignored	None
DLPX-57673	Support bundle generation can be time consuming if the engine has a large number of core files to process.	None
DLPX-57823	Changing the masking engine used by a VDB's masking job can lead to an internal error.	None
DLPX-58185	Changing a Custom Policy while it is running on an object can cause the Policy execution to fail.	None
DLPX-59473	It is not possible to set a password policy that prevents an Administrator from re-using a previous password, though this can be set for other users.	None
DLPX-66155	Restarting a Delphix Engine during a network throughput test is not recommended as it may lead to a system hang.	None
DLPX-66860	For SSO/SAML, ADFS requires explicit rule to transform emailAddress attribute into nameid.	Create an explicit rule in ADFS that transforms the emailAddress attribute into a nameid. The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type "Name ID". The nameid format must be "Email address".
DLPX-77986	On a sybase host with multiple Sybase instances, If access to the first instance picked up for discovery fails due to invalid credentials, the discovery job will exit immediately preventing discovery of the remaining instances.	Fix any credential failures.
DLPX-78589	During the upgrade, when Delphix was trying to run the ASE "UNMOUNT" command while trying to quiesce VDBs, UNMOUNT command got hung as this command doesn't run under a timeout and due to this upgrade job stalled.	When the ASE UNMOUNT command is hung, the ASE instance must be restarted.

Key	Summary	Workaround
DLPX-81478	If a transaction log is taken using the standby_access option for a SAP ASE database, the validated sync worker will not be able to restore that log, and will fail with Delphix fatal exception (as Delphix currently does not support this option).	Change the backup script creating transaction logs to Ingest FULL backups
DLPX-81559	After upgrading an Oracle VDB from 12c to 19c, VDB refresh fails with "Failed to mount database instance" due to ORA-01130 or ORA-00201 errors.	Update the VDB parameters (either directly or via a VDB Config Template). See this knowledge base article.
DLPX-83643	After engine upgrade or after disable and enable of vPDB, NFS version in GUI/API may be incorrect if - it is a vPDB in a vCDB, it was mounted with NFSv3 and now the host supports NFSv4 mounts. This condition corrects itself on the next refresh operation.	Perform a vPDB refresh operation to update the NFS protocol version to 4.
DLPX-84253	Users should be able to delete Delphix-generated CA certificate if no dependencies exist.	Customer may mark the fault Ignored, but will need to be aware the CA certificate will still appear in Truststore.
DLPX-84598	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-84710	Improved handling of missing networking devices after instance type migration	None
DLPX-86181	Provision, refresh, rewind or start operations on a virtual database on a Solaris host with NFSv4 enabled may become stuck indefinitely due to mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Delphix engine CLI, manually terminate the stuck mount processes on the Solaris host and re-attempt the failed Delphix operation.
DLPX-87213	When relocating multiple terabytes of data either via block to object storage migration or device removal, management of the engine can become unresponsive for a lengthy period of time (e.g. 30+ mins), dependent on the dataset size and workload.	None, the data relocation and concurrent IO workloads will continue in the background. If the engine cannot be accessed after one hour, contact Delphix Support for corrective actions.

Key	Summary	Workaround
DLPX-87320	Exporting a VDB or vPDB to ASM will fail with ORA-32771 when the database has a bigfile temporary tablespace.	If using the move-to-asm script, use an older version of script from Delphix engine v6.0.15.0 or earlier. No workaround if attempting to export a VDB or vPDB to a physical ASM or Exadata database when the database has a bigfile temporary tablespace using the database export CLI.
DLPX-87702	Provisioning an Oracle VDB/vPDB fails with "ORA-03214: File Size specified is smaller than minimum required" when tempfiles have a non-default local uniform size.	Recreate temp files in the source database with size smaller than 50MB and take a new snapshot.

3.3.15 Version 14.0.0.0

Key	Summary	Workaround
DLPX-56944	In Solaris 5.11 environments where Delphix OS user shell is set to <code>csh</code> , host parameters may be improperly parsed, leading to environment refresh and other job failures.	Contact Delphix Support for corrective actions.
DLPX-56978	Certain usernames are not available for use, as they are reserved system words (e.g. "root", "postgres", "delphix").	None
DLPX-56979	LDAP server test fails if authentication is set to DIGEST-MD5, but setup still works correctly.	None
DLPX-57142	The Job dashboard does not display the user that invoked each Job.	None
DLPX-57412	CLI parameters must be used exactly as described in documentation, including spelling and capitalization, or they are ignored.	None
DLPX-57673	Support bundle generation can be time consuming if the engine has a large number of core files to process.	None

Key	Summary	Workarround
DLPX-57823	Changing the Compliance Engine used by a VDB's masking job can lead to an internal error.	None
DLPX-58185	Changing a Custom Policy while it is running on an object can cause the Policy execution to fail.	None
DLPX-58226	Completed cleanup jobs may still show as running, even after an upgrade.	None
DLPX-59473	It is not possible to set a password policy that prevents an administrator from re-using a previous password, though this can be set for other users.	None
DLPX-66155	Restarting a Delphix Engine during a network throughput test is not recommended as it may lead to a system hang.	None
DLPX-66860	For SSO/SAML, ADFS requires explicit rule to transform <code>emailAddress</code> attribute into <code>nameid</code> .	Create an explicit rule in ADFS that transforms the <code>emailAddress</code> attribute into a <code>nameid</code> . The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type "Name ID". The <code>nameid</code> format must be "Email address".
DLPX-77849	An excessive number of connections to the SQL Server instance can cause infrastructure issues, leading the LSASS.exe to crash and the host to reboot.	Rather than using a Windows domain user for authentication, switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.
DLPX-77986	On a sybase host with multiple Sybase instances, If access to the first instance picked up for discovery fails due to invalid credentials, the discovery job will exit immediately preventing discovery of the remaining instances.	Fix any credential failures.

Key	Summary	Workarround
DLPX-78589	During the upgrade, when Delphix was trying to run the ASE "UNMOUNT" command while trying to quiesce VDBs, UNMOUNT command got hung as this command does not run under a timeout and due to this, the upgrade job stalled.	When the ASE UNMOUNT command is hung, the ASE instance must be restarted.
DLPX-80193	A vague error message appears in a case where provisioning fails due to a database being in read-only mode.	Change source database to read-write, create a backup and sync to the dSource and provision VDB.
DLPX-81300	Windows Environment Add/Refresh operations may fail if the iSCSI Initiator Name is not a valid IQN.	Set the initiator name to a valid name, e.g. <code>iqn.1991-05.com.microsoft:10-43-47-42.qa-ad.delphix.com</code> . The "Default" button can also be selected in Windows iSCSI configuration to reset to the default (valid) name.
DLPX-81478	If a transaction log is taken using the <code>standby_access</code> option for a SAP ASE database, the validated sync worker will not be able to restore that log, and will fail with Delphix fatal exception (as Delphix currently does not support this option).	Change the backup script creating transaction logs to Ingest FULL backups.
DLPX-81559	After upgrading an Oracle VDB from 12c to 19c, VDB refresh fails with "Failed to mount database instance" due to ORA-01130 or ORA-00201 errors.	Update the VDB parameters (either directly or via a VDB Config Template). See this knowledge base ⁷⁶ article.
DLPX-83643	After engine upgrade or after disable and enable of vPDB, NFS version in GUI/API may be incorrect; for a vPDB in a vCDB, it was mounted with NFSv3 and now the host supports NFSv4 mounts. This condition corrects itself on the next refresh operation.	Perform a vPDB refresh operation to update the NFS protocol version to 4.

⁷⁶ [https://support.delphix.com/Continuous_Data_Engine_\(formerly_Virtualization_Engine\)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_\(KBA6234\)](https://support.delphix.com/Continuous_Data_Engine_(formerly_Virtualization_Engine)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_(KBA6234))

Key	Summary	Workarround
DLPX-84075	SQL Server VDB Refresh operations may fail if the PowerShell command <code>[IO.Path]::GetTempFileName()</code> returns no value.	Go to the temp directory below and delete all files from it: <code>C:\Window\ServiceProfiles\NetworkService\appdata\local\temp</code>
DLPX-84253	Users should be able to delete Delphix-generated CA certificate if no dependencies exist.	Mark related faults as Ignored, but note that the CA certificate will still appear in Truststore.
DLPX-84598	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-84710	Improved handling of missing networking devices after instance type migration required.	None
DLPX-86181	Provision, refresh, rewind, or start operations on a virtual database on a Solaris host with NFSv4 enabled may become stuck indefinitely due to mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Delphix engine CLI, manually terminate the stuck mount processes on the Solaris host and re-attempt the failed Delphix operation.
DLPX-86894	After a canceled refresh operation, VDB refresh or delete may fail due to error code <code>exception.oracle.vdb.no.virtual.datafiles.found</code> . As a workarround, disable the VDB and try the operation again.	Disable the VDB and re-attempt the failed operation.
DLPX-87320	Exporting a VDB or vPDB to ASM fails with "ORA-32771: cannot add file to bigfile tablespace" when the database has a bigfile temporary tablespace	If using the <code>move-to-asm</code> script, use an older version of script from Delphix engine v6.0.15.0 or earlier. No workarround if attempting to export a VDB or vPDB to a physical ASM or Exadata database using the <code>database export</code> CLI.

3.3.16 Version 13.0.0.0

Key	Summary	Workaround
DLPX-56944	In Solaris 5.11 environments where the Delphix OS user shell is set to <code>csch</code> , host parameters may be improperly parsed, leading to 'environment refresh' and other job failures.	Contact Delphix Support for corrective actions.
DLPX-56978	Certain usernames are not available for use, as they are reserved system words (e.g. "root", "postgres", "delphix").	None
DLPX-56979	LDAP server test fails if authentication is set to DIGEST-MD5, but setup still works correctly.	None
DLPX-57142	The Job dashboard does not display the user that invoked each job.	None
DLPX-57412	CLI parameters must be used exactly as described in documentation, including spelling and capitalization, or they are ignored.	None
DLPX-57673	Support bundle generation can be time consuming if the engine has a large number of core files to process.	None
DLPX-57823	Changing the Compliance engine used by a VDB's masking job can lead to an internal error.	None
DLPX-58185	Changing a Custom Policy while it is running on an object can cause the Policy execution to fail.	None
DLPX-58226	Completed cleanup jobs may still show as running, even after an upgrade.	None
DLPX-59473	It is not possible to set a password policy that prevents an Administrator from re-using a previous password, though this can be set for other users.	None

DLPX-66155	Restarting a Delphix Engine during a network throughput test is not recommended, as it may lead to a system hang.	None
DLPX-66860	For SSO/SAML, ADFS requires an explicit rule to transform the emailAddress attribute into nameid.	Create an explicit rule in ADFS that transforms the emailAddress attribute into a nameid. The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type is "Name ID". The nameid format must be "Email address".
DLPX-77849	An excessive number of connections to the SQL Server instance can cause infrastructure issues, leading the LSASS.exe to crash and the host to reboot.	Rather than using a Windows domain user for authentication, switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.exe.
DLPX-77986	On a Sybase host with multiple Sybase instances, if access to the first instance picked up for discovery fails due to invalid credentials, the discovery job will exit immediately (preventing discovery of the remaining instances).	Fix any credential failures.
DLPX-78589	During an upgrade, when Delphix tried to run the ASE "UNMOUNT" command, while trying to quiesce VDBs, the UNMOUNT command got hung (as this command doesn't run under a timeout); due to this, the upgrade job stalled.	When the ASE UNMOUNT command is hung, the ASE instance must be restarted.
DLPX-80193	Vague error message appears in a case where provisioning fails due to a database being in read-only mode.	Change source the database to read-write, create a backup, sync to the dSource, and provision VDB.
DLPX-81300	Windows Environment Add/Refresh operations may fail if the iSCSI Initiator Name is not a valid IQN.	Set the initiator name to a valid name, eg: iqn.1991-05.com.microsoft:10-43-47-42.qa-ad.delphix.com. The "Default" button can also be selected in the Windows iSCSI configuration to reset to the default (valid) name.

DLPX-81478	If a transaction log is taken using the <code>standby_access</code> option for an SAP ASE database, the validated sync worker will not be able to restore that log and will fail with a Delphix fatal exception (as Delphix currently does not support this option).	Change the backup script creating transaction logs to ingest FULL backups.
DLPX-81559	After upgrading an Oracle VDB from 12c to 19c, a VDB refresh fails with, "Failed to mount database instance" due to ORA-01130 or ORA-00201 errors.	Update the VDB parameters (either directly or via a VDB Config Template). See this knowledge base⁷⁷ article.
DLPX-83643	After engine upgrade or after disable and enable of a vPDB, the NFS version in the GUI/API may be incorrect if it's a vPDB in a vCDB; this means it was mounted with NFSv3, and now the host supports NFSv4 mounts. This condition corrects itself on the next refresh operation.	Perform a vPDB refresh operation to update the NFS protocol version to 4.
DLPX-84075	SQL Server VDB Refresh operations may fail if the PowerShell command <code>[IO.Path]::GetTempFileName()</code> returns no value.	Go to the following temp directory and delete all the files from it: C:\Windows\ServiceProfiles\NetworkService\appdata\local\temp
DLPX-84253	Unable to delete Delphix-generated CA certificate if no dependencies exist.	Mark the fault Ignored, but the CA certificate will still appear in Truststore.
DLPX-84598	A sysadmin user cannot view actions initiated by a different sysadmin user.	None
DLPX-84710	Improved handling of missing networking devices after instance type migration required.	None

⁷⁷ [https://support.delphix.com/Continuous_Data_Engine_\(formerly_Virtualization_Engine\)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_\(KBA6234\)](https://support.delphix.com/Continuous_Data_Engine_(formerly_Virtualization_Engine)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_(KBA6234))

DLPX-85770	If a Oracle VDB/vPDB is already enabled, a Self-Service container <code>start</code> operation or the VDB/vPDB <code>enable</code> operation may fail with <code>exception.oracle.vdb.database.exists.enable.not.allowed / exception.oracle.vdb.pdb.exists.enable.not.allowed</code> .	Retry the failed VDB/vPDB start or self-service container start operation, it should succeed without any error.
DLPX-86181	Provision, refresh, rewind or start operations on a virtual database on a Solaris host with NFSv4 enabled may become stuck indefinitely due to the mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Delphix engine CLI, manually terminate the stuck mount processes on the Solaris host and re-attempt the failed Delphix operation.
DLPX-87006	Refresh operation fails for the self service containers having ordered sources.	None. Contact Delphix support for corrective actions.

3.3.17 Version 12.0.0.0

Key	Summary	Workaround
DLPX-56944	In Solaris 5.11 environments where the Delphix OS user shell is set to <code>csch</code> , host parameters may be improperly parsed, leading to environment refresh and other job failures.	Contact Delphix Support for corrective actions.
DLPX-56978	Certain usernames are not available for use, as they are reserved system words (e.g. "root", "postgres", "delphix").	None
DLPX-56979	LDAP server test fails if authentication is set to DIGEST-MD5, but setup still works correctly.	None
DLPX-57142	The Job dashboard does not display the user that invoked each Job.	None
DLPX-57412	CLI parameters must be used exactly as described in documentation, including spelling and capitalization, or they are ignored.	None

Key	Summary	Workaround
DLPX-57673	Support bundle generation can be time consuming if the engine has a large number of core files to process.	None
DLPX-57823	Changing the masking engine used by a VDB's masking job can lead to an internal error.	None
DLPX-58185	Changing a Custom Policy while it is running on an object can cause the Policy execution to fail.	None
DLPX-58226	A completed Cleanup Job, after upgrade, still shows as "running".	None
DLPX-59473	It is not possible to set a password policy that prevents an Administrator from re-using a previous password, though this can be set for other users.	None
DLPX-66155	Restarting a Delphix Engine during a network throughput test is not recommended, as it may lead to a system hang.	None
DLPX-66860	For SSO/SAML, ADFS requires explicit rule to transform emailAddress attribute into nameid.	Create an explicit rule in ADFS that transforms the emailAddress attribute into a nameid. The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type is "Name ID". The nameid format must be "Email address".
DLPX-77849	An excessive number of connections to SQL Server Instances causes infrastructure issues and leads LSASS.exe to crash, and host to reboot.	Rather than using a Windows domain user for authentication, switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.

Key	Summary	Workaround
DLPX-77986	On a sybase host with multiple Sybase instances, If access to the first instance picked up for discovery fails due to invalid credentials, the discovery job will exit immediately preventing discovery of the remaining instances.	Fix any credential failures
DLPX-78589	During the upgrade, when Delphix was trying to run the ASE "UNMOUNT" command while trying to quiesce VDBs, the UNMOUNT command gets hung (as this command doesn't run under a timeout and due to this, the upgrade job stalled).	When the ASE UNMOUNT command is hung, the ASE instance must be restarted.
DLPX-80193	Provide a proper error message in case provisioning fails due to database being in read-only mode.	Change source database to read-write, create a backup and sync to the dSource, and provision VDB.
DLPX-80920	A failed Delphix Engine upgrade can cause plugin operations to fail with "grpc_status 14".	Verify the upgrade and then apply the upgrade. If the issue occurs after a failed upgrade, restarting the management stack will resolve the issue.
DLPX-81300	Windows environment Add/Refresh operations may fail if the iSCSI Initiator Name is not a valid IQN.	Set initiator name to a valid name, eg: iqn.1991-05.com.microsoft:10-43-47-42.qa-ad.delphix.com The "Default" button can also be selected in the windows iSCSI configuration to reset to the default (valid) name.
DLPX-81478	If a transaction log is taken using the standby_access option for a SAP ASE database, the validated sync worker will not be able to restore that log, and will fail with Delphix fatal exception (as Delphix currently does not support this option).	Change the backup script creating transaction logs to ingest FULL backups.
DLPX-81559	After upgrading an Oracle VDB from 12c to 19c, VDB refresh fails with "Failed to mount database instance", due to ORA-01130 or ORA-00201 errors.	Update the VDB parameters (either directly or via a VDB Config Template). See this knowledge base⁷⁸ article.

⁷⁸[https://support.delphix.com/Continuous_Data_Engine_\(formerly_Virtualization_Engine\)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_\(KBA6234\)](https://support.delphix.com/Continuous_Data_Engine_(formerly_Virtualization_Engine)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_(KBA6234))

Key	Summary	Workaround
DLPX-83643	After an engine upgrade or after the disable/enable of a vPDB, the NFS version in the GUI/API may be incorrect if it's a vPDB in a vCDB or it was mounted with NFSv3 (and now the host supports NFSv4 mounts). This condition corrects itself on the next refresh operation.	Perform a vPDB refresh operation to update the NFS protocol version to 4.
DLPX-84075	SQL Server VDB Refresh operations may fail if the PowerShell command <code>[IO.Path]::GetTempFileName()</code> returns no value.	Go to the below mentioned temp directory, and delete all the files from it: <code>C:\Window\ServiceProfiles\NetworkService\apdata\local\temp</code> .
DLPX-84253	Users should be able to delete the Delphix-generated CA certificate, if no dependencies exist.	Users may mark the fault Ignored, but will need to be aware the CA certificate will still appear in Truststore.
DLPX-84598	Sysadmin users cannot view actions initiated by different sysadmin users.	None
DLPX-84710	Improved handling of missing networking devices after instance type migration.	None
DLPX-85469	JSON file masking does not support the use of a multi-column algorithm on (a) Fields in two or more different arrays (b) Fields at different levels in a single multi-dimensional array.	None
DLPX-85770	If an Oracle VDB/vPDB is already enabled, a self-service container start operation or the VDB/vPDB enable operation may fail with: exception.oracle.vdb.database.exists.enable.not.allowed/ exception.oracle.vdb.pdb.exists.enable.not.allowed	Retry the failed VDB/vPDB start or self-service container start operation, it should succeed without any error.
DLPX-86109	Oracle VDB unquiesce/enable may fail after a failed quiesce/disable on 10.0.0.X or 11.0.0.X.	To get disabled Oracle VDBs back to an enabled state, manually disable sources via the Delphix CLI and enable them back via the Delphix CLI/UI.

Key	Summary	Workaround
DLPX-86181	Provision, refresh, rewind, or start operations on a virtual database on a Solaris host with NFSv4 enabled may become stuck indefinitely due to mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Delphix engine CLI, manually terminate the stuck mount processes on the Solaris host and re-attempt the failed Delphix operation.
DLPX-86344	A failed Delphix Engine upgrade can cause plugin operation to fail with <code>grpc_status 14</code> .	Verify the upgrade and then apply the upgrade. If the issue is hit after a failed upgrade, Restarting the management stack will resolve the issue.
DLPX-86842	If there is any detached or unlinked Oracle dSource, upgrade failure may occur during `verify upgrade` job while upgrading to 12.0.0.0.	Re-link or delete the dSources before trying to upgrade to 12.0.0.0, OR upgrade to version 11.0.0.0 or 13.0.0.0.
DLPX-87006	Refresh operation fails for the self service containers having ordered sources.	None. Contact Delphix support for corrective actions.

3.3.18 Version 11.0.0.0

Key	Summary	Workaround
DLPX-56978	Certain usernames are not available for use, as they are reserved system words (e.g. "root", "postgres", "delphix").	None
DLPX-56979	LDAP server test fails if authentication is set to DIGEST-MD5, but setup still works correctly.	None
DLPX-57142	The Job dashboard does not display the user that invoked each job.	None
DLPX-57412	CLI parameters must be used exactly as described in documentation, including spelling and capitalization, or they are ignored.	None
DLPX-57673	Support bundle generation can be time consuming if the engine has a large number of core files to process.	None

Key	Summary	Workaround
DLPX-57823	Changing the Continuous Compliance engine used by a VDB's masking job can lead to an internal error.	None
DLPX-58185	Changing a Custom Policy while it is running on an object can cause the Policy execution to fail.	None
DLPX-58226	Completed Cleanup Job, after upgrade, will still show as running.	None
DLPX-59473	It is not possible to set a password policy that prevents an Administrator from re-using a previous password, though this can be set for other users.	None
DLPX-66155	Restarting a Delphix engine during a network throughput test is not recommended, as it may lead to a system hang.	None
DLPX-66860	For SSO/SAML, ADFS requires an explicit rule to transform emailAddress attribute into nameid.	Create an explicit rule in ADFS that transforms the emailAddress attribute into a nameid. The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type "Name ID". The nameid format must be "Email address".
DLPX-77849	Excessive number of connections to SQL Server instance causes infrastructure issues and leads the LSASS.exe to crash and the host to reboot.	Rather than using a Windows domain user for authentication, switch the dSource to use a database user. SQL Server should be able to handle the massive number of connections that Delphix is establishing for each dSource better than LSASS.EXE.
DLPX-77986	On a Sybase host with multiple Sybase instances, if access to the first instance picked up for discovery fails due to invalid credentials, the discovery job will exit immediately, preventing discovery of the remaining instances.	Fix any credential failures.

Key	Summary	Workaround
DLPX-78589	When Delphix tries to run the ASE "UNMOUNT" command (while trying to quiesce VDBs) during the upgrade, the UNMOUNT command gets hung up (this command does not have a timeout). Because of this, the upgrade job stalled.	When the ASE UNMOUNT command is hung up, the ASE instance must be restarted.
DLPX-80193	Provides a proper error message in case provisioning fails due to database being in read-only mode.	Change the source database to read-write, create a backup, and sync to the dSource, then provision the VDB.
DLPX-80920	A failed Delphix engine upgrade can cause plugin operation to fail with "grpc_status 14".	Verify the upgrade and then apply the upgrade. If the issue occurs after a failed upgrade, restarting the management stack will resolve the issue.
DLPX-81300	Windows Environment Add/Refresh operations may fail if the iSCSI Initiator Name is not a valid IQN.	Set the initiator name to a valid name, eg: iqn.1991-05.com.microsoft:10-43-47-42.qa-ad.delphix.com. The "Default" button can also be selected in the Windows iSCSI configuration to reset to the default (valid) name.
DLPX-81478	If the transaction log is taken using the `standby_access` option for a SAP ASE database, the validated sync worker will not be able to restore that log and will fail with a fatal exception, as Delphix currently does not support this option.	Change the backup script creating transaction logs. Ingest FULL backups.
DLPX-81559	After upgrading an Oracle VDB from 12c to 19c, VDB refresh fails with "Failed to mount database instance", due to ORA-01130 or ORA-00201 errors.	Update the VDB parameters (either directly or via a VDB config template). See this knowledge base article ⁷⁹
DLPX-83430	Initial configuration of Syslog breaks most of the pre-existing appenders.	Restart the management stack.

⁷⁹ [https://support.delphix.com/Continuous_Data_Engine_\(formerly_Virtualization_Engine\)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_\(KBA6234\)](https://support.delphix.com/Continuous_Data_Engine_(formerly_Virtualization_Engine)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_(KBA6234))

Key	Summary	Workaround
DLPX-83643	After an engine upgrade or after disable and enable of vPDB, the NFS version in the GUI/API may be incorrect if it's a vPDB in a vCDB, it was mounted with NFSv3 and now the host supports NFSv4 mounts. This condition corrects itself on the next refresh operation.	Perform a vPDB refresh operation to update the NFS protocol version to 4.
DLPX-84075	SQL Server VDB Refresh operations may fail if the PowerShell command [IO.Path]::GetTempFileName() returns no value.	Go to the below mentioned temp directory and delete all files from it: C:\Window\ServiceProfiles\NetworkService\apdata\local\temp.
DLPX-84253	Users should be able to delete Delphix-generated CA certificate if no dependencies exist.	User may mark the fault as ignored, but will need to be aware the CA certificate will still appear in TrustStore.
DLPX-84598	A sysadmin user cannot view actions initiated by different sysadmin user	None
DLPX-85578	Replaced the Win32_Volume class output with the mountvol output to fetch volumeld for Delphix iSCSI mount points.	None
DLPX-85770	If an Oracle VDB/vPDB is already enabled, a Self-Service container start operation or the VDB/vPDB enable operation may fail with exception.oracle.vdb.database.exists.enable.no t.allowed/ exception.oracle.vdb.pdb.exists.enable.not.allo wed.	Retry the failed VDB/vPDB start or Self-Service container start operation, it should succeed without any error.
DLPX-86109	Oracle VDB unquiesce/enable may fail after a failed quiesce/disable on 10.0.0.X or 11.0.0.X.	To get disabled Oracle VDBs back to Enabled state, manually disable such sources via the Delphix CLI and enable them back via the Delphix CLI/UI.
DLPX-86181	Provision, refresh, rewind, or start operations on a virtual database on a Solaris host with NFSv4 enabled may become stuck indefinitely due to the mount process getting stuck on the Solaris NFS client.	Switch the NFS protocol to v3 using the Delphix engine CLI, manually terminate the stuck mount processes on the Solaris host and re-attempt the failed Delphix operation.

3.3.19 Version 10.0.0.0

Key	Summary	Workaround
DLPX-56944	In Solaris 5.11 Environments where Delphix OS user shell is set to csh, host parameters may be improperly parsed leading to Environment refresh and other job failures.	Contact Delphix Support for corrective actions.
DLPX-56978	Certain usernames are not available for use as they are reserved system words (e.g. "root", "postgres", "delphix")	None
DLPX-56979	LDAP server test fails if authentication is set to DIGEST-MD5, but setup still works correctly	None
DLPX-57142	The Job dashboard does not display the user that invoked each Job	None
DLPX-57412	CLI parameters must be used exactly as described in documentation, including spelling and capitalization, or they are ignored	None
DLPX-57673	Support bundle generation can be time consuming if the engine has a large number of core files to process	None
DLPX-57823	Changing the masking engine used by a VDB's masking job can lead to an internal error	None
DLPX-58185	Changing a Custom Policy while it is running on an object can cause the Policy execution to fail	Disable/enable after fixing the problem
DLPX-58226	Completed Cleanup Job, After Upgrade, Still Shows as Running	None
DLPX-59473	It is not possible to set a password policy that prevents an Administrator from re-using a previous password, though this can be set for other users	None

Key	Summary	Workaround
DLPX-66155	Restarting a Continuous Data Engine during a network throughput test is not recommended as it may lead to a system hang.	Create an explicit rule in ADFS that transforms the emailAddress attribute into a nameid. The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type "Name ID". The nameid format must be "Email address".
DLPX-66860	For SSO/SAML, ADFS requires explicit rule to transform emailAddress attribute into nameid.	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Continuous Data is establishing for each dSource better than Windows LSASS.EXE.
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.
DLPX-77986	On a SAP ASE host with multiple SAP ASE instances, If access to the first instance picked up for discovery fails due to invalid credentials, the discovery job will exit immediately preventing discovery of the remaining instances.	Fix any credential failures
DLPX-78589	During the upgrade, when Delphix was trying to run the SAP ASE "UNMOUNT" command while trying to quiesce VDBs, UNMOUNT command hung as this command doesn't run under a timeout and due to this upgrade job stalled.	When the ASE UNMOUNT command is hung, the ASE instance must be restarted.
DLPX-80193	Provide proper error message in case provisioning fails due to database is in read-only mode.	Change source database to read-write, create a backup and sync to the dSource and provision VDB.

Key	Summary	Workaround
DLPX-80920	A failed Delphix engine upgrade can cause plugin (for plugins using docker runtime) operation to fail with <code>grpc_status 14</code> .	<ol style="list-style-type: none"> 1. Verify the upgrade and then apply the upgrade. 2. If the issue is hit after a failed upgrade, Restarting the management stack will resolve the issue.
DLPX-81300	Windows Environment Add/Refresh operations may fail if the iSCSI Initiator Name is not a valid IQN	Set initiator name to a valid name, eg: <code>iqn.1991-05.com.microsoft:10-43-47-42.qa-ad.delphix.com</code> . The "Default" button can also be selected in windows iscsi configuration to reset to the default (valid) name.
DLPX-81478	If transaction log is taken using <code>`standby_access`</code> option for SAP ASE database, the validated sync worker will not be able to restore that log and will fail with Delphix Fatal Exception as Delphix currently doesnt support this option.	Change the backup script creating transaction logs Ingest FULL backups
DLPX-81559	After upgrading an Oracle VDB from 12c to 19c, the VDB refresh fails with "Failed to mount database instance" due to ORA-01130 or ORA-00201 errors.	Update the VDB parameters (either directly or via a VDB Config Template). For more information, please see KBA6234 ⁸⁰
DLPX-83643	If you upgrade the engine or disable and then enable a virtual PDB, the displayed NFS version in the GUI or API might be incorrect. This happens if the virtual PDB is inside a virtual CDB and was previously mounted with NFSv3, but the host now supports NFSv4 mounts. However, the issue will automatically resolve itself during the next refresh operation.	Perform a vPDB refresh operation to update the NFS protocol version to 4.
DLPX-84075	SQL Server VDB Refresh operations may fail if the PowerShell command <code>[IO.Path]::GetTempFileName()</code> returns no value"	Go to the below mentioned temp directory, and delete all the files from it: <code>C:\Window\ServiceProfiles\NetworkService\apdata\local\temp</code>

⁸⁰ [https://support.delphix.com/Continuous_Data_Engine_\(formerly_Virtualization_Engine\)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_\(KBA6234\)](https://support.delphix.com/Continuous_Data_Engine_(formerly_Virtualization_Engine)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_(KBA6234))

Key	Summary	Workaround
DLPX-84598	sysadmin user cannot view actions initiated by different sysadmin user	Perform an export with the same unique name as of the VDB and then manually change the physical database's unique name.
DLPX-85493	MSSQL: Linking and AttachSource operations will fail with unnecessary permissions of source user on the staging host and staging database. This issue can be seen from 6.0.17.0 onwards.	Adding source user to the staging instance with read permission on master database and Giving write permission on connector directory path {Connector_Installation}/sourceValidation

3.3.20 Version 9.0.0.0

Key	Summary	Workaround
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.
DLPX-84977	For RAC environments, export of an Oracle VDB to a database with a new unique name is not supported.	Perform the export with the same unique name as of the VDB and then manually change the physical database's unique name.
DLPX-84423	Export operation does not retain the read-only mode in the newly converted physical database after an in-place conversion of a read-only Oracle VDB or vPDB	None
DLPX-84598	sysadmin user cannot view actions initiated by different sysadmin user	None
DLPX-84655	A false warning message that listener registration was not successful is posted when enabling a VDB or a vCDB, users can ignore this message.	Ignore the warning message.

Key	Summary	Workaround
DLPX-84679	Unable to add Staging push PDB if Staging Environment has more than one repository.	<p>From the Add dSource Wizard dSource Configuration screen for Staging Push.</p> <ul style="list-style-type: none"> • Before selecting PDB as the Database Type, select CDB. • Select the correct Staging Environment and repository. • Select PDB for the Database Type. • Now CDB will be shown under Container Database • Fill in the remaining PDB details
DLPX-85076	Instance init file is not copied to \$ORACLE_BASE_CONFIG/dbs during staging push dSource linking	<p>Specify the pfile parameter in the startup command as</p> <pre>pfile='<MOUNT_BASE>/ <DATABASE_UNIQUE_NAME> /script/<DATABASE_SID>/ init<DATABASE_SID>.ora'</pre>

3.3.21 Version 8.0.0.0

Key	Summary	Workaround
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	<p>Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.</p>

Key	Summary	Workaround
DLPX-84679	Unable to add Staging push PDB if Staging Environment has more than one repository.	<p>From the Add dSource Wizard dSource Configuration screen for Staging Push.</p> <ul style="list-style-type: none"> • Before selecting PDB as the Database Type, select CDB. • Select the correct Staging Environment and repository. • Select PDB for the Database Type. • Now CDB will be shown under Container Database • Fill in the remaining PDB details
DLPX-85076	Instance init file is not copied to \$ORACLE_BASE_CONFIG/dbs during staging push dSource linking	<p>Specify the pfile parameter to startup command as</p> <pre>pfile parameter=/<mount_base> <database_sid>="" <database_unique_name>="" init<database_sid>.ora<="" pre="" script=""> </mount_base>></pre>

3.3.22 Version 7.0.0.0

Upgrades from versions < 6.0.17.0 to any version between 6.0.17.0 and 7.0.0.0 on a replication target engine may fail due to the management services being down, which will require a support call. This applies to “Delay the Reboot” or “Apply Now” upgrades.

Key	Summary	Workaround
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.

Key	Summary	Workaround
DLPX-84255	In a Single Engine Continuous Vault product, adding a new Sybase dSource to a locked group may result in the background environment monitoring process to stop working.	No workaround.
DLPX-84495	If upgrading from versions < 6.0.17.0 to any version between 6.0.17.0 and 7.0.0.0, a support call is needed.	Call support.
DLPX-84679	Unable to add Staging push PDB if Staging Environment has more than one repository	From the Add dSource Wizard dSource Configuration screen for Staging Push. <ul style="list-style-type: none"> • Before selecting PDB as the Database Type, select CDB. • Select the correct Staging Environment and repository. • Select PDB for the Database Type. • Now CDB will be shown under Container Database • Fill in the remaining PDB details
DLPX-85076	Instance init file is not copied to \$ORACLE_BASE_CONFIG/dbs during staging push dSource linking	Specify the pfile parameter to startup command as <pre>pfile parameter=/<code><MOUNT_BASE></code>/<code><DATABASE_UNIQUE_NAME></code>/script/<code><DATABASE_SID></code>/ init<code><DATABASE_SID></code>.ora</pre>

3.3.23 Version 6.0.17.0

Key	Summary	Workaround
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.

Key	Summary	Workaround
DLPX-66860	For SSO/SAML, ADFS requires explicit rule to transform emailAddress attribute into nameid.	Create an explicit rule in ADFS that transforms the {{emailAddress}} attribute into a {{nameid}}. The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type "Name ID". The nameid format must be "Email address".
DLPX-83622	In 6.0.15.0 and 6.0.16.0, Fluentd gems from plugins were installed in the base Fluentd. These left over gems can cause Fluentd to fail post-upgrade.	No workaround.
DLPX-83643	After engine upgrade or after a disable and enable of a vPDB, the NFS version in GUI/API may be incorrect (if it's a vPDB in a vCDB, it was mounted with NFSv3 and now the host supports NFSv4 mounts). This condition corrects itself on the next refresh operation.	Perform a vPDB refresh operation to update the NFS protocol version to 4.
DLPX-83575	The port in the connection string for a vPDB in a Linked CDB may be shown incorrectly when it is registered to a non-default listener.	Use the port in the connection string of the CDB to connect.

3.3.24 Version 6.0.16.0

Key	Summary	Workaround
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.
DLPX-82448	Python2 has been deprecated and is being removed from the platform. During this removal, there are still trace artifacts of legacy Python versions being found on the engine.	No workaround.

Key	Summary	Workaround
DLPX-81559	After upgrading an Oracle VDB from 12c to 19c, the VDB refresh fails with "Failed to mount database instance" due to ORA-01130 or ORA-00201 errors.	Update the VDB parameters (either directly or via a VDB Config Template). For more information, please see KBA6234 ⁸¹
DLPX-82169	Provisioning a TDE-enabled vPDB to a CDB with a different patch level than the source CDB will fail.	Patch the dSource to match the target and provision again. If this is not an option, run datapatch on the vPDB, update the timeflow in engine metadata to a CONFIGURED state, restart the vPDB, and run SnapSync. This second option requires an engineering escalation.

3.3.25 Version 6.0.15.0

Key	Summary	Workaround
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.
DLPX-81610	If a tablespace is encrypted before an incremental snapshot is taken, provisioning from that snapshot can lead to the tablespace containing partially unencrypted data, which will not be accessible.	Take a snapshot with parameter "Force Full Backup" and provision a new vPDB/VDB with this snapshot.

⁸¹ [https://support.delphix.com/Continuous_Data_Engine_\(formerly_Virtualization_Engine\)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_\(KBA6234\)](https://support.delphix.com/Continuous_Data_Engine_(formerly_Virtualization_Engine)/Oracle/How_to_Fix_ORA-01130_or_ORA-00201_Errors_When_Provisioning_an_Oracle_VDB_(KBA6234))

3.3.26 Version 6.0.14.0

Key	Summary	Workaround
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.
DLPX-80489	TDE-enabled vPDB provisions failing with LOCAL_AUTOLOGIN configuration	Use a regular autologin wallet in the target CDB.
DLPX-80822	vPDB provision from a fully encrypted shared undo parent to local undo CDB results in a vPDB with new UNDO TS which is not encrypted	Encrypt the local undo space manually after provision, or with the Configure Clone hook point.
DLPX-81125	MSSQL Export fails when performed on a target with a Microsoft SQL Server instance running with the network service user	If you update the instance owner of the SQL server, you should refresh the environment to reflect the new user in the engine metadata.
DLPX-81128	Masking: Unable to create/edit a profile set from GUI	Profile set can be add/edited using API

3.3.27 Version 6.0.13.0

Key	Summary	Workaround
DLPX-38908	LogSync should automatically resolve faults for transient issues.	Manually resolve the faults generated when Oracle LogSync encounters transient issues.
DLPX-57078	Job cancel requests during provisioning are not processed until the end of the step.	Find and kill the Oracle pmon process for the instance that is being provisioned.

Key	Summary	Workaround
DLPX-64386	LogSync thread hangs when trying to remove temporary RMAN command file from source host toolkit directory.	Remove the <code>rm</code> alias for the Delphix OS user.
DLPX-76382	Force disable should succeed despite environmental problems.	No workaround.
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.
DLPX-78412	SCM/Talaria failure reason should be communicated in fault.	No workaround.
DLPX-78986	Prevent DSP connections for disabled cluster nodes.	No workaround.
DLPX-79212	While restoring full backups of file stream type database on open staging DB and taking snapshots, snapshots are consuming full space instead of referring to each snapshot.	No workaround.
DLPX-79355	V2P export throws an error when suspended and resumed at the Opening Database step.	Cancel the V2P export job and start the V2P export operation all over again.
DLPX-79502	SnapSync fails if more than 1000 tempfiles exist in the whole CDB.	No workaround.
DLPX-79596	DB files are getting deleted for staging DB if staging push dSource is forced disabled after performing a restore outside Delphix and then enabled again.	No workaround.
DLPX-79833	You can no longer select performance metric resolution for fluentd configurations.	No workaround.

Key	Summary	Workaround
DLPX-80385	Fluentd does not support deferred upgrades when upgrading to 6.0.13.0, and beyond, when starting from a prior release and using the Historic Splunk Insight solution.	Reboot after upgrade.

3.3.28 Version 6.0.12.0

Key	Summary	Workaround
DLPX-67604	Manually recovering a database after V2P from a snapshot of dSource fails with an error.	No workaround.
DLPX-69775	Updating Oracle credentials with an empty string throws an error when Simplified Connection Management is enabled.	Use the Delphix CLI to unset the user.
DLPX-75209	Network configuration is lost when changing EC2 instance type.	On Nitro-based instance types, use the virtual machine's virtual serial console and login to the sysadmin CLI, then add a DHCP address to the network interface.
DLPX-75878	The JDBC connection string for an Oracle vPDB does not get updated after a listener port change.	A second environment refresh will update the connection string for the vPDB.
DLPX-77231	When source discontinuity on the dSource is followed by resync on the livesource, one or more livesource workers may fail to start. This prevents livesource status from getting updated and the first snapshot from being taken after a resync.	No workaround.
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.

Key	Summary	Workaround
DLPX-78689	Oracle vPDB snapshot job fails after doing reset logs on a linked CDB.	Disable the vPDB and re-enable it to clear out the snapshot job errors.
DLPX-78700	Oracle vPDB source enable jobs for Oracle 21c are taking more than 15 minutes to complete. This issue is only seen during the first Oracle vPDB enable operation on Oracle 21c.	No workaround.

3.3.29 Version 6.0.11.0

Key	Summary	Workaround
DLPX-44544	A SnapSync of an Oracle standby dSource in Real-Time Apply mode sometimes calculates the snapshot's timestamp incorrectly. This can cause ORA-01194 or ORA-01152 errors when provisioning to a timestamp after the snapshot.	To provision from a snapshot of an Oracle standby dSource in Real-Time Apply mode, provision by SCN instead of timestamp.
DLPX-57971	The latest snapshot of a LiveSource may take a long time to show the SCN/timestamp range on its card in the GUI.	No workaround.
DLPX-72123	Detaching or deleting an Oracle dSource may fail on RAC environments due to the failure of deletion of RMAN backups on RAC and the operation needs to be retried with the force option.	If the detach or delete operation on an Oracle dSource fails, retry the command using the force option.
DLPX-75209	Network configuration is lost when changing EC2 instance type.	On Nitro-based instance types, use the virtual machine's virtual serial console and login to the sysadmin CLI, then add a DHCP address to the network interface.

Key	Summary	Workaround
DLPX-77664	Oracle SnapSync fails with "RMAN-06183: datafile or datafile copy (file="" number="">>) larger="" than="" maxsetsize="" if="" a="" datafile="" resized="" in="" the="" middle="" of="">>)"	One of the following three workarounds can be applied: 1. Re-issue SnapSync. 2. Reduce the frequency of datafile resizes, or 3. Ensure datafile resize operations are not being performed while the SnapSync operation is in progress.
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.
DLPX-77869	Unable to drop and recreate descending order (or any other functional) index as part of Oracle Connector masking/reidentification/tokenization jobs.	Oracle interprets descending order as functional indexes. There is no workaround. This is a known limitation of Drop Indexes for Oracle connectors that will be resolved in a future release.
DLPX-78015	V2P export with absolute data files is failing with an internal error.	No workaround.
DLPX-78263	A SnapSync of an Oracle standby dSource in Real-Time Apply mode sometimes fails with "exception.oracle.sql.linkedsources.current_scn.invalid" if the rate of change in the database is low.	Force a log switch on all primary instances/nodes and then try another SnapSync.

3.3.30 Version 6.0.10.0

Key	Summary	Workaround
DLPX-77467	Loading the setup app dashboard (as sysadmin) renders a server error popup with instruction to contact Delphix Support. This message can be ignored. However, it is known that this error impairs the ability to configure web proxy, PhoneHome, and SMTP servers via the GUI.	These settings can still be configured via the CLI. This issue will be fixed in the next version release.
DLPX-64082	Oracle provisioning scripts have hard-coded timeouts.	Retry the provisioning operation to see if it succeeds. Otherwise, contact Delphix Support.
DLPX-72369	RAC migration for VDB with a deleted parent may fail with error "Cannot update RAC instances if virtual source 'xxx' has a deleted parent."	No workaround.
DLPX-74896	Race condition during refresh may result in incorrect engine metadata entry for parent snapshot.	No workaround.
DLPX-75148	DSP throughput tests do not work when from-version is < 6.0.6.0 and target-version is >= 6.0.6.0.	No workaround, however, the user will need to upgrade the source version.
DLPX-75215	Switching AWS instance types can leave the Delphix engine with no network configuration.	On Nitro-based instance types, use the virtual machine's virtual serial console and login to the sysadmin CLI, then add a DHCP address to the network interface.
DLPX-75995	On Windows 2019 Server, with KB4598230 cumulative update, adding or refreshing an environment fails when PowerShell transcription is enabled.	The user has to turn off the transcription if the staging is on Windows 2019 Server with recent updates.
DLPX-77231	When source discontinuity on the dSource is followed by resync on the Oracle LiveSource, one or more LiveSources workers may fail to start. This prevents the LiveSource status from getting updated and the first snapshot from being taken after a resync.	No workaround.

Key	Summary	Workaround
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.

3.3.31 Version 6.0.9.0

Key	Summary	Workaround
DLPX-72186	CDB logfile retention works incorrectly if a PDB has multiple timeflows pointing to the same CDB timeflow.	No workaround.
DLPX-74749	Oracle ENVIRONMENT_REFRESH_AND_DISCOVER job may fail with "The object OraclePDBConfig does not exist on the system".	Manually run an environment refresh after the ENVIRONMENT_REFRESH_AND_DISCOVER job fails.
DLPX-75517	Provisioning an Oracle vPDB to a vCDB fails with "ORA-00959: tablespace 'TEMP' does not exist " if there is no temporary tablespace named TEMP within the production PDB\$SEED database.	One of the following two workarounds can be applied: <ol style="list-style-type: none"> 1. Re-attempt the vPDB provision to a linked CDB. The provision should succeed. 2. Manually create (or rename) the TEMP tablespace in the production PDB\$SEED database, take a new snapshot of the vPDB, and provision from that snapshot to the vCDB.
DLPX-75737	Retention saves unnecessary logs if the bookmark falls exactly on a snapshot end SCN or snapshot end timestamp.	No workaround.
DLPX-75995	On Windows 2019 Server, with KB4598230 cumulative update, adding or refreshing an environment fails when PowerShell transcription is enabled.	The user has to turn off the transcription if the staging is on Windows 2019 Server with recent updates.

Key	Summary	Workaround
DLPX-76388	Entering key pairs directly into hook environment variables (a new feature in 6.0.9.0 (see page 1102)) results in an internal error.	Use password variables instead, or use a password vault. See Passing Credentials Securely to Hook Operations (see page 1102)

3.3.32 Version 6.0.8.0

Key	Summary	Workaround
DLPX-64307	Environment refresh should ignore cluster discovery for VDBs	<p>The following workaround should resolve the issue without Delphix support intervention.</p> <p>For RAC databases</p> <ol style="list-style-type: none"> 1. Add the instances to the clusterware configuration, ensuring you add all instances configured via Delphix. For example: <div data-bbox="906 808 1423 992" style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <pre>srvctl add instance -db <Database Name> -instance <Instance Name> -node <Node Name></pre> </div> 2. Refresh the environment. At this point, Delphix will add the instances back to the Delphix configuration, and you should be able to perform actions such as stop, start, disable, enable, etc. <p>From here, we recommend removing the clusterware configuration.</p> 3. Stop the VDB via the Delphix GUI or CLI. 4. Remove the instances from clusterware <div data-bbox="906 1357 1423 1507" style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <pre>srvctl remove instance -db <Database Name> -instance <Instance Name></pre> </div> 5. Remove the database from clusterware <div data-bbox="906 1581 1423 1697" style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <pre>srvctl remove database -db <Database Name></pre> </div> 6. Refresh the environment. 7. Start the VDB via the Delphix GUI or CLI. <p>For RACOne databases</p> <ol style="list-style-type: none"> 1. Stop the instance.

Key	Summary	Workaround
		<pre data-bbox="906 367 1422 483">sqlplus "/as sysdba" shutdown immediate</pre> <p data-bbox="906 501 1422 562">2. Ensure the RACOne configuration has the "instance prefix" configuration set.</p> <pre data-bbox="906 591 1422 770">[oracle@mwtestx1 ~]\$ srvctl config database -d <vdb name> grep "Instance name prefix" Instance name prefix: VDB</pre> <p data-bbox="906 786 1422 815">3. If this is not set, then set it using</p> <pre data-bbox="906 844 1422 994">srvctl modify database -db <vdb name> -instance <instance prefix></pre> <p data-bbox="906 1010 1422 1070">4. Set the pfile location to allow clusterware to start the instance</p> <pre data-bbox="906 1099 1422 1218">srvctl modify database -db <vdb name> -spfile <path to pfile></pre> <p data-bbox="906 1234 1422 1263">The pfile is located in</p> <pre data-bbox="906 1292 1422 1408"><Delphix Mount base>/<VDB Name>/datafile/spfile.ora</pre> <p data-bbox="906 1424 1422 1453">5. Start the instance using clusterware</p> <pre data-bbox="906 1482 1422 1565">srvctl start database -d vdb</pre> <p data-bbox="906 1581 1422 1677">When querying the status of the database, it should now show a running instance. As an example:</p>

Key	Summary	Workaround
		<pre data-bbox="906 367 1422 577">[oracle@mwtestx1 ~]\$ srvctl status database -d VDB Instance VDB_1 is running on node mwtestx1 Online relocation: INACTIVE</pre> <p data-bbox="906 595 1414 748">6. Refresh the environment. At this point, Delphix will add the instances back to the Delphix configuration, and you should be able to perform actions such as stop, start, disable, enable, etc.</p> <p data-bbox="906 766 1385 824">From here, we recommend removing the clusterware configuration.</p> <p data-bbox="906 842 1401 869">7. Stop the VDB via the Delphix GUI or CLI.</p> <p data-bbox="906 887 1401 913">8. Remove the database from clusterware</p> <pre data-bbox="906 945 1422 1061">srvctl remove database -db <Database Name></pre> <p data-bbox="906 1079 1401 1106">9. Remove the database from clusterware</p> <pre data-bbox="906 1137 1422 1254">srvctl remove database -db <Database Name></pre> <p data-bbox="906 1272 1422 1330">10. Refresh the environment. 11. Start the VDB via the Delphix GUI or CLI.</p>
DLPX-72186	CDB logfile retention works incorrectly if a PDB has multiple timeflows pointing to the same CDB timeflow	No workaround.
DLPX-73409	Duplicate listener entry gets generated in engine metadata if Oracle listener is manually started with non-uppercase name	<p data-bbox="906 1541 1134 1568">Follow these steps:</p> <ol data-bbox="906 1585 1414 1832" style="list-style-type: none"> <li data-bbox="906 1585 1414 1644">1. Restart the listener without a name parameter so it displays in uppercase. <li data-bbox="906 1662 1326 1720">2. Update VDBs to use uppercase LISTENER. <li data-bbox="906 1738 1414 1832">3. Refresh the environment. lowercase listener will be removed and LISTENER updated appropriately.

Key	Summary	Workaround
DLPX-74749	Oracle ENVIRONMENT_REFRESH_AND_DISCOVER job may fail with "The object OraclePDBConfig does not exist on the system"	Manually run an environment refresh after the ENVIRONMENT_REFRESH_AND_DISCOVER job fails.
DLPX-74860	Provisioning a 2nd generation VDB from a dSource with imported RO transportable tablespaces fails with ORA-19654	No workaround.
DLPX-74882	Masking's SFTP client no longer compatible with SolarWinds and Goanyware SFTP servers	No workaround.
DLPX-75517	Provisioning an Oracle vPDB to a vCDB fails with "ORA-00959: tablespace 'TEMP' does not exist" if there is no temporary tablespace named TEMP within the production PDB\$SEED database	One of the following two workarounds can be applied: <ol style="list-style-type: none"> 1. Re-attempt the vPDB provision to a linked CDB. The provision should succeed. 2. Manually create (or rename) the TEMP tablespace in the production PDB\$SEED database, take a new snapshot of the vPDB and provision from that snapshot to the vCDB.

3.3.33 Version 6.0.7.0

Key	Summary	Workaround
DLPX-74457	Cluster discovery for Oracle RAC partially fails on Solaris 10	Switch the default login shell for the Delphix OS user from /bin/sh to /bin/bash .
DLPX-74749	Oracle ENVIRONMENT_REFRESH_AND_DISCOVER job may fail with "The object OraclePDBConfig does not exist on the system"	Manually run an environment refresh from the Delphix UI if the ENVIRONMENT_REFRESH_AND_DISCOVER job fails with the mentioned error.

Key	Summary	Workaround
DLPX-76718	Time required to display the point-in-time pop-over on timelines for Self-Service Templates with replicated objects can degrade linearly with each replication.	No workaround but reducing replication frequency can reduce the impact.

3.3.34 Version 6.0.6.0

Key	Summary	Workaround
DLPX-73224	When provisioning from a non-multitenant source to a virtual pluggable database (vPDB), the post-plug hook script (dx-post-plug-hook.sh) should exit with the vPDB either closed or open unrestricted. If the vPDB is left open with restricted access subsequent Snapshots of the vPDB will fail with "oracle.ucp.UniversalConnectionPoolException" and " java.sql.SQLException: ORA-01035 ORACLE only available to users with RESTRICTED SESSION privilege" .	To prevent the issue: Ensure that the vPDB is either closed/mounted or open unrestricted when exiting from dx-post-plug-hook.sh. After it has happened: close and reopen the vPDB.
DLPX-72749	Provisioning a TDE-enabled vPDB with system encrypted tablespaces fails with the error "ORA-28374: typed master key not found".	No workaround, contact Delphix Support (TBD)
DLPX-72655	Provisioning an Oracle TDE-enabled vPDB fails intermittently if the dSource is encrypted after linking	Enabling TDE on an existing non-encrypted dSource is not supported. Detach, rename the Delphix dSource name and re-attach it as a new TDE-enabled dSource before re-attempting the provisioning operation.
DLPX-73224	When provisioning from a non-multitenant source to a virtual pluggable database (vPDB), the post-plug hook script (dx-post-plug-hook.sh) should exit with the vPDB either closed or open unrestricted. If the vPDB is left open with restricted access subsequent Snapshots of the vPDB will fail with "oracle.ucp.UniversalConnectionPoolException" and " java.sql.SQLException: ORA-01035 ORACLE only available to users with RESTRICTED SESSION privilege"	To prevent the issue: Ensure that the vPDB is either closed/mounted or open unrestricted when exiting from dx-post-plug-hook.sh. After it has happened: close and reopen the vPDB.

Key	Summary	Workaround
DLPX-73357	Rewinding an Oracle TDE-enabled vPDB to the snapshot before vPDB migration may fail with <code>exception.oracle.tde.export.keys.failed</code> if all of the steps of the keystore merge procedure are not followed correctly	Verify that the CDB is restarted after merging the keys of the old target CDB into the new target CDB and re-attempt the rewind operation. If the rewind still fails, provision a new vPDB from the required snapshot instead of the rewind operation.
DLPX-72181	The "Restore Self-Service data container from the bookmark of sibling data container" operation may fail in an Oracle TDE environment with <code>exception.oracle.tde.export.keys.failed</code> if the keystore merge procedure is not followed correctly. In this case, the warning "Refresh operation on the TDE-configured container <target container> from the Timeflow of another container <sibling container> requires merging of the TDE keystores." will be displayed in the Delphix UI events log	Verify that the procedure for merging the sibling keystores is followed correctly and re-attempt the self-service operation.
DLPX-73742	Provisioning an Oracle TDE-enabled vPDB may fail with the error "ORA-28367: wallet does not exist" if the TDE wallet for the target linked CDB is stored on ASM storage	Storing the TDE wallet on ASM storage is currently unsupported. Modify <code>sqlnet.ora</code> to point to the keystore location outside of the ASM diskgroup and re-attempt the provisioning operation.
DLPX-73788	Provisioning or enabling an Oracle TDE-enabled vPDB fails when \$ORACLE_BASE is used in <code>sqlnet.ora</code>	Any environment variable referenced in <code>sqlnet.ora</code> must always be set in the environment for the Delphix OS user. Ensure that the environment variable \$ORACLE_BASE is set in the shell initialization file for the Delphix OS user and re-attempt the operation.
DLPX-73789	If WALLETS_ROOT initialization parameter is configured on a TDE-enabled dSource PDB, provisioning may fail since the auxiliary CDB instance uses dSource keystore location.	If the provision fails, there are 2 workarounds: <ol style="list-style-type: none"> 1. Provide permissions to the Delphix OS user to create files in the location identified by WALLETS_ROOT directory of the source keystore on the target host. 2. Modify the dSource database to not use WALLETS_ROOT to identify the TDE keystore.

3.3.35 Version 6.0.2.0

Key	Summary	Workaround
DLPX-69638	Masking job created on engine 6.0.1.1 or prior is failing after the upgrade to version 6.0.2.0 or later	Masking jobs created in 6.0.1.x using a Hana JDBC driver will need to be updated to grant the following permission {"java.io ⁸² .FilePermission" "/", "read"} in 6.0.2.0. All drivers created in and after 6.0.2.0 will be granted this permission by default.

3.3.36 Version 6.0.0.0

Key	Summary	Workaround
DLPX-60397	If a mapping algorithm is included in multiple jobs, only one job should be run at a time. If multiple jobs are run at the same time, then the mapping algorithm might contain multiple mappings to the same value or the jobs might deadlock.	Only run one job at a time.
DLPX-60947	Self-Service template with replica VDB is not updated with new Timeflow on incremental replication update	The latest replica VDB data can still be accessed by doing a Self-Service container Refresh, rather than a point-in-time restore from the template.
DLPX-61079	Certificate import validation may incorrectly reject a root CA certificate	Support must manually import the certificate into the truststore.
DLPX-61405	Masking operation should wait for zfs delete queue to drain	Replication may send more data than expected if masking involves dropping large DBF files.
DLPX-64493	V5 API /roles endpoint missing certain items	View and set these privileges through the GUI

⁸² <http://java.io/>

Key	Summary	Workaround
DLPX-66155	Failed DSP engine test leads to multiple blocked client.jar processes on target hosts.	Restarting a Delphix Engine during a network throughput test is not recommended as it may lead to a system hang.
DLPX-66860	ADFS does not like NameIDPolicy sent by SSO app	Create an explicit rule in ADFS that transforms the {{emailAddress}} attribute into a {{nameid}}. The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type "Name ID". The nameid format must be "Email address".
DLPX-66973	Date format is changed after importing the environment	Either (a) use the GUI import feature and then review the imported date formats for correctness or (b) use EngineSync to export/import jobs, which will not alter the date format.

3.4 Data source integration (plugin) release notes

This section covers the following topics:

- [Cassandra release notes](#) (see page 348)
- [CockroachDB release notes](#) (see page 350)
- [Couchbase release notes](#) (see page 352)
- [IBM Db2 release notes](#) (see page 356)
- [MongoDB release notes](#) (see page 374)
- [MySQL release notes](#) (see page 379)
- [Oracle E-Business Suite \(EBS\) 12.2 release notes](#) (see page 384)
- [PostgreSQL release notes](#) (see page 398)
- [SAP HANA release notes](#) (see page 412)
- [Yugabyte release notes](#) (see page 431)

3.4.1 Cassandra release notes

- [Fixed issues \(Cassandra\)](#) (see page 350)
- [New features \(Cassandra\)](#) (see page 349)

3.4.1.1 New features (Cassandra)

To deploy and configure the Cassandra plugin, refer to Overview.

3.4.1.1.1 Release 1.2.0

This is a bug fix release.

3.4.1.1.2 Release 1.1.1

This is a bug fix release.

3.4.1.1.3 Release 1.1.0

This release supports the following feature/features:

- Cassandra SSL Support for the below distributions:
 - DataStax Enterprise
 - Open-Source Apache Software Foundation
- Provide SSL Encryption (with local keystore) features for:
 - Inter-node Encryption
 - Client to Node Encryption
- Certified DataStax Enterprise v6.8.33
- Certified Apache Cassandra v4.1.1

3.4.1.1.4 Release 1.0.0

This release supports the following feature/features:

- First Version of Cassandra Plugin.
- Supports below Cassandra distributions:
 - DataStax Enterprise
 - Open-Source Apache Software Foundation
- Supports Staging Push Ingestion model.
- Code Structure referenced from Select Connector vSDK framework.
- Python version 3 compatibility.

3.4.1.2 Fixed issues (Cassandra)

3.4.1.2.1 Release 1.1.1

Key	Summary
CE - 319	Cassandra plugin security fix to avoid secret leaks in the process tree.
CE - 291	Cassandra dSource Sizing Implementation

Note: Install the `expect` utility on the remote host before upgrading to Cassandra Plugin v1.1.1.

3.4.1.2.2 Release 1.2.0

Key	Summary
CE - 659	DataStax Cassandra version 6.8.9 when running with JVM versions equal to or greater than 1.8.0_331, potentially leading to unexpected behavior.
CE - 634	Apache Cassandra startup error: Could not create the Java Virtual Machine.
CE - 731	MDS fields Redaction feature in plugin.

3.4.2 CockroachDB release notes

- [Known Issues \(CockroachDB\) \(see page 352\)](#)
- [New features \(CockroachDB\) \(see page 350\)](#)
- [Fixed issues \(CockroachDB\) \(see page 352\)](#)

3.4.2.1 New features (CockroachDB)

3.4.2.1.1 Release 1.3.0

This release supports the following feature/features:

- **Backup ingestion from GCP storage**

With this plugin release, the backup can now be ingested using GCP storage via credentials as well as implicit authentication. For more information, read the [Creating a dSource with ingestion type GCP \(see page 1176\)](#) page.

- **Staging Multi-node support**

Starting from this release, the staging database can now be scaled across a number of hosts providing improved staging database performance..

3.4.2.1.2 Release 1.2.0

This release supports the following feature/features:

- **Skip Localities Check (optionally)**

With this plugin release, we have introduced a checkbox in the dSource configuration option named "Skip Localities Check" allowing users to bypass the locality check of a cluster before initiating a restore operation.

3.4.2.1.3 Release 1.1.2

- CockroachDB: PoC for auth-implicit feature to restore from AWS S3.

If you are using implicit authentication feature, ensure that AWS credentials are configured on staging host using `aws configure` command.

3.4.2.1.4 Release 1.1.1

- Record ZFS Storage Calculation Command (CockroachDB).
- CockroachDB Plugin Security Fixes and Hardening.

3.4.2.1.5 Release 1.1.0

- Cockroach (CRDB) Select Connector Virtualization Plugin.
- Enabled the NFS restore functionality.

3.4.2.1.6 Release 1.0.0

- First Version of CockroachDB Plugin.
- [CE-27](#)⁸³ Cockroach (CRDB) Select Connector Virtualization Plugin

⁸³ <https://delphix.atlassian.net/browse/CE-27>

- Code Structure referenced from Select Connector vSDK framework.
- Python version 3 compatibility.
- Improved Code Diagnosability / Readability.

3.4.2.2 Fixed issues (CockroachDB)

3.4.2.2.1 Release 1.2.0

Bug number	Description
CE-689	ERROR: cannot restore view "mvw_schedules" without restoring referenced table (or "skip_missing_views" option)
CE-690	ERROR: detected a mismatch in regions between the restore cluster and the backup cluster, missing regions detected: us-east-1, us-east-2, us-west-2
CE-691	CRDB Plugin: dsource creation is failing with error: The network session with "[]" was interrupted
CE-719	Support appdata parameters redaction for engine metadata support bundle

3.4.2.3 Known Issues (CockroachDB)

3.4.2.3.1 Release 1.2.0

There are no known issues in this release.

3.4.3 Couchbase release notes

This section covers the following topic:

- [New features \(Couchbase\)](#) (see page 353)
- [Fixed issues \(Couchbase\)](#) (see page 353)

To view the Couchbase support matrix, visit the [Couchbase](#)⁸⁴ page.

⁸⁴ <https://cd.delphix.com/docs/latest/couchbase-support-matrices>

3.4.3.1 New features (Couchbase)

3.4.3.1.1 1.3.1

This connector release consists of only one bug fix.

3.4.3.1.2 1.3.0

- Bucket size control has been implemented.
- Ingestion from multiple full backups is now supported.
- Bucket creation can be retried if failed.
- Record ZFS Storage Calculation command has been implemented.
- Corrected a Python error when raising an exception with traceback.

3.4.3.1.3 1.2.2

- Couchbase version 7.1.3 support.
- REST API implementation for the following:
 - cluster-init
 - xdcr-setup
 - setting-cluster

3.4.3.1.4 1.2.1

- Security fixes and improvements
- An additional requirement to upgrade is the installation of the `expect` utility on staging and target hosts.

3.4.3.2 Fixed issues (Couchbase)

3.4.3.2.1 Release 1.3.1

Key	Summary
CE-633	Couchbase Plugin: Dsource sizing not working due to filesystem permissions

3.4.3.2.2 Release 1.3.0

Key	Summary
CE-588	Add DE support matrix in github docs
CE-582	Github documentation update
CE-575	Fix Python error when raising an Exception with traceback.
CE-574	Upgrade Logic
CE-572	Retry bucket creation if failed
CE-554	Implement precommit checks in couchbase repo
CE-541	Ingestion from multiple full backups
CE-540	bucket size control implementation

3.4.3.2.3 Release 1.2.2

Key	Summary
CE-550	Changes in cluster-init and server-add for couchbase 7.1.1
CE-549	Sanity testing with Couchbase 7.x Community Edition (7.1.1)
CE-548	Sanity testing with Couchbase version 6.6.1
CE-547	CodeQL fixes
CE-546	plugin version upgrade
CE-545	code hardening

Key	Summary
CE-544	fix XDCR delete configuration
CE-543	scope and collection pre-creation for xdcr dsource type
CE-542	VDB creation fix for couchbase version 7.1.3
CE-525	server-add command fix
CE-523	bucket-flush command fix
CE-521	cluster init fails when couchbase instance is recreated on a machine
CE-520	status check of replication fails in xdcr dsource type
CE-519	snapshot fails with backup restore failure
CE-518	index creation inside scope support
CE-511	REST API implementation for setting-cluster
CE-510	REST API implementation for xdcr-setup
CE-509	REST API implementation for cluster-init
CE-508	github documentation support matrix update
CE-507	Code changes to increase buffer size in bucket-list command
CE-506	Code changes to handle prompt changes in cluster-init
CE-477	Couchbase Version 7.1.3 Support

3.4.3.2.4 Release 1.2.1

Key	Summary
CE-341	Fix codeQL
CE-340	Code changes to mask password in "ps" using expect utility
CE-339	Addition of security tests in codeQL
CE-338	Master update with latest code base as of 25/05/2023
CE-337	Creation and update of 'develop' branch with latest codebase
CE-332	Disable python2.7 unit tests on couchbase repository
CE-331	Security vulnerability assessment

3.4.4 IBM Db2 release notes

This section covers the following topics:

- [New features \(IBM Db2\) \(see page 356\)](#)
- [Fixed issues \(IBM Db2\) \(see page 364\)](#)
- [Known issues \(IBM Db2\) \(see page 370\)](#)

To view the IBM Db2 support matrix, see [IBM Db2 matrix](#)⁸⁵.

3.4.4.1 New features (IBM Db2)

3.4.4.1.1 Release 4.8.0

- **SkipDb2VersionCheck**

Since the dSource snapshot metadata did not have modpack and fixpack version details taken before DB2 connector version 4.5.1, if the customer wishes to provision VDBs from these older snapshots, the skipDb2VersionCheck needs to be set to true so the connector overrides the check for modpack and fixpack changes and only compares major and minor changes. Doing this might not guarantee

⁸⁵ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/114534163/21.0.0.0+IBM+Db2+support+matrix>

successful provisioning as DB2 does not support successful provisioning between different instances with differing modpack and fixpack version.

3.4.4.1.2 Release 4.7.4

The IBM Db2 v4.7.4 plugin is now available on the download site. This plugin release consists of only bug fixes. Refer to the [Fixed Issues \(see page 364\)](#) page.

3.4.4.1.3 Release 4.7.3

This release version has been removed. Please install or upgrade to a later version.

3.4.4.1.4 Release 4.7.2

- **Skip data path verification (Optionally)**

You can now skip the data path verification process during VDB Snapsync if required. The `skipDataPathVerification` value is mandatory, if you are upgrading datasets from connector versions $\leq 3.1.1$ and do not wish to perform VDB re-provision or refresh.

3.4.4.1.5 Release 4.7.1

This plugin release consists of only bug fixes.

3.4.4.1.6 Release 4.7.0

- **SSL/TLS support for HADR ingestion**

The Db2 plugin version 4.7.0 introduces SSL/TLS support for HADR ingestion, enhancing data security during replication by encrypting data in transit between primary and standby databases.

- **Dynamic UI for Db2 virtualization**

With the introduction of various dynamic UI features, you can now experience a streamlined and user-friendly interface that adapts based on your selected choices, simplifying the linking process.

3.4.4.1.7 Release 4.6.1

This plugin release consists of only bug fixes.

3.4.4.1.8 Release 4.6.0

This plugin release has the following set of new features and bug fixes.

- **Staging push support for DPF databases**

The Db2 Plugin 4.6.0 version introduces Staging push support for DPF databases. This allows you to ingest databases using a backup agent solution of your choice.

- **VDB Provision with user-defined mount base**

This plugin version introduces support for user-defined mount base for VDBs, which allows you to provide a mount base of your choice during the provisioning of a VDB. **Note:** DIR_CACHE for the instance needs to be set to NO when users want to update the VDB dataset with the new mount base.

- **Optionally skip archive log validation**

With this feature, you can skip the archive log validation process during Snapsync if you choose to do so.

- **Load copy files support for Staging push**

The load copy files are now supported by the DB2 staging push automation script. This allows you to provide the load copy files along with the archive logs to successfully roll forward the database.

- **Allow Db2 dSources with Backup logs to rollforward to PIT**

The Db2 plugin introduces the **Rollforward to a timestamp** option to make sure the dSource is rollforwarded to the current time if no timestamp is provided during snapshot or to a PIT (timestamp) provided in Snapshot parameters or in Snapsync with Params.

3.4.4.1.9 Release 4.5.1

This plugin release consists of only bug fixes.

3.4.4.1.10 Release 4.5.0

This plugin release has the following set of new features and bug fixes.

- **Support for multiple backup paths for dSource ingestion**

The Db2 Plugin 4.5.0 version introduces the support for multiple backup paths instead of one for dSource ingestion. This allows you to provide single backup path for the dSource ingestion and add more backup paths with a dynamic UI to accommodate for the extra backup directories where the backup was split into.

3.4.4.1.11 Release 4.4.2

This plugin release consists of only bug fixes.

3.4.4.1.12 Release 4.4.1

This plugin release consists of only bug fixes.

3.4.4.1.13 Release 4.4.0

This plugin release has the following set of new features and bug fixes.

- **DB2 pull performance optimization**

The Db2 Plugin 4.4.0 version introduces the Pull Performance Optimization feature, which attempts to optimize the dSource workflows by allowing users to provide the degree of parallelisation to run the database restore operation. This feature allows users to ingest large databases in a faster way,

provided that there are sufficient resources for Db2 plugin to implement this parallelisation in the operation.

- **Source sizing implementation on the DSIL DB2 plugin**

The source sizing feature aligns the data source experience with Delphix database standards that will improve your ingestion reporting experience on the per TB pricing model. This feature enables you to calculate the dataset size based on the total allocated space on the mount point provided by the Delphix Engine for the dataset. For more details about this feature, see [Source Sizing Implementation for Datasets](#)⁸⁶.

3.4.4.1.14 Release 4.3.2

This plugin release consists of only bug fixes.

3.4.4.1.15 Release 4.3.1

This plugin release consists of only bug fixes.

3.4.4.1.16 Release 4.3.0

The DB2 plugin 4.3.0 introduces Staging push support for HADR dSources. You can now create and maintain dSources configured with HADR using the Staging push option.

3.4.4.1.17 Release 4.2.1

This plugin release consists of only bug fixes.

3.4.4.1.18 Release 4.2.0

This plugin release has the following set of new features and bug fixes.

- **Dsource snapshot with user-defined timestamp**

The Db2 Plugin version 4.2.0 introduces the dsource snapshot with the user-defined timestamp feature. This feature enables the user to specify a timestamp during dSource snapshot so that staging will roll forward to the requested timestamp before performing the dSource snapshot. For more information, see [Linking a Db2 dSource](#)⁸⁷.

3.4.4.1.19 Release 4.1.3

This plugin release consists of only bug fixes.

⁸⁶ <https://cd.delphix.com/docs/latest/source-sizing-implementation-for-ibm-db2-dsource>

⁸⁷ <https://cd.delphix.com/docs/latest/linking-ibm-db2-data-sources>

3.4.4.1.20 Release 4.1.2

This plugin release consists of only bug fixes.

3.4.4.1.21 Release 4.1.1

This plugin release consists of only bug fixes.

3.4.4.1.22 Release 4.1.0

This plugin release has the following set of new features and bug fixes.

- **User-specified mount path For DB2 dSource**
Users can specify the mount path of their choice on the target host to host the dSource dataset.
- **Staging push automation**
A set of scripts is being provided that can be used to automate the steps related to the restore and rollforward operations on the dSource.

3.4.4.1.23 Release 4.0.1

The Db2 Plugin version 4.0.1 includes the below improvements.

- Added support for 11.1.4.6 fix pack.

3.4.4.1.24 Release 4.0.0

The Db2 Plugin version 4.0.0 includes the below improvements.

- Plugin generated log file will now be placed at `<toolkit path>/<Delphix_COMMON>/DB2_18f4ff11-b758-4bf2-9a37-719a22f5a4b8/logs/<instance name>` .
- More user-friendly log statements will be printed.
- The logging.properties and advanceConf.config configuration files are now merged into the db2_plugin.conf file.
- Dependency on redirect restore script to get the data path information is now removed.

3.4.4.1.25 Release 3.1.1

The Db2 Plugin version 3.1.1 introduces the support for full online backups, which are taken using the "exclude logs" syntax. This support is only applicable to the dSources created using the Backup and Logs ingestion mechanism on a single partition.

In Db2, users have the flexibility to exclude logs while taking the full online backups. The Db2 plugin will read the backup header from the user-provided backup file. The backup header is used to figure out whether the backup was taken using the "exclude logs" syntax or not. In case the plugin detects that it was taken using the "exclude logs" option, then the required changes will be made in the restore syntax.

3.4.4.1.26 Release 3.1.0

The Db2 Plugin version 3.1.0 introduces the **Staging Push** feature. This feature will allow users to control the restore of the staging database and they can also control the state of the restored staging database. With the **Staging Push** feature, the restore and rollforward operations will be managed by the user from the CLI. During dSource creation (or RESYNC) the plugin will create an **empty mount point** and will provide a restore and rollforward template that will help the user to create the redirect restore script. Once the dSource will be ready then the user can perform restore and rollforward operations from CLI. The restore must be as per the plugin provided template. After the restore, the staging database should remain in rollforward pending state, and prior to the next snapshot, the user can do a rollforward to a specific Point-in-Time (by providing a timestamp to rollforward command) against the available archive logs.

3.4.4.1.27 Release 3.0.2

This release addresses a limitation in Db2 wherein the VDB can accept the connections when refresh, disable and delete Delphix operations are in process which eventually can corrupt the VDBs. This plugin version will reduce such occurrences by introducing maintenance window in these operations during which the VDB will not accept external connections.

3.4.4.1.28 Release 3.0.1

The Db2 Plugin version 3.0.1 fixes the bug wherein the jobs on UI hung intermittently due to a known IBM Db2 bug.

3.4.4.1.29 Release 3.0.0

The Db2 Plugin version 3.0.0 introduces support to Db2 Database Partitioning Feature (DPF). This will help the customer to ingest the data to a staging dsource from a Db2 DPF enabled source.

- **Database partitioning feature**

Database Partitioning Feature (DPF) lets you partition your database across multiple servers. Since you can add new machines and spread your database across them, this allows users to scale their database. This means more CPUs, more memory, and more disks from each of the additional machines are available for your database. DPF can be used to manage large databases for a variety of use cases including data warehousing, data mining, online analytical processing (OLAP), or online transaction processing (OLTP) workloads.

DPF enables the user to divide a database into database partitions, a database partition is a part of a database that consists of its own data, indexes, configuration files, and transaction logs. Each database partition can be configured on the different physical server having its own set of computing resources, including CPU and storage. When a query is processed, the request is divided so each database partition processes the rows that it is responsible for. DPF can maintain consistent query performance as the table grows by providing the capability to add more processing power in the form of additional database partitions. This capability is often referred to as providing linear scalability using Db2s shared-nothing architecture.

DPF is an approach to sizing and configuring an entire database system. Please follow the recommended practices for optimal performance, reliability, and capacity growth. Please refer to IBM documentation of DPF for more details in [IBM knowledge center](#)⁸⁸.

- **Pipelining logic for implementing parallel restores**

The plugin employs a parallel pipeline methodology so that the restore operation of non-catalog partitions can be performed in parallel in the Database Partitioning Feature (DPF). The number of parallel restores is determined by the value of “restorePipelineLimit” (default value is 10) in <Toolkit directory>/advanceConfFlag.conf. The parameter “restorePipelineLimit” is configurable by end-users. The plugin performs parallel restore for all non-catalog partitions. For e.g. If the total number of non-catalog partitions is 15, and the “restorePipelineLimit” parameter is set to 10, the first set of 10 restores will happen in parallel. The plugin will track the restore of each partition present in the pipe. Whenever a restore of a partition completes, it will move out from the pipe and a new partition will enter into that pipe. Thus, the plugin ensures that the pipe will always have the user-configured number of partitions being restored (default=10).

- **Data synchronization**

When “Customer Supplied Archive Logs” feature is used along with Db2 DPF feature, users will have to place the archive logs inside a folder with a name as NODE<Partition number> where <Partition number> is a four-digit number. For example, if the source environment has two partitions then the user-provided log path will have folder names NODE0000 and NODE0001. Both the folders will have respective archive logs. Snapshot operation will be used to apply the archive logs.

- **Advance configuration file**

The advanced config file is created at <Toolkit directory>/advanceConfFlag.conf during discovery or environment refresh operation if the file does not pre-exist already. This file will have the following configurable parameters:

- **Common group (*notCommonGroupFlag*)**

- This parameter sets the permission of “mnts”, “logs” and “code” directories at <Toolkit dir>/DB2 location.
- Set *notCommonGroupFlag* to *false*, if the primary group of the primary environment user (user which is used to do discovery) is shared with the instance users.
- Set *notCommonGroupFlag* to *true*, if you don't want to share any group between the primary environment user and the instance users.
- Once the necessary changes are made, refresh the environment in order to make the changes applicable.

By default, the *notCommonGroupFlag* parameter is not specified in the file. This means that the plugin implicitly assumes its value as false. The valid values for this parameter are true or false.

- **Allow source database on same instance (*allowSourceDBonSameInst*)**

By default, the DB2 Plugin restricts the provisioning of a VDB on a DB2 instance which contains a database with the same name as the VDB's source database

For example:

- When provisioning a VDB from a VDB then source VDB is treated as the source database.

⁸⁸ <https://www.ibm.com/developerworks/data/library/techarticle/dm-0608mcinerney/index.html>

- When provisioning a VDB from a dSource then a staging database is treated as the source database.

Set *allowSourceDBonSameInst* to true, if the user wants to provision a VDB on an instance which contains a database with the same name as the VDB's source database. The valid values for this parameter are true or false.

- **Restore pipeline limit (*restorePipelineLimit*)**

Db2 DPF Plugin performs restoration of all non-catalog partitions in parallel.

The parameter *restorePipelineLimit* allows the user to configure the number of partitions that should be restored in parallel. When the new *advanceConfFlag.conf* file is created during environment refresh or discovery operation, the default value of *restorePipelineLimit* is set to 10. If the *advanceConfFlag.conf* file is already present, the user will have to set the value of the `restorePipelineLimit` parameter to the desired value. The valid value for this field is any positive integer.

A default config file created during discovery or environment refresh operation: “

```
# If the user is not sharing a common group between primary environment user
and instance user.

# Then the user needs to set parameter notCommonGroupFlag as true.

# notCommonGroupFlag=true

# During provision operation check if instance contains a database name which
is identical to the source DB name used for provisioning operation.

# By default plugin will never allow creating a VDB on the instance where
source database (or other database which is identical in name with source DB)
already exists.

# If the user still wants to create a VDB on the instance which contains a
database name which is identical to the source DB name used for provisioning
operation,

# then the user needs to set parameter allowSourceDBonSameInst as true.

# allowSourceDBonSameInst=true

# Limit for parallel restores

restorePipelineLimit=10
```

3.4.4.2 Fixed issues (IBM Db2)

3.4.4.2.1 Release 4.8.0

Key	Summary
DB2-2402	Db2 dSources following end of logs from before shouldn't be forced to resync after 4.6.0.

3.4.4.2.2 Release 4.7.4

Key	Summary
DB2-2375	Unable to use a valid Db2 database name when linking dSource.
DB2-2379	Db2 VDB provision/refresh from parent VDB results in failed relocate database attempt

3.4.4.2.3 Release 4.7.3

This release version has been removed. Please install or upgrade to a later version.

3.4.4.2.4 Release 4.7.2

Key	Summary
DB2-1606	Custom mount base fails with 'attribute error' during VDB enable.
DB2-2349	Update Db Storage paths if old path structure, <mount_path>/<db_path> is found

3.4.4.2.5 Release 4.7.1

Key	Summary
DB2-2305	Custom mount base fails with 'attribute error' during VDB enable.

3.4.4.2.6 Release 4.7.0

There are no fixed issues in this release.

3.4.4.2.7 Release 4.6.1

Key	Summary
DB2-2190	Instead of failing the process, the housekeeping job should issue a warning.

3.4.4.2.8 Release 4.6.0

Key	Summary
DB2-2068	"VDB Name" requested to be entered twice during provisioning.
DB2-2117	Update LOGARCHCOMPR1 and LOARCHCOMPR2 to off during dSource creation
DB2-2155	db2greg should run from the latest installation of db2 on staging/target for environment discovery
DB2-2156	All DB2 dSources with Backup+logs should only rollforward to PIT
DB2-2178	MRT query fails with SQL1262N on staging hosts that are ahead of UTC timezone
DB2-2179	If DB2LOADREC registry value already set raise error.

3.4.4.2.9 Release 4.5.1

Key	Summary
DB2-2112	DB2 pre-snapshot phase runs rollforward to EOL on RF pit configuration

3.4.4.2.10 Release 4.5.0

There are no fixed issues in this release.

3.4.4.2.11 Release 4.4.2

Ticket number	Summary
DB2-2004	Some DB2 VDB deletes/refresh when canceled leave database running on instance in strange state

3.4.4.2.12 Release 4.4.1

Ticket number	Summary
DB2-2044	Db2 plugin shouldn't implement Source sizing for VDB datasets
DB2-2045	VDB provisioning fails with SQI5153N due to LOGSECOND value
DB2-2053	Provisioning VDB failed during db2relocatedb due to multiple storage group paths

3.4.4.2.13 Release 4.4.0

Ticket number	Summary
DB2-2033	Resync fails on staging hosts with fuser command
DB2-2041	HADR linking is failing for low privilege user environment

3.4.4.2.14 Release 4.3.2

Ticket number	Summary
DB2-1682	Db2 vSDK plugin should support all product editions
DB2-1971	Environment addition and other workflows fail when .profile is configured with banners
DB2-1992	Restore on dpf environment continues even when one or more nodes' restore fails in dSource creation
DB2-1997	Db2 staging push doesn't test for missing tablespaces/datapaths while running db2dart

3.4.4.2.15 Release 4.3.1

Ticket number	Summary
DB2-1973	Make sure the data paths are configured under "db_mount/DB_NAME" in staging push

3.4.4.2.16 Release 4.3.0

Ticket number	Summary
DB2-1952	<code>remove_event_bin_files</code> may fail due to regular expression mismatch for DIAGPATH value

3.4.4.2.17 Release 4.2.1

There are no fixed issues in this release.

3.4.4.2.18 Release 4.2.0

Ticket number	Summary
DB2-1901	VDB provision from dsource with rollforward to PIT is running <code>rollforward to end of logs and stop</code> instead of <code>rollforward stop</code>
DB2-1911	DB2 rollforward command failing with syntax error for <code>dpf</code> environments
DB2-1913	The rollforward command should work with timezone only when timestamp is provided.
DB2-1920	VDB provision fails with <code>Failed to execute rollforward command on database BDN9NAJZ</code> in case of dsource with backup and log ingestion.

3.4.4.2.19 Release 4.1.3

Ticket number	Summary
DB2-1812	CLI operations during snapsync may fail if commands return error messages in a different locale
DB2-1856	VDB provision fails with an issue during <code>db2relocatedb</code>
DB2-1875	VDB behavior when we provision them using the first snapshot vs the latter ones
DB2-1921	Fix permissions for <code>"/toolkit_dir/DB2"</code> along with <code>mnts/</code> and <code>logs</code>
DB2-1904	Staging push vSDK: snapsync operation on dSource fails with <code>TypeError: unhashable type: 'SnapshotDefinitionDataPaths'</code>

3.4.4.2.20 Release 4.1.2

Ticket number	Summary
DB2-1826	Moved Staging Push redirect restore template out of the plugin and added contextual values to plugin logs
DB2-1796	Unable to get the complete content of redirect restore script in case the script size is more than 1MB
DB2-1824	DB2 VDB provisioning fails during relocateDB

3.4.4.2.21 Release 4.1.1

There are no fixed issues in this release.

3.4.4.2.22 Release 4.1.0

There are no fixed issues in this release.

3.4.4.2.23 Release 4.0.1

Key	Summary
DB2-1684	[Staging Push]Enable operation on dSource should generate the Restore and Rollforward template file if it is missing

3.4.4.2.24 Release 4.0.0

There are no fixed issues in this release.

3.4.4.2.25 Release 3.1.1

There are no fixed issues in this release.

3.4.4.2.26 Release 3.1.0

There are no fixed issues in this release.

3.4.4.2.27 Release 3.0.2

There are no fixed issues in this release.

3.4.4.2.28 Release 3.0.1

There are no fixed issues in this release.

3.4.4.2.29 Release 3.0.0

There are no fixed issues in this release.

3.4.4.3 Known issues (IBM Db2)**3.4.4.3.1 Release 4.7.2**

Key	Summary	Workaround
DB2-2231	During upgrade from 6.0.x to 7.0, 8.0,21.0 , Delphix engine destroys the plugin's scratch path where all the plugin logs, configuration files are present. During the environment refresh, these paths and files are regenerated. However, any edits done in db2_plugin.conf will not be persisted	Before upgrading the engine, the user will have to make a copy of the db2_plugin.conf file to keep the changes intact.

3.4.4.3.2 Release 4.7.1

Key	Summary	Workaround
DB2-2056	Upgrade from lua version to VSDK has issues with VDB Snapsync	Re-provisioning the database with the dSource's snapshot fixes the issue.
DB2-2124	If the storage paths are subdirectories of another storage path, the instance name at target and true prod cannot be the same.	Create instance name on target different than true production

3.4.4.3.3 Release 4.7.0

Key	Summary	Workaround
DB2-2056	Upgrade from lua version to VSDK has issues with VDB Snapsync	Re-provisioning the database with the dSource's snapshot fixes the issue.
DB2-2124	If the storage paths are subdirectories of another storage path, the instance name at target and true prod cannot be the same.	Create instance name on target different than true production

3.4.4.3.4 Release 4.6.1

Key	Summary	Workaround
DB2-2056	Upgrade from lua version to VSDK has issues with VDB Snapsync	Re-provisioning the database with the dSource's snapshot fixes the issue.
DB2-2124	If the storage paths are subdirectories of another storage path, the instance name at target and true prod cannot be the same.	Create instance name on target different than true production

3.4.4.3.5 Release 4.6.0

Key	Summary	Workaround
DB2-2056	Upgrade from lua version to VSDK has issues with VDB Snapsync	Re-provisioning the database with the dSource's snapshot fixes the issue.
DB2-2124	If the storage paths are subdirectories of another storage path, the instance name at target and true prod cannot be the same.	Create instance name on target different than true production

3.4.4.3.6 Release 4.5.1

Key	Summary	Workaround
DB2-2107	db2ckbcp fails for Backup paths with spaces	Remove blank spaces from backup paths
DB2-2124	The instance name at target and true prod cannot be the same if the storage paths are sub directories of another storage path.	Create instance name on target different than true production

3.4.4.3.7 Release 4.5.0

Key	Summary	Workaround
DB2-2107	db2ckbcp fails for Backup paths with spaces	Remove blank spaces from backup paths

3.4.4.3.8 Release 4.4.2

3.4.4.3.26 Release 3.0.0

Key	Summary	Workaround / Comments
DB2-1318	Jobs on UI might hang intermittently due to a known IBM Db2 bug	This issue will be only observed when multiple datasets jobs, within the same Db2 instance, will get executed at the same time.

3.4.5 MongoDB release notes

This section covers the following topics:

- [New features \(MongoDB\)](#) (see page 374)
- [Fixed issues \(MongoDB\)](#) (see page 376)
- [Known issues \(MongoDB\)](#) (see page 379)

To view the MongoDB support matrix, visit the [MongoDB support matrix](#)⁸⁹ page.

3.4.5.1 New features (MongoDB)

3.4.5.1.1 1.4.0

- Supported `requireTLS` `tlsMode` for the `extendedcluster` `dsource` type.
- Improved debugging capabilities by un-redacting any generic information in engine metadata.

3.4.5.1.2 1.3.0

- Conducted comprehensive UI refactoring to improve user experience, streamline navigation, and enhance overall interface efficiency.

⁸⁹ <https://cd.delphix.com/docs/latest/mongodb-support-matrix>

- Improved MongoDB operations by introducing support for parallel execution of `mongodump` and `mongorestore`, significantly speeding up backup and restoration processes.

3.4.5.1.3 1.2.1

- Implemented security enhancements and hardening measures for the MongoDB plugin, ensuring robust protection against vulnerabilities and unauthorized access.
- Updated the documentation to include a support matrix for Atlas MongoDB dSource types, providing clear guidance on compatibility and configuration options.

3.4.5.1.4 1.2.0

- Introduced Source Sizing for the MongoDB plugin, enhancing the capacity planning and resource allocation process for more efficient database management.
- Addressed security concerns by concealing the MongoDB instance password in the staging host's `ps` output, preventing unauthorized access and improving system security.
- The MongoDB plugin now automatically captures and reports errors directly from MongoDB logs, to help streamline troubleshooting.
- MongoDB 6 and Cluster-to-Cluster Sync is now supported.
- MongoDB 6 on RHEL 8 is now supported.

3.4.5.1.5 1.1.0

- A refined version of the CRDB logger has been implemented to enhance data security, which includes generic masking of sensitive information (such as database passwords) preventing them from being displayed in plugin logs in clear text.
- SDD support has been added.

3.4.5.1.6 1.0.2

- Users can now specify the location of `mongodump` and `mongorestore`.
- Added support to accept a `.tar` extension of a MongoDB Ops Manager backup file in addition to `.tar.gz`.
- MongoDB 5.0.9 is now supported.

3.4.5.1.7 1.0.0

- First release version of the MongoDB connector

3.4.5.2 Fixed issues (MongoDB)

3.4.5.2.1 1.4.0

Bug number	Resolution
CE-702	Unredact schema.json parameters except sensitive information.
CE-703	Port requireTLS mode support for extendedcluster from HF 1.3.2.1

3.4.5.2.2 1.3.2.1

Bug number	Resolution
CE-685	Support tlsMode requireTLS for a staging database created using extendedcluster dsource type

3.4.5.2.3 1.3.2

Bug number	Resolution
CE-62	Fixed MongoDB Plugin: Onlinedump dSource Pre-Snapshot operation failure issue.
CE-449	Fixed the issue of linking MongoDB dSource dialogue allowing a Windows path in the Mount Path that results in fatal internal error.
CE-450	Fixed unable to read UI dialogue instructions for MongoDB Config Server Backup File.
CE-456	Fixed issue to display the mongorestore output in verbose mode
CE-457	Fixed the issue of MongoDB creating empty snapshots when there are no backups to restore.

Bug number	Resolution
CE-458	Fixed an intermittent issue of Offlinemongodb dSource runs SnapSync on policy schedule and creates snapshot despite no new backups.
CE-502	Fixed the issue of linking a MongoDB dSource failure due to user already exists.
CE-551	Fixed MongoDB VDB refresh sporadically failure due to Address already in use.
CE-559	Fixed the MongoDB dSource dialogue linking confusion.
CE-611	Validate if mongosh client exists in the PATH over the deprecated "mongo" client.
CE-638	Fixed the issue of VirtualSource object has no attribute mongo_shell_path.
CE-639	Previously shutdown mongod process fails to start throwing SocketException Address already in use.
CE-643	Fixed the mongodump and mongorestore defects at SSL/TLS enablement for address already in use in provisioning.
CE-644	MongoServerError: not primary and secondaryOk=false - consider using db.getMongo().setReadPref() or readPreference in the connection string
CE-645	VirtualSourceDefinition object has no attribute d_source_type

3.4.5.2.4 1.2.0

Bug number	Resolution
CE-142	Fixed an issue where dSource enable failed with "IllegalObjectAccess" after replication failover.
CE-189	Fixed an issue when a MongoDB instance is terminated with <code>kill</code> that would sometimes fail and leave child processes orphaned.
CE-240	Fixed an issue where <code>sh.addShard()</code> fails if the staging database password contains special characters.

Bug number	Resolution
CE-256	<code>sudo</code> rule examples in MongoDB staging and target requirements have been corrected.
CE-79	A description of the expected format for backup files has been added.
CE-186	Fixed an intermittent MongoDB issue where it errors out with “Address already in use” if temporary socket files for available ports exist on the staging environment.

3.4.5.2.5 1.1.0

Bug number	Resolution
DXE-986	Removed an additional “Source sharded” prompt if the type of data source (dSource_Type) has already been selected as <code>shardedsource</code> .
DXE-987	Removed the "Convert each shard to replica set" option from the dSource linking process, as it applies only to VDBs.

3.4.5.2.6 1.0.2

Bug number	Resolution
DXE-985	Fixed an issue where the incorrect date format in backup metadata files produce a linking error.
DXE-964	Fixed an issue where enabling authentication with <code>User Auth Mode</code> as <code>ldap</code> breaks dSource/VDB creation.

3.4.5.2.7 1.0.1

- Sharded dSource creation workflow has been fixed.

3.4.5.3 Known issues (MongoDB)

The following known issues take effect in all MongoDB plugin versions.

- The MongoDB plugin does not recognize any environment variables in hooks.
- dSources cannot be upgraded via GUI. Only the CLI interface is supported.

3.4.6 MySQL release notes

This section covers the following topics:

- [New features \(MySQL\)](#) (see page 379)
- [Fixed issues \(MySQL\)](#) (see page 381)

To view the MySQL support matrix, see [MySQL matrix](#) (see page 1367).

3.4.6.1 New features (MySQL)

3.4.6.1.1 Release 4.7.0

This plugin release supports the following feature/features:

- **Certification of RHEL 8.9**
 - Certified MySQL and Percona v8.0 on RHEL v8.9 and lower.

3.4.6.1.2 Release 4.6.0

This plugin release supports the following feature/features:

- **Certification of Amazon Linux 2**
 - The Amazon Linux 2 operating system is certified against the MySQL connector and MySQL 8.0.X.
 - This ensures that when Amazon Linux 2 is the source environment (MySQL 8.0.X) and Amazon Linux 2 (MySQL 8.0.X) is the staging environment, staging push and replication flows work as expected. Finally, VDBs can be provisioned onto Amazon Linux 2 target environments.
- **Certification of MySQL RDS / MySQL RDS Aurora with Amazon Linux 2 (Staging Push)** - Staging Push is certified with AWS RDS and AWS RDS Aurora in AWS (PaaS) as a source and Amazon Linux 2 as a staging environment.
- **Custom backup folder for Delphix Initiated backup** - By default, the `/tmp` folder was used to store the backup files during the Delphix initiated backup. With this release, customers can provide their backup folder with proper privileges.
- **Source Config parameters are now optional** - While creating dSources with Staging Push, the installation (or Source Config) parameters are optional. However, they are required for the two replication-based linking mechanisms.

3.4.6.1.3 Release 4.5.0

This plugin release supports the following feature/features:

- **Dynamic UI:** This release introduces dynamic UI changes that will make only those fields visible that are required for the selected ingestion mechanism (dSource Type) staging push or replication. As part of this feature, the following changes have been made:
 - The **Database List** and **Logsync** fields are now removed from the linking screen.
 - **Provide different Replication User** is added on the linking screen. This field is used in scenarios where you explicitly want to provide different replication user credentials.

3.4.6.1.4 Release 4.4.0

This plugin release consists of only bug fixes.

3.4.6.1.5 Release 4.3.0

This release renames the 'Manual Backup Ingestion' mechanism to 'Staging Push'. You can notice this change when you create a dsource. For more information, refer to [Linking using Staging Push mode](#)⁹⁰.

3.4.6.1.6 Release 4.2.0

This connector version introduces data source sizing which enables users to calculate the size of ingested MySQL databases. For more information, refer to [Source sizing implementation for MySQL dSources](#)⁹¹.

3.4.6.1.7 Release 4.1.0

This connector version blocks the creation, rollback, and refresh actions of VDBs on target environments when the installed MySQL version is not the same as the dSource's installed MySQL version. This is a protective feature that prevents the accidental corruption of MySQL VDBs.

3.4.6.1.8 Release 4.0.0

This connector version supports MySQL v8 across all certified editions.

3.4.6.1.9 Release 3.0.0

This connector version has the following new features:

- The MySQL connector version 3.0.0 has been enhanced for improved security and stability. We have added fixes for the following:

⁹⁰ <https://cd.delphix.com/docs/latest/staging-push>

⁹¹ <https://cd.delphix.com/docs/latest/mysql-source-sizing-implementation-for-dsource>

- Dataset creation workflows can detect if the provided port number is already in use by an existing MySQL instance and notify the user.
- Corrected the reported dSource and VDB statuses.
- Fixed the **Snapshot with Parameters** functionality of the Manual Backup Ingestion to work smoothly and without errors.
- Improved UI descriptions, UI and connector validations, and error messages.
- Added support for Percona Server for MySQL version 5.7 using Manual Backup Ingestion and Binary Log Replication ingestion models.
- Integrated support for MySQL and Percona Server for MySQL version 5.7 in a consolidated release stream. If you have installed divergent or custom branches of the MySQL connector you should look to migrate to this production stream. Future features and bugs will be resolved here.
- Implemented various security fixes.

3.4.6.1.10 Release 2.1.0

The MySQL connector 2.1.0 release consists of security improvements.

3.4.6.1.11 Release 2.0.26

This connector version has the following new features:

- **Selecting Databases:** Ability to select specific databases in the Source MySQL server when creating a dSource.
- **Delphix generated config file:** If a `my.cnf` file is not provided while creating a dSource, Delphix now creates one.
- **New Exit Return Codes:** MySQL connector 2.0.26 introduces more granular error exit codes.

Delphix began supporting MySQL connector version from v2.0.26.

3.4.6.2 Fixed issues (MySQL)

Release 4.7.0

Ticket number	Summary
MYSQL-296	The MySQL Discovery operation displayed an error if no MySQL repositories are found on the staging or target environment. Now, the discovery operation will no longer crash in these instances.

Ticket number	Summary
MYSQL-184	Redact potentially sensitive data during the generation of support bundles.

Release 4.6.0

Ticket number	Summary
MYSQL-250	<p>Plugin operation fails while writing logs if any previous logs exist in the toolkit directory.</p> <p>If the original environment (operating system) user is replaced with a new user, connector operations will fail due to the existence of logs and the new user's lack of file privileges. In this release, user permissions have been updated so that connector operations are completed successfully.</p>
MYSQL-275	<p>The mysqldump failing because of special characters</p> <p>The MySQL dump would fail if the password contained any of the following characters: \$ ``! \.</p>
MYSQL-292	<p>Changes in my.cnf allowed properties - removing some restriction</p> <p>Restrictions have been lifted to allow special characters and longer character lengths to support many MySQL runtime parameters specified during VDB provisioning.</p>
MYSQL-298	<p>Unable to refresh MySQL VDB due to shutdown timeout</p> <p>The timeout length has been increased from 3 to 15 minutes so that shutdown timeout errors are avoided.</p>

3.4.6.2.1 Release 4.5.0

Ticket number	Summary
MYSQL-242	Plugin Operation fails while writing logs if any previous logs exist in the toolkit directory.

3.4.6.2.2 Release 4.4.0

Ticket number	Summary
MYSQL-230	Added missing my.cnf update logic within the Rollback operation.
MYSQL-225	A quick fix to prevent code break.
MYSQL-214	Verified the CLI syntax, and conveyed it to the support team. Validated major CLI operations for the MySQL Document revamp as well.

3.4.6.2.3 Release 4.3.0

Ticket number	Summary
MYSQL-210	ESCL-4684 - Retry logic for Refresh
MYSQL-207	Runbash failing while shutting down(kill) the MySQL instance

3.4.6.2.4 Release 4.2.0

There are no fixed issues in this release.

3.4.6.2.5 Release 4.1.0

Ticket number	Summary
MYSQL-118	The MySQL Instance name is changed to Source Config name to reduce confusion during configuration and standardize across our connectors.

3.4.6.2.6 Release 4.0.0

Ticket number	Summary
MYSQL-138	The length of the MySQL Instance name has now been changed to support up to 255 characters.
MYSQL-81	Changed the command to change the root password which facilitates seamless working of the linking process.
MYSQL-72	Changed the commands to take backups as they were deprecated.

3.4.6.2.7 Release 3.0.0

There are no fixed issues in this release.

3.4.6.2.8 Release 2.1.0

There are no fixed issues in this release.

3.4.6.2.9 Release 2.0.26

There are no fixed issues in this release.

3.4.7 Oracle E-Business Suite (EBS) 12.2 release notes

This section covers the following topics:

- [New features \(EBS\) \(see page 384\)](#)
- [Fixed issues \(EBS\) \(see page 389\)](#)
- [Known issues \(EBS\) \(see page 395\)](#)

To view the EBS support matrix, see [Oracle E-Business Suite \(EBS\) matrix \(see page 1719\)](#).

3.4.7.1 New features (EBS)

3.4.7.1.1 Release 5.0.1

This plugin release consists of only bug fixes.

3.4.7.1.2 Release 5.0.0

The Oracle EBS plugin version 5.0.0 introduces the following enhancements:

- **AppsTier dsource ingestion from a Standby or Intermediate server**
From this release, users can link and configure AppsTier dSource from the standby/intermediate server. The source server is not required to be a primary AppsTier running server as in the previous releases. Refer to the [Linking the AppsTier \(see page 0\)](#) page.
- **Password change of APPS and Weblogic schemas during AppsTier VDB Enable workflow**
From this release, users can change the APPS and Weblogic passwords independently by updating the UI fields with the new passwords. A dataset refresh will not be required for changing VDB passwords saving hours. If users change the APPS or Weblogic passwords manually outside Delphix, they can update the same passwords in the UI fields to take effect. It is mandatory to take a snapshot of the VDB after updating the passwords. This feature enables users to manage their passwords not just through the EBS connector but also manually as per their choice. Refer to the [Managing the APPS and Weblogic Password \(see page 1811\)](#) page.
- **Dynamic UI Input fields in the AppsTier linking wizard**
This release introduces Dynamic UI input fields during AppsTier linking and validation of input formats like **Run Base Path** and **AD/TXK Code Level** during AppsTier Linking workflow.

3.4.7.1.3 Release 4.6.0

The Oracle EBS plugin version 4.6.0 introduces the below enhancements and bug fixes:

- Enhances plugin logging in the following AppsTier workflows:
 - Enable Operation
 - Disable Operation
 - Start Operation
 - Stop Operation
 - Snapshot Operations – pre-snapshot & post-snapshot
 - Environment Status Check Workflow
- Revises Oracle EBS connector documentation for better clarity and usability.

3.4.7.1.4 Release 4.5.0

The Oracle EBS plugin version 4.5.0 introduces the below enhancements and bug fixes:

- With this release, the plugin now enables the linking and virtualization of DBTECHSTACK on AIX operating systems. This update extends support for AIX DBTECHSTACK and database virtualization.
- In this release, an enhancement has been introduced to extend the timeout for the `adcfgclone.pl dbTechStack` job. Previously set at 1800 seconds, the new timeout has been increased to 5400 seconds (90 minutes). This extended timeout is now applicable across all operating systems.
- In the 19c Database version, the `adcdblnctl.sh` script is now the designated tool for executing the listener, regardless of the operating system type or version.

- The DBTECHSTACK plugin now manages the configuration of the `ROOTPRE_EXECUTED=Y ENV` environment variable.
- The CDB environment file is now sourced before triggering the `txkGenCDBTnsAdmin.pl` utility/script. This occurs after the sourcing of `txkSetCfgCDB.env`.

3.4.7.1.5 Release 4.4.0

The Oracle EBS plugin version 4.4.0 introduces below enhancements and bug fixes:

- **Updated Hooks content in hooks utility to support Solaris**
In this release, we have addressed issues related to the execution of hooks commands in Solaris environments. Certain commands were previously failing to execute as intended. To ensure uniform functionality across both Linux and Solaris machines, modifications have been implemented in the hooks utility. You can now expect consistent performance across platforms.
- **Support for load balancer implementation in EBS setup**
This release adds support for load balancer implementation in EBS setup, where you can now set `profile_option_value` for `apps_framework_agent` to load balancer hostname.
- **Updated sudoers entries**
This release adds new sudoers entries to documentation. Please update sudoers entries if you are using privilege elevation. For more information, refer to [this](#)⁹² documentation.
- **Other general enhancements and bug fixes**

3.4.7.1.6 Release 4.3.0

This plugin release has the following set of new features.

- **EBS Intelligent AppsTier linking**
This will remove the manual intervention while you are performing cutover from RUN FS(fs1) to PATCH FS(fs2) and now new PATCH FS(fs1), new RUN FS(fs2) and you don't have to make any changes in dSource configuration so linking will work seamlessly.
With 4.3.0 or later, we do not need to specify the "relative paths" of files to exclude in the Paths to Exclude list. Delphix Engine will automatically detect the RUN FS.
- **EBS HealthChecker utility**
The HealthChecker will perform various pre-requisite checks reporting to ensure OS libraries, utilities, OS user permissions, oracle central inventory, OS resources (CPU, RAM, swap space, storage) etc. are as per Oracle vendor EBS sizing guidelines. If anything is missing, it will be reported and must be fixed before Delphix Virtualization workflows are triggered by end-user
The HealthChecker ensures Delphix's linking, provision, and refreshes of EBS workflows run smoothly.
- **Performance improvement**
The latest 4.3.0 plugin version has an improved performance, due to the removal of explicit status checks of WLS Managed servers during the virtual AppsTier provision and refresh phase.

⁹² [https://cd.delphix.com/docs/19.0.0.0/preparing-target-ebs-r12-2-environments-for-provis#id-\(16.0.0.0\)PreparingtargetEBSR12.2environmentsforprovisioning-SudoersentryforLinux](https://cd.delphix.com/docs/19.0.0.0/preparing-target-ebs-r12-2-environments-for-provis#id-(16.0.0.0)PreparingtargetEBSR12.2environmentsforprovisioning-SudoersentryforLinux)

- **Improvement in the re-run of failed VDB provision or refresh workflows**

With this improvement, you don't have to delete a failed VDB. Instead, you can disable the VDB with the force option, clean up the target server after receiving the 'stale file handle' and stale processes problems, and then re-try the provision or refresh workflow.

3.4.7.1.7 Release 4.2.2

This plugin release consists of only bug fixes.

3.4.7.1.8 Release 4.2.1

This plugin release consists of only bug fixes.

3.4.7.1.9 Release 4.2.0

This plugin release has the following set of new features.

- **EBS database port customization**

This feature supports the provisioning of VDBs in EBS dbTechStack & AppsTier plugins to run on a customized port. Using this feature you can provision database binaries(ORACLE_HOME) cloning and listener process to run on a custom DB port and Application tier to connect to that port. The EBS Database Port Customization provide flexibility to choose the desired port for running the Delphix-created VDBs & listeners.

This feature is supported only in Oracle 19c Database.

3.4.7.1.10 Release 4.1.0

The Oracle EBS plugin version 4.1.0 introduces the hooks utility feature and also addresses the handling of an additional prompt for ISG Datasource password during AppsTier provisioning operation for `adcfgclone` execution.

- **Hooks utility feature**

This feature provides flexibility to end-users where they can provide a command with `configure/pre-snapshot` as an option in configuring and pre-snapshot hooks during DB provisioning. This is a huge improvement in terms of user experience in comparison to the conventional approach where end-users had to add entire content (by copying it from the user documentation) into the various hooks. The hooks utility also manages the logs for hooks execution; it'll be helpful in scenarios where end users want to track the hook execution. We have not removed or restricted the existing approach of providing hooks content from user documentation, the hooks utility can be used as an alternative to the existing approach.

3.4.7.1.11 Release 4.0.2

This plugin release consists of only bug fixes.

3.4.7.1.12 Release 3.0.3

This plugin release consists of only bug fixes.

3.4.7.1.13 Release 3.0.2

This is a patch release that aims to provide the following updates to EBS 12.2 plugin.

- Updated Hooks for 19c MT low and high privileged users.
- Fixed an issue where 19c DBTechStack provision fails during `adcfgclone` with java exception.

3.4.7.1.14 Release 3.0.1

This is a patch release that aims to provide the following updates to EBS 12.2 plugin.

- Added support for RHEL 8.3
- Updated Hooks for 19c MT low and high privileged users.

3.4.7.1.15 Release 3.0.0

The Oracle EBS plugin version 3.0.0 aims to support Oracle 19c MT architecture. Moreover, a new field has been added on the provisioning UI. This will provide the flexibility to the end-user to provide the maximum time allowed to virtualize the application tier.

3.4.7.1.16 Release 2.0.1

The Oracle EBS plugin version 2.0.1 aims to successfully stop application services while provisioning or refresh operation. Hence, creating successful snapshots.

3.4.7.1.17 Release 2.0.0

The Oracle EBS plugin version 2.0.0 aims to implement Sudo Privileges feature for both EBS 12.2 Database Tier and Application Tier.

3.4.7.1.18 Release 1.8.4

The Oracle EBS plugin version 1.8.4 aims to implement Weblogic password complexity validation as per the Oracle standards.

3.4.7.1.19 Release 1.8.3

The Oracle EBS plugin version 1.8.3 introduces a new feature while refreshing EBS appsTier where a Pre Refresh hook will help in aborting concurrent manager services and reduce the time taken to gracefully stop the EBS application.. The password required to execute the same will be pulled from a text file present on the target appsTier host which will be created automatically during appsTier provisioning.

3.4.7.1.20 Release 1.8.2

Oracle EBS plugin version 1.8.2 introduces a new feature where the user will not need to specify the source apps schema password in EBS DB hooks provision wizard. This password can now be pulled from a text file present on the target DB host which will be created automatically during DBTechStack provisioning.

3.4.7.2 Fixed issues (EBS)

3.4.7.2.1 Release 5.0.1

Ticket number	Summary
EBS-1529	The hooks utility fails to get the local_listener value and create the required PDB services.
EBS-1531	The connector cannot shut down the listener when two or more run on the same server.

3.4.7.2.2 Release 5.0.0

There are no fixed issues in this release.

3.4.7.2.3 Release 4.6.0

Ticket number	Summary
---------------	---------

EBS-1510	<p>The AppsTier provision/refresh workflow halts at the APPLPTMP prompt due to an expect block generated by the adcfgclone.pl utility that doesn't match older versions. The issue occurs as the keyword value after APPLPTMP is problematic in AD/TXK code level 13 or later releases.</p> <p>The prompt changes for the APPLPTMP input during adcfgclone.pl utility run.</p> <p>adcfgclone.pl with AD/TXK code level 12 or lower generates a prompt like this -</p> <p>Choose a value which will be set as APPLPTMP value on the target node [1]:</p> <p>adcfgclone.pl with AD/TXK code level 13 or later generates a prompt like this-</p> <p>Choose a value which will be set as APPLPTMP on the target node [1]:</p> <p>The v4.6.0 release smoothly handles this situation for AD/TXK code level 15 and lower.</p>
EBS-1490	<p>A regression bug from previous plugin version 4.5.0, update_adpreclone_file function is failing to comment the check_db_connection(); line in adpreclone.pl on DBTechStack side.</p>
EBS-1483	<p>Correction in the check_value variable's value in 12c hooks.</p>

3.4.7.2.4 Release 4.5.0

Ticket number	Summary
EBS-1469	<p>Correction in functions update_adpreclone_file() and replace_string_in_file(). A regression bug from 4.4.0 where adpreclone.pl version is latest and we comment check_db_connection() function call in adpreclone.pl script while taking dbTechStack snapshot and uncommenting the changes after taking the VDB dataset snapshot.</p>
EBS-1461	<p>Removing dependency of Isuf utility in solaris to get the running processes information.</p>

3.4.7.2.5 Release 4.3.0

Ticket number	Summary
EBS-1319	In DBTECHSTACK provision, Plugin should not run adpreclone.pl dbTechStack command
EBS-1312	WLS password is saved in updatedspassword file
EBS-1255	Unable to refresh a failed provision
EBS-874	Detach oracle home and delete apps password file during unconfigure/delete operation and cleanup before provision

3.4.7.2.6 Release 4.2.2

Ticket number	Summary
EBS-1292, HF-1225	Plugin was using wrong Autoconfig script location if <code>`s_jdbc_connect_descriptor_generation`</code> was not true in CONTEXT_FILE
EBS-1280	Strong password check for WLS password as per EBS requirement
EBS-1169	Source apps password file removed from all remote hosts to improve security.
EBS-1285	Implementation of AppData Bundle Redaction parameters in EBS plugin
EBS-1256	Expect utility availability is checked on additional application nodes for smooth multi-node provisioning.

3.4.7.2.7 Release 4.2.1

Ticket number	Summary
----------------------	----------------

EBS-1265	Hooks utility fails to get the short hostname if target server is SunOS SOLARIS
EBS-1278	Handling detach ORACLE HOME when inventory.xml has multiple HOMES
EBS-1259	If someone is upgrading from Lua(2.0.x) to vSDK version(4.x.x) and using oracle 11g, the end user will not be able to take snapshot in Delphix Engine
EBS-1275	Fix Isof issue in Solaris and Linux

3.4.7.2.8 Release 4.2.0

There are no fixed issues in this release.

3.4.7.2.9 Release 4.1.0

There are no fixed issues in this release.

3.4.7.2.10 Release 4.0.2

There are no fixed issues in this release.

3.4.7.2.11 Release 3.0.3

Key	Summary
EBS-1027	EBS 12.2 Plugin will validate user-provided ORACLE_HOME during DbTier provisioning
EBS-1028	Enhancements identified in dbTechStack code
EBS-1038	Fix shellchecks warnings/errors in hooks and sudoers entry for target dbtier
EBS-1066	Make the check stricter for listener process in DBTechStack status module and fix shellchecks

3.4.7.2.12 Release 3.0.2

Key	Summary
EBS-890	19C DBTechStack provision fails during adcfgclone with java exception

3.4.7.2.13 Release 3.0.1

There are no fixed issues in this release.

3.4.7.2.14 Release 3.0.0

Key	Summary
EBS-767	EBS appsTier linking failed while identifying Delta patch level information from low-privilege OS user
EBS-779	Continued timeouts - toolkit.ebs122-app-1-8-2.errorTimeout {admanagedsrvctl}
EBS-787	Toolkit should perform prior dependency/pre-requisite check in target host before starting to provision dBtechStack and Appstier
EBS-788	Error not being shown to the customer
EBS-798	GUI shows vfiles ORACLE_HOME as stopped however it is not
EBS-778	Expect timeout set to 8 hours which is too short
EBS-798	GUI shows vfiles ORACLE_HOME as stopped however it is not
EBS-816	EBS 12.2 disable Appstier vdb failed with Delphix cannot stop all processes under /u01/oracle/VIS on host

3.4.7.2.15 Release 2.0.1

Key	Summary
EBS-783	Provisioning VDB from Appstier dSource fails with adpreclone connection with Oracle WebLogic Administration Server

3.4.7.2.16 Release 2.0.0

Key	Summary
EBS-757	EBS plugin should check for data accessibility during status check.

3.4.7.2.17 Release 1.8.4

Key	Summary
EBS-712	WLS Password Complexity Issue - Merge ESCL_2983 into EBS 12.2 Plugin.
EBS-713	Multi-line support for SQL query O/P - merge ESCL-2988 into EBS 12.2 Plugin.

3.4.7.2.18 Release 1.8.3

Key	Summary
EBS-663	Abort EBS ConcMgr services before stopping EBS appsTier services during refresh.

3.4.7.2.19 Release 1.8.2

Key	Summary
EBS_566	Display port pool number in the error toolkit.ebs122-app-1-7-0.portPoolNotFreeError.

Key	Summary
EBS-597	Delphix Hooks Password-Storing Apps password to file for EBS appsTier

3.4.7.3 Known issues (EBS)

3.4.7.3.1 Release 5.0.1

Key	Summary	Workaround
EBS-1537	DBTechStack provision fails to link “libasmclntsh19.ohso”, “libasmperl19.ohso”, and “client_sharedlib” of makefile ins_rdbms.mk when Delphix storage is mounted using NFSv3 on target AIX environment.	Mount the Delphix engine storage using the NFSv4 protocol.
EBS-1509	With privilege elevation user, if perl rpm/ fileset is corrupted at the OS level, then the perl binary that comes with Oracle EBS AppsTier or DBTechStack cannot be used to invoke the adpreclone.pl or adcfgclone.pl utilities.	You must install perl rpm/ fileset at the OS level and the perl utility must be executable by Oracle OS users.

3.4.7.3.2 Release 5.0.0

Key	Summary	Workaround
EBS-1509	With privilege elevation user, if perl rpm/ fileset is corrupted at the OS level then perl binary that comes with EBS AppsTier or DBTechStack cannot be used to invoke adpreclone.pl or adcfgclone.pl utility.	You must install perl rpm/ fileset at the OS level and the perl utility must be executable by Oracle OS users.

3.4.7.3.3 Release 4.6.0

Key	Summary	Workaround
EBS-1509	With privilege elevation user, if <code>perl rpm/ fileset</code> is corrupted at the OS level then perl binary that comes with EBS AppsTier or DBTechStack cannot be used to invoke <code>adpreclone.pl</code> or <code>adcfgclone.pl</code> utility.	You must install <code>perl rpm/ fileset</code> at the OS level and the <code>perl</code> utility must be executable by Oracle OS users.

3.4.7.3.4 Release 4.5.0

There are no known issues in this release.

3.4.7.3.5 Release 4.4.0

There are no known issues in this release.

3.4.7.3.6 Release 4.3.0

There are no known issues in this release.

3.4.7.3.7 Release 4.2.2

There are no known issues in this release.

3.4.7.3.8 Release 4.2.1

There are no known issues in this release.

3.4.7.3.9 Release 4.2.0

There are no known issues in this release.

3.4.7.3.10 Release 4.1.0

There are no known issues in this release.

3.4.7.3.11 Release 4.0.2

There are no known issues in this release.

3.4.7.3.12 Release 3.0.3

There are no known issues in this release.

3.4.7.3.13 Release 3.0.2

There are no known issues in this release.

3.4.7.3.14 Release 3.0.1

Key	Summary
EBS-836	"ebs_<PDB_SID>" listener services are getting disappeared on VDB stop/start. As a workaround, a new Third Configure Clone Hook has been added.

3.4.7.3.15 Release 3.0.0

Key	Summary
EBS-836	"ebs_<PDB_SID>" listener services are getting disappeared on VDB stop/start. As a workaround, a new configure clone hook (see page 1770) has been added.

3.4.7.3.16 Release 2.0.1

There are no known issues in this release.

3.4.7.3.17 Release 2.0.0

There are no known issues in this release.

3.4.7.3.18 Release 1.8.4

There are no known issues in this release.

3.4.7.3.19 Release 1.8.3

Key	Summary
EBS-692	EBS link operation fails when source EBS environment is linked with BYOOJ
DLPX-69617	OperationRunnerImpl incorrectly assumes toolkit JDK always exists

3.4.7.3.20 Release 1.8.2

Key	Summary
EBS-692	EBS link operation fails when source EBS environment is linked with BYOOJ
DLPX-69617	OperationRunnerImpl incorrectly assumes toolkit JDK always exists

3.4.8 PostgreSQL release notes

This section covers the following topics:

- [New features \(PostgreSQL\)](#) (see page 398)
- [Fixed issues \(PostgreSQL\)](#) (see page 403)
- [Known issues \(PostgreSQL\)](#) (see page 410)

To view the PostgreSQL support matrix, see [PostgreSQL matrix](#) (see page 1834).

3.4.8.1 New features (PostgreSQL)

3.4.8.1.1 Release 4.3.1

This plugin release consists of only bug fixes.

3.4.8.1.2 Release 4.3.0

This plugin release allows you to provision a VDB in Kubernetes using an existing dSource. Provisions are completed through the K8s Driver integration. For more information, link a source using this documentation set and then refer to the [K8s Driver documentation](#)⁹³ to provision.

⁹³ <https://ecosystem.delphix.com/docs/main/kubernetes>

3.4.8.1.3 Release 4.2.3

This plugin release consists of only bug fixes.

3.4.8.1.4 Release 4.2.2

This plugin release consists of only bug fixes.

This plugin release includes a bug fix that may not function optimally in certain customer environments. Consequently, access to download this version is restricted in this release. If you need to download this specific version, please reach out to our dedicated Customer Support team for assistance.

3.4.8.1.5 Release 4.2.1

This plugin release consists of only bug fixes.

3.4.8.1.6 Release 4.2.0

This plugin release has the following set of new features.

- **Auto Roll Forward Optional**
With PostgreSQL Plugin 4.2.0 and onwards, the plugin will apply the latest wal logs copied to the wal log path only when the snapshot button clicks from UI. For more information, refer to [Creating a dSource with external backups using WAL Logs \(see page 1868\)](#).
- **Ubuntu 18.04 with Postgres 15 certification**
This release certifies Ubuntu 18.04 with Postgres 15.

3.4.8.1.7 Release 4.1.1

This plugin release consists of only bug fixes.

3.4.8.1.8 Release 4.1.0

This plugin release has the following set of new features.

- **Source sizing for dSource with ZFS**
With PostgreSQL Plugin 4.1.0 and onwards, dSource database size will be calculated using `du` command on dSource mount path. For more information, see [Source sizing implementation for dSource \(see page 1894\)](#).

- **Azure Database for PostgreSQL - Flexible Server Certification**

Added support for the PaaS-to-IaaS ingestion model of Azure Flexible Server 11, 12, 13, and 14 versions.

3.4.8.1.9 Release 4.0.0

This plugin release has the following set of new features.

- **Provisioning a PostgreSQL VDB PiT with external logs**

With the latest PostgreSQL Plugin 4.0.0 and onwards, you can provision a VDB to a point in time by providing the WAL logs on the target host. For detailed information, see [Provisioning a PostgreSQL VDB PiT with External Logs \(see page 1901\)](#).

- **pg_dumpall support for single database ingestion**

PostgreSQL plugin 4.0.0, supports `pg_dumpall` which has been added with Single Database Ingestion to get the global objects like roles and tablespaces.

3.4.8.1.10 Release 3.2.0

This plugin release has the following set of new features.

- **Enhancement to the external backup mechanism**

With the 3.2.0 release, while using External Backup Mechanism it is now **not** mandatory for you to provide the backups as ZIP files. This enhancement thus removes the mandatory requirement of `pg_basebackup` to be encapsulated in `PostgreSQL_T<YYYYMMDD>.zip` format. You can now store the backups (as tars) on the staging server directly, without providing the backups as ZIP files (reducing the time spent on creating ZIP files) using the following additional ways:

- Within folders (named `PostgreSQL_T<YYYYMMDDhhmmss>`) created inside the provided backup path.
- Within the provided backup path - `PostgreSQL Backup File Path`

Switching to the new mechanism is easy, just store the full backup within the same backup path and run a resync operation.

The plugin still supports the usage of zip files.

- **Introducing a LOG_LEVEL parameter in the PostgreSQL plugin configuration**

PostgreSQL plugin supports remote side logging, with all plugin logs available within the scratch path on the remote host (`<tookit_path>/Delphix_COMMON_*/plugin/postgres-vsdk_*`). You can tweak the log parameters related to log rotation within the plugin configuration file called `dplx_postgres_config.ini`. The 3.2.0 version, introduces a new parameter called **LOG_LEVEL**, with the capability of handling the amount of logs being generated on the remote host. Accepted values are **DEBUG, INFO, WARNING, and ERROR**, with **INFO** being the default value.

3.4.8.1.11 Release 3.1.0

This plugin release has the following set of new features.

- **Source sizing implementation on PostgreSQL plugin**

This feature enables you to check the size of PostgreSQL cluster or database being virtualized from the Delphix Engine. The calculation of the dataset size is based on the ingestion method used. For staging pull methods, if the whole cluster is ingested then the size of the cluster will be calculated or else the size of the ingested single database will be calculated. Source sizing cannot be implemented when staging push method is used.

This feature requires the plugin to run SQL queries on the datasets. If the plugin cannot login to the dataset for any reason, then source sizing cannot be implemented. For more details about this feature, see [Source Sizing Implementation for dSource \(see page 1894\)](#).

If you are using privilege elevation and upgrading to PostgreSQL 3.1.0 version, then you will have to change the sudoers entry. For more details see, [Prerequisites for Privilege Elevation using DLPX_DB_EXEC Script \(see page 1846\)](#).

3.4.8.1.12 Release 3.0.0

This plugin release has the following set of new features.

- **Staging push**

The PostgreSQL Plugin 3.0.0 release introduces a new data ingestion mechanism i.e. Staging Push that enables you to push data into the Delphix-provided mount point on your own. It is an alternative Delphix dSource data ingestion approach that enables you to push the data in Delphix, which is different from the conventional pull model where Delphix pulls the data.

Delphix relinquishes the responsibility to prepare the data (ie: recover to a specific state) on the staging push. It is different from conventional staging where Delphix controls the state of recovery of the staging database.

There are two mechanisms to create dSource on the staging server.

- Pull architecture: The Postgres plugin pulls the data into the Delphix-provided mount location.
- Staging Push architecture: You push the data into the Delphix-provided mount point on your own.

For more details, see [Staging Push Implementation \(see page 1890\)](#).

3.4.8.1.13 Release 2.1.1

This plugin release consists of only bug fixes.

3.4.8.1.14 Release 2.1.0

This plugin release has the following set of new features.

- **Privilege elevation**

The Privilege Elevation feature allows you to use a low privileged OS user to create a dSource or VDB. To use this feature, you must provide a username in the **Privileged OS account (optional)** field on the dSource creation page. The plugin will then use the `dlpx_db_exec` script to perform the privilege elevation. The script has to be updated via the engine API before the creation/discovery of an environment.

3.4.8.1.15 Release 2.0.0

The PostgreSQL Plugin version 2.0.0 includes the following improvements and features:

- Plugin generated log file will now be placed at `<toolkit path>/Delphix_COMMON_<long id>/plugin/postgres-vsdk_12c9a11f-fab6-4792-a5da-49d726c004df/<os user>` instead of `<toolkit path>/postgres/logs`.
- Improved logging
- The plugin logs will be part of the support bundle.
- The plugin logs will be available on the target host as well as on the Delphix Engine host.
- Introduction of a new generic config ini file `dlpx_postgres_config.ini` which will be present at the scratch path. The previous log configure file `dlpx_pg_logrotate.conf` will no longer be available and the contents of this file will be moved to the generic config ini file `dlpx_postgres_config.ini`.
- The PostgreSQL plugin will now have one more ingestion mechanism - Single Database Ingestion that allows you to virtualize a single database.

3.4.8.1.16 Release 1.5.1

This release includes the Streaming Replication Monitoring feature that monitors the streaming replication by reading the Postgres database logs every minute.

3.4.8.1.17 Release 1.5.0

This plugin release consists of only bug fixes.

3.4.8.1.18 Release 1.4.4

This plugin release consists of only bug fixes.

3.4.8.1.19 Release 1.4.3

This plugin release consists of only bug fixes.

3.4.8.1.20 Release 1.4.2

This plugin release consists of only bug fixes.

3.4.8.1.21 Release 1.4.1

This plugin release consists of only bug fixes.

3.4.8.1.22 Release 1.4.0

PostgreSQL Plugin version 1.4.0 contains the following certifications :

- Operating System - RHEL/CentOS 7.8 version Support with PostgreSQL 12.x.

3.4.8.2 Fixed issues (PostgreSQL)

3.4.8.2.1 Release 4.3.1

Key	Summary
POST-1122	No diagnosis is found when PostgreSQL fails to start due to timeout.
POST-1133	The Postgres configuration setting allow comma-separated (",") values for the text field.
POST-1135	Restoration of roles/users failing for single database ingestion PostgreSQL.

3.4.8.2.2 Release 4.2.3

Key	Summary
POST-442	PostgreSQL: SnapSync with resync says it will block share but does not
POST-963	Poor error when dSource fails to enable due to a failure during DB_SYNC after adding new dSource
POST-971	PostgreSQL plugin fails to provision on hosts without locale en_US.UTF-8 installed
POST-1003	min_wal_size should be copied from source

Key	Summary
POST-1094	Tablespace handling isn't working correctly for VDBs provisioned from single db ingestion dSource snapshot
POST-1082	Revert POST-1027 change for graceful restore
POST-1100	Restrict upgrade from LUA to 4.2.3 version of vSDK directly

3.4.8.2.3 Release 4.2.2

Key	Summary
POST-1000	Staging push error "Not able to find database files inside it" confuses users
POST-1025	The PG dSource cluster should not be stopped to run a SnapSync operation in any case
POST-1040	pg_dumpall command should use a single database parameter

3.4.8.2.4 Release 4.2.1

Key	Summary
POST-1027	PostgreSQL SnapSync fails to restore certain tables but succeeds without warning users. See the Known issues section if you are experiencing errors with the SnapSync process.
POST-1013	PostgreSQL VDB is not closing open connections during refresh / rollback
POST-1034	Source sizing is failing in plugin with internal error

3.4.8.2.5 Release 4.2.0

There are no fixed issues in this release.

3.4.8.2.6 Release 4.1.1

Key	Summary
POST-690	Incorrect error: The mount path has been changed from the UI
POST-936	def locate_files & def __find_repo_using_env_variable are not able to suppress the warning "Permission denied"

3.4.8.2.7 Release 4.1.0

Key	Summary
POST-720	Postgres staging and target database should use the same local as the source database
POST-85	The Plugin post-snapshot workflow breaking for non-english locales

3.4.8.2.8 Release 4.0.0

There are no fixed issues in this release.

3.4.8.2.9 Release 3.2.0

Ticket number	Summary
POST-293	Compressed backup and backup timestamp
POST-470	Pg_vSDK >> Plugin should add a parameter to control debug log ON/OFF in `dlpx_pg_logrotate.conf`
POST-497	Ingestion from backup should be more efficient
POST-699	Removing source sizing for VDB

3.4.8.2.10 Release 3.1.0

Ticket number	Summary
POST-596	New mechanism of creating files to remove wildcard entry for `echo` in sudoers file.
POST-611	Ubuntu Certification >> Linking is failing when pg_hba.conf and pg_ident.conf files are not at data directory
POST-642	dSource Single DB Ingestion >> User should not be allowed to change database name parameter, unless it's a RESYNC operation
POST-668	Staging Push >> Failure to provision a VDB using privilege elevation from Staging Push snapshot with provisioning allowed

3.4.8.2.11 Release 3.0.0

Ticket number	Summary
POST-537	<code>postgresql.auto.conf</code> and <code>recovery.signal</code> config files needs to be handled in VDB creation
POST-546	`logging_collector` should be enabled for the dSource
POST-563	SP >> Snapshot operation is failing if the port value is quoted with the strings in config file
POST-565	PG 2.1.1 >> Variable value is missing in error
POST-566	Time difference issue between Delphix Engine and Staging Environment Host
POST-571	Environment variables between low-privileged user & high-privileged user are not translated

3.4.8.2.12 Release 2.1.1

Ticket number	Summary
POST-555	Logging of large content is failing at staging/target side
POST-562	Echo command in .bash_profile of the user blocks several Plugin operations

3.4.8.2.13 Release 2.1.0

Ticket number	Summary
POST-494	Using dlp _x _db_exec for privilege elevation
POST-511	<code>`max_connections`</code> parameter on staging should be set according to the source
POST-518	<code>`netstat`</code> utility is not available in SuSE 15

3.4.8.2.14 Release 2.0.0

PostgreSQL version 2.0.0 contains the following bug fixes and enhancements:

Ticket number	Summary
POST-300	pg_basebackup failure not captured
POST-303	Default value for PostgreSQL Mount Path is wrong
POST-306	Delphix GUI allows PostgreSQL VDB port to be changed while the VDB is running
POST-422	Snapshots created for dSource despite failure to start staging database
POST-428	Instance failure reason not captured

Ticket number	Summary
POST-431	Unable to provision PostgreSQL VDB with parameters that use the strftime specification formatting
POST-441	Postgres dsource creation with existing backup fails due to missing wal file

3.4.8.2.15 Release 1.5.1

Ticket number	Summary
POST-418	Replication monitoring - Lua plugin

3.4.8.2.16 Release 1.5.0

Ticket number	Summary
POST-202	If the port is not present in postgresql.conf on the source, it's not provided in staging and VDBs
POST-283	Security enhancement - Plugin overrides listen_addresses parameter in postgresql.conf to "localhost" on staging & target server
POST-292	dSource configuration parameters don't accept empty values
POST-295	The staging server is created using a copy of the production parameters file
POST-297	Postgres Plugin Should check if the toolkit directory is accessible by the OS user
POST-298	primary_conninfo' parameter is not getting commented out in vdb flow
POST-302	Allow users to set empty values for a parameter in a configuration file
POST-312	delphix_postgres_debug.log is too large to manage

Ticket number	Summary
POST-316	Propagation of Hotfix 1112 code changes to plugin 1.5.0 release

3.4.8.2.17 Release 1.4.4

Key	Summary
POST-291	Error Handling for Authentication Failure in <code>pg_basebackup</code> command

3.4.8.2.18 Release 1.4.3

Key	Summary
POST-284	The plugin doesn't check if the staging Postgres database is in a stable state or not

3.4.8.2.19 Release 1.4.2

Key	Summary
POST-274	<code>`data_directory`</code> parameter in the <code>postgresql.conf</code> file is causing failure in dSource and VDB flow
POST-275	Linking Fails if the parameter which needs to be configured is commented through multiple <code>`#`</code>
POST-276	Linking Fails if the mandatory parameter required to setup replication is commented in config file

3.4.8.2.20 Release 1.4.1

Key	Summary
POST-269	Postgres DB_SYNC fails - ESCL-3179
POST-270	Plugin should handle postgresql.auto.conf entries during dsource creation

3.4.8.2.21 Release 1.4.0

There are no fixed issues in this release.

3.4.8.3 Known issues (PostgreSQL)**3.4.8.3.1 Release 4.2.3**

There are no known issues in this release.

3.4.8.3.2 Release 4.2.2

- POST-1027 - The PostgreSQL SnapSync resolution which was intended to ingest missing tables, introduced additional failures during the SnapSync process. The SnapSync process will fail without a clear resolution if an extension is missing. The issue has been resolved in v4.2.3.

3.4.8.3.3 Release 4.2.1

- POST-1027 - The PostgreSQL SnapSync resolution which was intended to ingest missing tables, introduced additional failures during the SnapSync process. The SnapSync process will fail without a clear resolution if an extension is missing. The issue has been resolved in v4.2.3.

3.4.8.3.4 Release 4.2.0

There are no known issues in this release.

3.4.8.3.5 Release 4.1.1

There are no known issues in this release.

3.4.8.3.6 Release 4.1.0

There are no known issues in this release.

3.4.8.3.7 Release 4.0.0

There are no known issues in this release.

3.4.8.3.8 Release 3.2.0

There are no known issues in this release.

3.4.8.3.9 Release 3.1.0

There are no known issues in this release.

3.4.8.3.10 Release 3.0.0

There are no known issues in this release.

3.4.8.3.11 Release 2.1.1

There are no known issues in this release.

3.4.8.3.12 Release 2.1.0

There are no known issues in this release.

3.4.8.3.13 Release 2.0.0

There are no known issues in this release.

3.4.8.3.14 Release 1.5.1

There are no known issues in this release.

3.4.8.3.15 Release 1.5.0

There are no known issues in this release.

3.4.8.3.16 Release 1.4.4

There are no known issues in this release.

3.4.8.3.17 Release 1.4.3

There are no known issues in this release.

3.4.8.3.18 Release 1.4.2

There are no known issues in this release.

3.4.8.3.19 Release 1.4.1

There are no known issues in this release.

3.4.8.3.20 Release 1.4.0

There are no known issues in this release.

3.4.9 SAP HANA release notes

This section covers the following topics:

- [New features \(SAP HANA\)](#) (see page 412)
- [Fixed issues \(SAP HANA\)](#) (see page 415)
- [Known issues \(SAP HANA\)](#) (see page 418)

To view the SAP HANA support matrix, see [SAP HANA matrix](#)⁹⁴.

3.4.9.1 New features (SAP HANA)

3.4.9.1.1 Release 6.3.4

This plugin release consists of only bug fixes.

3.4.9.1.2 Release 6.3.3

This plugin release has no new features. This release fixes the logic in the plugin to calculate the port numbers during VDB creation for HANA installations having instance numbers other than 00. For more information, refer to the [Fixed Issues](#) (see page 415) section.

3.4.9.1.3 Release 6.3.2

This plugin release consists of only bug fixes.

⁹⁴ <https://cd.delphix.com/docs/latest/sap-hana-support-matrix>

3.4.9.1.4 Release 6.3.1

This plugin release consists of only bug fixes.

3.4.9.1.5 Release 6.3.0

This plugin release has the following set of new features.

- **Source sizing implementation on HANA plugin**

The SAP HANA 2.0 Plugin version 6.3.0 introduces the source sizing feature, that aligns the data source experience with Delphix database standards which will improve your ingestion reporting experience on the per TB pricing model. This feature enables you to calculate the dataset size based on the total allocated space on the mount point provided by the Delphix Engine for the dataset. Source sizing is not implemented for VDB.

3.4.9.1.6 Release 6.2.1

The SAP HANA 2.0 Plugin version 6.2.1 validates the SAP HANA's Staging Push solution with third party backup vendors.

3.4.9.1.7 Release 6.2.0

The SAP HANA 2.0 Plugin version 6.2.0 introduces the **Staging Push** feature. This feature provides a new data ingestion mechanism that helps users to push data into the Delphix provided mount point on their own.

3.4.9.1.8 Release 6.1.1

This patch release contains an enhancement that allows the `create_backup_metadata.sh` script to be executed in a non-interactive mode as well.

3.4.9.1.9 Release 6.1.0

This plugin release has the following set of new features.

- **SAP HANA port control**

With this release, a solution has been introduced that keeps the port numbers consistent throughout the VDB life cycle so that the connections made to the VDBs are not disrupted during their life cycle.

3.4.9.1.10 Release 6.0.1

This plugin release consists of only bug fixes.

3.4.9.1.11 Release 6.0.0

This is a conversion from SAP HANA direct plugin to vSDK-based, staged plugin. This plugin will support only customer-provided/External backups ingestion mechanism.

3.4.9.1.12 Release 4.3.2

This plugin release consists of only bug fixes.

3.4.9.1.13 Release 4.3.1

This plugin release consists of only bug fixes.

3.4.9.1.14 Release 4.3.0

Below features are being provided:

1. **Non-ingestion of backups into Delphix:** This means that database backups will not be transferred into the Delphix Engine during any of the operation. This will be driven on the basis of a checkbox that can be selected by the customer during dSource creation.
2. Support provided for log backups along with the data backups (only when non-ingestion has been chosen during dSource creation).
3. Ability to use Delphix provided storage for all virtualized tenant services. This is valid even for the user-created services outside the plugin.
4. Multiple HANA installations on the same VM will also be supported.
5. Support for Self-Service (Jetstream) has been certified with this release.
6. Certification of plugin support with HANA Standard and Enterprise Edition 2.0 SP05 on RHEL 8.1.

3.4.9.1.15 Release 4.2.0

With this release, we are including the support for `basepath_databackup` parameter. Backups created via plugin will now be created on the PATH specified by this parameter. This parameter can be defined at the system and at the tenant level. If this parameter has not been specified then default location will be used for creating the backups.

3.4.9.1.16 Release 4.1.2

This plugin release consists of only bug fixes.

3.4.9.1.17 Release 4.1.1

This plugin release consists of only bug fixes.

3.4.9.2 Fixed issues (SAP HANA)

3.4.9.2.1 Release 6.3.4

Delphix ticket number	Summary
CTCHANA-1992	Fixed the SAP Hana plugin logic to identify nameserver topology file

3.4.9.2.2 Release 6.3.3

Delphix ticket number	Summary
CTCHANA-1961	Port numbers determination during VDB creation is failing for the hana instance other than 00

3.4.9.2.3 Release 6.3.2

Delphix ticket number	Summary
CTCHANA-1936	Handling services not having volumes information in m_volumes for VDB creation.

3.4.9.2.4 Release 6.3.1

Delphix ticket number	Summary
CTCHANA-1914	Refining the plugin discovery logic to search for HANA instances.

3.4.9.2.5 Release 6.3.0

Delphix ticket number	summary
CTCHANA-1906	Changing the plugin's environment discovery logic to refer "HDB --version" instead of "landscapeDescription.xml"
CTCHANA-1900	Removal of tenant parameters from UI and plugin
CTCHANA-1891	Incorrect execution time for VDB

3.4.9.2.6 Release 6.2.1

There are no fixed issues in this release.

3.4.9.2.7 Release 6.2.0

There are no fixed issues in this release.

3.4.9.2.8 Release 6.1.1

Delphix ticket number	Summary
CTCHANA-1661	v6.0.0.0 create_backup_metadata.sh needs ability to run non-interactively
CTCHANA-1667	HANA Recovery failure on staging host yields difficult to decipher error

3.4.9.2.9 Release 6.1.0

Delphix ticket number	Summary
CTCHANA-821	HANA SQL Port value should remain consistent for the life of VDB.

3.4.9.2.10 Release 6.0.1

There are no fixed issues in this release.

3.4.9.2.11 Release 6.0.0

There are no fixed issues in this release.

3.4.9.2.12 Release 4.3.2

Delphix ticket number	Summary
CTCHANA-1666	Backporting the password change through hooks issue to the master branch
CTCHANA-1660	remove dependency on /etc/SuSE-release for suse o/s platforms

3.4.9.2.13 Release 4.3.1

There are no fixed issues in this release.

3.4.9.2.14 Release 4.3.0

There are no fixed issues in this release.

3.4.9.2.15 Release 4.2.0

There are no fixed issues in this release.

3.4.9.2.16 Release 4.1.2

There are no fixed issues in this release.

3.4.9.2.17 Release 4.1.1

There are no fixed issues in this release.

3.4.9.3 Known issues (SAP HANA)

3.4.9.3.1 Release 6.3.4

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

3.4.9.3.2 Release 6.3.3

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

3.4.9.3.3 Release 6.3.2

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

3.4.9.3.4 Release 6.3.1

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None

CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

3.4.9.3.6 Release 6.2.1

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

3.4.9.3.7 Release 6.2.0

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

3.4.9.3.8 Release 6.1.1

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

3.4.9.3.9 Release 6.1.0

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

3.4.9.3.10 Release 6.0.0

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	Dsource tenant database can be accessed and written onto	None
CTCHANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

3.4.9.3.11 Release 6.0.0

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	Dsource tenant database can be accessed and written onto	None
CTCHANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None

3.4.9.3.12 Release 4.3.2

Delphix ticket number	Summary	Workaround/Comments
HANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None
DLPX-44359	Job cancellation may fail.	None
CTCHANA-930	Upgrade from 3.4.5 to 3.5.0/3.5.1/4.0.0/4.1.1/4.1.2/4.2.0 needs a manual deletion of the existing tenant databases for disable/enable to work.	Drop the tenant database manually before enabling the VDB.

3.4.9.3.13 Release 4.3.1

Delphix Ticket Number	Summary	Workaround/Comments
HANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None.
DLPX-44359	Job cancellation may fail.	None.
CTCHANA-930	Upgrade from 3.4.5 to 3.5.0/3.5.1/4.0.0/4.1.1/4.1.2/4.2.0 needs a manual deletion of the existing tenant databases for disable/enable to work.	Drop the tenant database manually before enabling the VDB.

3.4.9.3.14 Release 4.3.0

Delphix ticket number	Summary	Workaround/Comments
HANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None.

Delphix ticket number	Summary	Workaround/Comments
DLPX-44359	Job cancellation may fail.	None.
CTCHANA-930	Upgrade from 3.4.5 to 3.5.0/3.5.1/4.0.0/4.1.1/4.1.2/4.2.0 needs a manual deletion of the existing tenant databases for disable/enable to work.	Drop the tenant database manually before enabling the VDB.

3.4.9.3.15 Release 4.2.0

Delphix ticket number	Summary	Workaround/Comments
HANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None.
DLPX-44359	Job cancellation may fail.	None.
CTCHANA-930	Upgrade from 3.4.5 to 3.5.0/3.5.1/4.0.0/4.1.1/4.1.2/4.2.0 needs a manual deletion of the existing tenant databases for disable/enable to work.	Drop the tenant database manually before enabling the VDB.

3.4.9.3.16 Release 4.1.2

Delphix ticket number	Summary	Workaround/Comments
HANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None.
DLPX-44359	Job cancellation may fail.	None.
CTCHANA-930	Upgrade from 3.4.5 to 3.5.0/3.5.1/4.0.0/4.1.1/4.1.2 needs a manual deletion of the existing tenant databases for disable/enable to work.	Drop the tenant database manually before enabling the VDB.

3.4.9.3.17 Release 4.1.1

Delphix ticket number	Summary	Workaround/Comments
HANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None.
DLPX-44359	Job cancellation may fail.	None.
CTCHANA-930	Upgrade from 3.4.5 to 3.5.0/3.5.1/4.0.0/4.1.1 needs a manual deletion of the existing tenant databases for disable/enable to work.	Drop the tenant database manually before enabling the VDB.

3.4.10 Yugabyte release notes

- [New features \(Yugabyte\)](#) (see page 431)
- [Fixed issues \(Yugabyte\)](#) (see page 432)

3.4.10.1 New features (Yugabyte)

To deploy and configure the Yugabyte plugin, refer to [Overview](#) (see page 2315).

3.4.10.1.1 Release 1.2.0

Cluster Creation with Yugabyte Anywhere (YBA)

In this release, users can easily create and manage clusters through the Yugabyte Anywhere (YBA) interface by streamlining cluster setup and operations.

3.4.10.1.2 Release 1.1.1

Yugabyte select connector now supports RHEL 8.x.

3.4.10.1.3 Release 1.1.0

3.4.10.1.3.1 Features

- Backup ingestion from AWS S3 location.

3.4.10.1.4 Release 1.0.0

3.4.10.1.4.1 Features

- Backup ingestion from NFS location.

Future releases may add support for additional OS platforms and Delphix Continuous Data Engine versions.

3.4.10.2 Fixed issues (Yugabyte)

3.4.10.2.1 Release 1.2.0

Ticket number	Summary
CE-824	Fixed the issue of provisioning Yugabyte VDB failure due to list index out of range
CE-840	Fixed issues of YugabyteDB VDB Provision: Failure to set password should trigger job failure.

3.4.10.2.2 Release 1.1.1

Ticket number	Summary
CE-803	Yugabyte discovery conflicts with PostgreSQL plugin discovery suggesting discovery could not be completed.
CE-804	Yugabyte repository spelled wrong

3.4.10.2.3 Release 1.1.0

There are no fixed issues in this release.

3.4.10.2.4 Release 1.0.0

There are no fixed issues in this release.

3.5 Windows connector release notes

This section covers the following topics:

- [New features \(Windows connector\)](#) (see page 433)
- [Fixed issues \(Windows connector\)](#) (see page 433)

3.5.1 New features (Windows connector)

There are no new feature updates for Windows connector versions, which are not listed below. These versions include internal improvements.

3.5.1.1 Release 1.37.0.0

The Delphix Windows connector now supports cipher exclusion for its connections through a new API/CLI endpoint; `service > cipherconfig > connector` accessible under system user login.

3.5.2 Fixed issues (Windows connector)

- To know more about the Delphix Continuous Data Engine and JRE version for the respective Windows connector versions, refer to the *Windows connector matrix* on the [SQL Server matrix](#) (see page 2118) page.
- For Windows connector versions that are not listed below, there are no bug fixes. These versions include internal improvements.

3.5.2.1 Release 1.36.0.0

Bug number	Description
DLPX-90119	Updated Java version to 8u402b06

3.5.2.2 Release 1.34.0.0

Bug number	Description
DLPX-89300	Fixed an issue related to MSSQL full backup hangs by logging the robocopy command output to the log file, at the Delphix connector logs folder, during sync operation.

3.5.2.3 Release 1.33.0.0

Bug number	Description
DLPX-79498	Fixed an error message when the Delphix Connector service is already installed with the previous version.

3.5.2.4 Release 1.32.0.0

Bug number	Description
DLPX-88488	Fixed an issue where not enough samples are collected for performance analysis.

3.5.2.5 Release 1.28.0.0

Bug number	Description
DLPX-82882	Replacing Self-signed Certificates, on the Delphix Connector.

3.5.2.6 Release 1.27.0.0

Bug number	Description
DLPX-83043	Weak DH 1024-bit exchange key detected by security scanner for the Delphix connector.
DLPX-83149	From the Windows connector side, while handshaking, stop using the cipher suites that use Diffie-Hellman key exchange with keys less than 2,048 bits in size.
DLPX-73533	Added a fix to prevent multiple connector operations testing for the presence of the same SCRIPT directory. Hence, improved performance by reducing the number of remote PowerShell calls performed during connector operations.

3.5.2.7 Release 1.22.0.0

Bug number	Description
DLPX-78791	This release upgrades log4j from 1.2.17 to the latest 2.x in Windows connector.

3.5.2.8 Release 1.21.0.0

Bug number	Description
DLPX-75335	Added a product name and product version for the Delphix Connector executable so this information can be available before installation.

3.5.2.9 Release 1.20.0.0

Bug number	Description
DLPX-28435	MS SQL instances PatchLevel will be displayed in preference to the version on the UI.

3.6 API changes

This section covers the following topics:

- [API changes in Delphix 28.0.0.0](#) (see page 437)
- [API changes in Delphix 27.0.0.0](#) (see page 438)
- [API changes in Delphix 26.0.0.0](#) (see page 440)
- [API changes in Delphix 25.0.0.0](#) (see page 440)
- [API changes in Delphix 24.0.0.0](#) (see page 440)
- [API changes in Delphix 23.0.0.0](#) (see page 441)
- [API changes in Delphix 22.0.0.0](#) (see page 442)
- [API changes in Delphix 21.0.0.0](#) (see page 443)
- [API changes in Delphix 20.0.0.0](#) (see page 444)
- [API changes in Delphix 19.0.0.0](#) (see page 445)
- [API changes in Delphix 18.0.0.0](#) (see page 446)
- [API Changes in Delphix 17.0.0.0](#) (see page 447)
- [API Changes in Delphix 16.0.0.0](#) (see page 447)
- [API Changes in Delphix 15.0.0.0](#) (see page 448)
- [API Changes in Delphix 14.0.0.0](#) (see page 449)
- [API Changes in Delphix 13.0.0.0](#) (see page 450)
- [API Changes in Delphix 12.0.0.0](#) (see page 451)
- [API changes in Delphix 11.0.0.0](#) (see page 454)
- [API changes in Delphix 10.0.0.0](#) (see page 457)
- [API changes in Delphix 9.0.0.0](#) (see page 459)
- [API changes in Delphix 8.0.0.0](#) (see page 461)
- [API changes in Delphix 7.0.0.0](#) (see page 464)
- [API changes in Delphix 6.0.17.0](#) (see page 467)
- [API changes in Delphix 6.0.16.0](#) (see page 470)
- [API changes in Delphix 6.0.15.0](#) (see page 472)
- [API changes in Delphix 6.0.14.0](#) (see page 475)
- [API changes in Delphix 6.0.13.0](#) (see page 478)
- [API changes in Delphix 6.0.12.0](#) (see page 483)
- [API changes in Delphix 6.0.11.0](#) (see page 487)
- [API changes in Delphix 6.0.10.0](#) (see page 492)
- [API changes in Delphix 6.0.9.0](#) (see page 495)

- [API changes in Delphix 6.0.8.0](#) (see page 498)
- [API changes in Delphix 6.0.7.0](#) (see page 503)
- [API changes in Delphix 6.0.6.0](#) (see page 506)
- [API changes in Delphix 6.0.5.0](#) (see page 507)
- [API changes in Delphix 6.0.4.0](#) (see page 510)
- [API changes in Delphix 6.0.3.0](#) (see page 512)

3.6.1 API changes in Delphix 28.0.0.0

In Delphix 28.0, the new API version is 1.11.39. This section describes all API changes since API version 1.11.38, which was released with Continuous Data 27.0. All URL paths are relative to `/resources/json/delphix`

3.6.1.1 What's new?

API Object	Path	Type	Name	Description
system	/system	Property	generateAppBoots trapApiKey	New property added.
about	/about	Property	EngineType	New engineType added "DCT"
about	/about	Property	packagedAppVersions	New property added.
PackagedAppVersion	N/A (value type)	API Type	PackagedAppVersion	Version information about a packaged application.

3.6.1.2 What's changed?

API Object	Path	Type	Name	Change
------------	------	------	------	--------

SystemInitializationParameters	N/A	Property	defaultPassword	Default password create parameter set optional.
--------------------------------	-----	----------	-----------------	---

3.6.2 API changes in Delphix 27.0.0.0

In Delphix 27.0, the new API version is 1.11.38. This section describes all API changes since API version 1.11.37, which was released with Continuous Data 26.0. All URL paths are relative to `/resources/json/delphix`.

3.6.2.1 What's new?

API Object	Path	Type	Name	Description
Namespace	/namespace	API Type	failoverTime	Returns the time the namespace was failed over.
SerializationPoint	/replication/serializationpoint	API Type	estimatedTotalBytes	Estimates total bytes of the serialization point to be transferred.
SerializationPoint	/replication/serializationpoint	API Type	remainingTimeNanos	Estimates remaining time to complete sending the serialization point (nanoseconds).
OciObjectStoreRepavePreviewParameters	/repave/preview	API Type	OciObjectStoreRepavePreviewParameters	Returns Oracle Cloud repave parameters used for Elastic Data engines.
GcpObjectStoreRepavePreviewParameters	/repave/preview	API Type	GcpObjectStoreRepavePreviewParameters	Returns Google Cloud repave parameters used for Elastic Data engines.

API Object	Path	Type	Name	Description
BlobObjectStoreRepavePreviewParameters	/repave/preview	API Type	BlobObjectStoreRepavePreviewParameters	Returns Azure repave parameters used for Elastic Data engines.
S3ObjectStoreRepavePreviewParameters	/repave/preview	API Type	S3ObjectStoreRepavePreviewParameters	Returns AWS/S3 repave parameters used for Elastic Data engines.
OciObjectStoreRepaveApplyParameters	/repave/apply	API Type	OciObjectStoreRepaveApplyParameters	The parameters to use as input to repave apply on Oracle Cloud.
GcpObjectStoreRepaveApplyParameters	/repave/apply	API Type	GcpObjectStoreRepaveApplyParameters	The parameters to use as input to repave apply on Google Cloud.
BlobObjectStoreRepaveApplyParameters	/repave/apply	API Type	BlobObjectStoreRepaveApplyParameters	The parameters to use as input to repave apply on Azure.
S3ObjectStoreRepaveApplyParameters	/repave/apply	API Type	S3ObjectStoreRepaveApplyParameters	The parameters to use as input to repave apply on AWS/S3.

3.6.2.2 What's changed?

API Object	Path	Type	Name	Change
User	/user	Property	isDefault	Amended API documentation to inform users that Create and Update parameters are set to readOnly .

3.6.3 API changes in Delphix 26.0.0.0

In Delphix 26.0, the new API version is 1.11.37. This section describes all API changes since API version 1.11.36 that was released with Delphix 25.0. All URL paths are relative to `/resources/json/delphix`.

3.6.3.1 What's new?

There are no new APIs in this release.

3.6.3.2 What's changed?

There are no changes in this release.

3.6.4 API changes in Delphix 25.0.0.0

In Delphix 25.0, the new API version is 1.11.36. This section describes all API changes since API version 1.11.35 that was released with Delphix 24.0. All URL paths are relative to `/resources/json/delphix`.

3.6.4.1 What's changed?

There are no changes in this release.

3.6.4.2 What's new?

API Object	Path	Type	Name	Description
ConnectorCiphers	/service/cipherconfig/ connector	API Type	ConnectorCiphers	Ciphers configuration for connectors. Added list and create APIs.
SourceEnvironment	/environment	Operation	getHostConnectorCipher	Lists the ciphers configured in the host connector.

3.6.5 API changes in Delphix 24.0.0.0

In Delphix 24.0, the new API version is 1.11.35. This section describes all API changes since API version 1.11.34 that was released with Delphix 23.0. All URL paths are relative to `/resources/json/delphix`.

3.6.5.1 What's new?

There are no new APIs in this release.

3.6.5.2 What's changed?

There are no changes in this release.

3.6.6 API changes in Delphix 23.0.0.0

In Delphix 23.0, the new API version is 1.11.34. This section describes all API changes since API version 1.11.33 that was released with Delphix 22.0. All URL paths are relative to `/resources/json/delphix`.

3.6.6.1 What's new?

API Object	Path	Type	Name	Description
<code>ASEHostEnvironmentParameters</code>	NA (value type)	Property	<code>enableTls</code>	True if you want to discover the SAP ASE instances configured with TLS/SSL.
<code>ASEHostEnvironmentParameters</code>	NA (value type)	Property	<code>skipServerCertificateValidation</code>	Setting it to true will skip the server certificate validation during the SSL handshake. Only set it if you do not want to add the required certificate into the Delphix Engine truststore but still want to use the TLS/SSL-enabled database connection. This is not recommended for a production environment as it is less secure.
<code>ASEInstance</code>	NA (value type)	Property	<code>tlsEnabled</code>	True if the SAP ASE instance is TLS/SSL enabled on the given port.
<code>GcpObjectStoreTest</code>	NA (value type)	API Type	<code>GcpObjectStoreTest</code>	A Google Cloud object store connectivity test object.

GcpObjectStore	NA (value type)	API Type	GcpObjectStore	A Google Cloud object store.
----------------	-----------------	----------	----------------	------------------------------

3.6.6.2 What's changed?

There are no changes in this release.

3.6.7 API changes in Delphix 22.0.0.0

In Delphix 22.0, the new API version is 1.11.33. This section describes all API changes since API version 1.11.32, which was released with Delphix 21.0. All URL paths are relative to `/resources/json/delphix`.

3.6.7.1 What's changed?

API Object	Path	Type	Name	Change
Namespace	namespace	Property	locked	default is set to false
StorageTestParameters	NA (value type)	Property	testRegion	maximum is set to 1099511627776
NfsEncryptionConfig	/service/nfs/encryption	API Type	NfsEncryptionConfig	The end point <code>/service/nfs/encryption</code> is moved to <code>/service/security/env_encryption</code> and the object <code>NfsEncryptionConfig</code> is replaced with <code>EnvEncryptionConfig</code>

3.6.7.2 What's new?

API Object	Path	Type	Name	Description
CapacityBreakdown	NA (value type)	Property	currentTimeflowUnvirtualizedSpace	Unvirtualized space used by the current (active) TimeFlow. This is approximately equal to the space a VDB would take upon a virtual-to-physical (V2P) operation.
EnvEncryptionConfig	security/ env_encryption	API Type	EnvEncryptionConfig	Configuration for the environment encryption services like NFS and iSCSI.

3.6.8 API changes in Delphix 21.0.0.0

In Delphix 21.0, the new API version is 1.11.32. This section describes all API changes since API version 1.11.31 that was released with Delphix 20.0. All URL paths are relative to `/resources/json/delphix`.

3.6.8.1 What's new?

There are no new APIs in this release.

3.6.8.2 What's changed?

API Object	Path	Type	Name	Change
OracleDBConfig	NA (value type)	Property	tdeKeystoreConfigType	Property type changed from string to ["string", "null"] Property update changed from readonly to optional

API Object	Path	Type	Name	Change
S3objectStore	NA (value type)	Property	region	Property create changed from required to optional

3.6.9 API changes in Delphix 20.0.0.0

In Delphix 20.0, the new API version is 1.11.31. This section describes all API changes since API version 1.11.30, which was released with Delphix 19.0. All URL paths are relative to `/resources/json/delphix`.

3.6.9.1 What's New?

There are no new APIs in this release.

3.6.9.2 What's Changed?

API Object	Path	Type	Name	Change
Host	NA (value type)	Property	nfsEncryptionPort	Renamed from nfsEncryptionPort to encryptionPort.
MSSqlStagingPushSyncStrategy	NA (value type)	Property	dbState	Property dbState added - User provided db state that will be used to create staging push db.
OracleStagingSourceParameters	NA (value type)	Property	mountBase	Property mountBase modified to include new attribute format
SourceEnvironment	NA (value type)	Property	nfsEncryptionEnabled	Renamed from nfsEncryptionEnabled to encryptionEnabled

UnixRuntimeMountInformation	NA (value type)	Property	nfsEncryptionEnabled	Renamed from nfsEncryptionEnabled to encryptionEnabled
-----------------------------	-----------------	----------	----------------------	--

3.6.10 API changes in Delphix 19.0.0.0

In Delphix 19.0, the new API version is 1.11.30. This section describes all API changes since API version 1.11.29, which was released with Delphix 18.0. All URL paths are relative to `/resources/json/delphix`.

3.6.10.1 What's new?

There are no new APIs in this release.

3.6.10.2 What's changed?

API Object	Path	Type	Name	Description
OracleDBConfig	NA	Property	tdeKeystoreConfigType	tdeKeystoreConfigType has been added
OracleHostParameters	NA	Property	tdeExternalKeyManagerCredential	tdeExternalKeyManagerCredential has been added.
OracleHostParameters	NA	Property	tdeOkvHomePath	tdeOkvHomePath has been added.
OracleLinkFromStaging	NA	Property	tdeKeystoreConfigType	tdeKeystoreConfigType has been added.

API Object	Path	Type	Name	Description
OracleVirtualCdbSource	NA	Property	redoLogSizeInMB	redoLogSizeInMB has been removed.
OracleVirtualCdbSource	NA	Property	redoLogGroups	redoLogGroups has been removed.
OracleVirtualPdbSource	NA	Property	parentTdeKeystorePath	null has been added to types list along with string.

3.6.11 API changes in Delphix 18.0.0.0

In Delphix 18.0, the new API version is 1.11.29. This section describes all API changes since API version 1.11.28, which was released with Delphix 17.0. All URL paths are relative to `/resources/json/delphix`.

3.6.11.1 What's New?

There are no new APIs in this release.

3.6.11.2 What's Changed?

API Object	Path	Type	Name	Description
EventFilter	NA	Property	eventTypes	pattern has been updated in items.
FluentdConfig	service/fluentd/configuration	API Type	FluentdConfig	rootOperations has been removed.

3.6.12 API Changes in Delphix 17.0.0.0

In Delphix 17.0, the new API version is 1.11.28. This section describes all API changes since API version 1.11.27, which was released with Delphix 16.0. All URL paths are relative to `/resources/json/delphix`.

3.6.12.1 What's New?

API Object	Path	Type	Name	Description
NfsEncryptionConfig	/resources/json/delphix/service/nfs/encryption	API Type	NfsEncryptionConfig	Configuration for the nfs encryption of this application. Contains property "cipherSuite" to allow change of ciphersuite used in NFS Encryption.
SourceEnvironment	/resources/json/delphix/environment	Property	enableAllSources	Enable all sources of an environment.
SourceEnvironment	/resources/json/delphix/environment	Property	disableAllSources	Disable all sources of an environment.

3.6.13 API Changes in Delphix 16.0.0.0

In Delphix 16.0, the new API version is 1.11.27. This section describes all API changes since API version 1.11.26, which was released with Delphix 15.0. All URL paths are relative to `/resources/json/delphix`.

3.6.13.1 What's Changed?

API Object	Path	Type	Name	Change
------------	------	------	------	--------

PublicSystemInfo	/about	Property	userManagementEnabled	Property userManagementEnabled has been removed.
PublicSystemInfo	/about	Property	centralManagementProductName	Property centralManagementProductName has been removed.
CloudEnableParameters	NA (value type)	API Type	CloudEnableParameters	CloudEnableParameters has been removed.
CloudStatus	/service/cloud	API Type	CloudStatus	CloudStatus has been removed.
DelphixDataServicesComponentInfo	NA (value type)	API Type	DelphixDataServicesComponentInfo	DelphixDataServicesComponentInfo has been removed.
OracleNodeListener	NA	nameParent	OracleNodeListener	nameParent has been added.
UserManagement	NA (value type)	API Type	UserManagement	UserManagement has been removed.

3.6.14 API Changes in Delphix 15.0.0.0

In Delphix 15.0, the new API version is 1.11.26. This section describes all API changes since API version 1.11.25, which was released with Delphix 14.0. All URL paths are relative to `/resources/json/delphix`.

3.6.14.1 What's Changed?

API Object	Path	Type	Name	Change
FluentdPlugin	/service/fluentd/plugins	Property	downloadFluentdLog	Property downloadFluentdLog has been added.

OracleVirtualSource	NA (value type)	Property	invokeDatapatch	Property invokeDatapatch has been added.
---------------------	-----------------	----------	-----------------	--

3.6.14.2

What's New?

API Object	Path	Type	Name	Description
OracleExportDBTTimeflowPointTransferStrategy	NA (value type)	API Type	OracleExportDBTTimeflowPointTransferStrategy	Create a non-MT physical database from a TimeFlow point.
OracleExportPDBTimeflowPointTransferStrategy	NA (value type)	API Type	OracleExportPDBTimeflowPointTransferStrategy	Create a physical pluggable database from a TimeFlow point.

3.6.15 API Changes in Delphix 14.0.0.0

In Delphix 14.0, the new API version is 1.11.25. This section describes all API changes since API version 1.11.24, released with Delphix 13.0. All URL paths are relative to `/resources/json/delphix`.

3.6.15.1 What's Changed?

API Object	Path	Type	Name	Change
FluentdPlugin	/service/fluentd/plugins	Property	gems	Property gems have been removed.
Host	/host	Property	nfsAddressList	Property nfsAddressList has been updated for property format from host to hostOrCIDRAddress.

3.6.15.2

What's New?

API Object	Path	Type	Name	Description
Host	/host	API Type	nfsEncryptionPort	Property nfsEncryptionPort have been added.
MSSqlAdditionalDatabaseParameters	NA (value type)	API Type	MSSqlAdditionalDatabaseParameters	Collection of all the parameters that are not inherited during provisioning of a vdb.
MSSqlSnapshot	NA (value type)	API Type	additionalDatabaseParameters	Collection of all the parameters that are not inherited during provisioning of a vdb.
OciObjectStoreTest	NA (value type)	API Type	OciObjectStoreTest	An Oracle Cloud object store connectivity test object.
OciObjectStore	NA (value type)	API Type	OciObjectStore	An Oracle Cloud object store.
SourceEnvironment	/environment	API Type	nfsEncryptionEnabled	Flag indicating whether nfs is encrypted or not.
UnixRuntimeMountInformation	NA (value type)	API Type	nfsEncryptionEnabled	The flag for NFS Encryption.

3.6.16 API Changes in Delphix 13.0.0.0

In Delphix 13.0, the new API version is 1.11.24. This section describes all API changes since API version 1.11.23, which was released with Delphix 12.0. All URL paths are relative to /resources/json/delphix.

3.6.16.1 What's Changed?

API Object	Path	Type	Name	Change
OracleRefreshParameters	NA (value type)	Property	force	Property force has been added.
OracleRollbackParameters	NA (value type)	Property	force	Property force has been added.
TimeflowSnapshot	/snapshot	Property	operations	Property parameters has been removed from property operations

3.6.16.2

What's New?

API Object	Path	Type	Name	Description
ContainerStorageInfo	NA (value type)	API Type	ContainerStorageInfo	Container Storage Information.
Container	/database	API Type	containerStorageInfo	Container Storage Information.

3.6.17 API Changes in Delphix 12.0.0.0

In Delphix 12.0, the new API version is 1.11.23. This section describes all API changes since API version 1.11.22, which was released with Delphix 11.0. All URL paths are relative to `/resources/json/delphix`.

3.6.17.1 What's Changed?

API Object	Path	Type	Name	Change
KeyPairCredential	NA (value type)	Property	publicKey	Property create has been updated from required to optional
OracleBaseExternalLinkData	NA (value type)	API Type	sourcingPolicy	Property sourcingPolicy has been added
OracleExportDBInPlaceTransferStrategy	NA (value type)	API Type	OracleExportDBInPlaceTransferStrategy	Property operationsPostV2P has been added
OracleExportPDBInPlaceTransferStrategy	NA (value type)	API Type	OracleExportPDBInPlaceTransferStrategy	Property operationsPostV2P has been added
OracleDatabaseContainer	NA (value type)	Property	sourcingPolicy	Ref has been updated from delphix-oracle-sourcing-policy.json to delphix-oracle-base-sourcing-policy.json
OracleSourcingPolicy	NA (value type)	Property	OracleSourcingPolicy	Ref has been updated from delphix-sourcing-policy.json to delphix-oracle-base-sourcing-policy.json
OracleVirtualSource	NA (value type)	API Type	OracleVirtualSource	Property allowRefreshRewindPostV2P has been added.
ValidateNTParameters	NA (value type)	Property	address	Format has been updated from hostname to host.

3.6.17.2 What's New?

OracleBaseSour cingPolicy	NA (value type)	API Type	OracleBaseSour cingPolicy	Oracle Database policies for managing SnapSync and LogSync across sources for a Oracle container.
OracleStagingS ourcingPolicy	NA (value type)	API Type	OracleStagingS ourcingPolicy	Database policies for managing LogSync for Oracle Staging push container.
SuperuserSessi onLogDeleteRec ord	NA (value type)	API Type	SuperuserSessi onLogDeleteRec ord	Represents a deletion of a Delphix superuser session log file.
SuperuserSessi onLogDownloadR ecord	NA (value type)	API Type	SuperuserSessi onLogDownloadR ecord	Represents a download of a Delphix superuser session log file.
SuperuserSessi on	/superuser/ session	API Type	SuperuserSessi on	Audit logs for superuser sessions.
OracleExportOp erationsPostV2 P	NA (value type)	API Type	OracleExportOp erationsPostV2 P	Describes operations allowed on virtual source post V2P.
OracleExportTr ansferStrategy	NA (value type)	API Type	OracleExportTr ansferStrategy	The transfer strategy for exporting a database whether in-place or TimeFlow point based.
SystemInfo	system	API Type	SystemInfo	Property maxNativeMemoryGb has been added

3.6.18 API changes in Delphix 11.0.0.0

In Delphix 11.0, the new API version is 1.11.22. This section describes all API changes since API version 1.11.21, which was released with Delphix 10.0. All URL paths are relative to `/resources/json/delphix`.

3.6.18.1 What's changed?

API object	Path	Type	Name	Change
AzureAuthentication	NA (value type)	API Type	AzureAuthentication	Properties have been added tenantId and clientId.
CpuUtilDatapoint	NA (value type)	API Type	CpuUtilDatapoint	Removed property dtrace.
AzureSecretsAuthentication	NA (value type)	API Type	AzureSecretsAuthentication	Removed properties tenantId and clientId.
AzureSecretsAuthentication	NA (value type)	Property	clientSecret	Description has been updated for property clientSecret
CipherSuite	/service/tls/cipherSuite	Property	name	enum property values have been updated.
Container	/database	Property	delete, operations, rollback, sync	PgSQLDatabaseContainer and MySQLDatabaseContainer have been removed from defaultType.
DeleteParameters	NA (value type)	API Type	DeleteParameters	The description has been updated.
DeletionDependency	NA (value type)	Property	size	The description has been updated for property size.

API object	Path	Type	Name	Change
KeyPairCredential	NA (value type)	Property	privateKey	The format has been updated from password to pemKey.
KeyPairCredential	NA (value type)	Property	publicKey	Property format has been updated from password to hostKey and property create has been updated from required to optional.
NamedKeyPairCredential	NA (value type)	Property	privateKey	The property format has been updated from password to pemKey.
NamedKeyPairCredential	NA (value type)	Property	publicKey	The property format has been updated from password to hostKey.
OracleExportTimeflowFilesystemLayout	NA (value type)	API Type	OracleExportTransferStrategy	Property rmanFileSectionSizeInGb has been added.
PemClientCertificate	NA (value type)	Property	privateKey	The property format has been updated from password to pemKey.
RefreshParameters	NA (value type)	API Type	RefreshParameters	The description has been updated.
RollbackParameters	NA (value type)	API Type	RollbackParameters	The description has been updated.
SourceConfig	/sourceconfig	Property	operations	PgSQLDBClusterConfig has been removed from defaultType.
SourceDisableParameters	NA (value type)	API Type	SourceDisableParameters	The description has been updated

API object	Path	Type	Name	Change
SourceEnableParameters	NA (value type)	API Type	SourceEnableParameters	The description has been updated
SourceIngestionData	NA (value type)	Property	containerType	MYSQL_DB_CONTAINER and PGSQL_DB_CONTAINER have been removed from enum.
SourceStartParameters	NA (value type)	API Type	SourceStartParameters	The description has been updated
SourceStopParameters	NA (value type)	API Type	SourceStopParameters	The description has been updated
SourceTypeAggregateIngestedSize	NA (value type)	Property	containerType	MYSQL_DB_CONTAINER and PGSQL_DB_CONTAINER have been removed from enum.
Source	/source	Property	operations, disable, start, stop	PgSQLLinkedSource, PgSQLStagingSource, PgSQLVirtualSource, MySQLLinkedSource, MySQLStagingSource, MySQLVirtualSource
User	/user	Property	publicKey	Property redact-in-logs have been removed.

3.6.18.2 What's new?

API object	Path	Type	Name	Description
OracleExportTimeflow FilesystemLayout	NA (value type)	API Type	OracleExportTransferStrategy	Property rmanFileSectionSizeInGb has been added.

API object	Path	Type	Name	Description
OracleStagingSource	NA (value type)	API Type	OracleStagingSource	Property datafileMountPath and archiveMountPath has been added
TimeConfig	/service/time	API Type	TimeConfig	Property rootOperations has been added.
ValidateNTPParameters	NA (value type)	API Type	ValidateNTPParameters	Validate an NTP server by querying it for the time.
AzureCertificateAuthentication	NA (value type)	API Type	AzureCertificateAuthentication	Client certificate for authenticating to an Azure vault.

3.6.19 API changes in Delphix 10.0.0.0

In Delphix 10.0.0.0, the new API version is 1.11.21. This section describes all API changes since API version 1.11.20, which was released with Delphix 9.0. All URL paths are relative to

`/resources/json/delphix.`

What's changed?

API object	Path	Type	Name	Change
NfsConfig	/service/nfs	Property	mountVersion	Property mountVersion (enum) has been updated to include NFSv4.
OracleVirtualCdbSource	NA (value type)	API Type	OracleVirtualCdbSource	Removed property nodeListeners.

API object	Path	Type	Name	Change
PasswordVaultTestParameters	NA (value type)	API Type	PasswordVaultTestParameters	Removed properties host and port.
SystemInfo	/System	Property	maxHeapSizeGb	Maximum heap size of the management application.

3.6.19.1 What's new?

API object	Path	Type	Name	Description
AzureAuthentication	NA (value type)	API Type	AzureAuthentication	Parameters for authenticating to an Azure vault.
AzureSecretsAuthentication	NA (value type)	API Type	AzureSecretsAuthentication	Secret credential for authenticating to an Azure vault.
AzureVaultCredential	NA (value type)	API Type	AzureVaultCredential	The Azure vault based security credential.
AzureVaultTestParameters	NA (value type)	API Type	AzureVaultTestParameters	Azure password vault test configuration.
AzureVault	NA (value type)	API Type	AzureVault	Azure password vault configuration.

API object	Path	Type	Name	Description
HostedVaultTestParameters	NA (value type)	API Type	HostedVaultTestParameters	Hosted password vault test configuration.

3.6.20 API changes in Delphix 9.0.0.0

In Delphix 9.0, the new API version is 1.11.20. This section describes all API changes since API version 1.11.19, that was released with Delphix 8.0.0.0. All URL paths are relative to `/resources/json/delphix.`

3.6.20.1 What's changed?

API object	Path	Type	Name	Change
MSSqlVirtualSource	NA (value type)	Property	configParameters	Can now be updated via CLI.
CyberArkPasswordVault	NA (value type)	API Type	CyberArkPasswordVault	Returns a list of password vault objects on the system. Limits CLI visibility for create, update and delete of password vault objects to system users only.
NamespaceFailoverParameters	NA (value type)	API Type	NamespaceFailoverParameters	Removed property smartFailover.
PasswordVault	/service/passwordVault	API Type	PasswordVault	Removed property host and port.

API object	Path	Type	Name	Change
TimeZone	/timezone	Property	id	Property id (enum) has been updated to include America/Rosario,Europe/Belfast.

3.6.20.2 What's new?

API object	Path	Type	Name	Description
MSSqlVirtualSource	N/A (value type)	Property	configTemplate	Optional database template to use for provisioning, refresh and enable. If set, configParams will be ignored on the provision or refresh.
HostedPasswordVault	N/A (value type)	Property API Type	HostedPasswordVault	Password vaults with host and port.
UnixHost	N/A (value type)	Property	toolkitPath	Added property format with value unixabsolutePath.
OracleDBExportParameters	N/A (value type)	API Type	OracleDBExportParameters	Parameters to use as input to export Oracle non-MT databases.
OracleEnhancedExportParameters	N/A (value type)	API Type	OracleEnhancedExportParameters	The enhanced parameters to use as input to export Oracle databases.
OraclePDBExportParameters	N/A (value type)	API Type	OraclePDBExportParameters	Parameters to use as input to export Oracle PDB databases.

API object	Path	Type	Name	Description
<code>OracleExportPDBInPlaceTransferStrategy</code>	N/A (value type)	API Type	<code>OracleExportPDBInPlaceTransferStrategy</code>	Convert a virtual PDB to a physical PDB in-place.
<code>OracleExportDBInPlaceTransferStrategy</code>	N/A (value type)	API Type	<code>OracleExportDBInPlaceTransferStrategy</code>	Convert a non-MT virtual DB to a physical DB in-place.
<code>OracleExportASMStorageStrategy</code>	N/A (value type)	API Type	<code>OracleExportASMStorageStrategy</code>	Storage strategy for exporting database files to ASM.
<code>OracleASMLayout</code>	N/A (value type)	API Type	<code>OracleASMLayout</code>	ASM diskgroups for datafiles, archive logs/redo logs.

3.6.21 API changes in Delphix 8.0.0.0

In Delphix 8.0.0.0, the new API version is 1.11.19. This section describes all API changes since API version 1.11.18, which was released with Delphix 7.0.0.0. All URL paths are relative to `/resources/json/delphix.`

3.6.21.1 What's changed?

API object	Path	Type	Name	Change
<code>FluentdConfig</code>	<code>/service//fluentd/configuration</code>	Property	<code>performanceMetricsResolution</code>	Can now set property via CLI.

API object	Path	Type	Name	Change
NamespaceFailoverParameters	N/A (value type)	Property	getFailbackCapability	Return object has changed from string to object.
RepavePrepareParameters	N/A (value type)	API Type	RepavePrepareParameters	Removed properties: <ul style="list-style-type: none"> • quiesceSources • enableSourcesOnFailure • ignoreMaskingJobsInProgress Added property: <ul style="list-style-type: none"> • unquiesceSourcesOnFailure
SNMPV2Config	/service/snmp/v2	Property	severity	Added enum value AUDIT.
Source	/source	Property	update	Restrict CLI visibility to domain users only.
Source	/source	Property	operations	Restrict CLI visibility to domain users only.
Source	/source	Property	disable	Restrict CLI visibility to domain users only.
Source	/source	Property	stop	Restrict CLI visibility to domain users only.
Source	/source	Property	lock	Restrict CLI visibility to domain users only.
SsoSuccessfulLoginRecord	N/A (value type)	API Type	SsoSuccessfulLoginRecord	Redact email from logs.

API object	Path	Type	Name	Change
User	/user	Property	isDefault	Can no longer set property via CLI.

3.6.21.2 What's new?

API object	Path	Type	Name	Description
CloudEndpoint	N/A (value type)	API Type	CloudEndpoint	A mapping of a recommend region and endpoint for use with Cloud Engines.
FailbackCapability	N/A (value type)	API Type	FailbackCapability	A replica namespace's fallback capability.
OracleLinkedSourceOperations	N/A (value type)	API Type	OracleLinkedSourceOperations	Describes operations which are performed on linked sources at various times.
SystemInfo	/system	Property	rootOperations	Added getRecommendedCloudStorageEndpoints to get list of recommended endpoints and regions for Cloud Engine setup.
OracleBaseLinkData	N/A (value type)	Property	operations	Added preLogSync property and new optional fields.
OracleLinkedSource	N/A (value type)	Property	operations	Added preLogSync property and new optional fields.

3.6.22 API changes in Delphix 7.0.0.0

In Delphix 7.0.0.0, the new API version is 1.11.18. This section describes all API changes since API version 1.11.17, which was released with Delphix 6.0.17.0. All URL paths are relative to `/resources/json/delphix.`

3.6.22.1 What's changed?

API object	Path	Type	Name	Change
Domain	N/A (value type)	API Type	lock	Restrict CLI visibility to domain users only.
MSSqlExportParameters	N/A (value type)	Property	prodSyncConfigParameter	Property removed.
NettyVersionInfo	/netty	Property	NettyVersionInfo	API object removed.
OracleExportAsmParameters	N/A (value type)	Property	OracleExportAsmParameters	API object removed.
SystemPackage	/system/package	Property	SystemPackage	API object removed.

3.6.22.2 What's new?

API Object	Path	Type	Name	Description
Domain	N/A (value type)	Property	cliVisibility	Restrict CLI visibility to system or domain users.

API Object	Path	Type	Name	Description
FluentdAttribute	N/A (value type)	API Type	FluentdAttribute	Fluentd attribute.
FluentdConfig	N/A (value type)	API Type	FluentdConfig	Fluentd configuration information.
FluentdPlugin	/service/fluentd/plugins	API Type	FluentdPlugin	Upload and manage fluentd plugins.
FluentdRegularAttribute	N/A (value type)	API Type	FluentdRegularAttribute	Fluentd attribute with a plain value.
FluentdSecretAttribute	N/A (value type)	API Type	FluentdSecretAttribute	Fluentd attribute with a secret value.
MSSqlSnapshot	N/A (value type)	Property	emptySnapshot	Readonly - True if the staging push dSource snapshot is empty.
OracleStagingSource	N/A (value type)	Property	customEnvVars	Custom environment variables for Oracle databases.
OracleBaseStagingLinkData	N/A (value type)	API Type	OracleBaseStagingLinkData	Represents common parameters to link an Oracle database using a staging database.
OracleStagingPushSyncParameters	N/A (value type)	API Type	OracleStagingPushSyncParameters	The parameters to use as input to sync a staging Oracle database.
OracleStagingPushSyncStrategy	N/A (value type)	API Type	OracleStagingPushSyncStrategy	Oracle specific parameters for staging push sync strategy.

API Object	Path	Type	Name	Description
OracleSyncFromStagingParameters	N/A (value type)	API Type	OracleSyncFromStagingParameters	The parameters to use as input to sync from a Staging Oracle database.
OracleLinkFromStaging	N/A (value type)	API Type	OracleLinkFromStaging	Represents parameters to link a non-pluggable Oracle database using a staging database.
OraclePDBLinkFromStaging	N/A (value type)	API Type	OraclePDBLinkFromStaging	Represents parameters to link a pluggable Oracle database using a staging database.
OracleSourceLessSyncStrategy	N/A (value type)	API Type	OracleSourceLessSyncStrategy	Base type for Oracle source less sync strategy and associated parameters.
S3ObjectStoreRepaveApplyParameters	N/A (value type)	API Type	S3ObjectStoreRepaveApplyParameters	An Amazon Simple Storage Service (Amazon S3) object store.
BlobObjectStoreRepaveApplyParameters	N/A (value type)	API Type	BlobObjectStoreRepaveApplyParameters	An Azure blob object store.
BlockStorageRepaveApplyParameters	N/A (value type)	API Type	BlockStorageRepaveApplyParameters	Block Storage.
RepaveApplyParameters	N/A (value type)	API Type	RepaveApplyParameters	The parameters to use as input to repave apply.
RepavePrepareParameters	N/A (value type)	API Type	RepavePrepareParameters	The parameters to use as input to repave prepare.

3.6.23 API changes in Delphix 6.0.17.0

In Delphix 6.0.17.0, the new API version is 1.11.17. This section describes all API changes since API version 1.11.16, which was released with Delphix 6.0.16.0. All URL paths are relative to `/resources/json/delphix/`.

3.6.23.1 What's changed?

API object	Path	Type	Name	Change
AppDataExportParameters	N/A (value type)	API Type	AppDataExportParameters	Object now subclasses GenericExportParameters
ASEAttachData	N/A (value type)	Property	stagingPreScript	Property removed.
ASEAttachData	N/A (value type)	Property	stagingPostScript	Property removed.
ASELinkData	N/A (value type)	Property	stagingPreScript	Property removed.
ASELinkData	N/A (value type)	Property	stagingPostScript	Property removed.
ASEStagingSource	N/A (value type)	Property	preScript	Property removed.
ASEStagingSource	N/A (value type)	Property	postScript	Property removed.
DbExportParameters	N/A (value type)	API Type	DbExportParameters	Object now subclasses GenericExportParameters

API object	Path	Type	Name	Change
ExportParameters	N/A (value type)	Property	timeflowPointParameters	Property removed and added to GenericExportParameters
ExportParameters	N/A (value type)	Property	sourceConfig	Property removed and added to GenericExportParameters
OracleHostParameters	N/A (value type)	Property	tdeKeystoresRootPath	Restrict format to valid unix path
OracleVirtualPdbSource	N/A (value type)	Property	targetVcdbTdeKeystorePath	Remove maxLength constraint. Add minLength constraint of 1 character.
RefreshParameters	N/A (value type)	API Type	RefreshParameters	Object now subclasses ReversionParameters
RollbackParameters	N/A (value type)	API Type	RollbackParameters	Object now subclasses ReversionParameters
TimeflowPointSemantic	N/A (value type)	Property	location	Add OLDEST_SNAPSHOT to acceptable values

3.6.23.2 What's new?

API object	Path	Type	Name	Description
Container	/database	Property	cdbContainer	Restrict listing to only include the PDB datasets belonging to the specified CDB dataset reference. This option is mutually exclusive with all the other options.
Container	/database	Object Operations	deprovision	Deprovisions a container.
Container	/database	Object Operations	reprovision	Reprovisions a container. This should only be called after a deprovision using the ReprovisionParameters returned from that operation.
EventsConfig	/service/events	API Type	EventsConfig	Event Message Configuration.
GenericExportParameters	N/A (value type)	API Type	GenericExportParameters	The parameters to use as input to export requests.
JobRetentionConfig	/job/retention	API Type	JobRetentionConfig	Configuration for job retention.
OracleStagingSource	N/A (value type)	Property	allowAutoStagingRestartOnHostReboot	Indicates whether Delphix should automatically restart this staging source when target host reboot is detected.

API object	Path	Type	Name	Description
ReprovisionParameters	N/A (value type)	API Type	ReprovisionParameters	The input parameters to refresh and rollback requests.
SourceIngestionData	N/A (value type)	Property	containerTypeLabel	Human readable description of containerType.
SystemInfo	/system	Property	cloudRegion	The region of the current system if hosted on an applicable cloud service provider.
SystemInfo	/system	Property	smtpConfigured	Whether SMTP has been configured."

3.6.24 API changes in Delphix 6.0.16.0

In Delphix 6.0.16.0, the new API version is 1.11.16. This section describes all API changes since API version 1.11.15, which was released with Delphix 6.0.15.0. All URL paths are relative to `/resources/json/delphix`.

3.6.24.1 What's changed?

API object	Path	Type	Name	Change
NetworkRoute	/network/route	Property	gateway	Parameter has been made optional.
OracleBaseSourceRuntime	N/A (value type)	Property	databaseMode	UNMOUNTED mode added.

3.6.24.2 What's new?

API object	Path	Type	Name	Description
FluentdConfig	N/A (value type)	Property	performanceMetricsResolution	Performance metrics resolution.
HostNfsChecksParameters	N/A (value type)	API Type	HostNfsChecksParameters	Mechanism to verify user can mount/unmount on a remote host.
OracleStagingSourceParameters	N/A (value type)	Property	physicalStandby	Whether this staging database will be configured as a physical standby.
OracleStagingSource	N/A (value type)	Property	physicalStandby	Whether this staging database will be configured as a physical standby.
PasswordResetConfig	N/A (value type)	API Type	PasswordResetConfig	Password Reset Configuration
PasswordResetRequestParameters	N/A (value type)	API Type	PasswordResetRequestParameters	Parameters in a password reset request.
PasswordResetValidationParameters	N/A (value type)	API Type	PasswordResetValidationParameters	Self-service password Reset validation parameters.

API object	Path	Type	Name	Description
PasswordResetValidationResult	N/A (value type)	API Type	PasswordResetValidationResult	Self-service password Reset validation result.
PluginManifest	N/A (value type)	Property	hasLinkedSourceSize	Indicates whether linked.source_size() operation has been implemented.
PluginManifest	N/A (value type)	Property	hasVirtualSourceSize	Indicates whether virtual.source_size() operation has been implemented.
SourceEnvironment	/environment	Property	nfsChecks	Tests that the environment user can run mount and unmount successfully on the host.

3.6.25 API changes in Delphix 6.0.15.0

In Delphix 6.0.15.0, the new API version is 1.11.15. This section describes all API changes since API version 1.11.14, which was released with Delphix 6.0.14.0. All URL paths are relative to `/resources/json/delphix/`.

3.6.25.1 What's changed?

API object	Path	Type	Name	Change
DatabaseTemplate	N/A (value type)	Property	sourceType	MySQLVirtualSource and PgSQLVirtualSource removed from acceptable values. OracleLinkedSource added to acceptable values.

API object	Path	Type	Name	Change
S3objectStoreTestResult	N/A (value type)	API Type	timestamp	Object removed and replaced by ObjectStoreTestResult
ObjectStore	/storage/objectStorage	Property	root	Change root path to /resources/json/delphix/storage/objectStorage
S3objectStore	N/A (value type)	Standard operations	read update	Properties removed and added to ObjectStore
S3objectStore	N/A (value type)	Root operations	testConnection cacheHits Report clearCacheHits	Properties removed and added to ObjectStore
TimeZone	N/A (value type)	Property	sendSocketBuffer	Add Pacific/Kanton timezone

3.6.25.2 What's new?

API object	Path	Type	Name	Description
BlobObjectStoreAccess	N/A (value type)	API Type	BlobObjectStoreAccess	Blob object store access

API object	Path	Type	Name	Description
BlobObjectStoreAccessKey	N/A (value type)	API Type	BlobObjectStoreAccessKey	Blob object store access key
BlobObjectStoreAccessManagedIdentities	N/A (value type)	API Type	BlobObjectStoreAccessManagedIdentities	Blob object store access through Managed Identities
ObjectStoreCacheHitsReport	N/A (value type)	API Type	ObjectStoreCacheHitsReport	A cache hits report for an object store
ObjectStoreTestResult	N/A (value type)	API Type	ObjectStoreTestResult	An object store connectivity test result
ObjectStoreTest	N/A (value type)	API Type	ObjectStoreTest	An object store connectivity test object
ObjectStore	/storage/objectStorage	Standard operations	read update	Retrieve the specified ObjectStore object Update the specified ObjectStore object

API object	Path	Type	Name	Description
ObjectStore	/storage/objectStorage	Root operations	testConnection cacheHitsReport clearCacheHits	Test connectivity to an object store Get a ZettaCache hits-by-size report Clear the accumulated ZettaCache hits-by-size data

3.6.26 API changes in Delphix 6.0.14.0

In Delphix 6.0.14.0, the new API version is 1.11.14. This section describes all API changes since API version 1.11.13, which was released with Delphix 6.0.13.0. All URL paths are relative to `/resources/json/delphix`.

3.6.26.1 What's changed?

API object	Path	Type	Name	Change
CompatibilityCriteria	N/A (value type)	Property	processor	Constraints removed
JobEvent	N/A (value type)	Property	timestamp	Description changed to "Time the event last occurred."
MSSqlExportParameters	N/A (value type)	Property	filesystemLayout	Description changed to note this filesystem configuration is specific to an exported MSSQL database.

API object	Path	Type	Name	Change
NetworkDSPTestParameters	N/A (value type)	Property	queueDepth	Changed from 32 to 64
NetworkDSPTestParameters	N/A (value type)	Property	blockSize	Changed from 65536 to 1048576
NetworkDSPTestParameters	N/A (value type)	Property	sendSocketBuffer	Changed from 262144 to 1048576
NetworkDSPTestParameters	N/A (value type)	Property	receiveSocketBuffer	Changed from 262144 to 1048576
OracleBaseDBConfig	N/A (value type)	Property	user	Field changed to be nullable
OracleBaseDBConfig	N/A (value type)	Property	credential	Field changed to be nullable
OracleVirtualPdbSource	N/A (value type)	Property	tdeKeyIdentifier	minLength changed from 1 to 34
Schedule	N/A (value type)	Property	cutoffTime	Added to description: "A value of 0 indicates no cutoff"

3.6.26.2 What's new?

API object	Path	Type	Name	Description
AppDataLinkedSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.

API object	Path	Type	Name	Description
ASELinkedSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
ASEStagingSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
JobEvent	N/A (value type)	Property	startTime stamp	Time the event first occurred.
MSSqlFileMappingParameters	N/A (value type)	API Type	MSSqlFile MappingParameters	The parameters to use as input to provide File Mapping for MSSQL databases.
MSSqlLinkedSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
MSSqlStagingSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
MSSqlTimeflowFilesystemLayout	N/A (value type)	API Type	MSSqlTime flowFilesystemLayout	A filesystem layout that matches the filesystem of a Delphix MSSQL TimeFlow.
OracleLinkedSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.

API object	Path	Type	Name	Description
OracleStagingSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
Source	/source	Root operation	lock	Protects source from deletion and other data-losing actions. Cannot be undone.

3.6.27 API changes in Delphix 6.0.13.0

In Delphix 6.0.13.0, the new API version is 1.11.13. This section describes all API changes since API version 1.11.12, which was released with Delphix 6.0.12.0. All URL paths are relative to `/resources/json/delphix`.

3.6.27.1 What's changed?

API object	Path	Type	Name	Change
MSSqlNoBackupSyncParameters	API Type	N/A (value type)	MSSqlNoBackupSyncParameters	STAGING_PUSH_INGESTION feature flag removed
MSSqlSourcelessSyncStrategy	API Type	N/A (value type)	MSSqlSourcelessSyncStrategy	STAGING_PUSH_INGESTION feature flag removed
MSSqlStagingPushSyncStrategy		N/A (value type)	MSSqlStagingPushSyncStrategy	STAGING_PUSH_INGESTION feature flag removed
NetworkInterface	API Type	/network/interface	NetworkInterface	Removed Domain User access on CLI

API object	Path	Type	Name	Change
NetworkRoute	API Type	/network/ route	NetworkRoute	Removed Domain User access on CLI
NetworkRoute	Property	/network/ route	protocol	Changed from "readonly" to "optional" when creating.
OAuth2Config	API Type	/service/ oauth2	OAuth2Config	Added Domain User access from CLI. Provide System user only access for updates and root operations.
ObjectStore	API Type	N/A (value type)	ObjectStore	DELPHIX_DATA_BANK feature flag removed. Added update operation.
OracleDBConfig	Properties	N/A (value type)	databaseName uniqueName	Replace property pattern with format - oracleDatabaseName oracleDbUniqueName
OracleInstance	Property	N/A (value type)	instanceName	Replace property pattern with format - oracleInstanceName
OraclePDBConfig	Property	N/A (value type)	databaseName	Replace property pattern with format - oraclePDBName
S3ObjectStoreAccessInstanceProfile	API Type	N/A (value type)	S3ObjectStoreAccessInstanceProfile	DELPHIX_DATA_BANK feature flag removed.

API object	Path	Type	Name	Change
S3objectStoreAccessKey	API Type	N/A (value type)	S3objectStoreAccessKey	DELPHIX_DATA_BANK feature flag removed.
S3objectStoreAccess	API Type	N/A (value type)	S3objectStoreAccess	DELPHIX_DATA_BANK feature flag removed.
S3objectStoreTestResult	API Type	N/A (value type)	S3objectStoreTestResult	DELPHIX_DATA_BANK feature flag removed.
S3objectStoreTest	API Type	N/A (value type)	S3objectStoreTest	DELPHIX_DATA_BANK feature flag removed.
S3objectStore	API Type	/storage/objectStorage	S3objectStore	DELPHIX_DATA_BANK feature flag removed. "Update" operation added for all the properties.

3.6.27.2 What's new?

API object	Path	Type	Name	Description
FluentdAttributeDefinition	N/A (value type)	API Type	FluentdAttributeDefinition	Fluentd attribute definition.
FluentdAttribute	N/A (value type)	API Type	FluentdAttribute	Fluentd attribute.

API object	Path	Type	Name	Description
FluentdConfig	/service/fluentd/configuration	API Type	FluentdConfig	Fluentd configuration information.
FluentdPlugin	/service/fluentd/plugins	API Type	FluentdPlugin	Upload and manage fluentd plugins.
FluentdRegularAttribute	N/A (value type)	API Type	FluentdRegularAttribute	Fluentd attribute with a plain value.
FluentdSecretAttribute	N/A (value type)	API Type	FluentdSecretAttribute	Fluentd attribute with a secret value.
MaskingServiceConfig	/maskingjob/serviceconfig	Property	maxJobFetchCount	Maximum number of jobs to fetch from masking service. Defaults to 500.
NettyVersionInfo	/netty	API Type	NettyVersionInfo	View netty version and switch between legacy and latest netty version.
ObjectStore	N/A (value type)	Property	configured	States whether an object store has been configured.
OracleBaseStagingLinkData	N/A (value type)	API Type	OracleBaseStagingLinkData	Represents common parameters to link an Oracle database using a staging database.
OracleLinkFromStaging	N/A (value type)	API Type	OracleLinkFromStaging	Represents parameters to link a non-pluggable Oracle database using a staging database.

API object	Path	Type	Name	Description
OraclePDBLinkFromStaging	N/A (value type)	API Type	OraclePDBLinkFromStaging	Represents parameters to link a pluggable Oracle database using a staging database.
OracleSourceLessSyncStrategy	N/A (value type)	API Type	OracleSourceLessSyncStrategy	Base type for Oracle source less sync strategy and associated parameters.
OracleStagingPushSyncParameters	N/A (value type)	API Type	OracleStagingPushSyncParameters	The parameters to use as input to sync a staging Oracle database.
OracleStagingPushSyncStrategy	N/A (value type)	API Type	OracleStagingPushSyncStrategy	Oracle specific parameters for staging push sync strategy.
OracleStagingSourceParameters	N/A (value type)	Property	instanceName	The name (sid) of the instance.
S3objectStore	/storage/objectStorage	Root operations	cacheHits ReportclearCacheHits	Get print out of the ZettacCache hit-by-size histogram. Clear the current ZettacCache hit-by-size histogram.
S3objectStoreTestResult	N/A (value type)	Property	errorMessage	Error message from connectivity test.

3.6.28 API changes in Delphix 6.0.12.0

In Delphix 6.0.12.0, the new API version is 1.11.12. This section describes all API changes since API version 1.11.11, which was released with Delphix 6.0.11.0. All URL paths are relative to `/resources/json/delphix`.

3.6.28.1 What's changed?

API object	Path	Type	Name	Change
AbstractToolkit	/toolkit	property	language	Removed.
CipherSuite	/service/tls/cipherSuite	property	name	Removed values for enum - "TLS_RSA_WITH_AES_256_CBC_SHA", "TLS_RSA_WITH_AES_128_CBC_SHA", "TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA", "TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA", "TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA", "TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA", "TLS_DHE_RSA_WITH_AES_256_CBC_SHA", "TLS_DHE_RSA_WITH_AES_128_CBC_SHA", "TLS_DHE_DSS_WITH_AES_256_CBC_SHA", "TLS_DHE_DSS_WITH_AES_128_CBC_SHA".
HttpConnectorConfig	/service/httpConnector	property	tlsVersions	Removed values for enum - "SSLv3", "TLSv1", "TLSv1_1"
OAuth2Config	/service/oauth2	property	userMatchingFieldType	Updated description.

API object	Path	Type	Name	Change
OracleLinkedSource	N/A (value type)	property	config backupLevelEnabled rmanChannels filesPerSet checkLogical encryptedLinkingEnabled compressedLinkingEnabled bandwidthLimit numberOfConnections	Removed.
OracleSource	N/A (value type)	property	config	Removed.
StorageDevice	/storage/device	property	list operations	Removed CliDisplay parameters - "bootDevice", "allocating". Removed operations - "remove", "removeVerify".

API object	Path	Type	Name	Change
UnixHost	N/A (value type)	property	oracleJdbcKeyStorePassword	Removed.
User	/user	property	apiUser	Renamed to allowPasswordAuthentication (see in What's New?)

3.6.28.2 What's new?

API object	Path	Type	Name	Description
ConfiguredStorageDevice	N/A (value type)	property	allocating	True if the device is being used for allocations. Allocations will be disabled automatically if the device is going to be removed. The allocating property will also be false for devices that are not configured.
MSSqlNoBackupSyncParameters	N/A (value type)	API Type	MSSqlNoBackupSyncParameters	The parameters to use as input to sync MSSQL databases without a backup.
MSSqlSourcelessSyncStrategy	N/A (value type)	API Type	MSSqlSourcelessSyncStrategy	MSSQL specific parameters for sourceless sync strategy.
MSSqlStagingPushSyncStrategy	N/A (value type)	API Type	MSSqlStagingPushSyncStrategy	MSSQL specific parameters for staging push sync strategy.

API object	Path	Type	Name	Description
OracleHostParameters	N/A (value type)	API Type	OracleHostParameters	Oracle specific host parameters.
OracleLinkedSource	N/A (value type)	property	syncStrategy overrideMapsTo	Parameters used to sync the container. These are persisted and used for every sync operation. Override 'mapsTo' property from source.js for the query parameters defined in 'list' section.
OracleManagedSource	N/A (value type)	property	config	Reference to the configuration for the source.
Plugin	N/A (value type)	property	language	Implementation language for workflows in this plugin.
StorageDeviceRemovalStatus	/storage/remove	property	rootOperations	Add "start" and "verify" root operations to <ul style="list-style-type: none"> remove storage devices verify storage devices can be removed.
StorageDeviceRemoveParameters	N/A (value type)	API Type	StorageDeviceRemoveParameters	The parameters to use as input when removing devices.
UnixHost	N/A (value type)	property	oracleHostParameters	The Oracle specific parameters associated with the host.

API object	Path	Type	Name	Description
User	/user	property	allowPasswordAuthentication	If the Delphix Engine has been configured for SAML SSO, only users with this property set can authenticate with a username and password for API or CLI access.

3.6.29 API changes in Delphix 6.0.11.0

In Delphix 6.0.11.0, the new API version is 1.11.11. This section describes all API changes since API version 1.11.10, which was released with Delphix 6.0.10.0. All URL paths are relative to `/resources/json/delphix/`.

3.6.29.1 What's changed?

API object	Path	Type	Name	Change
AdvancedSettingsInfo	/system/advancedSettings	API Type	AdvancedSettingsInfo	Hidden behind feature flag SYSTEMTUNABLEINTERFACE
DelphixManagedBackupIngestionStrategy	N/A (value type)	API Type	DelphixManagedBackupIngestionStrategy	Removed.
ExternalBackupIngestionStrategy	N/A (value type)	API Type	ExternalBackupIngestionStrategy	Removed.
IngestionStrategy	N/A (value type)	API Type	IngestionStrategy	Removed.

API object	Path	Type	Name	Change
MSSqlDBConfig	N/A (value type)	property	mssqlUser	Removed.
MSSqlLinkedSource	N/A (value type)	property	config sharedBackupLocations ingestionStrategy mssqlNetbackupConfig mssqlCommvaultConfig	Removed.
MSSqlSourceSyncStrategy	N/A (value type)	property	config	Optional while creating.
NoBackupIngestionStrategy	N/A (value type)	API Type	NoBackupIngestionStrategy	Removed.
OracleLinkFormExternal	N/A (value type)	property	config	Extends reference changed from OracleBaseLinkData to OracleBaseExternalLinkData. Config property removed.
OraclePDBLinkFromExternal	N/A (value type)	property	config	Extends reference changed from OracleBaseLinkData to OracleBaseExternalLinkData. Configproperty removed.

API object	Path	Type	Name	Change
OracleTimeflow	N/A (value type)	property	tdeUUID	No Longer behind feature flag ORACLEMTTDE.
OracleVirtualPdbSource	N/A (value type)	property	parentTdeKeyStorePath parentTdeKeyStorePassword tdeExportedKeyFileSecret tdeUUID	No Longer behind feature flag ORACLEMTTDE.
Source	N/A (value type)	property	config	nameParent changed from config to container. Configproperty removed from properties and list operation.
SsoFailedLoginRecord	N/A (value type)	property	userAgent originIp reason	Extends reference changed from TypedObject to FailedLoginRecord. All properties removed.
SsoSuccessfulLoginRecord	N/A (value type)	property	userAgent originIp	Extends reference changed from TypedObject to LoginRecord. Properties removed.

3.6.29.2 What's new?

API object	Path	Type	Name	Description
AppDataCompatibilityCriteria	N/A (value type)	API Type	AppDataCompatibilityCriteria	The compatibility criteria to use for filtering the list of available AppData repositories.
AppDataSource	N/A (value type)	property	config	Reference to the configuration for the source.
ASESource	N/A (value type)	property	config	Reference to the configuration for the source.
FailedLoginRecord	N/A (value type)	API Type	FailedLoginRecord	Represents an successful login using an external identity provider.
LoginRecord	N/A (value type)	API Type	LoginRecord	Represents a failed SSO login.
MSSqlDelphixManagedSyncStrategy	N/A (value type)	property	config	Reference to the configuration for the source.
MSSqlExternalManagedSourceSyncStrategy	N/A (value type)	property	config	Reference to the configuration for the source.
MSSqlLinkedSource	N/A (value type)	property	syncStrategy overrideMapsTo	Sync strategy for this source. Override mapsTo property for the query parameter defined in list at the root type.

API object	Path	Type	Name	Description
MSSqlStagingSource	N/A (value type)	property	config	Reference to the configuration for the source.
MSSqlUser	N/A (value type)	property	config	Reference to the configuration for the source.
MySQLSource	N/A (value type)	property	config	Reference to the configuration for the source.
OAuth2Config	/service/oauth2	API Type	OAuth2Config	OAuth2 Configuration.
OAuth2FailedLoginRecord	N/A (value type)	API Type	OAuth2FailedLoginRecord	Represents a failed OAuth2 login.
OAuth2SuccessfulLoginRecord	N/A (value type)	API Type	OAuth2SuccessfulLoginRecord	Represents a successful OAuth2 login.
OracleBaseExternalLinkData	N/A (value type)	API Type	OracleBaseExternalLinkData	Represents common parameters to link all externally managed Oracle databases.
OracleSourceBasedSyncStrategy	N/A (value type)	API Type	OracleSourceBasedSyncStrategy	Base type for Oracle source based sync strategy and associated parameters.
OracleSource	N/A (value type)	property	config	Reference to the configuration for the source.

API object	Path	Type	Name	Description
OracleSyncStrategy	N/A (value type)	API Type	OracleSyncStrategy	Base type for Oracle sync strategy and associated parameters.
OracleVirtualPdbSource	N/A (value type)	property	tdeKeyIdentifier	ID of the key created by Delphix, as recorded in encryption_keys.key_id.
OracleVirtualSource	N/A (value type)	property	newDBID	Indicates whether Delphix will generate a new DBID during VDB provision or refresh.
OsAdminStatus	/osadmin/engineStatus	API Type	OsAdminStatus	Information for the current state of the Delphix Engine.
PgSQLSource	N/A (value type)	property	config	Reference to the configuration for the source.
PluginManifest	N/A (value type)	property	hasVirtualCleanup	Indicates whether virtual.cleanup() operation has been implemented.
ReplicationSourceState	N/A (value type)	property	lastKnownTargetVersion	The Delphix version of the target engine during the last replication using the spec.
ReplicationTargetState	N/A (value type)	property	lastKnownSourceVersion	The Delphix version of the source engine during the last replication of the namespace.

3.6.30 API changes in Delphix 6.0.10.0

In Delphix 6.0.10.0, the new API version is 1.11.10. This section describes all API changes since API version 1.11.9, which was released with Delphix 6.0.9.0. All URL paths are relative to `/resources/json/delphix`.

3.6.30.1 What's changed?

API object	Path	Type	Name	Change
CredentialsEnvVars	N/A (value type)	API Type	CredentialsEnvVars	Extends reference changed from TypedObject to IdentifiableArrayElement.
CredentialsEnvVars	N/A (value type)	property	baseVarName credentials	Optional for an update. Optional for update.
IscsiTarget	/storage/ iscsi/target	property	state	Added enum value ERROR.
KeyPairCredential	N/A (value type)	property	privateKey publicKey	Required for create. Optional for update.
NetworkRoute	/network/ route	property	list	Add enum value protocol in "cliDisplay".
Operation	N/A (value type)	API Type	Operation	Extends reference changed from TypedObject to IdentifiableArrayElement.
OracleDatabaseContainer	N/A (value type)	property	racMaxInstanceLag	FeatureFlag 'ORACLERACMAXINSTANCELAG' is removed. default value changed to 3.
OracleExportParameters	N/A (value type)	property	filesystemLayout	Extends reference changed from TimeFlowFilesystemLayout to OracleExportTimeflowFilesystemLayout

API object	Path	Type	Name	Change
SystemInitializationParameters	N/A (value type)	property	devices	Optional while creating.
TimeZone	/timezone	property	id	Removed values for enum - "ACT", "AET", "AGT", "ART", "AST", "SST", "US/Pacific-New", "VST".

3.6.30.2 What's new?

API object	Path	Type	Name	Description
BlobObjectStoreAccesses	N/A (value type)	API Type	BlobObjectStoreAccess	Blob object store access
BlobObjectStoreAccessKey	N/A (value type)	API Type	BlobObjectStoreAccessKey	Blob object store access key
BlobObjectStoreAccessManagedIdentities	N/A (value type)	API Type	BlobObjectStoreAccessManagedIdentities	Blob object store access through Managed Identities
ObjectStoreCacheHitsReport	N/A (value type)	API Type	ObjectStoreCacheHitsReport	A cache hits report for an object store
ObjectStoreTestResult	N/A (value type)	API Type	ObjectStoreTestResult	An object store connectivity test result

API object	Path	Type	Name	Description
ObjectStoreTest	N/A (value type)	API Type	ObjectStoreTest	An object store connectivity test object
ObjectStore	/storage/objectStorage	Standard operations	read update	Retrieve the specified ObjectStore object Update the specified ObjectStore object
ObjectStore	/storage/objectStorage	Root operations	testConnection cacheHitsReport clearCacheHits	Test connectivity to an object store Get a ZettaCache hits-by-size report Clear the accumulated ZettaCache hits-by-size data

3.6.31 API changes in Delphix 6.0.9.0

In Delphix 6.0.9.0, the new API version is 1.11.9. This section describes all the API changes since API version 1.11.8, which was released with Delphix 6.0.8.0. All URL paths are relative to `/resources/json/delphix`.

3.6.31.1 What changed

API object	Path	Type	Name	change
AppDataProvisionParameters	N/A (value type)	property	sourceConfig	Type changed from AppDataSourceConfig to AppDataDirectSourceConfig.

API object	Path	Type	Name	change
BaseSupportBundleParameters	N/A (value type)	property	bundleType	Added enum value DOCKER_LOG.
CipherSuite	/service/tls/cipherSuite	property	name	Added enum values TLS_AES_128_CCM_8_SHA256, TLS_AES_128_CCM_SHA256, TLS_AES_128_GCM_SHA256, TLS_AES_256_GCM_SHA384, and TLS_CHACHA20_POLY1305_SHA256.
HttpConnectorConfig	/service/httpConnector	property	tlsVersions	Added enum value TLSv1_3.
Namespace	/namespace	property	locked	No longer behind a feature flag.
OracleCluster	/environment	property	name version	No longer read-only Deleted.
ReplicationSpec	N/A (value type)	property	lockedProfile	No longer behind a feature flag.
WindowsCluster	/environment	property	name	No longer read-only.

3.6.31.2 What is new

API object	Path	Type	Name	Description
AlertProfile	/alert/ profile	property	user	User to which the alert profile is assigned. Defaults to the logged-in user.
CredentialsEnvVars	N/A (value type)	API type	Credentials EnvVars	Credentials to be placed in environment variables for an operation.
IscsiTargetDiscoverParameters	N/A (value type)	property	chapUsername chapPassword chapUsernameIn chapPasswordIn	CHAP username to be used for iSCSI Discovery. CHAP password to be used for iSCSI Discovery. Target/Mutual CHAP username to be used for iSCSI Discovery (bidirectional authentication). Target/Mutual CHAP password to be used for iSCSI Discovery (bidirectional authentication).
IscsiTarget	/storage/ iscsi/ target	property	chapUsername chapPassword chapUsernameIn chapPasswordIn	CHAP username to be used for iSCSI Target authentication. CHAP password to be used for iSCSI Target authentication. Target/Mutual CHAP username (bidirectional authentication). Target/Mutual CHAP password (bidirectional authentication).
SourceOperation	N/A (value type)	property	credentials EnvVarsList	List of environment variables that will contain credentials for this operation.

API object	Path	Type	Name	Description
SystemVersion	/system/ version	property	hotfixVersion	The hotfix version.

3.6.32 API changes in Delphix 6.0.8.0

In Delphix 6.0.8.0, the new API version is 1.11.8. This section describes all API changes since API version 1.11.7, which was released with Delphix 6.0.7.0. All URL paths are relative to `/resources/json/delphix`.

3.6.32.1 What changed

API object	Path	Type	Name	Change
AttachData	N/A (value type)	property	config	Deleted.
Container	/database	operation	undo	HTTP method changed from GET to POST.
LinkData	N/A (value type)	property	config	Deleted.

API object	Path	Type	Name	Change
MSSqlAttachData	N/A (value type)	property	backupLocationCredentials backupLocationUser/ source config externalFilePath ingestionStrategy mssqlDefaultConfig mssqlNetbackupConfig mssqlUser sharedBackups	Deleted. (See the new syncStrategy property in the table below.)

API object	Path	Type	Name	Change
MSSqLLinkData	N/A (value type)	property	backupLocationCredentials backupLocationUser config externalFilePath ingestionStrategy mssqlDefaultConfig mssqlNetbackupConfig mssqlUser sharedBackupLocations	Deleted. (See the new syncStrategy property in the table below.)
MSSqLLinkedSource	/source	property	backupLocationCredentials backupLocationUser externalFilePath	Deleted.
NamespaceFailoverParameters	N/A (value type)	property	smartFailover	Default changed to true.
OracleSyncFromExternalParameters	N/A (value type)	property	filesForFullBackup	No longer behind a feature flag.

API object	Path	Type	Name	Change
SourceIngestionData	N/A (value type)	property	containerType	Removed obsolete value VMWARE_CONTAINER from enum.
SourceRepository	/repository	property	linkingEnabled	Deleted.
SourceTypeAggregateIngestedSize	N/A (value type)	property	containerType	Removed obsolete value VMWARE_CONTAINER from enum.
Source	/source	property	status	Removed value DETACHED from enum.
VMware*		API types	VMware*	Deleted all types whose names start with VMware (obsolete).

3.6.32.2 What is new

API object	Path	Type	Name	Description
AdvancedSettingsInfo	/system/advancedSettings	API type	AdvancedSettingsInfo	Set advanced virtualization, OS, network, and service tunables.
ASESnapshot	/snapshot	property	dbEncryptionKey	Name of database encryption key present for this snapshot.
IscsiInitiator	/storage/iscsi/initiator	API type	IscsiInitiator	Endpoint for iSCSI initiator information.
MSSqlAttachData	N/A (value type)	property	syncStrategy	Configuration that determines what sync strategy the source will use.

API object	Path	Type	Name	Description
MSSqlDelphixManagedSyncStrategy	N/A (value type)	API type	MSSqlDelphixManagedSyncStrategy	MSSQL specific parameters for delphix managed source based sync strategy.
MSSqlExternalManagedSourceSyncStrategy	N/A (value type)	API type	MSSqlExternalManagedSourceSyncStrategy	MSSQL specific parameters for externally managed source based sync strategy.
MSSqlLinkData	N/A (value type)	property	syncStrategy	Configuration that determines what sync strategy the source will use for linking.
MSSqlSourceSyncStrategy	N/A (value type)	API type	MSSqlSourceSyncStrategy	MSSQL specific parameters for source based sync strategy.
MSSqlSyncStrategy	N/A (value type)	API type	MSSqlSyncStrategy	Base type for mssql specific parameters for sync strategy.
Namespace	/ namespace	property	locked	Indicates the namespace is locked. (Behind the DATA_VAULT feature flag.)
OracleDatabaseContainer	/container	property	racMaxInstanceLag	Maximum number of log sequences that a node can lag behind on RAC before considering instance offline. (Behind the ORACLERACMAXINSTANCELAG feature flag.)

API object	Path	Type	Name	Description
ReplicationSpec	N/A (value type)	property	lockedProfile	Indicates the replication profile is locked. (Behind the DATA_VAULT feature flag.)
SyncStrategy	N/A (value type)	API type	SyncStrategy	Base type for specific parameters for sync strategy.
Tunable	N/A (value type)	API type	Tunable	The name of the tunable and its value.
TunableIdentifier	N/A (value type)	API type	TunableIdentifier	The subsystem and name for a tunable.

3.6.33 API changes in Delphix 6.0.7.0

In Delphix 6.0.7.0, the new API version is 1.11.7. This section describes all API changes since API version 1.11.6, which was released with Delphix 6.0.6.0. All URL paths are relative to `/resources/json/delphix`.

3.6.33.1 What's changed

API object	Path	Type	Name	Change
PgSQLDBClusterConfigConnectivity	N/A (value type)	API type	PgSQLDBClusterConfigConnectivity	Deleted.
OracleBaseDBConfig	/sourceconfig	property	nonSyncCredentials	Changed type from PasswordCredential to Credential.

API object	Path	Type	Name	Change
OracleLinkFromExternal	N/A (value type)	property	nonSy sCrede ntials	Changed type from PasswordCredential to Credential.
ReplicationSecureList	N/A (value type)	API type	Repli cation Secure List	No longer behind feature flag MDD.
SNMPV3Manager	/service/ snmp/v3/ manager	property	usern ame	Introduced a minimum length of 1.
Source	/source	property	statu s	Added DETACHED to the list of possible values.

3.6.33.2 What 's new

API object	Path	Type	Name	Description
AbstractToolkit	/toolkit	root operation	schema Defini tions	Get the platform's JSON schema definitions that plugin schemas can reference.

API object	Path	Type	Name	Description
ASESyncParameters	N/A (value type)	property	dropAndRecreateDevices	If this parameter is set to true, it will drop the older devices and create new devices during manual sync operations instead of trying to remap the devices. This might increase the space utilization on Delphix Engine.
NamedKeyPairCredential	N/A (value type)	API type	NamedKeyPairCredential	Username and key-pair credential.
NamedPasswordCredential	N/A (value type)	API type	NamedPasswordCredential	Pair of username and password credential.
OracleSyncFromExternalParameters	N/A (value type)	property	filesForFullBackup	List of datafiles to take a full backup of. This would be useful in situations where certain datafiles could not be backed up during previous SnapSync due to corruption or because they went offline.
SsoConfig	/service/sso	property	entityId	Audience Restriction (SP entity ID, Partner's Entity ID) of this engine as an SSO service provider.

API object	Path	Type	Name	Description
SsoConfig	/service/sso	property	responseSkewTime	Maximum time difference allowed between a SAML response and the engine's current time, in seconds. If not set, it defaults to 86,400 seconds (one day).
SsoConfig	/service/sso	property	maxAuthenticationAge	How far in the past to accept authentications to the identity provider, in seconds. If not set, it defaults to 120 seconds.
SupportBundleConfiguration	/service/support/bundle	property	maxActions	Maximum number of actions not referenced anywhere else to include from the metadata store. The most recent such actions are included.
SupportBundleConfiguration	/service/support/bundle	operation	read	Retrieve the specified SupportBundleConfiguration object.
SupportBundleConfiguration	/service/support/bundle	operation	update	Update the specified SupportBundleConfiguration object.

3.6.34 API changes in Delphix 6.0.6.0

In Delphix 6.0.6.0, the new API version is 1.11.6. This section describes all API changes since API version 1.11.5, which was released with Delphix 6.0.5.0. All URL paths are relative to `/resources/json/delphix`.

3.6.34.1 What's changed

API object	Path	Type	Name	Change
OracleMultitenantProvisionParameters	N/A (value object)	object property	timeflowPointParameters	The source timeflow point can now reference an Oracle non-multitenant database. In which case the non-multitenant database will be provisioned from the timeflow point to a virtual pluggable database.

3.6.35 API changes in Delphix 6.0.5.0

In Delphix 6.0.5.0, the new API version is 1.11.5. This section describes all API changes since API version 1.11.4, which was released with Delphix 6.0.4.0. All URL paths are relative to `/resources/json/delphix`.

3.6.35.1 What's changed

API object	Path	Type	Name	Change
CloudStatus	/service/cloud	property	delphixDataServicesComponentStatus	Made read-only for update.
CloudStatus	/service/cloud	property	delphixDataServicesComponentInfo	Made read-only for update.
CloudStatus	/service/cloud	root operation	enable	Added optional payload CloudEnableParameters.

API object	Path	Type	Name	Change
OracleDBConfig	/sourceconfig	property	tdeKeystorePassword	Impose a maximum length of 256.
OracleInstance	N/A (value object)	property	instanceNumber	Change type from number to integer.
OracleSnapshot	/snapshot	property	redoLogSizeInBytes	Change type from number to integer.
OracleStartParameters	N/A (value object)	property	instances	Change type from number to integer.
OracleStopParameters	N/A (value object)	property	instances	Change type from number to integer.
TimeZone	/timezone	property	id	Added enum values America/Nuuk and Asia/Qostanay.

3.6.35.2 What's new

API object	Path	Type	Name	Description
CloudEnableParameters	N/A (value object)	value type	CloudEnableParameters	Parameters to the Cloud Enable operation
CloudStatus	/service/cloud	property	proxyMode	Whether an HTTP proxy must be used to connect to Central Management.

API object	Path	Type	Name	Description
CloudStatus	/service/ cloud	property	proxyConf iguration	Proxy configuration for communication with Delphix Central Management. This property is ignored unless the 'proxyMode' property is set to CLOUD_SPECIFIC_SETTING.
CloudStatus	/service/ cloud	operation	update	Update the specified CloudStatus object. Payload is a CloudStatus.
HostConfiguration	N/A (value object)	property	powerShell Version	The PowerShell version installed on the windows target host.
OracleSTConvertedToPD BAttachData	N/A (value object)	value type	OracleSTCo nvertedToPD BAttachData	Sub-type of OraclePDBAttachData.
OracleTimeflow	/timeflow	property	tdeUUID	Unique identifier for TimeFlow-specific TDE objects that reside outside of Delphix storage.
OracleVirtualPdbSourc e	/source	property	parentTdeK eystorePass word	The password of the keystore specified in parentTdeKeystorePath.
OracleVirtualPdbSourc e	/source	property	tdeExporte dKeyFileSec ret	Secret to be used while exporting and importing vPDB encryption keys if Transparent Data Encryption is enabled on the vPDB.

API object	Path	Type	Name	Description
OracleVirtualPdbSource	/source	property	tdeUUID	Unique identifier for PDB-specific TDE objects that reside outside of Delphix storage.
StaticHostAddress	/service/host/address	new API	StaticHostAddress	Static mapping of hostname to IP address.
WindowsHost	/host	property	connectorVersion	The Windows Connector version that is installed on the provided host.
WindowsHost	/host	property	connectorDotNetFrameworkVersion	The .NET Framework version used for Windows Connector Service.

3.6.36 API changes in Delphix 6.0.4.0

In Delphix 6.0.4.0, the new API version is 1.11.4. This section describes all API changes since API version 1.11.3, which was released with Delphix 6.0.3.0. All URL paths are relative to `/resources/json/delphix`.

3.6.36.1 What's changed

API object	Path	Type	Name	Change
OracleDBConfigConnectivity	N/A (value object)	object property	password	Name changed to credentials Type changed to Credential
OracleBaseAttachData	N/A (value object)	object property	oracleFallbackCredentials	Type changed to Credential

API object	Path	Type	Name	Change
OracleBaseDBConfig	/sourceconfig	object property	credentials	Type changed to Credential
OracleBaseLinkData	N/A (value object)	object property	oracleFallbackCredentials	Type changed to Credential
OracleDatabaseContainer	/database	object property	tdeProvisioningEnabled	Deleted
OracleManagedSource	/source	object property	mountBase	Format is now unixrestrictedpath
OracleVirtualPdbSource	/source	object property	parentTdeKeyStorePath	Format is now unixrestrictedpath
UnixRuntimeMountInformation	N/A (value object)	object property	nfsVersionReason	Added enum value INCOMPLETE_V4_CONFIG
X500DistinguishedNameComposite	N/A (value object)	object property	dname	Minimum length is now 1

3.6.36.2 What's new

API object	Path	Type	Name	Description
X509Certificate	/service/certificate	new API	X509Certificate	X509 Certificate.

3.6.37 API changes in Delphix 6.0.3.0

In Delphix 6.0.3.0, the new API version is 1.11.3. This section describes all API changes since API version 1.11.2, which was released with Delphix 6.0.2.0. All URL paths are relative to `/resources/json/delphix`.

3.6.37.1 What's changed

API object	Path	Type	Name	Change
ApplyVersionParameters	N/A (value object)	object property	verify	Default changed from true to false.
OracleBaseAttachData	N/A (value object)	object property	dbUser dbCredentials	Name changed to oracleFallbackUser. The database user. Optional if bequeath connections are enabled (to be used in case of bequeath connection failures). Name changed to oracleFallbackCredentials . The password for the database user. Optional if bequeath connections are enabled (to be used in case of bequeath connection failures).
OracleBaseLinkData	N/A (value object)	object property	dbUser dbCredentials	Name changed to oracleFallbackUser. The database user. Optional if bequeath connections are enabled (to be used in case of bequeath connection failures). Name changed to oracleFallbackCredentials . The password for the database user. Optional if bequeath connections are enabled (to be used in case of bequeath connection failures).
Plugin	/toolkit	object property	status	Deleted

3.6.37.2 What's new

API object	Path	Type	Name	Description
AbstractToolkit	/toolkit	object property	status	The status of the toolkit. ACTIVE indicates toolkit is actively referenced and in use. INACTIVE means toolkit needs to go through a manual upgrade operation before it can be used.
Certificate	/service/tls/caCertificate /service/tls/endDateCertificate	object property	isCertificateAuthority	Whether this certificate is a Certificate Authority (CA).
ConfiguredStorageDevice	/storage/device	object property	fragmentation	Percent fragmentation for this device.
CyberArkVaultCredential	N/A (value object)	subclass of Credential	CyberArkVaultCredential	CyberArk vault based security credential.
DNSConfig	/service/dns	object property	source	The source of the DNS configuration (STATIC or DHCP).
HashiCorpVaultCredential	N/A (value object)	subclass of Credential	HashiCorpVaultCredential	HashiCorp vault based security credential.
LicenseInfo	/license	object	LicenseInfo	Retrieve all external licenses.
NetworkDSPTestParameters	N/A (value object)	object property	xportScheduler	The transport scheduler to use.

API object	Path	Type	Name	Description
OracleInstall	/ repository	object property	oracleBaseConfig oracleBaseHome	The Oracle Base Config directory. The Oracle Base Home directory.
OracleVirtualPdbSource	/source	object property	parentTdeKeystorePath	Path to a copy of the parent's Oracle transparent data encryption keystore on the target host. Required to provision from snapshots containing encrypted database files.
PasswordVault	/service/ password Vault	new API	PasswordVault	Password vault configuration.
Plugin	/toolkit	object property	luaName minimumLuaVersion	The name of the LUA toolkit that this plugin can upgrade. The minimum version (in major.minor format) of a LUA toolkit that this plugin can upgrade.
RunDefaultPowerShellOnSourceOperation	N/A (value object)	subclass of SourceOperation	RunDefaultPowerShellOnSourceOperation	A user-specifiable operation that runs a PowerShell command (using default version) on the target host.

API object	Path	Type	Name	Description
SnapshotCapacityData	/capacity/ snapshot	object property list parameter	namespace snapshotTimez one snapshotLatest Change namespace	Reference to the namespace to which this snapshot belongs. Time zone of the source database at the time the snapshot was taken. The timestamp of the latestChangePoint of the associated snapshot. The namespace to list snapshot data for. If null, will limit returned snapshots to the default namespace.
StatisticSlice	/analytics	getData parameter	count	The number of data points to return. Engine metadata points will be combined in order to meet this requirement. When count is specified at least two of the other getData parameters must be specified.
SystemInfo	/system	object property	poolFragmenta tion	Percent fragmentation for the domain0 pool.

3.7 Support matrices

This section covers the following topics:

- [Kerberos support matrix](#) (see page 516)
- [Data source certifications](#) (see page 522)
- [Select connectors matrix](#) (see page 526)

You can find all other dataset support matrices under the **Support and Requirements** sections of that particular datasets.

3.7.1 Kerberos support matrix

■ Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

Key:

Color	Supported?
Y	Yes
N	No
NA	Not Applicable

3.7.1.1 Oracle - Red Hat Enterprise Linux (RHEL)

Supported OS Version	Supported DBMS Version					
	Oracle 11gR2	Oracle 12cR1	Oracle 12cR2	Oracle 18c	Oracle 19c	Oracle 21c

AIX 7.1	Y	Y	Y
AIX 7.2	Y	Y	Y

3.7.2 Data source certifications

3.7.2.1 Legal notice

IMPORTANT: The policies outlined in this document are subject to change. The policies and timelines are provided as rough estimates when certifications of interoperability/connectivity with third-party products may be completed and are subject to whether such interoperability/connectivity is part of the Delphix product roadmap and support policy and should not be regarded as a commitment.

Speak with Delphix Product Management if you need more specific information or are unsure of these policies.

3.7.2.2 Goals

The goal of this certification cadence is to maintain a cadence for certifications of new software releases.

The objectives are:

1. To set reasonable expectations for our organization and customers regarding how and when we will address certifications
2. To define an intended timeframe for certification of new data sources versions and operating systems versions to maintain an up-to-date support matrix

3.7.2.2.1 Certification expectations:

Please note that certification only covers previously supported functionality of the Delphix Engine. Any new features and functionality introduced in the database or operating system (DB/OS) will be tracked through the regular release planning and roadmap process and considered as features/functionality/fixes.

Specifically, the following paths exist with varying delivery timeline commitments, in the following priority order:

1. [Security Response Policy](#)⁹⁵: In case security issues are discovered in a certain DB and/or OS version, we will follow our security response policy, which supersedes the goals described in this document.
2. Certifications: As described in the document.
3. Roadmap Features: No policies outlined. This follows the regular roadmap planning process.

3.7.2.3 Data sources

This documentation currently applies only to the following data source integrations:

- Oracle
- SQL Server
- SAP ASE

⁹⁵ https://support.delphix.com/Support_Policies/KBA1504_Delphix_Support_Policies

3.7.2.4 Cadence for data source database version changes

Release type	Certification details	Goal
A new version of a database with all currently supported operating systems	Certification with all supported operating systems	8 months from new version GA date

3.7.2.5 Cadence for operating system version changes

Release type	Certification details	Goal
A new major operating system version with all currently supported databases	Certification with all supported versions of the database	6 months from new version GA date
A new update* operating system version with all currently supported databases	Certification with all supported versions of the database	4 months from new version GA date

*Terminology for an 'update' version varies across operating systems. See the Appendix for more information.

3.7.2.6 Appendix

3.7.2.6.1 Product lifecycle of Oracle related DB/OS vendors:

Software	Product lifecycle	Notes
Oracle Database	Link ⁹⁶	12.1 is Oracle Enterprise Edition (EE) ⁹⁷
Red Hat Enterprise Linux	Link ⁹⁸	

⁹⁶ <http://www.oracle.com/us/support/library/lifetime-support-technology-069183.pdf>

⁹⁷ <https://docs.oracle.com/database/121/DBLIC/editions.htm#DBLIC116>

⁹⁸ <https://access.redhat.com/support/policy/updates/errata>

Software	Product lifecycle	Notes
Solaris (x86 and SPARC)	Link⁹⁹	
SuSE Linux (SLES)	Link¹⁰⁰	
IBM AIX	Link¹⁰¹	
HP-UX	Link¹⁰²	

3.7.2.6.2 Product lifecycle of SQL server related DB/OS vendors:

Software	Product Lifecycle

SuSE Linux (SLES)	Link ¹⁰⁸
IBM AIX	Link ¹⁰⁹

3.7.2.6.4 Footnote 1: Update version terminology

Operating System releases typically include updated versions, the terminology for which varies depending on the vendor. Below are the various operating systems which we support, as well as the terminology for updates to use with the document above.

Vendor	Update version terminology	Definition
Red Hat Enterprise Linux	Update version	Installed on top of major releases to provide larger-scale point-release updates via Red Hat Network, after initial installation via traditional methods (PXE, DVD, etc.).
Solaris (x86 and SPARC)	Update release	Update release number. The update release number for this Oracle Solaris release. The update value is 0 for the first customer shipment of an Oracle Solaris release, 1 for the first update of that release, 2 for the second update of that release, and so forth.
SuSE Linux (SLES)	Service Pack (SP) release	Service Packs are minor updates and enhancements, usually with security fixes, that are applied to the major version of the OS.
IBM AIX	Service Pack (SP) release	A Technology Level (TL) gives new features, while an SP contains fixes for problems that are critical and can't wait until the next TL. Service Packs are limited to minimal corrections that don't change the way things work or add any new functionality.

¹⁰⁸ <https://www.suse.com/lifecycle/>

¹⁰⁹ <http://www-01.ibm.com/support/docview.wss?uid=isg3T1012517>

Vendor	Update version terminology	Definition
HP-UX	Patch release	Patch sets are groups of patches that should be installed to support common HPE products and sub-systems.
Windows	New Release (R) version or Service Pack (SP) release	A service pack (SP) is a collection of updates and fixes, called patches, for an operating system or a software program. Many of these patches are often released before a larger service pack, but the service pack allows for an easy, single installation.

3.7.3 Select connectors matrix

Color	Supported?
Y	Yes
N	No
NA	Not Applicable

3.7.3.1 Couchbase

3.7.3.1.1 Data source version and OS version

	RHEL 6.x	RHEL 7.0	RHEL 8.0	Windows
Couchbase 6.0.x	Y	Y	Y	N
Couchbase 6.5.x	Y	Y	Y	N
Couchbase 6.6.x	Y	Y	Y	N
Couchbase 7.1.x	Y	Y	Y	N

3.7.3.1.2 Database/Plugin support matrix

	Plugin version 1.2.1	Plugin version 1.2.2	Plugin version 1.3.0
Couchbase 6.0.x	Y	Y	Y
Couchbase 6.5.x	Y	Y	Y
Couchbase 6.6.x	Y	Y	Y
Couchbase 7.1.x	N	Y	Y

3.7.3.1.3 Couchbase Edition Compatibility Matrix

	Community Edition XDCR only	Enterprise Edition
Couchbase 6.0.x	Y	Y
Couchbase 6.5.x	Y	Y
Couchbase 6.6.x	Y	Y
Couchbase 7.1.x	Y	Y

3.7.3.1.4 Size in TB / sizing

- No known restrictions.
- Memory, Network, IOPS metrics from Couchbase GUI

3.7.3.1.5 Frequency of refreshes

No specific limitations

3.7.3.1.6 Source backup policy

- Supports backups using Couchbase Backup Manager (cbbkpmgr)
- Supports Couchbase XDCR technology

3.7.3.1.7 Use case (PIT Provisioning, Dev/Test)

- Does not support Point-in-Time Provisioning.
- Not appropriate for high throughput performance requirement.

3.7.3.1.8 Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

- V2P is not supported.

3.7.3.1.9 Timestamp on snapshot metadata

This plugin ingests Backups at any time, so the time flow may not go in linear order. Time of Backup is not readily available.

3.7.3.2 Architecture options

- Only 1 VDB per host is supported (couchbase restriction of 1 instance per Node)
- Dedicated 1 Staging host is needed for each dSource created using XDCR technology

3.7.3.2.1 Authentication type (LDAP, Kerberos,)

- Kerberos is not supported.
- LDAP not tested.

3.7.3.2.2 Ingestion type (Backup, Dump, Replication, Snapshot)

- Couchbase Backup Manager (cbbkpmgr)
- XDCR

3.7.3.2.3 Link to documentation

<https://delphix.github.io/couchbase-plugin>

3.7.3.3 Mongo

3.7.3.3.1 Data Source version and OS version

Supported Mongo Version	mongoDB 4.2.x	mongoDB 4.4.x	mongoDB 5.0.x	mongoDB 6.0.x
RHEL 6.x	Y	Y	Y	Y
RHEL 7.x	Y	Y	Y	Y
RHEL 8.x	Y	Y	Y	Y
CentOS 6.x	Y	Y	Y	Y
CentOS 7.x	Y	Y	Y	Y
CentOS 8.x	Y	Y	Y	Y
Windows	N	N	N	N

3.7.3.3.2 Engine Compatibility Matrix

MongoDB Version	Mongopy 1.0.0	Mongopy 1.0.1	Mongopy 1.0.2	Mongopy 1.1.0	Mongopy 1.2.0	Mongopy 1.2.1	Mongopy 1.3.0
6.0.7.x-6.0.11.x	Y	Y	N	N	N	N	N
6.0.12.x-6.0.15.x	Y	Y	Y	Y	N	N	N
7.x-18.x	N	N	N	N	Y	Y	Y

3.7.3.3.3 Mongo/Plugin Version Compatibility Matrix

MongoDB Version	Mongopy 1.0.0	Mongopy 1.0.1	Mongopy 1.0.2	Mongopy 1.1.0	Mongopy 1.2.0	Mongopy 1.2.1	Mongopy 1.3.0
4.x-5.x	Y	Y	Y	Y	Y	Y	Y
6.x	N	N	N	N	Y	Y	Y

3.7.3.3.4 Size in TB / sizing

- Not tested with large datasets.
- Memory, Network, IOPS metrics from Mongo OPS Manager

3.7.3.3.5 Frequency of refreshes

No specific limitations

3.7.3.3.6 Source backup policy

- Sharded Mongo always ingest full. Non-Sharded mongo ingestion may be full or incremental based on the mechanism used for ingestion.
- Sharded : Full
- Non-Sharded (Using Backups) - Full
- Non-sharded (Using replicaset member) - incremental
- Mongodump - Full or incremental based on type of source and type of ingestion

3.7.3.3.7 Use case (PIT Provisioning, Dev/Test)

- Does not support Point-in-Time Provisioning.
- Not appropriate for high throughput performance requirement.

3.7.3.3.8 Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

- V2P is not supported.

3.7.3.3.9 Timestamp on snapshot metadata

This plugin ingests Backups at any time, so the time flow may not go in linear order. Time of Backup is not readily available.

3.7.3.4 Architecture options

3.7.3.4.1 Sharding

Supported

	Unsharded VDB	Sharded VDB
Unsharded Source >= 3.6	Y	N
Sharded Source >= 4.2	N	Y

Example: Sharded sources are supported, but require backup vendor MongoOPS Manager to create backup.

3.7.3.4.2 Authentication type (LDAP, Kerberos,)

- LDAP and SCRAM supported
- Kerberos not supported

3.7.3.4.3 Ingestion type (Backup, Dump, Replication, Snapshot)

- MongoOPS Manager Backup Files
- Mongodump
- Replicaset

3.7.3.4.4 Encryption (At Rest, TLS/SSL, Encrypted backups)

Supported

3.7.3.4.5 Link to documentation

<https://delphix.github.io/mongo-plugin/>

3.7.3.5 Microsoft SQL backup ingestion

3.7.3.5.1 Data source version and OS version

	Windows 2012	Windows 2012 R2	Windows 2016	Windows 2019	Windows 2022
SQLServer 2012	Y	Y	Y	N	N
SQLServer 2014	Y	Y	Y	N	N
SQLServer 2016	Y	Y	Y	Y	N
SQLServer 2017	Y	Y	Y	Y	Y
SQLServer 2019	N	N	Y	Y	Y
SQLServer 2022	N	N	Y	Y	Y

3.7.3.5.2 Size in TB / sizing

No sizing limitation

3.7.3.5.3 Frequency of refreshes

No limitation

3.7.3.5.4 Source backup policy

dSource sync is managed by customers and can apply backup on staging whenever required.

3.7.3.5.5 Use case (PIT provisioning, Dev/Test)

Does not support Point-in-Time Provisioning.

3.7.3.5.6 Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

V2P is not supported

3.7.3.5.7 Timestamp on snapshot metadata (Affects other products too (HANA, but not Oracle/SQLServer))

This plugin ingests Backups at any time, so the time flow may not go in linear order.

3.7.3.6 Architecture options

3.7.3.6.1 Failover clusters and availability groups

- Does not support Windows Failover Clusters or Availability Groups for Windows Staging and Target environments.
- Authentication Type (LDAP, Kerberos,)

Ex: LDAP and Kerberos are not supported at this time, but please contact Ranzo Taylor if you have a customer who requires this.

3.7.3.6.2 Ingestion type (Backup, Dump, Replication, Snapshot)

Full backups, Differential backups, Log Shipping, Transaction replication

3.7.3.6.3 Backup vendor (Commvault, Native, Replication)

All backup vendors are supported

3.7.3.6.4 Encryption (At Rest, TLS/SSL, Encrypted Backups)

- Encryption at Rest should work, but has not been tested.
- Encrypted Backups should work, and has not been tested.

3.7.3.6.5 Link to documentation

https://delphix.github.io/mssql_plugin_doc

3.7.3.7 Oracle backup ingestion

3.7.3.7.1 Data source version and OS version

	RHEL 6.x	RHEL 7.0	Windows
Oracle 9i/10g/11r1	N	N	N
Oracle >= 11gR2	Y	Y	N

3.7.3.7.2 Size in TB / sizing

No Restrictions.

3.7.3.7.3 Frequency of refreshes

No specific limitations

3.7.3.7.4 Source backup policy

No limitations for disk.

For Tape Backup - Autobackup should be enabled.

3.7.3.7.5 Use case (PIT Provisioning, Dev/Test)

- Disk - Archivelog need to be made available on target host for Point-in-Time Provisioning.
- Tape - Tape library installed on target and authorized to access tape from target host.
- Support using timestamp.

3.7.3.7.6 Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

- V2P is not supported.

3.7.3.7.7 Timestamp on snapshot metadata

This plugin ingests Backups at any time, so the time flow may not go in linear order. Time of Backup is not readily available.

3.7.3.8 Architecture Options

Full	Y	Y	Y	Y	Y	NA
Partial	Y	Y	Y	Y	Y	NA
PDB	Y	Y	Y	Y	Y	N
Partial PDB	Y	Y	Y	Y	Y	N
Use Existing CDB	NA	NA	NA	N	NA	N
Seed	NA	NA	NA	NA	N	NA

3.7.3.8.1 RAC

Manual Addition, Selection of nodes and Checks needed to create successful RAC VDBs.

3.7.3.8.2 Ingestion type (Backup, Dump, Replication, Snapshot)

- RMAN database backup

3.7.3.8.3 Backup vendor (Oracle RMAN, ZDLRA, DDBOOST, NETBACKUP, Generic Tape Drivers)

- Oracle RMAN
- ZDLRA
- DDBOOST
- NETBACKUP
- Other Tape Vendors not listed above not tested but most probably will work

3.7.3.8.4 Link to documentation

<https://delphix.github.io/obi-plugin/>

3.7.3.9 SAPIQ

3.7.3.9.1 Data source version and OS version

Supported OS Version	SAPIQ 16.0	SAPIQ 16.1
RHEL 7.0	Y	Y
RHEL 7.4	Y	Y
RHEL 7.9	Y	Y
Windows x.x	N	N

3.7.3.9.2 Size in TB / sizing

Tested at the customer with 600-800GB ingestion size.

3.7.3.9.3 Frequency of refreshes

No limitation

3.7.3.9.4 Source backup policy

Customers will manage backup located on the staging host required to create dSource.

3.7.3.9.5 Use case (PIT Provisioning, Dev/Test)

Does not support Point-in-Time Provisioning.

3.7.3.9.6 Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

- V2P is not supported.
- Password Vault is not supported.
- SDD is not supported.

3.7.3.9.7 Timestamp on snapshot metadata

This plugin ingests backups at any time, so the time flow may not go in linear order. Time of Backup is not readily available.

3.7.3.10 Architecture options

Supports SAPIQ Simplex Architecture for VDBs.

Architecture	SAPIQ 16.0	SAPIQ 16.1
Simplex	Y	Y
Multiplex	N	N

- IQ Plugin converts multiplex architecture to simplex during VDB provision.
- Ingest SAPIQ source databases which are backed up using SAPIQ built-in backup mechanism.
- Data Ingestion to Delphix Engine will always start with a full DB backup.
- As best practices, it is recommended to keep a similar SAPIQ version in all environments (source, staging and target).

3.7.3.10.1 Authentication type (LDAP, Kerberos)KE

- Kerberos not supported.
- LDAP not tested.

3.7.3.10.2 Ingestion type (Backup, Dump, Replication, Snapshot)

Full backups for Simplex Architecture Tested.

3.7.3.10.3 Backup Vendor

Tested with manual SAPIQ backups.

3.7.3.10.4 Encryption (At Rest, TLS/SSL, Encrypted Backups)

- Encryption at Rest has not been tested.
- Encrypted Backups have not been tested.

3.7.3.10.5 Link to documentation

<https://delphix.github.io/SAPIQ/>

3.7.3.11 Cockroach

3.7.3.11.1 Data source version and OS version

Supported OS Version	CRDB v21.1.x	CRDB v21.2.x	CRDB v22.1.x	CRDB v22.2.x
RHEL 7.x	Y	Y	Y	Y
RHEL 8.x	Y	Y	Y	Y
Windows	N	N	N	N

3.7.3.11.2 Architecture options

Architecture	Disk	Seed	AWS	GCP	Azure
Full	Y	Y	Y	N	N
Incremental	Y	Y	Y	N	N

3.7.3.11.3 Engine compatibility matrix

Engine Version	CRDB v1.0.0	CRDB v1.1.0	CRDB v1.1.1	CRDB v1.1.2
6.0.12.0 - 6.0.17.x	Y	Y	Y	Y
7.0.0.0 - 13.0.0.0	Y	Y	Y	Y

3.7.3.11.4 PostgreSQL JDBC driver matrix

PostgreSQL Driver Version	Supported
42.3.2	Y
42.3.6	Y
42.4.0	Y

3.7.3.11.5 JDBC masking support matrix

Masking Mode	Feature	Availability
In-Place Masking	Multi-Tenant	Available
	Streams/Threads	Available
	Batch Update	Available
	Drop Indexes	Unavailable
	Disable Constraint	Unavailable
	Disable Trigger	Unavailable NA for CockroachDB ¹¹⁰
	Identity Column Support	Available
On-The-Fly Masking		Unavailable
Profiling	Multi-Tenant	Available
	Streams	Available

¹¹⁰ <https://www.cockroachlabs.com/docs/stable/sql-feature-support.html>

- Drop Indexes and Disable Constraint are not supported natively while masking CockroachDB. Use pre/post scripts if you want to use these features.
- CockroachDB supports rowid natively for tables with no primary key defined. It will automatically create a primary key over a hidden, INT-typed column named rowid.
- To create a successful JDBC connection to CockroachDB cluster running in secure mode, please enable the password authentication without TLS using flag `--accept-sql-without-tls` with `cockroach start` command.
- To mask the CockroachDB data source where CDC (change data capture) feature is enabled, disable all the running change-feed jobs using the below command. CockroachDB supports rowid natively for tables with no primary key defined. It will automatically create a primary key over a hidden, INT-typed column named rowid.

- ```
SHOW CHANGEFEED JOBS; PAUSE JOBS (WITH x AS (SHOW CHANGEFEED JOBS) SELECT * FROM x WHERE status = ('running'));
```

Resume CDC job once CockroachDB masking is completed.

- ```
RESUME JOBS (WITH x AS (SHOW CHANGEFEED JOBS) SELECT * FROM x WHERE status = ('paused'));
```

3.7.3.11.6 Ingestion type

- AWS S3 Backup Ingestion
- Seed Ingestion

3.7.3.11.7 Limitations

- CockroachDB Ingestion from Azure, GCP, and Disk is not supported.
- CockroachDB Point-in-time restore is not supported.
- Delphix V2P is not supported.
- Delphix Password Vault is not supported.

3.7.3.11.8 Link to documentation

<https://delphix.github.io/crdb/>

3.7.3.12 Cassandra

3.7.3.12.1 Delphix engine compatibility

Engine Version	Cassandra v1.0.0	Cassandra v1.1.0	Cassandra v1.1.1	Cassandra v1.2.0
6.0.16.0 - 22.x	Y	Y	Y	Y

3.7.3.12.2 Supported Database / OS

Supported DBMS Version	DataStax Cassandra v5.1.16	DataStax Cassandra v6.8.9 - v6.8.33	Apache Cassandra v4.0.7 - v4.1.1
RHEL 7.4	Y	Y	Y
RHEL 7.9	Y	Y	Y
RHEL 8.0	Y	Y	Y
Windows	N	N	N

3.7.3.12.3 Supported Ingestion

Cassandra Distribution	Staging Push	Disk	AWS
DataStax Enterprise	Y	N	N
Open-Source Apache	Y	N	N

3.7.3.12.4 Link to documentation

<https://delphix.github.io/cassandra/>

3.8 Upgrade matrix

This section lists all the Delphix Engine versions that a user can upgrade to the required or the latest version.

- **Upgrades from versions older than 5.3.0:** Self-service upgrades to version 6.0.x.x are not supported for Delphix Engines running version 5.3.0 or older.
- **Upgrades from versions 5.3.6.0 to 5.3.9.0:** These versions can be upgraded to version 6.0.6.1. Following this, further upgrades to newer versions are possible.
- **Delphix upgrade policy for version 6.0.10.0 and Later:** Starting with version 6.0.10.0, direct upgrades are only supported for versions released within the last 12 months.
- **Direct upgrades to version 6.0.10.1:**
 - Versions 6.0.4.1 and above can directly upgrade to version 6.0.10.1.
 - Versions 6.0.0.0 to 6.0.4.0 can be upgraded to 6.0.7.0 first, and then to 6.0.10.1.

Version	Date Released	Can Upgrade To	VDB Downtime Required
> 5.3.5.0	Aug 8th, 2019	Contact Support	Yes
5.3.6.0	Oct 10th, 2019	6.0.0.0 - 6.0.6.1	Yes
5.3.7.0	Dec 9th, 2019	6.0.1.0 - 6.0.6.1	Yes
5.3.7.1	Jan 13th, 2020	6.0.1.0 - 6.0.6.1	Yes
5.3.8.0	Feb 10th, 2020	6.0.1.0 - 6.0.6.1	Yes
5.3.8.1	Feb 26th, 2020	6.0.1.0 - 6.0.6.1	Yes
5.3.9.0	Apr 14th, 2020	6.0.2.0 - 6.0.6.1	Yes
6.0.0.*	Jan 22nd, 2020	6.0.0.* - 6.0.7.*	Optional
6.0.1.*	Mar 19th, 2020	6.0.1.* - 6.0.7.*	Optional
6.0.2.*	May 7th, 2020	6.0.2.* - 6.0.7.*	Optional

Version	Date Released	Can Upgrade To	VDB Downtime Required
6.0.3.*	Jul 31st, 2020	6.0.3.* - 6.0.7.*	Optional
6.0.4.*	Sep 10th, 2020	6.0.4.* - 6.0.7.*	Optional
6.0.5.*	Nov 5th, 2020	6.0.5.* - 6.0.11.*	Optional
6.0.6.*	Jan 21st, 2021	6.0.6.* - 6.0.12.*	Optional
6.0.7.*	Mar 15th, 2021	6.0.7.* - 6.0.13.*	Optional
6.0.8.*	May 13th, 2021	6.0.8.* - 6.0.14.*	Optional
6.0.9.*	Jul 13th, 2021	6.0.9.* - 6.0.15.*	Optional
6.0.10.*	Sep 9th, 2021	6.0.10.* - 6.0.16.*	Optional
6.0.11.*	Nov 11th, 2021	6.0.11.* - 6.0.17.*	Optional
6.0.12.*	Jan 14th, 2022	6.0.12.* - 7.0.0.*	Optional
6.0.13.*	Mar 10th, 2022	6.0.13.* - 9.0.0.*	Optional
6.0.14.*	May 20th, 2022	6.0.14.* - 11.0.0.*	Optional
6.0.15.*	Jul 7th, 2022	6.0.15.* - 13.0.0.*	Optional
6.0.16.*	Sep 8th, 2022	6.0.16.* - 15.0.0.*	Optional
6.0.17.*	Nov 15th, 2022	6.0.17.* - 17.0.0.*	Optional
7.0.0.*	Jan 12th, 2023	7.0.0.* - 19.0.0.*	Optional
8.0.0.*	Feb 13th, 2023	8.0.0.* - 20.0.0.*	Optional
9.0.0.*	Mar 13th, 2023	9.0.0.* - 21.0.0.*	Optional

Version	Date Released	Can Upgrade To	VDB Downtime Required
10.0.0.*	Apr 13th, 2023	10.0.0.* - 22.0.0.*	Optional
11.0.0.*	May 24th, 2023	11.0.0.* - 23.0.0.*	Optional
12.0.0.*	Jun 21st, 2023	12.0.0.* - 24.0.0.*	Optional

15.0.0.*	Sep 20th, 2023	15.0.0.* - 27.0.0.*	Optional
16.0.0.*	Oct 18th, 2023	16.0.0.* - 28.0.0.*	Optional
17.0.0.*	Nov 21st, 2023	17.0.0.* - 28.0.0.*	Optional
18.0.0.*	Dec 20th, 2023	18.0.0.* - 28.0.0.*	Optional
19.0.0.*	Jan 24th, 2024	19.0.0.* - 28.0.0.*	Optional
20.0.0.*	Feb 21st, 2024	20.0.0.* - 28.0.0.*	Optional
21.0.0.*	Mar 20th, 2024	21.0.0.* - 28.0.0.*	Optional
22.0.0.*	Apr 17th, 2024	22.0.0.* - 28.0.0.*	Optional
23.0.0.*	May 22nd, 2024	23.0.0.* - 28.0.0.*	Optional
24.0.0.*	Jun 20th, 2024	24.0.0.* - 28.0.0.*	Optional
25.0.0.*	Jul 24th, 2024	25.0.0.* - 28.0.0.*	Optional
26.0.0.*	Aug 21st, 2024	26.0.0.* - 28.0.0.*	Optional
27.0.0.*	Sep 18th, 2024	27.0.0.* - 28.0.0.*	Optional

Version	Date Released	Can Upgrade To	VDB Downtime Required
28.0.0.*	Oct 23rd, 2024	28.0.0.*	N/A

The * in the above table represents patch releases. When upgrading from X.Y.Z.x to X.Y.Z.x, the target version must be greater than the source version. Please refer to the [How to Upgrade \(see page 942\)](#) article for steps, or check with Delphix Support to perform the upgrade.

1. VDB Downtime is caused by a reboot of the Delphix Engine when DelphixOS is modified by an upgrade.
2. VDB Downtime may be optional for an upgrade when a release contains DelphixOS changes that are also optional.

3.9 Tested browser and operating systems

This topic describes the Web browsers and operating systems that have been tested for use with the Delphix Management application.

The following table lists the supported browsers and operating systems.

OS	Browsers
Windows 11	Microsoft Edge, Firefox, Chrome
Windows 10	Microsoft Edge, Firefox, Chrome
Windows 8.1	Microsoft Edge, Firefox, Chrome
Windows 7	Microsoft Edge, Firefox, Chrome
Mac OS X	Microsoft Edge, Firefox, Chrome

Delphix supports the latest version of Microsoft Edge, Firefox, and Chrome as well as the immediate prior version.

3.10 Deprecated and end-of-life features

3.10.1 Release 26.0.0.0

3.10.1.1 Deprecated features

- **Oracle LiveSource**

We are announcing deprecation of the Oracle LiveSource feature, in favor of the already available Staging Push with Active Dataguard. The deprecation timeline is 6 months, and the feature End of Life is currently planned for January 2025.

3.10.1.2 End-of-life features

Support for the following OS versions have reached EOL in this release:

- **RHEL 4.x and 5.x**
- **AIX 5.x and 6.x**

3.10.2 Release 23.0.0.0

3.10.2.1 Deprecated features

Support for the following OS versions have been deprecated in this release:

- **RHEL 4.x and 5.x**
- **AIX 5.x and 6.x**

3.10.3 Release 21.0.0.0

3.10.3.1 Deprecated features

- **Delphix Self-Service**

Has been deprecated and will reach its end of life in September 2025. Visit the [community blog](https://community.delphix.com/blogs/nicholas-mathison/2024/02/08/delphix-end-of-support-for-delphix-self-service)¹¹¹ for more information and guidance on transitioning to Data Control Tower's improved developer experience.

¹¹¹ <https://community.delphix.com/blogs/nicholas-mathison/2024/02/08/delphix-end-of-support-for-delphix-self-service>

3.10.4 Release 17.0.0.0

3.10.4.1 End-of-life feature

Support for the following ESXi versions has reached EOL in this release:

- **ESXi 6.5 and 6.7**

3.10.5 Release 11.0.0.0

3.10.5.1 End-of-life feature

Support for the following ESXi version has reached EOL in this release:

- **ESXi 6.0**

3.10.6 Release 10.0.0.0

3.10.6.1 Deprecated features

Support for the following ESXi versions have been deprecated in this release:

- **ESXi 6.5 and 6.7**

VMware's end of technical guidance for ESXi 6.5 and 6.7 is on 11/15/2023. To align our support, Delphix will end support of ESXi 6.5 and 6.7 in version 17.0.0.0 (November 2023 release).

3.10.7 Release 9.0.0.0

3.10.7.1 Deprecated features

- **Oracle** `move-to-asm.sh`

The `move-to-asm.sh` scripted procedure has been deprecated in favor of the new feature **export an Oracle virtual DB or virtual PDB to a physical Oracle ASM or Exadata database**. For more details on this new feature, refer to the Export an Oracle VDB or vPDB to a Physical ASM or Exadata Database ([see page 1700](#))_section. The `move-to-asm.sh` scripted procedure is still supported in 9.0.0.0, but is discouraged by Delphix and will be eventually removed in future versions of the Delphix Continuous Data Engine.

3.10.8 Release 6.0.17.0

3.10.8.1 End-of-life features

Support for the following database version has reached EOL in this release:

- **Oracle 11.1**

Details of the Oracle database EOL can be found in the [Oracle Lifetime Support Policy](#)¹¹² PDF.

3.10.8.2 Deprecated features

Support for the following ESXi versions have been deprecated in this release:

- **ESXi 6.0**

3.10.9 Release 6.0.12.0

3.10.9.1 End-of-life features

- **Internet Explorer 11 support**

Internet Explorer 11 is no longer supported by Delphix. The users are requested to refer to the list of [supported browsers](#) (see page 545).

Support for the following OS versions has reached EOL in this release:

- **EBS 12.1**

Starting 6.0.12.0 and beyond, EBS 12.1 is no longer supported by Delphix. The users are requested to [upgrade](#) (see page 1752) to EBS 12.2 and start using this plugin.

- **SAP HANA 1.0**

Starting 6.0.12.0 and beyond, SAP HANA 1.0 is no longer supported by Delphix. The users are requested to [upgrade](#) (see page 2041) to HANA 2.0 and start using this plugin.

3.10.10 Release 6.0.11.0

3.10.10.1 Deprecated features

Support for the following OS versions have been deprecated in this release:

- **Oracle 11.1**

Details of the Oracle database EOL can be found in the [Oracle Lifetime Support Policy](#)¹¹³ PDF.

¹¹² <https://www.oracle.com/us/assets/lifetime-support-technology-069183.pdf>

¹¹³ <https://www.oracle.com/us/assets/lifetime-support-technology-069183.pdf>

- **TLS 1.0 and 1.1**

These versions of TLS are known to be vulnerable, enterprise use is heavily discouraged.

3.10.10.2 End-of-life features

Support for the following OS versions has reached EOL in this release:

- **Oracle 10g**
- **TLS 1.0 and 1.1**

These versions of TLS are known to be vulnerable, enterprise use is heavily discouraged.

3.10.11 Release 6.0.10.0

3.10.11.1 End-of-life features

- **EBS12.1**

EBS 12.1 remains deprecated with a planned EOL (and removal from the product) in December 2021. This is in line with Oracle's planned EOL for EBS 12.1 later this year. The users are encouraged to [upgrade \(see page 1752\)](#) to Delphix's EBS 12.2.

- **Masking ruleset edit options**

The Table Suffix, Add Column, Join Table, and List options were deprecated in the 6.0.3.0 release. These options have reached the EOL in the 6.0.10.0 release and have been completely removed from the product.

- **Internet Explorer 11 support**

Internet Explorer 11 is planned for EOL in December 2021. This is in line with Microsoft's planned EOL for Internet Explorer 11 later this year.

3.10.12 Release 6.0.9.0

3.10.12.1 End-of-life features

- Delphix Reporting (Formerly, *Mission Control*) is EOL starting 6.0.9.0 (July 1st, 2021). The users interested in continuing their reporting workflows are recommended to discuss Data Control Tower with their account teams.
- Also, EBS 12.1 remains deprecated with a planned EOL (and removal from the product) in December 2021. This is in line with Oracle's planned EOL for EBS 12.1 later this year. The users are encouraged to [upgrade](#)¹¹⁴ to Delphix's EBS 12.2.

¹¹⁴ <https://cd.delphix.com/docs/latest/oracle-ebs-installation-and-upgrade>

3.10.13 Release 6.0.8.0

3.10.13.1 End-of-life features

Support for the following OS versions has reached EOL in this release:

- SAP ASE 15.0.3
- Windows Server 2008 R2
- SQL Server 2008
- SQL Server 2008 R2

3.10.14 Release 6.0.7.0

3.10.14.1 End-of-life features

- ESX 5.5 support will be end-of-life in 6.0.7
- Masking Connectors: Db2 LUW and zOS v9, Db2 LUW and zOS v10, SQL Server 2005, 2008, 2008 R2

3.10.15 Release 6.0.5.0

The following list of OS and DB versions are now past their respective support windows. Delphix will deprecate these versions to stay in line with Microsoft, Oracle, and SAP lifecycle policies:

- Windows 2008 R2: Microsoft End of Extended Support (EoES) January 4th, 2020
- SQL Server 2008/2008 R2: Microsoft End of Extended Support (EoES) July 9th, 2019
- Oracle 10: Oracle End of Extended Support (EoES) July 2013
- SAP ASE 15.0.3: SAP End-of-Life (EoL) March 31st, 2015

3.10.16 Release 6.0.4.0

3.10.16.1 End-of-life features

- **Masking:**
 - Job Scheduler - As of this release, Delphix has removed the Job Scheduler feature. The introduction of Masking's REST API several releases ago allowed customers to schedule job executions using their preferred job scheduler. As a result, the integrated scheduler is seldom used.

3.10.16.2 Deprecated features

- **Masking:**
 - FTP, SFTP, and mount upload for XML and Cobol formats - FTP/SFTP/Mount-based format import were the original modes for XML and Cobol files, since then, Delphix has added the ability to upload a format file, which is far simpler to set up. After the introduction of “upload”, we’ve seen a dramatic shift away from the legacy import modes in favor of the simplicity of “upload”.
 - Row Type Feature - Originally geared for limiting masking to subsets of rows within a column, this feature was seldomly used. Its functionality, if desired, can still be replicated via the Custom SQL feature.
 - Redundant Settings for ‘Edit Table’ under Rule Sets - Table Suffix, Add Column, Join Table, and List - These settings are redundant and can be replicated with the Custom SQL setting.
 - ‘HAVING’ clause from Masking API - Deprecating due to low use. This feature, if desired, can be replicated with Custom SQL.

3.10.17 Release 6.0.2.0

3.10.17.1 End-of-life features

- AWS i.3 (EOL) January 22, 2020
- Microsoft Azure GSx (EOL) May 7, 2020

3.10.18 Release 6.0.0.0

3.10.18.1 End-of-life features

- **Removed Virtualization Features:**

A few features will be removed with the 6.0 release. If these features are in use, the upgrade will not proceed.

 - Cross Platform Provisioning (XPP)
 - AIX 6.1 Technology Levels 0-6 and AIX 7.1 Technology Levels 0-2 for Environments
 - Windows Server 2008 for Environments

Windows Server 2008 will not have an upgrade blocker.

- **Removed Masking Features:**

Please note that Excel files can still be masked by first converting them to one of Delphix's supported file types (CSV, etc). Also, XML CLOBs can be masked by extracting their values into a table (example - using `extractValue` in Oracle).

- Native XML CLOB masking: After upgrade, columns masked as XML CLOBs will have the NULL SL algorithm assigned.
- DB2 9.1, 9.5, and other 9.x versions of LUW & Z/OS
- "Create target" job option: After upgrade jobs using "create target" will be removed.
- "Bulk data" job option: After upgrade, jobs using "bulk data" will be turned into non-bulk data jobs.
- Native Microsoft Excel Masking: After upgrade, MS Excel connectors, rulesets and jobs will be removed.

3.11 Licenses and notices

The Delphix Dynamic Data Platform includes licensed, third-party products from the following companies. These products are copyrighted and all rights are reserved by the respective companies:

- Highcharts, © Highsoft

The Delphix Masking engine includes licensed, third-party products from the following companies. These products are copyrighted and all rights are reserved by the respective companies:

- Kendo UI, © Telerik

Starting with 6.0.3.0, the license info is available via a CLI/API on the engine when logged in as a system administrator.

```
engine> cd license
engine license> getLicense
engine license getLicense *> commit
```

Access to the source code of such third party open source components may be permitted or required in certain instances under the applicable open source licenses by sending an email to <mailto:open-source@delphix.com>

4 Overview

4.1 What is Delphix?

Delphix is the organization behind the Delphix DevOps Data Platform, which combines enterprise-wide data coverage with data compliance to enable modern CI/CD workflows, accelerate the journey to the cloud, transform user experiences, and increase the adoption of disruptive AI technologies. The DevOps Data Platform is composed of various products, such as Delphix Continuous Data, Continuous Compliance, Data Control Tower, Delphix Compliance Services, and various integrations.

4.2 What is Delphix Continuous Data?

Delphix Continuous Data is a data management solution that provides the ability to securely copy and share data. The solution will ingest from a data source, create data copies, and flexibly manage them based on the organization's governance model. Delphix Continuous Data's copies are full, read-write capable database instances. This enables all data consumers, such as application, artificial intelligence, or machine learning teams, to create and manage previously expensive databases at a fraction of the total time, effort, and cost. These capabilities are often summarized as virtualization.

4.3 Deployment

Delphix Continuous Data is distributed through a virtual software appliance that can be installed on a wide variety of hypervisor platforms, such as VMware, Azure, Google Cloud Platform, and Amazon Web Services. Data copies are then served from a shared storage footprint called Delphix Storage. All of the day-to-day virtualization configuration and capabilities can be performed by logging in through the Administrator, Management, or Self-Service UI, and extended further through APIs or CLI tooling. The installed appliance is frequently referred to as the engine.

4.4 Environments

In addition to the engine itself, Delphix Continuous Data requires the availability of additional environments (or hosts) to manage the ingestion of a data source and provisioning of its copies. There are three primary environment types: Source, Target, and Staging.

- The **Source** environment is the originating data source location.
- The **Target** environment is where the data copies will be provisioned.
- The **Staging** environment is an optional environment where the sourced data can be pre-processed to minimize any performance concerns.

Frequently, Delphix Continuous Data will connect directly to the Staging environment, which allows administrators to maintain a controlled connection to the Source environment and update the Staging environment as needed.

Deciding which environments are connected to Delphix Continuous Data and how many are required depends on the chosen data source ingestion architecture. Learn more on the [General architecture \(see page 1046\)](#) page.

4.5 Data Source

Delphix Continuous Data ingests the data's files and logs to maintain an internal, condensed, and authoritative copy of the linked data source. This copy, along with all incremental updates, is referred to as the dSource. The dSource is kept in sync based on the configured ingestion method and user-defined policy.

Once created, Delphix Continuous Data maintains a Timeflow of the dSource which is a record of changes to the data. These changes are recorded in increments called Snapshots. From any snapshot within that Timeflow, a virtual database (VDB) can be instantly created or updated. Learn more about data sources in the [dSource management \(see page 1074\)](#) section.

4.6 Virtual Databases

Virtual Databases (VDBs) are the virtual copies of the data. VDBs are initially provisioned (aka created) from selecting a dSource's snapshot. Once provisioned, a VDB is an independent, read-write database, and changes made to the VDB by users or applications are written to new, compressed blocks in Delphix storage. Then, as the VDB is updated, their state is recorded within the Timeflow via Snapshots like dSources. At any time, VDBs can be provisioned from other VDBs and the data within a VDB can be refreshed from its parent VDB or dSource. Learn more about virtual databases in the [Virtual Databases management \(see page 1080\)](#) section.

4.7 Product information

4.7.1 Overview

Delphix Engines are delivered and maintained as a closed virtual software appliance. Like all virtual appliances, these engines are a tightly integrated combination of a special-purpose operating system and business logic; The **Continuous Data Engine** can be configured for **data virtualization**, while the **Continuous Compliance Engine** can be configured for **data masking**.

The product is delivered as a closed appliance, due to dependencies between software components within the virtual appliance that require end-to-end testing. Delphix does not provide administrative access to the operating system for any reason, including installing software, making customizations, or performing security scans. More details about the administrative model are provided in later sections of this page.

4.7.2 Packaging

Delphix software is delivered and maintained as a virtual software appliance. The mode of product delivery is dependent on the hosting hypervisor platform described in the table below:

Hypervisor Platform	Delivery Vehicle	Notes
VMware ESXi	OVA image	
Amazon AWS EC2	AMI image	Manual deployment to EC2
Amazon AWS EC2	Guest Machine Appliance	Amazon Marketplace
Microsoft Azure	Guest Machine Appliance	Azure Marketplace
Google Cloud Platform	Guest Machine Appliance	
Hyper V	Hyper image	

4.7.3 Updates, upgrades, and versions

Regardless of the initial packaging used to deploy Continuous Data or Continuous Compliance engines, updates are supplied as a single upgrade image of the new release, and the same image can be used for any prior release from which an upgrade is supported. This upgrade image delivers a completely new appliance, including both the operating system and business logic components.

The upgrade process retains prior configuration and user data to ensure that nothing is lost during the upgrade process, in addition to retaining a copy of the previous version of the components for automatic recovery in case an upgrade fails. Installed versions older than the prior version are automatically deleted during the upgrade.

There is no component patching of Continuous Data or Continuous Compliance engines; fixes are delivered in new versions of the software as a new software appliance. There is no management of patches involved and each engine version is a consistent, tested virtual appliance.

4.7.4 Administration

Administration of Continuous Data or Continuous Compliance engines happens through product interfaces only. These interfaces provide the proper configuration and testing of user infrastructure components, such as network addresses, storage, Domain Name Service (DNS) servers, authentication servers (LDAP), etc. The interfaces also control the business logic and control of the overall platform, including how data is used and provisioned by the system.

Although the special-purpose operating system may be accessed by Delphix Support and Engineering personnel for the purpose of diagnostics and problem remediation, there are no user-accessible interfaces at the operating system level. Users are not provided access to the underlying operating system nor can any custom software be installed on the appliance.

4.7.5 Customization

The product has several endpoints allowing customization for improved integration with user environments, local business workflow requirements, and alternative data sources.

Interface	Functional Area	Description
Data Plugins	Continuous Data	Delivered by Delphix Services or Integration Partners. These plugins allow for supporting additional data types including both structured and unstructured data.
Privilege Elevation Profiles	Continuous Data	Delivered by Delphix Services or Integration Partners. These customizations allow for the use of privilege mechanisms other than sudo on Linux and Unix target environments. Sudo is the product default.
Hook Scripts	Continuous Data	These user-managed scripts allow for custom business logic to be applied to Oracle and SQL Server data sources and virtual databases. The scripts are not integrated into the appliance but are referenced and invoked by the product during data operations.
Custom Algorithms	Continuous Compliance	Delivered by Delphix Services or Integration Partners. Custom algorithms provide specialized data transformations to secure or anonymize sensitive data.

In addition to these endpoints, Delphix provides a robust set of application programming interfaces (APIs) that enable business automation and fully integrated data operations into client workflows.

4.8 Delphix glossary

This glossary is your guide to exploring Delphix terms and definitions.

4.8.1 Products

Term	Definition
Delphix Continuous Data	Delphix Continuous Data is a Delphix product to deliver data on-demand to application developers and testers. Running as a virtual appliance, it is sometimes referred to as a Data Engine.
Delphix Continuous Data with Elastic Data	Elastic Data is a storage feature of Delphix Continuous Data that allows optimal data management to minimize costs through the use of block and elastic storage.
Delphix Continuous Compliance	Delphix Continuous Compliance is a Delphix product for discovering sensitive data and replacing it with realistic but fictitious data. Running as a virtual appliance, it is sometimes referred to as a Compliance Engine.
Data Control Tower	Data Control Tower (DCT) is a Delphix product that provides a data mesh to unify data governance, automation, and compliance across all applications and cloud platforms.

4.8.2 Interfaces

Term	Definition
Delphix Setup	Delphix Setup is the Delphix Continuous Data's user interface for system administrators to configure their engine settings, such as storage, support bundle, authentication, and network configurations.
Delphix Management	Delphix Management is Delphix Continuous Data's user interface for product administrators to manage their virtualized or masked datasets.
Delphix Self-Service	Delphix Self-Service is the Delphix Continuous Data user interface designed specifically for project teams, application developers, and testers to manage their virtualized datasets.
Command Line Interface (CLI)	Command Line Interface (CLI) is the engine's terminal interface which allows users to perform various administrative commands. This is not to be confused with the <code>dxtoolkit</code> .

Term	Definition
Delphix Download Portal	Delphix Download Portal ¹¹⁵ is the location where users download Delphix's products.
Delphix Support Portal	Delphix Support Portal ¹¹⁶ is the location where users receive support for Delphix's products.

4.8.3 Core concepts

Term	Definition
Virtualization	Virtualization describes the capability of producing a functioning database or filesystem copy that is lightweight and ephemeral.
Masking	Masking describes the capability of iterating through a dataset to identify all sensitive fields and replace them with desensitized values to eliminate risk in lower environments.
Data Source	Data Source is a database or unstructured files located in a user's environment. It generally describes ingestion sources and is typically located in a Source or Staging Environment.
Dataset	Dataset is an instance of any collection of data, such as VDB, dSource, vFiles, data source, or database. The dataset may or may not be managed by Delphix Continuous Data.
Transaction Log(s)	Transaction Log(s) are a general term for a database's record of all events or changes. Typically used for PITR and various ingestion mechanisms. Databases that support this mechanism might refer to these files differently, perhaps calling them something like "redo logs", but the purpose is the same.
Point-in-Time or Point-in-Time Recovery	Point-in-Time is the recovery or roll forward of a virtual database up to a user specified point in time. This is made possible through the availability of Transaction Logs ingested via LogSync or another mechanism. This is synonymous with Point-in-Time Recovery (PITR).

¹¹⁵ <https://download.delphix.com/>

¹¹⁶ <https://support.delphix.com/>

4.8.4 Continuous Data

Term	Definition
Environment	<p>Environment is a collection of hardware and/or software required to run a source or virtualized dataset. (For example, a Linux system running PostgreSQL.) This may either be a standalone instance or a cluster of instances.</p> <p>See Source, Staging, and Target Environments definitions for different environment types.</p>
dSource	<p>dSource is the copy of a source database's persistent data layer that Delphix Continuous Data uses to create and update virtual databases (VDBs). Based on the ingestion model and data source type, the dSource could be exposed through a mount point and interacts with a Staging Database Instance, Database, or Files. Consult the data source connector documentation for specific details.</p>
Virtual Database (VDB)	<p>Virtual Database (VDB) is a full read-and-write copy of the source data that is provisioned from either a dSource or another VDB. A VDB is provisioned and managed by Delphix Continuous Data.</p>
Timeflow	<p>Timeflow describes the timeline of data of a virtual database or dSource.</p>
Snapshot	<p>Snapshot represents the state of a dataset at a specific moment in time. They are used to create or refresh the same or another timeline.</p>
Hooks	<p>Hooks are mechanisms that allow the execution of custom operations at specific points in various processes like linking, provisioning, and managing virtual datasets.</p>
Replication	<p>Replication is the process of copying objects from one engine (the source) to another (the target).</p>
Unstructured Files (vFiles)	<p>Unstructured files (vFiles) are data stored in a filesystem that is not typically accessed by a Database Management System (DBMS) or similar software.</p>

Term	Definition
Delphix Connector	Delphix Connector is a service that runs on the Windows Staging and Target Environments to enable communication with Delphix Continuous Data. The Delphix Connector should not be confused with Data Source Connectors.
Delphix Toolkit	Delphix Toolkit is a set of applications that are installed on the Source, Staging, and Target Environments which enables communication with Delphix Continuous Data. This should not be confused with <code>dxtoolkit</code> .
Delphix Storage	Delphix Storage is an underlying component in Delphix Continuous Data's architecture. Delphix Continuous Data uses this storage for ingesting the source data and storing the ZFS snapshots of the ingested data.
HostChecker	HostChecker is a standalone application that validates environments and hosts are configured correctly. HostChecker is available on the Delphix Download Portal.
Object(s)	Object(s) is a general term to refer to a Delphix Continuous Data entity, such as VDB, dSource, Snapshot, or Environment.

4.8.5 Architecture

Term	Definition
Host	Host is a single server within the environment collection. An environment is considered to be one or more hosts. For example, a RAC environment contains multiple hosts.
Staging Architecture	Staging Architecture is an ingestion strategy where a copy of the source data is recreated on an alternate environment where persistent storage is provided by Delphix Continuous Data.
Source Environment	Source Environment is the "production" or "golden" environment that contains the ideal database the user would like to virtualize in Delphix Continuous Data.

Term	Definition
Staging Environment	Staging Environment hosts the replica, copy, or backup of the database which Delphix Continuous Data will link and ingest.
Target Environment	Target Environment is the configured infrastructure, with available database binaries, in which virtual database copies will be hosted.
Privilege Elevation	Privilege Elevation is the optional functionality to provide a low-privileged environment user with sufficient permissions to perform the required ingestion and provisioning actions. This solution is not required, but suggested for production implementation of Delphix Continuous Data.
Installation	<p>Installation is the location on source, staging, or target hosts that maintain the dataset's binaries and data. Often referred to as Repository or Dataset Home.</p> <p>Installations that are part of a Source and Staging Host will also be composed of one or more Databases. These Databases enable Delphix Continuous Data to identify the location from which a specific source dataset can be ingested. Often referred to as a Source Config.</p>
Ingestion	Ingestion is the intake process by which Delphix configures the linking connection, obtains a copy of the backing data for the dSource, persists the data to Delphix Storage and takes a snapshot.
Direct Ingestion	Direct Ingestion is a form of intake into Delphix Storage where the persistent data of a dSource is provided directly to Delphix without any need for staging (example: from Oracle RMAN)
Staged Ingestion	Staged Ingestion is a form of intake into Delphix where the persistent data of a dSource must be recreated on an alternate staging host which has mounted Delphix Storage
Staging Pull	Staging Pull is an ingestion method where Delphix controls and executes the necessary operations to prepare the data content in the Staging Environment.
Staging Push	Staging Push is an ingestion method where the user (not Delphix) controls and executes the operations to prepare the data content in the Staging Environment.

4.8.6 Datasets

Term	Definition
Link	Link is the process of establishing a relationship between a data source and Delphix Continuous Data. After linking a data source, Delphix Continuous Data can import data periodically and manage it as it evolves over time. Also called Attach.
Unlink	Unlink is the process of disconnecting Delphix Continuous Data from the data source. Also called Detach.
Discovery	Discovery is a process that allows the connector to gather information about installation details in an environment. The database's discovery typically occurs as part of the initial environment setup process.
SnapSync	SnapSync is the standard process for importing data from a source into Delphix Continuous Data. An initial SnapSync is performed to create a dSource. Incremental SnapSyncs are performed to provide additional points in time to the dSource. Also, referred to as Sync.
LogSync	LogSync is an advanced process imports more granular source change data through Transaction Logs. This mechanism, often called Point-in-Time Recovery, allows for finer control of VDB point-in-time provision, refresh, or rollbacks.
Validated Sync	Validated Sync is a supportive process that executes cleanup and preparation activities on the Staging environment's database.
Resync	Resync is a Delphix operation by which the existing contents of the dSource are overwritten with a new full copy (ie a full sync) of the source data
Provision	Provision is an operation in which a new child dataset is created from a specific snapshot of the parent dataset (i.e. A VDB from a dSource, or a VDB from a VDB).
Refresh	Refresh is an operation where the virtual database is re-provisioned from its dSource's snapshot or a point in time. All current contents of the dataset are forfeited and the contents are fully restored to the state which has been captured in the chosen snapshot.

Term	Definition
Rewind	Rewind is an operation in which the contents of a specific virtual database are reset to the last point in its Timeflow. All current contents of the dataset are forfeited and the contents are fully restored to the state which has been captured in the chosen snapshot.
Enable	Enable is an operation in which a specific virtual database is deployed to a chosen Target environment. Specifically, the persisted virtual database is made available on the environment host via the appropriate network storage operation(s), and then visible and usable on that host. If there is an associated DBMS using that virtual database, the DBMS instance is also started.
Disable	Disable is an operation in which a virtual database is removed from the Target environment on which it is currently deployed. If there is an associated DBMS using the virtual database, that DBMS instance is also stopped.
Start	Start is an operation in which the associated DBMS is started. The virtual database must be in an ENABLED state on the Target environment for this operation to succeed
Stop	Stop is an operation in which an associated DBMS is stopped, but the virtual database is left in an ENABLED state on the Target environment.
Migrate	Migrate is an operation in which a specific virtual database is dissociated from one Target environment and moved to another Target environment on the same Delphix Continuous Data. A complete virtual database migration typically involves DISABLE, MIGRATE, and ENABLE operations. See REPLICATION to migrate datasets from one Delphix Continuous Data to another.
Virtual To Physical (V2P)	Virtual To Physical (V2P) is an operation to take a virtual database and provision it to a third-party database outside of Delphix Continuous Data. This is often used for disaster recovery purposes or as part of a performance test.

4.8.7 Data Source Connectors

Term	Definitions
Connector	Connector refers to the Delphix Continuous Data's data source connection mechanism. A connector enables Delphix Continuous Data functionality with a specific data source system or DBMS. See other connector types for specific details.
Standard Connector	Standard Connector are connectors that are built and supported by Delphix. They are included for free with a Delphix Continuous Data License Agreement.
Select Connector	Select Connector are connectors that are built and supported by Delphix but require a separate License Agreement.
Premium Connector	Premium Connector are connectors that are built and supported by a third party. They often require a separate License Agreement.
Plugin	Plugin is the software delivery framework for many Connectors. The user must upload the plugin into Delphix Continuous Data to install the associated Connector.

4.8.8 Transparent Data Encryption (TDE) definitions

Term	Definition
Artifact directory	Directory on the target system (not on Delphix Storage) which stores keys needed to support Delphix workflows on TDE-enabled vPDBs. It is located under the toolkit directory.
Auxiliary container database (CDB)	Provisioning an Oracle vPDB requires running recovery to bring the snapshotted datafiles into a consistent state. This needs to be done in the context of a container database, which is created on the target system. After the recovery is complete, the vPDB is unplugged and plugged into the target container, and the auxiliary container is deleted.

Term	Definition
Exported KeyFile	File located on the target Oracle host which contains keys that have been exported from the KeyStore. It is encrypted with a secret that is specified when it is exported. The exported KeyFile itself cannot be used as a KeyStore, but its contents can be imported into a new KeyStore.
Key rotation	Process for changing the master encryption key in the KeyStore via ADMINISTER KEY MANAGEMENT SET KEY. This does not remove the original key, rather it adds a new key to the wallet and future data will be encrypted with the new key.
KeyStore/wallet	File found on the Oracle host which stores the keys used to encrypt and decrypt the internal table keys in a database. Every KeyStore has a password that is set when it is first created and must be supplied for operations on it.
Parent KeyStore	KeyStore with the keys used to encrypt the dSource PDB files.
Target KeyStore	KeyStore for the target CDB into which the TDE-encrypted vPDB is plugged.

4.8.9 Users roles

User role	Role privileges	Group privileges
Reader	Access statistics on the dSource, VDB, or Snapshot such as usage, history, and space consumption	Access statistics on all dSources, VDBs, or Snapshots in the group such as usage, history, and space consumption
Provisioner	<ul style="list-style-type: none"> Access statistics on the dSource, VDB, or Snapshot such as usage, history, and space consumption Provision VDBs from owned dSources and VDBs 	<ul style="list-style-type: none"> Access statistics on all dSources, VDBs, or Snapshots in the group such as usage, history, and space consumption Provision VDBs from all dSources and VDBs in the group

User role	Role privileges	Group privileges
Owner	<ul style="list-style-type: none"> • Provision VDBs from owned dSources and VDBs • Perform Virtual to Physical (V2P) from owned dSources • Access the same statistics as a Reader • Refresh or Rollback VDBs • Take Snapshots of dSources and VDBs 	<ul style="list-style-type: none"> • Provision VDBs from all dSources and VDBs in the group • Refresh or Rollback all VDBs in the group • Snapshot all dSources and VDBs in the group • Perform Virtual to Physical (V2P) from owned dSources • Apply custom policies to dSources and VDBs • Create template policies for the group • Assign Owner privileges for dSources and VDBs • Access the same statistics as a Provisioner, Data Operator, or Reader
Data operator	<ul style="list-style-type: none"> • Access statistics on the dSource, VDB, or snapshot such as usage, history, and space consumption • Refresh or rollback VDBs 	<ul style="list-style-type: none"> • Access statistics on all dSources, VDBs, or snapshots in the group such as usage, history, and space consumption • Refresh or rollback all VDBs in the group

4.8.10 User privileges

User type	Role privileges	Group privileges
sysadmin	Can perform typical system administration duties such as: modifying NTP, SNMP, SMTP settings; managing storage; downloading support logs for the Delphix Continuous Data Engine, and performing upgrades and patches. The sysadmin user launches the initial Delphix Setup configuration application and has access to the Command Line Interface (CLI).	Has privileges for storage, upgrades, network, etc.

4.8.11 Types of notification

Type	Notification
Event	Completion of some action in the Delphix Continuous Data Engine. Examples include user-initiated tasks such as snapshots or VDB provisioning, policy-based tasks, and background monitoring and maintenance tasks.
Alert	<p>Caused by a single event on a Delphix Continuous Data Engine. Also known as a System Event, and viewable through the System Event Viewer. Examples include warnings on source/target environment settings, recoverable errors, or incorrect connection settings.</p> <p>Alert Levels: Informational, Warning, Critical</p>
Fault	<p>A persistent event on a Delphix Continuous Data Engine that remains until the issue is resolved. The fault may be marked resolved automatically or require that it be resolved manually. Selecting to Ignore a fault will also ignore future faults of that exact type against the same object.</p> <p>System faults describe states and configurations that may negatively impact the functionality of the Delphix Continuous Data Engine and which can only be resolved through active user intervention.</p> <p>Examples: Delphix Continuous Data Engine storage failure, communication failures between the Delphix Continuous Data Engine and a source or target environment/host</p> <p>Fault Levels: Warning, Critical</p>

4.8.12 Delphix Self-Service terms

Term	Explanation
Administrator	<p>Has full access to all report data and can configure and administer Delphix Self-Service. Additionally, can use the Delphix Continuous Data Engine to:</p> <ul style="list-style-type: none"> • add/delete reports • add/delete users • change tunable settings • add/delete tags • create and assign data templates and containers

Term	Explanation
Bookmark	<p>A logical reference to a point in time on a branch. You can use it as a point from which to fork new branches. It can also be the target of policies – for example, you can arrange to keep this bookmark for two years.</p> <p>Bookmarks are a way to mark and name a particular moment of data on a timeline. You can restore the active branch's timeline to the moment of data marked with a bookmark. You can also share bookmarks with other Delphix Self-Service users, which allows them to restore their own active branches to the moment of data in your container. The data represented by a bookmark is protected and will not be deleted until the bookmark is deleted.</p>
Branches	<p>Branches are task-specific groupings you can create within a data container. A branch is used to track a logical task and contains a timeline of the historical data for that task. As you work within your data container, you can create more branches overtime to run or complete separate tasks.</p> <p>Branches represent a logical sequence of activity, separate from the underlying data lineage. This is the main concept introduced in the core engine and forms the basis of many higher-level primitives. Branches:</p> <ul style="list-style-type: none"> • Can have only one timeline active at any time • Can be user-visible (e.g. exported to a user target) or implementation (e.g. just a staging source to run a series of transformations)
Branch group/target group	<p>A collection of multiple Branches that are treated as a single entity. The system can determine compatibility automatically, or a template can be used to create more complex orchestration.</p>
Branch timeline	<p>A dynamic point-in-time interface for user actions within the Branch. Common activities include re-setting Data Sources to run a test, refreshing the Data Container with the most current source data, and bookmarking data to share or track interesting moments of time along the branch timeline.</p>
Data container	<p>Consists of one or more Data Sources, such as databases, application binaries, or other application data. Allows users to:</p> <ul style="list-style-type: none"> • Undo any changes to their application data in seconds or minutes • Have immediate access to any version of their data over the course of their project • Share their data with other people on their team, without needing to relinquish control of their own container • Refresh their data from production data without waiting for an overworked DBA

Term	Explanation
Data template	Created by the Engine Administrator, data templates consist of the data sources users need in order to manage their data playground and their testing and/or development environments. Data templates serve as the parent for a set of data containers that the administrator assigns to Delphix Self-Service users. Additionally, data templates enforce the boundaries for how data is shared. Data can only be shared directly with other users whose containers were created from the same parent data template.
Data User	Delphix Self-Service data users have access to production data provided in a data container. The data container provides these users with a playground in which to work with data using the Self-Service Toolbar.

4.9 Product icon reference

This topic illustrates the icons that appear on dSources and virtual databases (VDBs) in the Delphix Engine graphic user interface and describes the meaning of each, along with tips for clearing those that represent errors.

Icon	Description
	Environment
	Host
	Cluster
	dSource
	VDB
	Masked VDB
	vFiles
	Live Source
	Universal control for adding, creating users and objects

Icon	Description
	Provision a Virtual Database (VDB)
	Refresh a VDB
	Take a snapshot
	Rewind or roll back a VDB to a point in time
	Copy Virtual Database to a physical database (V2P)
	Open Log Sync to create a dataset from a point in time
	Filter control to narrow the results in a list view
	Toggle to expand the current state
	Toggle to collapse current state
	Timeflow view selector
	There is a warning fault associated with the dataset
	There is a critical fault associated with the dataset

5 Deployment

This section covers the necessary requirements to deploy the Delphix Engine across multiple different environments. Specific technical requirements for both on-premise and cloud deployments can be found under each platform topic (VMware, AWS, Azure, Google Cloud, etc.). This section covers the following topics:

- [Accessing the Continuous Data Engine](#) (see page 571)
- [Standard deployment architecture](#) (see page 574)
- [Checklist of information required for installation and configuration](#) (see page 575)
- [Network connectivity requirements](#) (see page 580)
- [Installation and initial system configurations](#) (see page 585)
- [Validating host deployment with host Checker](#) (see page 618)
- [Deployment for VMware](#) (see page 619)
- [Deployment for KVM](#) (see page 630)
- [Deployment for Hyper-V](#) (see page 634)
- [Deployment for AWS EC2](#) (see page 640)
- [Deployment for Microsoft Azure](#) (see page 651)
- [Deployment for Google cloud platform](#) (see page 659)
- [Deployment for OCI](#) (see page 665)
- [Deployment for IBM cloud](#) (see page 675)
- [Hotfix information](#) (see page 684)

5.1 Accessing the Continuous Data Engine

5.1.1 Default users

After installation, the Delphix Continuous Data Engine will have two users; **admin** and **sysadmin**. Email address is a mandatory input for both the accounts. The user can create multiple sysadmin, admin users and other users with more restricted privileges. For more information, refer to the [Managing System Administrators](#)¹¹⁷ section.

The below table lists the privileges of both admin and sysadmin users.

User	Initial password	Abilities and duties

¹¹⁷ <https://cd.delphix.com/docs/latest/managing-system-administrators>

sysadmin	sysadmin	<ul style="list-style-type: none"> • System administration duties such as: <ul style="list-style-type: none"> • Modifying NTP, SNMP, SMTP settings • Managing storage • Downloading support logs for Delphix Continuous Data Engine • Performing upgrades and patches • Launching the initial Server Setup configuration application • Accessing Command Line Interface (CLI)
admin	delphix	<ul style="list-style-type: none"> • Managing data objects, all collectively referred to as the Delphix Continuous Data Engine: <ul style="list-style-type: none"> • dSources • Virtual databases (VDBs) • Users • Groups • Related policies and resources • Managing the Delphix Continuous Data Engine using either the browser-based Engine Admin application or the Command Line Interface (CLI).

5.1.2 Access methods

The three main interfaces to the Delphix Continuous Data Engine includes:

- Web browser (http or https)
- Command Line Interface (CLI) through SSH
- Delphix Web APIs

5.1.2.1 Accessing the Delphix Continuous Data Engine using a web browser

To access Delphix Continuous Data Engine administrator and the Delphix Management application, use **http://<engine IP or hostname>** or **https://<engine IP or hostname>**.

In order to use your hostname, your Domain Name System (DNS) administrator must add the hostname and IP Address to your DNS system.

5.1.2.1.1 Delphix Management application

By default, the GUI login screen of the Delphix Continuous Data Engine will log you into the Delphix Management application, where the activities such as linking source databases and VDB provisioning takes place. This Delphix Management application contains a link which directs the user to the Delphix Server Setup application.

Once the user has logged into the Delphix Server Setup application, the user can switch to the Delphix Management application login by clicking **Management** in the upper-right corner of the Delphix Server Setup screen.

5.1.2.1.2 The Delphix Server Setup Graphical User Interface (GUI)

For accessing the Delphix Continuous Data Engine to perform system administrator actions such as adding storage, changing system-level parameters, etc., the user can switch the login screen to the Delphix Server Setup login by clicking **Server setup** on the default login screen.

If the user is logged into the Delphix Management application, the user can switch to the Delphix Server Setup login screen by clicking the username in the upper-right corner and selecting **Setup**.

5.1.2.2 Accessing the Delphix Continuous Data Engine using administrative Command Line Interface (CLI)

Delphix administrative CLI can be used in various scenarios such as:

- For users who prefer using CLI or automation over a graphical user interface.
- For users with limited bandwidth connections.

The user can access the Delphix Administrative CLI through a Secure Socket Shell (SSH) session. Similar to GUI, there are separate Administrative CLIs for the Delphix Continuous Data Engine administrator (admin) and Delphix System administrator (sysadmin) roles. The appropriate Administrative CLI will be automatically selected based on the role granted to the user.

Using your SSH client of choice, access the Delphix Continuous Data Engine in a method similar to the following:

```
ssh <user>@<engine IP or hostname>
```

Where <user> is a predefined user on the Delphix Continuous Data Engine, and <engine IP> is the IP address of a Delphix Continuous Data Engine.

```
ssh delphix_admin@dlpxengine1
```

All Delphix Continuous Data Engine functionality is available via the Administrative CLI. For more information on using the Delphix Administrative CLI, refer to the [Command Line Interface Guide](#)¹¹⁸ section.

¹¹⁸ <https://cd.delphix.com/docs/latest/command-line-interface-guide>

5.1.2.3 Accessing the Delphix Continuous Data Engine using the Delphix web API

Delphix offers a set of RESTful web service APIs with which a user can administer the Delphix Continuous Data Engine. Web API calls allow the user to create powerful, complex automation, often in coordination with other technologies like Jenkins, Puppet, Chef, and Ansible. All Delphix Continuous Data Engine functionality is available via the Web API. For more information refer to [Delphix Web Service API Guide](#)¹¹⁹ section.

5.2 Standard deployment architecture

5.2.1 Overview

At a high level, Continuous Data functions to efficiently ingest data off of a source host by creating a compressed copy of that data, called a dSource, on the Delphix Engine. From there, the Delphix Engine can easily create multiple virtual databases (VDBs) on a target host with a marginal increase in storage. From an architecture perspective, the diagram below details how an engine interacts with an organizations infrastructure.

Delphix Architecture - Infrastructure Level

Architectural diagram of a common Delphix deployment (configurations vary depending on RDBMS platforms).

On an infrastructure level, Continuous Data relies on a Source, Staging, and Target Hosts, in addition to the Delphix Engine needing specific compute requirements (outlined in the platform-specific requirements section). Storage Requirements, like compute, vary by host type and are outlined in subsequent sections. Staging and Target host storage is provided from the Delphix Engine, which is mounted over the network similar to any Target host (NFS/iSCSI).

¹¹⁹ <https://cd.delphix.com/docs/latest/web-services-api-guide>

5.3 Checklist of information required for installation and configuration

5.3.1 Overview

This article describes the information required for the initial installation and configuration of the Delphix Engine.

The **InstallWorkbooks** articles list all the values that need to be captured, as well as sample values. Choose the workbook for the corresponding hypervisor. In addition to required values, the InstallWorkbooks also lists useful data to document as part of the installation.

- [InstallWorkbook_Azure.xls](#)¹²⁰
- [InstallWorkbook_VMware.xls](#)¹²¹
- [InstallWorkbook_AWS.xls](#)¹²²

5.3.2 Hypervisor specific options

As a virtual appliance, Delphix supports a number of different hypervisors and configurations. The choice of hypervisor and network configuration will determine what configurations are needed for the first step in the installation of Delphix.

Attribute	Sample data	Used with the following hypervisor options			
		VMware with Static IP	VMware with DHCP	AWS	Azure
Name	mydelphix1	*	*	*	*
Gateway IP	192.168.0.1	*	*	*	*
Root Volume Size	127GB	*	*	*	*

¹²⁰ https://delphixdocs.atlassian.net/wiki/download/attachments/255561563/InstallWorkbook_Azure.xls?api=v2&cacheVersion=1&modificationDate=1729522825762&version=1

¹²¹ https://delphixdocs.atlassian.net/wiki/download/attachments/255561563/InstallWorkbook_VMware.xls?api=v2&cacheVersion=1&modificationDate=1729522824528&version=1

¹²² https://delphixdocs.atlassian.net/wiki/download/attachments/255561563/InstallWorkbook_AWS.xls?api=v2&cacheVersion=1&modificationDate=1729522825176&version=1

Attribute	Sample data	Used with the following hypervisor options			
ESX Hostname	thx1138	*	*		
Domain	mydomain.com	*		*	*
DNS server IP(s), comma-separated	10.80.1.1, 10.80.1.2	*		*	*
Static IP and Subnet Mask in CIDR Notation	172.16.180.130/24	*			
Number of vSCSI Controllers	4	*			
VMDK/RDMs and Sizes	SAN 03- 3 TB, SAN04-3 TB, SAN05-3 TB & SAN06-3 TB	*			
Virtual Private Cloud (VPC) Name	vpc-673822a23			*	
Subnet	subnet-748391e26			*	
Auto-assign Public IP	disable			*	
EC2 instance type	r3.8xlarge			*	
Security Groups	sg-78sdg99879, sg-8798s77009			*	
Root Volume Type	Magnetic			*	
Number of EBS volumes	4			*	

Attribute	Sample data	Used with the following hypervisor options			
Size of EBS volumes	500G			*	
Type of EBS volumes	Provisioned IOPS SSD			*	
IOPS set on each volume	5,000			*	
Encryption on EBS volumes	TRUE			*	
Virtual Network (vnet)					*
Subnet					*
Network Interface w/ Static Public IP					*
VM Size	Example: D8s_v3				*
Network Security Group					*
OS Disk	127 GB - Premium SSD				*
Data Disks	Premium SSDs				*

5.3.3 Optional information required for initial configuration

Class	Attribute	Sample data
Time	NTP Servers (Highly Recommended)	172.16.180.10, 172.16.180.11

Class	Attribute	Sample data
	Timezone	US/Pacific
Serviceability (Highly Recommended)		
	Enable Phone Home? (Highly Recommended)	Yes
	Web Proxy Server IP Address	192.168.1.200
	Web Proxy Server Port	8080
	Web Proxy Server Username (If Required)	user
	Web Proxy Server Password (If Required)	***
	Enable SMTP Server (Highly Recommended)	Yes
	SMTP Server IP Address	192.168.22.22
	SMTP Server Port Number	25
	SMTP Server From Email Address	delphix@hostname.mydomain.com ¹²³
	SMTP Server User (Optional)	user
	SMTP Server Password (Optional)	***
	SMTP Use TLS Authentication? (Optional, Default=No)	No

¹²³ <mailto:delphix@hostname.mydomain.com>

Class	Attribute	Sample data
	SMTP Send Timeout (Optional, Default=60)	60
Authentication (Highly Recommended)		
	LDAP Server IP Address	192.168.7.7
	LDAP Server Port	389 (636 for SSL)
	Protect LDAP traffic with SSL/TLS (true false)	false
	LDAP SSL Authentication (SIMPLE DIGEST_MD5)	SIMPLE
SNMP Integration		
	SNMP Server IP Address	192.168.77.156
	SNMP Server Port	162
	SNMP Community	mycommunity
	SNMP Use INFORM Instead of TRAP	false
	SNMP Severity Level (INFORMATIONAL, WARNING, CRITICAL)	CRITICAL
Splunk integration (Highly recommended)		
	Splunk Server IP address	192.168.8.8
	Splunk Server HEC Port Number	8088

Class	Attribute	Sample data
	Splunk HEC Token	12345678-1234-1234-1234-1234567890 AB
	Index Name for Events	delphix_events
	Index Name for Metrics	delphix_metrics
ADMIN		
	Email Address	u12345@mydomain.com ¹²⁴
SYSADMIN		
	Email Address	u12345@mydomain.com ¹²⁵

5.4 Network connectivity requirements

5.4.1 Overview

This topic covers the general network and connectivity requirements for the Delphix Engine, including connection requirements, port allocation, and firewall and Intrusion Detection System (IDS) considerations. For platform-specific network and connectivity requirements, see relevant topics under the **Requirements** article for each platform.

5.4.2 General outbound from the Delphix engine port allocation

Protocol	Port Numbers	Use
TCP	25	Connection to a local SMTP server for sending email
TCP/UDP	53	Connections to local DNS servers

¹²⁴ <mailto:u12345@mydomain.com>

¹²⁵ <mailto:u12345@mydomain.com>

Protocol	Port Numbers	Use
UDP	123	Connection to an NTP server
UDP	162	Sending SNMP TRAP messages to an SNMP Manager
TCP	443	HTTPS connections from the Delphix Engine to the Delphix Support upload server
TCP/UDP	636	Secure connections to an LDAP server
TCP	8415	Connections to a Delphix replication target (see Configuring Replication (see page 2412))
TCP	50001	Connections to source and target environments for network performance tests

5.4.3 General inbound to the Delphix Engine port allocation

Protocol	Port Number	Use
TCP	22	SSH connections to the Delphix Engine
TCP	80	HTTP connections to the Delphix GUI
UDP	161	Messages from an SNMP Manager to the Delphix Engine
TCP	443	HTTPS connections to the Delphix Management Application

Protocol	Port Number	Use
TCP	8415	Delphix Session Protocol connections from all DSP-based network services including Replication, SnapSync for Oracle, V2P, and the Delphix Connector.
TCP	50001	Connections from source and target environments for network performance tests via the Delphix CLI
TCP	54046	Connections from source and target environments to the engine when encryption is enabled for a Linux environment.
TCP	53260	Connections from the iSCSI stunnel server to the secured iSCSI target on the loopback IP.
TCP	53261	Connection from Staging or Target Environment to the Engine When encryption is enabled for the Windows environment.

5.4.4 Firewalls and intrusion detection systems (IDS)

Production databases on source environments (for dSources) are often separated from the non-production environment by firewalls. Firewalls can add milliseconds to the latency between servers. Accordingly, for best performance, there should be no firewalls between the Delphix Engine and the virtual database (VDB) target environments. If the Delphix Engine is separated from a source environment by a firewall, the firewall must be configured to permit network connections between the Delphix Engine and the source environments for the application protocols (ports) listed above.

Intrusion detection systems (IDSs) should also be made permissive to the Delphix Engine deployment. IDSs should be made aware of the anticipated high volumes of data transfer between dSources and the Delphix Engine.

5.4.5 Setting up network access to the Delphix engine

5.4.5.1 Overview

This article outlines the procedure for setting up network access to the Delphix Engine. Follow the initial installation instructions in [Installing the Delphix engine \(see page 585\)](#) before addressing this procedure.

5.4.5.2 Procedure

1. Power on the Delphix Engine and open the Console.
2. Wait for the Delphix Management Service and Delphix Boot Service to come online. This might take up to 10 minutes during the first boot. Wait for the large orange box to turn green.
3. Press any key to access the sysadmin console.
4. Enter `sysadmin` for the username and the password.
5. A description of available network settings and instructions for editing will be shown.

Delphix Engine Network Setup

To access the system setup through the browser, the system must first be configured **for** networking in your environment. From here, you can configure the primary **interface**, DNS, hostname, and **default** route. When DHCP is configured, all other properties are derived from DHCP settings.

To see the current settings, run `"get."` To change a property, run `"set <property>=<value>."` To commit your changes, run `"commit."` To exit **this** setup and **return** to the standard CLI, run `"discard."`

`defaultRoute` IP address of the gateway **for** the **default** route -- **for** example, `"1.2.3.4."`

`dhcp` Boolean value indicating whether DHCP should be used **for** the primary **interface**. Setting **this** value to `"true"` will cause all other properties (address, hostname, and DNS) to be derived from the DHCP response

`dnsDomain` DNS Domain -- **for** example, `"delphix.com"`

`dnsServers` DNS server(s) as a list of IP addresses -- **for** example, `"1.2.3.4,5.6.7.8."`

```
hostname Canonical system hostname, used in alert and other logs --
for example, "myserver"
```

```
primaryAddress Static address for the primary interface in CIDR notation
-- for example, "1.2.3.4/22"
```

Current settings:

```
defaultRoute: 192.168.1.1
dhcp: false
dnsDomain: example.com
dnsServers: 192.168.1.1
hostname: Delphix
primaryAddress: 192.168.1.100/24
```

6. Configure the `hostname` . If using DHCP, this step can be skipped.

```
delphix network setup update *> set hostname=<hostname>
```

Use the same hostname entered during the server installation.

7. Configure DNS. If using DHCP, this step can be skipped.

```
delphix network setup update *> set dnsDomain=<domain>
delphix network setup update *> set dnsServers=<server1-ip>[,<server2-ip>,...]
```

8. Configure either a static or DHCP address:

DHCP configuration

```
delphix network setup update *> set dhcp=true
```

Static configuration

```
delphix network setup update *> set dhcp=false
delphix network setup update *> set primaryAddress=<address>/<prefix-len>
```

The static IP address must be specified in CIDR notation (for example, `192.168.1.2/24`).

9. Configure a default gateway. If using DHCP, this step can be skipped.

```
delphix network setup update *> set defaultRoute=<gateway-ip>
```

10. Commit the changes. Use the `get` command prior to committing to verify the desired configuration.

```
delphix network setup update *> commit
Successfully committed network settings. Further setup can be done through the
browser at:
```

```
http://<address>
```

Type `'exit'` to disconnect, or any other commands to **continue** using the CLI.

11. Check that the Delphix Engine can now be accessed through a Web browser by navigating to the displayed IP address, or hostname if using DNS.

12. Exit setup.

```
1. delphix> exit
```

5.5 Installation and initial system configurations

This section covers the following topics:

- [Initial setup](#) (see page 585)
- [Customizing the Delphix Continuous Data Engine system settings](#) (see page 613)
- [Installing an OVA or AMI](#) (see page 616)

5.5.1 Initial setup

5.5.1.1 Overview

Delphix runs as a virtual appliance deployed in various types of platforms, as outlined in these **Deployment** articles. When first logging into an instance, the setup wizard will help with initial configurations for network, storage, authentication, and more. This article describes each step in the setup process and will outline and the different options available.

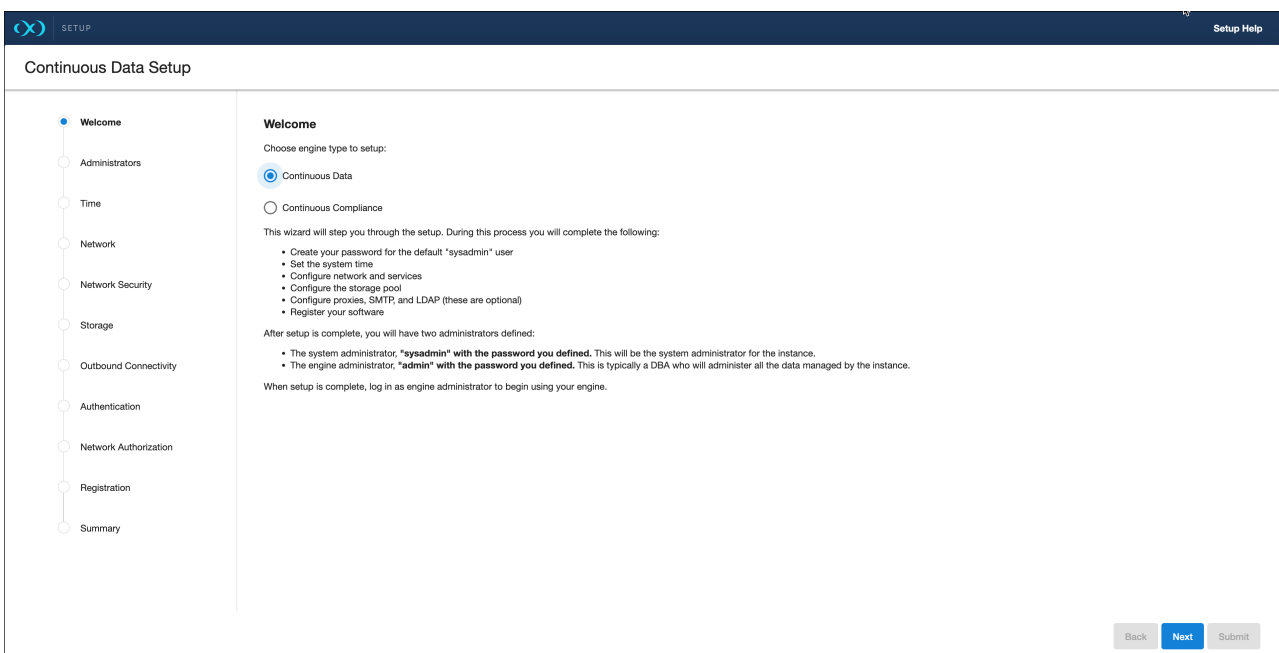

When first connecting to the Delphix Engine via any supported browser, enter the default sysadmin login; **username:** sysadmin, **password:** sysadmin. On the first login, there will be a prompt to change the default password for security purposes.

A login failure issue could occur if the Delphix Engine clock is not in sync with the IdP (identity provider) clock. To resolve the issue, either use the NTP (network time) clock or set up the skew time property in the SSO (Single Sign-On) configuration.

Anti-virus programs can impact both performance and operation. Delphix recommends anti-virus scanning exclude folders where Delphix files are maintained, in addition to the normal exclusions put in place for MSSQL operation. This is largely applicable to Windows machines.

5.5.1.2 Welcome

The Welcome section asks users to select the engine type being setup, whether Continuous Data or Continuous Compliance. This article explains the Continuous Data setup, the Continuous Compliance version can be found at [First time setup](#)¹²⁶.

5.5.1.3 Administrators

Each **Continuous Data** engine has two default accounts:

- **System Administrator:** `sysadmin` with a user-defined password. This will be the system administrator for the instance.
- **Engine Administrator:** `admin` with a user-defined password. This is typically a DBA who will administer all the data managed by the instance.

Provide an email address and password for both users in the Administrator section.

Each **Continuous Compliance** engine has this default account:

- **Masking Administrator:** `admin` with a user-defined password. This will be the user responsible for setting up other users and handling administrative actions.

¹²⁶ <https://masking.delphix.com/docs/latest/first-time-setup>

5.5.1.4 Time

The Delphix engine leverages its time setting to determine policies and actions that take place within the application. Manually set the time or choose from an NTP server, an explanation of these options are shown below.

Option	Notes
Set NTP Server (recommended)	After selecting this option, select an NTP server from the list, or select Add NTP Server to manually enter one or more server(s). When configuring a Delphix Engine on VMware, be sure to configure the NTP client on the host to use the same servers that are entered here.
Manually Select Time and Date	Select the Use browser time and date option to set the system time, or select the date and time by using the calendar and clock icons. If this option is selected, the date and time will persist as the local time, even if time zones are changed.

5.5.1.5 Network

The initial network configuration will be pre-populated based on the deployment platform used for Delphix. For VMware deployments, Delphix defaults to the VMXNET3 network adapter.

Select **Settings** for each Network interface to manage the following options:

Option	Notes
DHCP or Static network addressing	For Static addressing, enter an IP Address and Subnet Mask. The static IP address must be specified in CIDR notation (for example, 192.168.1.2/24).
Jumbo Frames	This setting is highly recommended. VMXNET3 supports Ethernet jumbo frames, which can be used to maximize throughput and minimize CPU utilization.
Routing	A default gateway will be specified in this section.
DNS Services	Enter a DNS Domain Name and DNS Server to be used for this engine.

5.5.1.6 Network security

Delphix installs certificates signed by the engine's Certificate Authority. Users have the ability to manage their own certificates for HTTPS and DSP (Delphix Session Protocol) connections to and from the Delphix Engine. You can add or modify certificates and certificate signing requests (CSRs) via the ... option.

When you update the Certificate Authority certificate, your HTTPS and DSP certificates will be automatically updated.

For more information please refer to [Certificate management](#)¹²⁷ in the Security section of this documentation.

5.5.1.7 Storage

5.5.1.7.1 Storage for engines backed by block devices

The Delphix Continuous Data Engine automatically discovers and displays storage devices. For each device, confirm that **Usage Assignment** is set to Data.

You can associate additional storage devices with the Continuous Data Engine after initial configuration, as there are two options for storage disk usage assignment:

1. **Enabled:** Once you set the storage unit assignment for a disk and save the configuration, it cannot be changed again.
2. **Unassigned:** These are disks being held for later use.

Configure at least four disks for the storage of user data. This makes the Continuous Data Engine storage manager function more efficient, since duplicated metadata can be distributed across multiple disks.

5.5.1.7.2 Storage for Elastic Data Engines backed by object storage

- To configure object storage, select from:
 - [Azure Blob storage](#)¹²⁸
 - [AWS object storage](#)¹²⁹
 - [GCP object storage](#) (see page 602)
 - [OCI object storage](#)¹³⁰
 - [Other S3 compatible object storage](#)¹³¹
- If utilizing on-premise object storage solutions, opt for [Other S3 compatible object storage](#)¹³².

¹²⁷ <https://cd.delphix.com/docs/latest/certificate-management>

¹²⁸ <https://cd.delphix.com/docs/latest/azure-object-storage-setup>

¹²⁹ <https://cd.delphix.com/docs/latest/aws-object-storage-setup>

¹³⁰ <https://cd.delphix.com/docs/latest/oci-object-storage-setup>

¹³¹ <https://cd.delphix.com/docs/latest/other-s3-compatible-object-storage-setup>

¹³² <https://cd.delphix.com/docs/latest/other-s3-compatible-object-storage-setup>

 Elastic Data Engines require a valid NTP server configured to ensure communication between the engine and the object storage.

5.5.1.8 Outbound connectivity

5.5.1.8.1 Web proxy

If a Web Proxy Server is necessary for your environment, select **Configure web proxy**, then enter the hostname and credentials for that server.

5.5.1.8.2 Phone home (service)

The support and phone home bundles contain metadata from the Delphix Engine, but do not include the customer data that has been ingested into the Continuous Data Engine. Redaction of known PII data (i.e., names and email addresses for Delphix users) is done on-engine, before and after bundles are uploaded to Delphix, to ensure the latest redaction rules are applied to each bundle without requiring the engine to be continually upgraded. There may be some limited environment data in the bundle (i.e., IP addresses and database names) that are needed for debugging purposes. Support bundles are automatically deleted within 30 days after the support case is closed, or 30 days after upload, whichever comes later.

5.5.1.8.3 Enabling/disabling phone home

Enabling this service sends information to Delphix periodically over HTTPS (SSL). This data is securely managed by the internal team for product analysis and improvements. This feature requires a connection to the internet and will use the Web Proxy Server configuration.

Perform the following steps to enable/disable phone home.

1. Login to the Delphix Continuous Data Engine setup using the sysadmin credentials.
2. From the Outbound Connectivity widget, click **Modify**.
3. To enable phone home, select the checkbox before the **Enable phone home service** option. If enabled, this service will automatically send a stream of anonymous, non-personal metadata describing user interaction with the product's user interface.
4. To disable, deselect the checkbox before the **Enable phone home service** option.
5. Click **Save** to save for the settings.

5.5.1.8.4 User-click analytics

User-click analytics is a lightweight method to capture how users interact with Delphix product UIs, allowing Delphix to collect browser-based, user-click data. Delphix does not collect, transmit, or store any personally identifiable information (PII) such as email addresses, IP addresses, usernames, etc.

5.5.1.8.5 SMTP server

Select **Use an SMTP Server** and enter the server name or IP address to enable email notifications for events and alerts. When a critical fault occurs with the Delphix Engine, it will automatically send an email alert to the admin user. Make sure to configure the SMTP server so that alert emails can be sent to this user. See **System Faults** for more information.

5.5.1.9 Authentication

On the Authentication page, configure authentication protocols such as LDAP and SAML/SSO. See [User and authentication management](#)¹³³ for further details.

5.5.1.9.1 LDAP

To avoid configuration issues, consult with the lightweight directory access protocol (LDAP) administrator before attempting to set up LDAP authentication of users for the Delphix engine. When configuring LDAP, provide an LDAP Server. Two authentication methods are currently supported: **SIMPLE** and **DIGEST_MD5**.

Select to **Protect LDAP traffic with SSL/TLS** if desired. This option requires an import of the server certificate. If LDAP has been set up as an authentication service for the Delphix Engine, add new users with LDAP as their authentication mechanism. For more information, see the [User groups](#)¹³⁴ article.

5.5.1.9.2 SAML/SSO

To enable SAML/SSO, there are two properties to set:

1. **Audience Restriction:** The audience restriction must be set to the entity id configured in the Delphix Server via the Delphix Setup. Its default value is **https://Delphix Server ID**, where **Delphix Server ID** is a 36-character hexadecimal string of the form xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxx.
 - a. See [Determining the Delphix server ID and host name](#)¹³⁵ for more on the Delphix Server ID. If the Continuous Data Engine does not exist or is unreachable, enter a temporary value (such as `delphix-sp-id`), which must later be replaced by the actual Delphix Server ID.
2. **IdP Metadata:** an XML document that must be exported from the application created in the IdP. Paste its contents into the provided field.

5.5.1.10 Kerberos

The Kerberos page allows for Kerberos authentication to communicate between hosts connected with Continuous Data. Enabling this option will allow Kerberos key-based authentication when adding new environments to Continuous Data.

¹³³ <https://cd.delphix.com/docs/latest/user-and-authentication-management>

¹³⁴ <https://cd.delphix.com/docs/latest/users-and-groups>

¹³⁵ <https://cd.delphix.com/docs/latest/determining-the-delphix-server-id-and-host-name>

1. **Realm:** the domain over which a Kerberos authentication server has the authority to authenticate a user, host, or service.
2. **Principal:** a unique identity to which Kerberos can assign tickets.
3. **Keytab:** a file containing pairs of Kerberos principals and encrypted keys (which are derived from the Kerberos password).

5.5.1.11 Registration

As described in [Registration management](#)¹³⁶, registration allows Delphix Support to access the engine, properly diagnose, and identify any issues during support cases. If the Continuous Data Engine has access to the internet, auto-register the engine with Delphix Support credentials in the **Online Registration** section.

If external connectivity is not immediately available, perform the manual registration.

1. Copy the Delphix Engine registration code displayed.
2. Transfer the Delphix Engine's registration code to a workstation with access to the external network Internet. For example, e-mail the registration code to an externally accessible email account.
3. On a machine with access to the internet, use a browser to navigate to the **Delphix Registration Portal** at <http://register.delphix.com>¹³⁷.
4. Log in with Delphix support credentials.
5. Paste the Registration Code.
6. Click **Register**.¹³⁸

The Continuous Data Engine will work without registration, but it is recommended to register each engine as part of the setup. Failing to register the Continuous Data Engine will impact its supportability.

5.5.1.12 Summary

The final Summary section will enable a review of the configurations for each page in the setup tutorial. Confirm that everything looks correct, and click submit to complete the setup.

5.5.1.12.1 After Setup

- After the configuration is complete, the Continuous Data Engine will restart and launch the browser-based Delphix Management application.

¹³⁶ <https://cd.delphix.com/docs/latest/registration-management>

¹³⁷ <https://register.delphix.com/>

¹³⁸ <https://delphixdocs.atlassian.net/wiki/spaces/CC/pages/9962775/Introduction+to+Delphix+Masking>

- After the Delphix Management application launches, the admin can log in using the initial default username **admin** and the initial default password **Delphix**. On the first login, there will be a prompt to change the initial password.

5.5.1.13 Azure object storage setup

From the **Storage** setup page, select **Azure Blob Storage** from the **Storage Type for Data** dropdown menu. For specific block storage requirements, see the **Storage configuration** section of [Deployment for Microsoft Azure](#)¹³⁹.

Delphix is compatible solely with the **Online access tier** ([hot tier](#)¹⁴⁰ of Standard GPv2) for [Azure-Blob](#)¹⁴¹.

Continuous Data Setup

Storage

BLOCK STORAGE FOR CACHE

Enabled	Name	Size	Unused	Expand
<input checked="" type="checkbox"/>	Disk0:1	8.00GB	-	<input type="checkbox"/>

5.5.1.13.1 Access method

You can choose between [Managed Identities](#)¹⁴², including System-assigned and User-assigned types, or the [Access Key](#)¹⁴³ method. Make sure you do not have versioning on your blob/bucket, otherwise deleted space will not be reclaimed since it will be held by the versioning logic of the cloud vendor.

¹³⁹ <https://cd.delphix.com/docs/latest/deployment-for-microsoft-azure>

¹⁴⁰ <https://learn.microsoft.com/en-us/azure/storage/blobs/access-tiers-overview>

¹⁴¹ <https://learn.microsoft.com/en-us/azure/storage/blobs/storage-blobs-introduction#storage-accounts>

¹⁴² <https://learn.microsoft.com/en-us/azure/active-directory/managed-identities-azure-resources/overview>

¹⁴³ [https://learn.microsoft.com/en-us/azure/storage/common/storage-account-keys-manage?](https://learn.microsoft.com/en-us/azure/storage/common/storage-account-keys-manage?toc=%2Fazure%2Fstorage%2Fblobs%2Ftoc.json&bc=%2Fazure%2Fstorage%2Fblobs%2Fbreadcrumb%2Ftoc.json&tab)

[toc=%2Fazure%2Fstorage%2Fblobs%2Ftoc.json&bc=%2Fazure%2Fstorage%2Fblobs%2Fbreadcrumb%2Ftoc.json&tab](https://learn.microsoft.com/en-us/azure/storage/common/storage-account-keys-manage?toc=%2Fazure%2Fstorage%2Fblobs%2Ftoc.json&bc=%2Fazure%2Fstorage%2Fblobs%2Fbreadcrumb%2Ftoc.json&tab)
[s=azure-portal](https://learn.microsoft.com/en-us/azure/storage/common/storage-account-keys-manage?toc=%2Fazure%2Fstorage%2Fblobs%2Ftoc.json&bc=%2Fazure%2Fstorage%2Fblobs%2Fbreadcrumb%2Ftoc.json&tab)

Managed Identities are recommended to minimize security risks and maintenance related to access keys.

<input checked="" type="checkbox"/>	Disk0:1	8.00GB	-	<input type="checkbox"/>

Back Next Submit

5.5.1.13.2 Storage capacity

Enter the desired data storage capacity. Azure Blob's billing is based on actual space used, not provisioned. Therefore, if you allocate 10TB but only use 1TB, charges will apply only to the used space. The specified number also serves as a quota to limit the blob storage from expanding beyond an unforeseen point. This quota can be modified later through the sysadmin login or Setup UI, but not reduced below the current usage by the Delphix Engine.

5.5.1.13.3 Container setup

Input your storage container's name and test the connection to confirm VM accessibility to the container.

5.5.1.13.4 Block storage for cache

Block devices are utilized as cache, reducing latencies for frequently read data and acting as temporary storage for synchronous writes before the writes are persisted to object storage. Size the cache based on your knowledge of the frequently accessed data, adding an extra 10% for overhead, or start with a cache size at 50% of all dSources to be added to the engine.

For detailed block storage requirements, see the **General storage** section of [Deployment for Microsoft Azure](#)¹⁴⁴.

To support the engine's throughput, set up the disks accordingly. For example, Ultra disks are recommended for their customizable high IOPS and throughput, even at smaller sizes.

- Ultra disks can be configured to have high IOPS and throughput at relatively small sizes. At 300 IOPS per GiB ratio, a 256 GB volume can have 76,800 IOPS and 4000 MB/s throughput.
- Premium SSD disks can have high performance, though they need to be much larger. For example, a P80 32TiB volume has 20K IOPS and 900 MB/s. The new Premium SSD v2 disks have better IOPS per GiB ratio though they are not available in all regions. SSD v2 is currently untested due to this unavailability.

5.5.1.13.5 Storage account and permission setup

5.5.1.13.5.1 Storage container

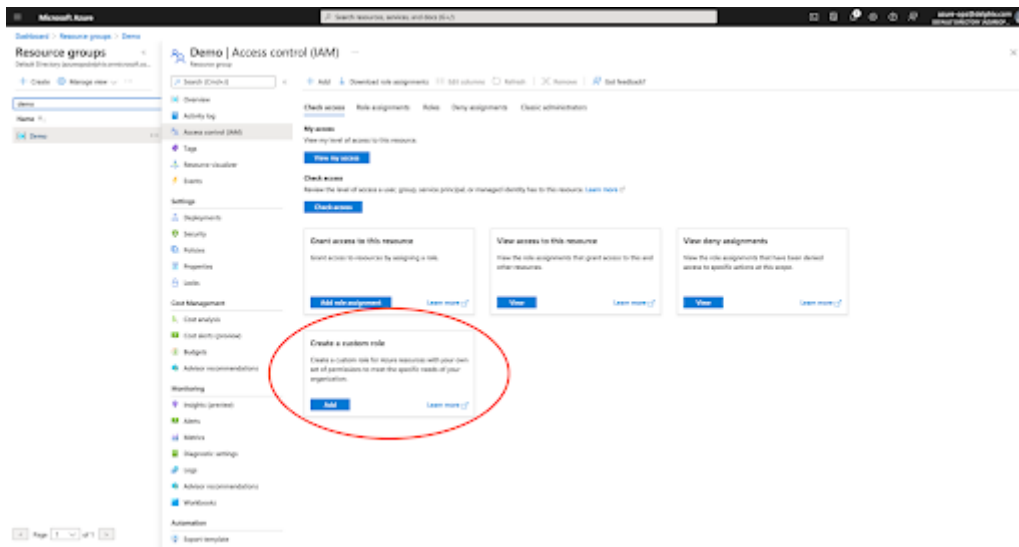

Create a dedicated Storage Account for your Delphix Engine by navigating to Storage Accounts and clicking **Create**. Remember that Azure imposes ingress and egress limitations per storage account, which are detailed in their documentation: <https://docs.microsoft.com/en-us/azure/storage/common/scalability-targets-standard-account>

Next, create a Storage Container within the Storage Account to be used for your Delphix Engine by navigating to the chosen **Storage Account**, selecting **Containers** under **Data Storage**, and clicking **+ Container**. Note the names of the Storage Container, Storage Account, and Resource Group.

5.5.1.13.5.2 Managed role

Forge a custom role to grant access to the storage account, which will be assigned to your virtual machine post-creation. Navigate to the Resource Group containing your Storage Container and select **Access Control (IAM)**.

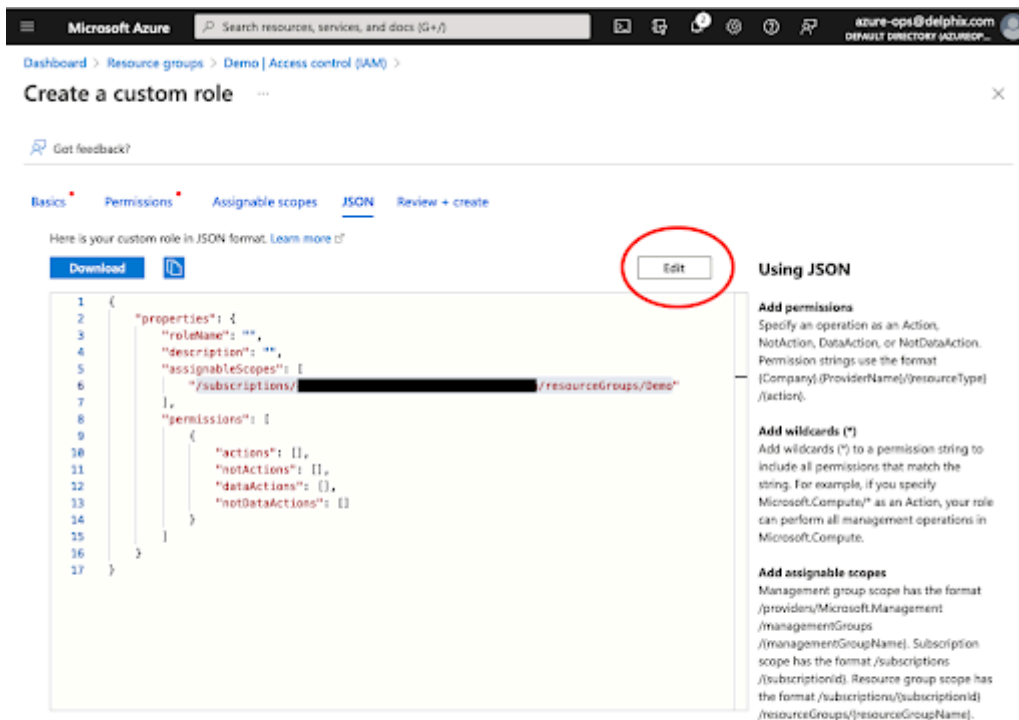

¹⁴⁴ <https://cd.delphix.com/docs/latest/deployment-for-microsoft-azure#Storage-configuration>

Then **Create a custom role** with a minimum scope of the storage account that your Delphix Engine will be using:

Permission Type	Permission
Action	Microsoft.Storage/storageAccounts/blobServices/containers/read
DataAction	Microsoft.Storage/storageAccounts/blobServices/containers/blobs/write
DataAction	Microsoft.Storage/storageAccounts/blobServices/containers/blobs/read
DataAction	Microsoft.Storage/storageAccounts/blobServices/containers/blobs/move/action
DataAction	Microsoft.Storage/storageAccounts/blobServices/containers/blobs/add/action
DataAction	Microsoft.Storage/storageAccounts/blobServices/containers/blobs/delete

For the JSON view, navigate to the role's JSON view, click **Edit**, and replace the bolded sections with your specific values. Save the changes afterwards.

Use the example below, but replace the following placeholders with your values: `Your_Role_Name`, `Your_Subscription_ID`, `Your_Resource_Group_Name`, `Your_Storage_Account_Name`.

```
{
  "properties": {
    "roleName": "<Your_Role_Name>",
    "description": "Delphix object storage Azure role permissions",
    "assignableScopes": [
      "/subscriptions/<Your_Subscription_ID>/resourceGroups/
<Your_Resource_Group_Name>/providers/Microsoft.Storage/storageAccounts/
<Your_Storage_Account_Name>"
    ],
    "permissions": [
      {
        "actions": [
          "Microsoft.Storage/storageAccounts/blobServices/containers/read"
        ],
        "notActions": [],
        "dataActions": [
          "Microsoft.Storage/storageAccounts/blobServices/containers/blobs/write",
          "Microsoft.Storage/storageAccounts/blobServices/containers/blobs/read",
          "Microsoft.Storage/storageAccounts/blobServices/containers/blobs/move/
action",

```

```

        "Microsoft.Storage/storageAccounts/blobServices/containers/blobs/add/
action",
        "Microsoft.Storage/storageAccounts/blobServices/containers/blobs/delete"
    ],
    "notDataActions": []
  }
]
}
}

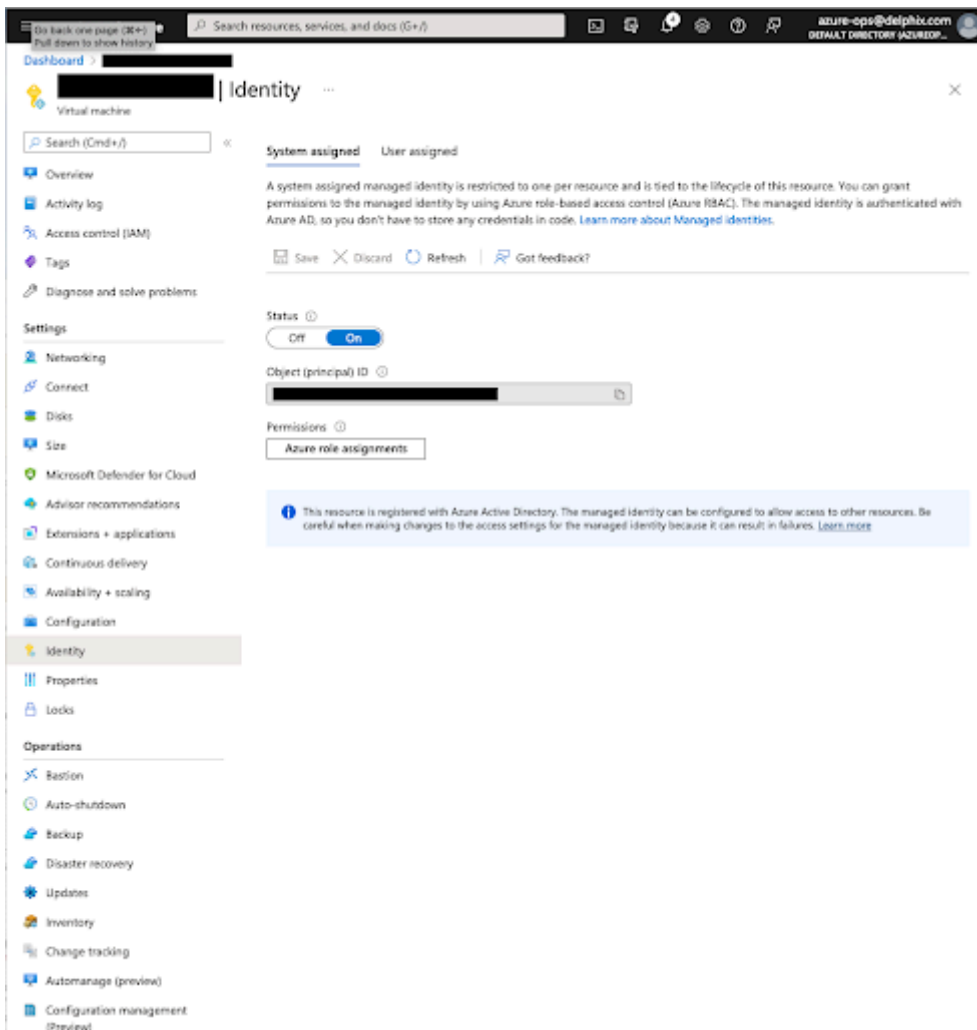

```

5.5.1.13.6 Virtual machine

Ensure the system-assigned Managed Identity is enabled when creating your virtual machine.

Navigate to the virtual machine and click on **Identity** and then **Azure role assignments**. After creation, assign the newly created role to the virtual machine for the necessary permissions.

Click **Add role assignments**. For the scope, select **Storage**. Select your subscription. For **Resource**, select the Storage Account you will be using. For the **Role**, select the new role you created above.

5.5.1.13.7 Testing permissions

To ensure that the role permissions are functioning properly, assign the role to a generic Ubuntu VM with the Azure CLI installed. Follow the [Azure CLI installation](https://learn.microsoft.com/en-us/cli/azure/install-azure-cli)¹⁴⁵ guide.

Then, execute the following commands to test access to your storage container:

```
delphix@demo-vm:~$ az login --identity
[
  {
    "environmentName": "AzureCloud",
    "homeTenantId": "<Tenant>",
    "id": "<ID>",
    "isDefault": true,
```

145 <https://learn.microsoft.com/en-us/cli/azure/install-azure-cli>

```

    "managedByTenants": [],
    "name": "Pay-As-You-Go",
    "state": "Enabled",
    "tenantId": "<Tenant>",
    "user": {
      "assignedIdentityInfo": "MSI",
      "name": "systemAssignedIdentity",
      "type": "servicePrincipal"
    }
  }
]

# List the storage containers
delphix@demo-vm:~$ az storage container list --account-name

5.5.1.13.8 Key based access

If Managed Identities are not used, static Storage Account access keys can be an alternative. Azure's comprehensive guidelines on managing Storage Account access keys, including best practices for key security and rotation, can be found in the [Storage account keys manage](#)¹⁴⁶ article.

5.5.1.14 AWS object storage setup

From the **Storage** setup page, select **AWS Object Storage** from the **Storage Type for Data** dropdown menu.

5.5.1.14.1 Access method

Choose the preferred method for the engine to access the storage bucket: Role ([Instance profile](#)¹⁴⁷) or [Access Key](#)¹⁴⁸. Role-based access is advocated to mitigate security risks and minimize the maintenance associated with access keys.

¹⁴⁶ <https://docs.microsoft.com/en-us/azure/storage/common/storage-account-keys-manage>

¹⁴⁷ <https://repost.aws/knowledge-center/ec2-instance-access-s3-bucket>

¹⁴⁸ https://docs.aws.amazon.com/IAM/latest/UserGuide/id_credentials_access-keys.html

Role-based access is recommended to minimize security risks and maintenance related to access keys.

The screenshot shows the 'Continuous Data Setup' interface. On the left is a navigation menu with steps: Welcome, Administrators, Time, Network, Network Security, **Storage** (highlighted), Outbound Connectivity, Authentication, Network Authorization, Registration, and Summary. The main area is titled 'Storage' and contains the following fields:

- OBJECT STORAGE FOR DATA**
 - Storage Type for Data: AWS Object Storage (dropdown)
 - Role: (dropdown)
 - Max size: (input field) TB (dropdown)
 - Select region: us-west-2 (dropdown)
 - Endpoint: s3.us-west-2.amazonaws.com (input field)
 - Bucket: (input field)
 - Test Connection: (button)

At the bottom right are 'Back', 'Next', and 'Submit' buttons.

5.5.1.14.2 Select region

From the **Select region** dropdown menu, choose from the available AWS regions. If your desired region is not listed, select **Other**, which will prompt you to fill out the **Endpoint**¹⁴⁹ field.

5.5.1.14.3 Storage capacity

Input the desired data storage capacity. AWS S3's pricing is based on the actual storage used. For instance, if you provision 10TB but only 1TB is utilized, you will be charged for the 1TB only. Adjusting this number post-setup is straightforward via the sysadmin login or Setup UI, but it cannot be reduced below the current usage by the Delphix engine. The specified number also serves as a quota to limit the object storage from expanding beyond an unforeseen point.

Enter the name of your bucket in the **Bucket** field and test the connection to verify the VM's access to the bucket.

¹⁴⁹ <https://docs.aws.amazon.com/general/latest/gr/rande.html>

5.5.1.14.4 Block storage for cache

Block devices are utilized as cache, reducing latencies for frequently read data and acting as temporary storage for synchronous writes before the writes are persisted to object storage. The cache should be sized to match the frequently accessed data plus an additional 10% for bookkeeping. Alternatively, begin with a cache sized at 50% of all dSources to be added to the engine.

For specific block storage requirements, refer to the **EBS configuration** section in the [Deployment for AWS EC2¹⁵⁰](#) page.

When setting up the disks, ensure they support the throughput of the engine. For example:

- gp3 disks are recommended as they offer good performance at a lower cost. At 500 IOPS per 1GiB ratio, a 32 GiB volume can be configured to have the gp3 volume 16K IOPS limit and 1000 MB/s throughput. For reference, r5n.8xlarge instance has a 30K IOPS and 850 MB/s throughput limits so two gp3 devices would be sufficient for the instance.
- io2 disks have lower latency at a higher cost. However, the lower latency is not beneficial once the instance IOPS or throughput limit is reached.

5.5.1.14.5 Elastic data engines on AWS: Permissions

At a minimum, the following permissions are required for the object storage bucket:

```
AWS: [  
  "s3:PutObject",  
  "s3:GetObject",  
  "s3:ListBucket",  
  "s3:DeleteObject"  
]
```

5.5.1.15 GCP object storage setup

From the **Storage** setup page, select **GCP Object Storage** from the **Storage Type for Data** dropdown menu.

¹⁵⁰ <https://cd.delphix.com/docs/latest/deployment-for-aws-ec2#EBS-configuration>

5.5.1.15.2 Storage capacity

When specifying storage capacity, note that GCP charges are based on the actual storage used. Thus, if you provision for 10TB but only utilize 1TB, billing will reflect the 1TB of actual usage. Adjusting this capacity is manageable through the sysadmin login or Setup UI, but cannot be decreased below what the Delphix Continuous Data Engine is currently utilizing. The specified number also serves as a quota to limit the object storage from expanding beyond an unforeseen point.

5.5.1.15.3 Bucket

Enter the name of your bucket in the **Bucket** field and test the connection to verify the VM's access to the bucket.

5.5.1.15.4 Block storage for cache

Block devices such as cache are used to reduce latencies for frequently read data and as temporary storage for synchronous writes before the writes are sent to object storage. If you already know the size of the frequently accessed data, then size the cache equal to (size of frequently accessed data + Extra 10% for bookkeeping purposes), If not, start with sizing the cache to 50% of the size of all dSources that will be added to the engine.

For the detailed block storage requirements, refer to the **General storage configuration** section in the [Deployment for GCP \(see page 663\)](#) documentation.

Set up the disks such that they can support the throughput of the engine. **SSD Persistent Disks** are recommended.

5.5.1.15.5 Elastic data engines on GCP: Permissions

5.5.1.15.5.1 Setup

Create a service account and custom role and assign that role to a virtual machine.

- Enable private Google Access on the subnet used by the VM if it is not in the public subnet
- Create a virtual machine
- Create a bucket
- Create a compute service account

5.5.1.15.5.2 Permissions

Create a service account and provide access scoped to storage APIs or all cloud APIs. The account creating the virtual machine should have `serviceAccountUser` permissions on the service account so that while creating the instance this account could be assigned.

5.5.1.15.5.3 scopes = ["cloud-platform"]

The service account should have permissions to the following roles:

- legacyBucketWriter
- legacyObjectOwner

Here is an example of applying permissions from this service account on a bucket.

You can also create and use a custom role for providing more restrictive permissions.

5.5.1.15.5.4 Bucket Protection and Lifecycle

Any protection policy (e.g. Object versioning, retention, event-based hold, etc...) or added Lifecycle rules are not supported. If present, the connectivity test to the bucket will fail or will have an adverse effect on the engine's data storage stability.

5.5.1.15.5.5 Testing Bucket Permissions

You can test the connection from the Delphix engine to the bucket via the Setup UI, but there is no way in the Setup UI to test the connection without starting from the beginning of setup for the engine. To test only the engine connection to a bucket or multiple buckets, use the `testConnection` API in the Delphix Continuous Data Engine CLI and look for the result status after executing the commit operation. If the connection test is successful, the result status will be true. Here is an example of how to use the Delphix Continuous Data Engine CLI to test the engine connection to the object storage bucket, which results in a successful connection. The engine hostname in the example is `test-gcp`:

```
$ ssh sysadmin@test-gcp
test-gcp> storage objectStorage testConnection

test-gcp objectStorage testConnection *> set type=GcpObjectStoreTest

test-gcp storage objectStorage testConnection *>

test-gcp storage objectStorage testConnection *> ls

Properties

  type: GcpObjectStoreTest (*)

  bucket: (required)

test-gcp storage objectStorage testConnection *> set bucket=test-gcp-1

test-gcp storage objectStorage testConnection *> commit

  type: ObjectStoreTestResult
```

```
errorMessage: (unset)
result: true
```

5.5.1.16 OCI object storage setup

From the **Storage** setup page, select **OCI Object Storage** from the **Storage Type for Data** dropdown menu.

5.5.1.16.1 Access method

For accessing the object storage, OCI supports Role ([Instance Principals](https://docs.oracle.com/en-us/iaas/Content/Identity/Tasks/callingservicesfrominstances.htm)¹⁵¹) as the sole method. This approach parallels the role-based access of AWS IAM, promoting secure and low-maintenance access to the object storage.

151 <https://docs.oracle.com/en-us/iaas/Content/Identity/Tasks/callingservicesfrominstances.htm>

Storage

OBJECT STORAGE FOR DATA

Storage Type for Data
OCI Object Storage

Max size: TB

Bucket

Test Connection

BLOCK STORAGE FOR CACHE

Rediscover

Enabled	Name	Size	Unused	Expand
<input checked="" type="checkbox"/>	xvdb	200.00GB	-	<input type="checkbox"/>

5.5.1.16.2 Storage capacity

When specifying storage capacity, note that OCI charges based on the actual storage used. Thus, if you provision for 10TB but only utilize 1TB, billing will reflect the 1TB of actual usage. Adjusting this capacity is manageable through the sysadmin login or Setup UI, but cannot be decreased below what the Delphix engine is currently utilizing. The specified number also serves as a quota to limit the object storage from expanding beyond an unforeseen point.

Ensure that the bucket name is correctly entered in the **Bucket** field and test the connection to verify the VM's access to the bucket.

5.5.1.16.3 Block storage for cache

Block devices are utilized as cache, reducing latencies for frequently read data and acting as temporary storage for synchronous writes before the writes are persisted to object storage. The cache size should be equivalent to the size of the frequently accessed data, plus an additional 10% for overhead. If the data size is unknown, initiate with a cache sized at 50% of the dSources to be added to the engine.

For detailed block storage requirements, refer to the **General storage configuration** section in the [Deployment for OCI¹⁵²](#) documentation.

¹⁵² [https://cd.delphix.com/docs/latest/deployment-for-oci#id-\(16.0.0.0\)DeploymentforOCI-Generalstorageconfiguration](https://cd.delphix.com/docs/latest/deployment-for-oci#id-(16.0.0.0)DeploymentforOCI-Generalstorageconfiguration)

It is important to configure the disks to support the engine's throughput, such as using Ultra High Performance or Higher Performance volumes, which are supported. The maximum IOPS and throughput will be proportional to the volume size, requiring a minimum size of 200GB for Higher Performance volumes.

5.5.1.16.4 Permissions and setup

5.5.1.16.4.1 Setup

The OCI IAM allows for access to various services from an OCI instance without API keys or customer secrets. Instance principals provide a secure method for service access, similar to AWS IAM Roles.

To create a dynamic group in the OCI Console, navigate to **Identity** → **Dynamic Groups** → **Create Dynamic Group**. Specify the **Name** and **Description** the group and choose if you want all the rules or just one to match for the dynamic group.

The screenshot shows the 'Create Dynamic Group' interface in the Oracle Cloud console. The 'Name' field contains 'demo-prod' and the 'Description' field contains 'Dynamic group used for prod instances'. Under 'Matching Rules', there is an example rule: 'Any (instance.id = 'ocid1.instance.oc1.iad..exampleuniqueid1', instance.compartment.id = 'ocid1.compartment.oc1..exampleuniqueid2')'. Below the example, there are two radio buttons: 'Match any rules defined below' (unselected) and 'Match all rules defined below' (selected). A 'Rule 1' field is empty, and there is a 'Rule Builder' button next to it. At the bottom right, there is a '+ Additional Rule' button. At the bottom left, there are 'Create', 'Cancel', and 'Create Another Dynamic Group' buttons.

5.5.1.16.4.2 Creating rules

Dynamic groups require rules to identify which instances belong to them. For instance, rules can be based on the tag value of an instance or the presence of instances in a specific compartment. Here are examples of rules:

- `tag.InstanceType.value = 'prod'` : Check the tag value on the instance and match it with some defined value.
- `instance.compartment.id = 'ocid1.compartment.oc1..aaaaaaxx'` : All the instances present in a specific compartment.

5.5.1.16.4.3 Policy

Post group creation, it is necessary to define a policy specifying the access level for the service. A policy instructs the OCI IAM to provide access to the dynamic group. To understand OCI Policies in detail, visit [How Policies Work \(without Identity Domains\)](#)¹⁵³. Policies can be created via the OCI Console by navigating to **Identities** → **Policies** → **Create Policy**, where you can specify the **Name**, **Description**, **Compartment**, and **Policy Statement**.

The policy should allow the dynamic group to manage and inspect buckets and objects within a specified compartment. Here is an example of a policy statement:

```
Allow dynamic-group <dynamic group name> to manage buckets in compartment id
<compartment id> where target.bucket.name=<regex for bucket name>
Allow dynamic-group <dynamic group name> to inspect buckets in compartment id
<compartment id>
Allow dynamic-group <dynamic group name> to manage objects in compartment id
<compartment id> where target.bucket.name=<regex for bucket name>
```

Once the setup is complete, instances launched in the specified compartment with the defined tag will have access to manage object storage objects within that compartment.

5.5.1.16.5 Testing permissions

You can demonstrate the use of instance principals with the OCI CLI, which does not require managing security credentials. The OCI CLI can be installed on various operating systems following the [Quickstart](#)¹⁵⁴ guide. With the CLI, you can make calls using the `--auth instance_principal` parameter. Here are some example commands:

```
# Get details of a bucket
oci os bucket get -bn prodbucket --auth instance_principal

# Upload an object to a bucket
oci os object put -bn prodbucket --auth instance_principal --file object.txt
```

Setting `OCI_CLI_AUTH=instance_principal` as an environment variable is also an option.

Instance principals are compatible with OCI CLI and SDKs such as Python and Java but do not work with the Amazon S3 Compatibility API, which requires customer secret keys.

¹⁵³ <https://docs.oracle.com/en-us/iaas/Content/Identity/Concepts/policies.htm>

¹⁵⁴ <https://docs.oracle.com/en-us/iaas/Content/API/SDKDocs/cliinstall.htm>

5.5.1.17 Other S3 compatible object storage setup

From the **Storage** setup page, select **Other S3 Compatible Object Storage** for use only with Private Cloud/on-premise object storage from the **Storage Type for Data** dropdown menu.

The screenshot shows the 'Continuous Data Setup' interface. On the left, a sidebar lists setup steps: Welcome, Administrators, Time, Network, Network Security, **Storage** (selected), Outbound Connectivity, Authentication, Network Authorization, Registration, and Summary. The main content area is titled 'Storage' and features a dropdown menu for 'Storage Type for Data'. The dropdown is open, showing options: OCI Object Storage, AWS Object Storage, Azure Blob Storage, **Other S3 Compatible Object Storage** (highlighted), and Block Storage. Below the dropdown, there are input fields for 'Access ID' and 'Access Key'. Further down, there are fields for 'Max size' (with a dropdown set to 'TB'), 'Region', 'Endpoint', and 'Bucket'. A 'Test Connection' button is located below these fields. At the bottom right, there are 'Back', 'Next', and 'Submit' buttons.

5.5.1.17.1 Access method

For on-premise object storage we currently support storage vendors that conform to the following

- S3 REST API compatibility
- strong read-after-write consistency
- supports S3 key id and secret access key authentication
- perpetual key support

Should your on-premise object storage require a security certificate for secure connections between the Delphix engine and the object storage, this certificate must be installed on the Delphix engine before configuring the storage. For more information, refer to the [Certificate management](https://cd.delphix.com/docs/latest/certificate-management)¹⁵⁵ page.

¹⁵⁵ <https://cd.delphix.com/docs/latest/certificate-management>

The screenshot shows the 'Continuous Data Setup' interface. On the left is a vertical navigation menu with steps: Welcome, Administrators, Time, Network, Network Security, **Storage** (highlighted with a blue dot), Outbound Connectivity, Authentication, Network Authorization, Registration, and Summary. The main content area is titled 'Storage' and 'OBJECT STORAGE FOR DATA'. It features a dropdown menu for 'Storage Type for Data' set to 'Other S3 Compatible Object Storage'. Below this are input fields for 'Access ID', 'Access Key', 'Max size', 'Region', 'Endpoint', and 'Bucket'. A 'Test Connection' button is located below the 'Bucket' field. At the bottom right, there are 'Back', 'Next', and 'Submit' buttons.

5.5.1.17.2 Authentication details

The following details are required for accessing the on-premise object storage:

- Access ID
- Access Key
- Region (optional, depending on whether a region is required for your setup)
- Endpoint
- Bucket

Enter these details carefully and ensure that you test the connection to confirm that the VM can access the bucket.

5.5.1.17.3 Storage capacity

Determine the amount of data you wish to store on the engine. This size should be akin to the total storage on a traditional engine. With Elastic Data Engines, modifying this number post-setup is straightforward, accessed via the sysadmin login or Setup UI, but it cannot be decreased below the engine's current usage. The specified number also serves as a quota to limit the object storage from expanding beyond a certain point.

5.5.1.17.4 Block storage for cache

Block devices are utilized as cache, reducing latencies for frequently read data and acting as temporary storage for synchronous writes before the writes are persisted to object storage. When sizing the cache, if the size of the frequently accessed data is known, set the cache size to equal that amount plus an extra 10%

for overhead. If the size is uncertain, start with a cache that is 50% of the total size of all dSources to be added to the engine.

For detailed block storage requirements, see the **General storage** section of [Deployment for VMware](#)¹⁵⁶.

Ensure that the disks are set up to handle the engine's throughput needs.

5.5.1.18 Updating object storage endpoints

In 18.0.0.0, parameters like endpoint, region, bucket/container, and access credentials can be updated. This ability is only available via the CLI, with a graphical interface soon to come.

The following example CLI session shows how the `accessCredentials` can be updated (from using keys to using managed identities) on a cloud engine:

```
az-test> storage objectStorage
az-test storage objectStorage> get
  type: BlobObjectStore
  accessCredentials:
    type: BlobObjectStoreAccessKey
    azureAccount: doseprod
    azureKey: *****
  cacheDevices: lun0,lun1,lun2
  configured: true
  container: az-test
  endpoint: -
  size: 1TB
az-test storage objectStorage> update
az-test storage objectStorage update *> edit accessCredentials
az-test storage objectStorage update accessCredentials *> set
type=BlobObjectStoreAccessManagedIdentities
az-test storage objectStorage update accessCredentials *> get
  type: BlobObjectStoreAccessManagedIdentities (*)
  azureAccount: doseprod
az-test storage objectStorage update accessCredentials *> commit
az-test storage objectStorage> get
  type: BlobObjectStore
  accessCredentials:
    type: BlobObjectStoreAccessManagedIdentities
    azureAccount: doseprod
  cacheDevices: lun0,lun1,lun2
  configured: true
  container: az-test
```

¹⁵⁶ <https://cd.delphix.com/docs/latest/deployment-for-vmware#SCSI-controller>

```

endpoint: -
size: 1TB
az-test storage objectStorage>

```

5.5.2 Customizing the Delphix Continuous Data Engine system settings

5.5.2.1 Overview

This page describes how to customize the initial system setup requirements for memory, number of CPUs, storage disks, and network configuration. The OVA file used to install the Delphix Continuous Data Engine is configured for the minimum system requirements. These can be customized to match the capabilities of a specific system.

5.5.2.2 Procedure

1. Shut down the guest operating system and power off the Delphix Continuous Data Engine.
2. From **Getting Started**, select **Edit Virtual Machine Settings**.
3. The system settings can now be customized.

Setting	Options
Memory Size	Set to 64GB or larger based on sizing analysis. In the Resource Allocation panel, ensure that Reserve all guest memory is checked. To adjust the resource allocation of a VM without rebooting it, Delphix supports "hot-plugging" CPUs and memory to ZFS. Please note that this is only available on ESX. For more information, refer to the Enabling hot-adding section on this page.
Number of CPUs	Allocate 8 vCPUs or more based on Delphix licensing. vCPUs should be fully reserved to ensure that the Delphix Engine does not compete for CPU cycles on an overcommitted host.

Setting	Options
Supported Controllers	<p>Delphix supports Paravirtual SCSI (PVSCSI) controllers or LSI Parallel controllers. A mix of different types of SCSI controllers is not supported within the engine.</p> <p>It is recommended to use PVSCSI controllers by default. Although PVSCSI supports high throughput with minimal processing cost, the performance improvements on Delphix Engine may vary from case to case.</p>
Disks for Data Storage	<p>Add virtual disks to provide storage for user data such as dSources and VDBs. The underlying storage must be redundant. Add a minimum of 150GB per storage disk. All virtual disks should be the same size and have the same performance characteristics. If using VMFS, use thick provisioned, lazy zeroed disks. To alleviate IO bottlenecks at the virtual controller layer, spread the virtual disks across all four virtual SCSI controllers.</p>
Data Storage Multipathing Policy	<p>For EMC storage, the multipathing policy should always be set to round-robin (default for 5.x). Additionally, change the IO Operation Limit from the default of 1000 to 1. This should be strongly considered for other storage platforms as well.</p> <p>See VMware KB article EMC VMAX and DMX symmetrix storage array recommendations for optimal performance on VMware ESXi/ESX¹⁵⁷.</p>

157 <https://kb.vmware.com/s/article/2072070>

Setting	Options
Network	<p>The network configuration is set to have a VMXNET3 network adapter. VMXNET3 is a tuned network interface that is included with the VMtools provided in the OVA file. It will be assigned to VM Network.</p> <p>JUMBO Frames VMXNET3 supports Ethernet jumbo frames, this can be used to maximize throughput and minimize CPU utilization.</p> <p>Adding Link Aggregation via VMware NIC Teaming To increase throughput or for failover, add multiple physical NICs to the vSwitch that is connected to the Delphix Engine. To increase throughput, NIC Teaming must use the Route Based on IP Hash protocol for load balancing.</p> <p>Dedicate Physical NICs to the Delphix Engine For best performance, assign the Delphix Engine to network adapters that are used exclusively by Delphix.</p>

The Delphix Continuous Data Engine supports a maximum of 750 objects. However, managing a higher number of objects may require increased memory and CPU resources. Therefore, system specifications must be upgraded based on usage to ensure optimal performance.

5.5.2.3 Enabling hot-adding

To manually enable hot-adding in the vCenter console, use the following steps.

1. Login into the Delphix Continuous Data Engine.
2. Right-click on the engine and select **Edit settings**.
3. Edit settings:
 - a. To enable CPU hot-add, navigate to the CPU section and select the **CPU Hot Plug** checkbox.
 - b. To enable memory hot-add, navigate to the memory section and select the **Memory Hot Plug** checkbox.
4. Modify the appropriate setting to the new value; note that only expansion of CPU and memory is supported, and attempts to reduce the values available to the Delphix Engine will fail.
5. Click **Ok** to confirm the changes.

Newly-added memory is not automatically reflected in system information APIs nor in the UI. Restarting the management service is needed to refresh this information.

For customers migrating from versions before 6.0, an extra step is required to enable CPU/memory hot-plug.

1. After migrating, turn off the VM.
2. Open **VM Settings**.
3. Select **VM Options**.
4. Under **General**, update the guest OS to Ubuntu (64-bit).
5. Under **Advanced**, select **Edit Configuration**.
6. Set **disk.EnableUUID** to TRUE.
7. Follow normal hot-plug enable steps.

For customers that are upgrading their existing engines from versions below 6.0.6.0, two vSphere properties need to be enabled manually after the upgrade from vSphere in order to use this feature. The properties are **cpusHotAddEnabled** and **memoryHotAddEnabled**. When upgrading to 6.0 from 5.3, the guest OS and version in vSphere also needs to be updated to Ubuntu, in addition to the above two properties. Without this, it has been noticed that hot-adding memory is not allowed from vSphere, even if memoryHotAddEnabled is enabled.

5.5.2.4 Post-requisites

- After making any changes to the system settings, power on the Delphix Engine again and proceed with the initial system configuration as described in [Setting up network access to the Delphix engine](#) (see page 583).

5.5.3 Installing an OVA or AMI

5.5.3.1 Overview

This article outlines how to install the Delphix Engine using an OVA or AMI file.

5.5.3.2 Procedure to install an OVA

Use the Delphix-supplied OVA file to install the Delphix Engine. The OVA file is configured with many of the minimum system requirements. The underlying storage for the install is assumed to be redundant SAN storage.

1. Download the OVA file from <https://download.delphix.com>¹⁵⁸. A support login is needed from the Delphix representative or welcome letter.
 - a. Navigate to the Delphix Product Releases/<Current Version>/Appliance Images page.
2. Login using the vSphere client to the vSphere server (or vCenter Server) where the Delphix Engine will be installed.
3. In the vSphere Client, click **File**.
4. Select **Deploy OVA Template**.
5. Browse to the OVA file.
6. Click **Next**.
7. Select a **hostname** for the Delphix Engine. This hostname will also be used in configuring the Delphix Engine network.
8. Select the **data center** where the Delphix Engine will be located.
9. Select the **cluster** and the **ESX host**.
10. Select one (1) **data store** for the **Delphix OS**. This datastore can be **thin-provisioned** and must have enough free space to accommodate the 127GB comprising the Delphix operating system.
11. Select four (4) or more **data stores** for Database Storage for the Delphix Engine. The Delphix Engine will stripe all of the Database Storage across these VMDKs, so for optimal I/O performance, each VMDK must be equal in size and be configured **Thick Provisioned - Eager Zeroed**. Additionally, these VMDKs should be distributed as evenly as possible across all four SCSI I/O controllers.
12. Select the **virtual network** to be used. If using multiple physical NICs for link aggregation, vSphere NIC teaming must be used. Do not add multiple virtual NICs to the Delphix Engine itself. The Delphix Engine should use a single virtual network. For more information, see [Optimal Network Architecture for the Delphix Engine \(see page 733\)](#).
13. Click **Finish**. The installation will begin and the Delphix Engine will be created in the location specified.
14. Once the installation has completed, power on the Delphix Engine and proceed with the initial system configuration as described in [Setting Up Network Access to the Delphix Engine \(see page 583\)](#).

5.5.3.3 Procedure to install an AMI

Use the Delphix-supplied AMI file to install the Delphix Engine.

1. On the Delphix download site, click the AMI to be shared and accept the Delphix License agreement. Alternatively, follow a link given by the Delphix solutions architect.
2. On the **Amazon Web Services Account Details** form presented:

¹⁵⁸ <https://download.delphix.com/>

- a. Enter the **AWS Account Identifier**, which can be found here: <https://console.aws.amazon.com/billing/home?#/account>¹⁵⁹. To use the **Gov Cloud AWS Region**, be sure to enter the ID for the AWS Account which has Gov Cloud enabled.
 - b. Select which **AWS Region** the AMI should be shared in. To have the AMI shared in a different region, contact the Delphix account representative for the proper arrangements.
3. Click **Share**. The Delphix Engine will appear in the list of AMIs in AWS momentarily.

5.6 Validating host deployment with host Checker

5.6.1 Overview

Delphix has developed a hostchecker script that contains standardized checks for source and target hosts - these checks generally fall into three buckets:

- OS and Host permissions/access
- Network Port Checks
- DB-specific functionality

OS and Host permissions/access and network port checks can (and should) be performed prior to Delphix installation to ensure a smooth deployment.

Each DB should have a specifically associated hostchecker, there is detailed documentation on the DB-specific hostchecker page.

5.6.2 Procedure

1. Download the appropriate **HostChecker tarball** for the engine from <https://download.delphix.com/>. Tarballs follow the naming convention "hostchecker_<OS>_<processor>.tar". For example, if validating a linux x86 host, download the hostchecker_linux_x86.tar tarball.
2. Create a working directory and extract the **HostChecker files** from the **HostChecker tarball**

```
mkdir dlp-host-checker
cd dlp-host-checker/
tar -xf hostchecker_linux_x86.tar
```

3. Run the `sh` script contained within:

```
sh hostchecker.sh
```

¹⁵⁹ <https://console.aws.amazon.com/billing/home?#/account>

This will extract the JDK included in the tarball (if necessary) and invoke the HostChecker.

```
ora10205@bbdhcp: /home/ora10205/hostchecker- > sh hostchecker.sh  
Extracting the JDK from the tarball jdk-6u45-linux-i586.tar.gz.
```

Do not run the HostChecker as root; this will cause misleading or incorrect results from many of the checks.

4. Select which **checks** to run. Note that it is possible to run checks without spawning the interface. Enter `--help` to get a list of arguments that can pass to the HostChecker.
5. As the checks are made, enter the requested **arguments**.
6. Read the output of the check. The general format is that severity increases farther down the output. First comes informational output, then warnings, then errors. If you see a message that starts with `Internal Error`, forward it to Delphix Support immediately. This represents a potential bug in the HostChecker, and not necessarily a problem with your environment.
7. Error or warning messages will explain any possible problems and how to address them. Resolve the issues that the HostChecker describes. Do not be surprised or undo your work if more errors appear the next time you run HostChecker, because the error you just fixed may have been masking other problems.
8. Repeat steps 3 - 7 until all the checks return no errors or warnings.

5.7 Deployment for VMware

5.7.1 Overview

This article outlines the requirements for deploying the Delphix Engine on VMware (including supported versions and instance configurations), as well as recommended configuration parameters for optimal performance.

The Delphix Engine is an intensive platform, both from a network and a storage perspective. If the Delphix Engine competes with other virtual machines on the same host for resources it will result in increased latency for all operations. As such, it is crucial that the ESXi host is not over-subscribed, as this eliminates the possibility of a lack of resources for the Delphix Engine. This includes allowing a percentage of CPU resources for the hypervisor itself as it can de-schedule an entire VM if the hypervisor is needed for managing IO or compute resources.

Delphix disk storage capabilities are based on the backend storage provided. Performance, redundancy, and stability characteristics are determined by the hypervisor or Cloud provisioned storage.

5.7.2 Supported ESX versions

Requirements	Notes
<ul style="list-style-type: none"> VMware Cloud VMware ESXi 8.0, 8.0 U1 VMware ESXi 7.0, 7.0 U1, 7.0 U2, 7.0 U3 VMware ESXi 8.0, 8.0 U1, 8.0 U2, 8.0 U3 	<ul style="list-style-type: none"> If a minor release version is listed as supported, then all patch releases applicable to that minor release are supported. Public cloud deployments such as VMware cloud on AWS¹⁶⁰ and Azure VMware solution¹⁶¹ are supported. While ESXi 7.0 U3 is supported, this is only for patch releases 3c and newer, due to critical issues in the earlier patch versions¹⁶².

5.7.3 Virtual machine hardware versions

The Delphix Engine VM is distributed as an OVA for VMware, and is configured with the hardware version corresponding to the lowest ESXi version that release is qualified for. As the Engine is upgraded, the ESXi versions supported may change, but the hardware version may remain the same based on the original deployment.

Users who wish to upgrade the VM hardware version for compatibility, enhanced feature support, or other reasons may feel free to do so, with consideration for any compatibility concerns that may arise in environments where multiple ESXi versions are present, as an upgraded hardware version can affect other VMware operations (vMotion, etc). VMware support and documentation should be consulted before committing any hardware version upgrade for a guest VM, but Delphix does not maintain any version requirements in this regard.

¹⁶⁰ <https://www.vmware.com/products/vmc-on-aws.html>

¹⁶¹ <https://azure.microsoft.com/en-us/products/azure-vmware>

¹⁶² <https://kb.vmware.com/s/article/86398>

5.7.4 Virtual CPUs

Requirements	Notes
8 vCPUs	<ul style="list-style-type: none"> • CPU resource shortfalls can occur both on an over-committed host as well as competition for host resources during high IO utilization. • CPU reservations are strongly recommended for the Delphix VM so that Delphix is guaranteed the full complement of vCPUs even when resources are overcommitted. • It is suggested to use a single core per socket unless there are specific requirements for other VMs on the same ESXi host.
Never allocate all available physical CPUs to virtual machines	<ul style="list-style-type: none"> • CPU for the ESXi Server to perform hypervisor activities must be set aside before assigning vCPUs to Delphix and other VMs. • We recommend that a minimum of 8-10% of the CPUs available are reserved for hypervisor operation. (e.g. 12 vCPUs on a 128 vCore system).

5.7.5 Memory

Requirements	Notes
128 GB vRAM (recommended) 64GB vRAM (minimum)	<ul style="list-style-type: none"> • The Delphix Engine uses its memory to cache database blocks. More memory will provide better read performance. • Memory reservations are required for the Delphix VM. The performance of the Delphix Engine will be significantly impacted by the over-commitment of memory resources in the ESX Server. • Reservations ensure that the Delphix Engine will not be forced to swap pages during times of memory pressure on the host. A swapped page will require orders of magnitude more time to be brought back to physical memory from the ESXi swap device.

Requirements	Notes
Never allocate all the available physical memory to virtual machines.	<ul style="list-style-type: none"> The default ESX minimum free memory requirement is 6% of the total RAM. When free memory falls below 6%, ESX starts swapping out the Delphix guest OS. Delphix recommends leaving about 8-10% free to avoid swapping. For example, when running on an ESX Host with 512GB of physical memory, no more than 470GB (92%) should be allocated to the Delphix VM (and all other VMs on that host).
Memory for the ESX Server to perform hypervisor activities must be set aside before assigning memory to Delphix and other VMs.	Failure to ensure sufficient memory for the host can result in a hard memory state for all VMs on the host which will result in a block for memory allocations.

5.7.6 Network

Requirements	Notes
The ova is pre-configured to use one virtual ethernet adapter of type VMXNET 3.	<ul style="list-style-type: none"> Jumbo frames are highly recommended to reduce CPU utilization, decrease latency and increase network throughput. (typically 10-20% throughput improvement) If additional virtual network adapters are desired, they should also be of type VMXNET 3.
A 10GbE NIC in the ESX Server is recommended.	<ul style="list-style-type: none"> For VMs having only gigabit networks, it is possible to aggregate several physical 1GbE NICs together to increase network bandwidth (but not necessarily to reduce latency). Refer to NIC teaming in ESXi and ESX and process to configure¹⁶³ for more information. However, it is not recommended to aggregate NICs in the Delphix Engine VM.

¹⁶³ <https://knowledge.broadcom.com/external/article?legacyId=1004088>

Requirements	Notes
<p>If the network load in the ESX Server hosting the Delphix engine VM is high, dedicate one or more physical NICs to the Delphix Engine.</p>	<ul style="list-style-type: none"> • Adding NICs only works if VMs are discovered using different interfaces. The NFS/iSCSI mounts will only use the network associated with the discovery. • See General Network and Connectivity Requirements (see page 731) for information about specific port configurations, and Network Performance Configuration Options (see page 733) for information about network performance tuning

To bootstrap a networking configuration to reach the Delphix Engine, after deploying it into your environment for the first time, you can use one of the following options:

- DHCP
- Cloud-init for public clouds
- You can login to the serial console to configure networking via the CLI
- [OVF guest customizations \(see page 613\)](#) to pass in network configuration to the VM before it has a network connection. For the customization steps:
 - Type the name of the profile and click **Next**
 - The domain will be ignored by Delphix. Click **Next**
 - The time zone setting will be ignored by Delphix, Click **Next**
 - Delphix doesn't allow scripts, click **Next**
 - Manually select custom settings, select a **NIC** and click **Edit**
 - Provide **Netmask** and **Gateway**
 - Select one of the options for IP
 - Confirm changes and click **Next**
 - Add **DNS**
 - Confirm creation of profile, click **Finish**
 - You can use this template to clone a VM

5.7.7 SCSI controller

Requirements	Notes
PVSCSI (default)/ LSI Logic Parallel	<p>When adding virtual disks make sure that they are evenly distributing the load across the maximum of 4 virtual SCSI controllers. Spreading the disks across available SCSI controllers evenly will ensure optimal IO performance from the disks. For example, a VM with 4 SCSI controllers and 8 virtual disks should distribute the disks across the controllers as follows:</p> <p>disk0 = SCSI(0:0) - System Disk on Controller 0 Port 0 (ignore for purposes of load balancing)</p> <p>disk1 = SCSI(0:1) - Data Disk on Controller 0 Port 1 disk2 = SCSI(1:1) - Data Disk on Controller 1 Port 1 disk3 = SCSI(2:1) - Data Disk on Controller 2 Port 1 disk4 = SCSI(3:1) - Data Disk on Controller 3 Port 1</p> <p>disk1 = SCSI(0:2) - Data Disk on Controller 0 Port 2 disk2 = SCSI(1:2) - Data Disk on Controller 1 Port 2 disk3 = SCSI(2:2) - Data Disk on Controller 2 Port 2 disk4 = SCSI(3:2) - Data Disk on Controller 3 Port 2</p> <div style="border: 1px solid black; padding: 10px; margin-top: 10px;"> <p>For load purposes, we generally focus on the Delphix storage (data disks) and ignore the controller placement of the system disk.</p> <p>IDE and SATA controllers are not supported on VMware platforms</p> </div>

5.7.8 General storage

VMware offers options for disk storage, which include "Independent - Persistent" and "Independent - Non-persistent". The non-persistent setting is catastrophic to the Delphix platform when the VM reboots, thus, **Independent - Persistent** is required for installation.

Requirements	Notes
Storage used for Delphix must be provisioned from storage that provides data protection.	<p>For example, using RAID levels with data protection features, or equivalent technology.</p> <p>The Delphix engine product does not protect against data loss originating at the hypervisor or SAN layers.</p> <p>For more information refer to, Optimal Storage Configuration Parameters for the Delphix Engine (see page 911).</p>

5.7.9 Delphix storage options

There are three types of data that Delphix stores on disk, which is:

1. **Delphix VM Configuration Storage:** stores data related to the configuration of the Delphix VM. VM Configuration Storage includes the VMware ESX configuration data as well as log files.
2. **Delphix Engine System Disk Storage:** stores data related to the Delphix Engine system data, such as the Delphix .ova settings.
3. **Database Storage:** stores data used by Delphix objects such as dSources and virtual databases (VDBs).

5.7.9.1 Delphix VM configuration storage

The Delphix VM configuration should be stored in a VMFS volume (often called a "datastore").

Requirements	Notes
The VMFS volume should have enough available space to hold all ESX configuration and log files associated with the Delphix Engine.	If a memory reservation is not enabled for the Delphix Engine (in violation of memory requirements stated above), then space for a paging area equal to the Delphix Engine's VM memory must be added to the VMFS volume containing the Delphix VM configuration data.

5.7.9.2 Delphix engine system disk storage

The VMFS volume must be located on shared storage in order to use vMotion and HA features.

Requirements	Notes
The Delphix Engine system disk should be stored in a VMDK.	<ul style="list-style-type: none"> The VMDK for the Delphix Engine System Disk Storage is often created in the same VMFS volume as the Delphix VM definition. In that case, the datastore must have sufficient space to hold the Delphix VM Configuration, the VMDK for the system disk, and a paging area if a memory reservation was not enabled for the Delphix Engine.
The Delphix .ova file is configured for a 127GB system drive.	<ul style="list-style-type: none"> The VMFS volume where the .ova is deployed should, therefore, have at least 127GB of free space prior to deploying the .ova.

5.7.9.3 Database storage

5.7.9.4 Option 1: Block Storage for database storage

Shared storage is required in order to use vMotion and HA features. In addition to making sure the latest VMware patches have been applied, check with the organizations hardware vendor for updates specific to the hardware configurations. VMDKs (Virtual Machine Disks) or RDMs (Raw Device Mappings) operating in virtual compatibility mode can be used for database storage.

Requirements	Notes
A minimum of 4 VMDKs or RDMs should be allocated for database storage.	<ul style="list-style-type: none"> Allocating a minimum of 4 VMDKs or RDMs for database storage enables the Delphix File System (DxFS) to make sure that its file systems are always consistent on disk without additional serialization. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.

Requirements	Notes
<p>If using VMDKs:</p> <ul style="list-style-type: none"> • Each VMDK should be the only VMDK in its VMFS volume • The VMFS volumes should be assigned to dedicated physical LUNs on redundant storage. • The VMDKs should be created with the Thick Provision Lazy Zeroed option. 	<ul style="list-style-type: none"> • Provisioning VMDKs from isolated VMFS volumes on dedicated physical LUNs: <ul style="list-style-type: none"> • Reduces contention for the underlying physical LUNs • Eliminates contention for locks on the VMFS volumes from other VMs and/or the ESX Server Console • Enables higher availability of the Delphix VM by allowing vSphere to vMotion the VM to a different ESX host in the event of a failure of the Delphix ESX host • Initialize is intended to offset any 'first-write' penalty for thin provisioned storage • It is not required to wait for the initialize storage device actions to complete before starting new tasks on the engine. For example, dSource data ingestion, snapSync policies, vdb creation, etc... are not blocked by the disk initialization.
<p>The quantity and size of VMDKs or RDMs assigned must be identical across all 4 controllers</p>	<ul style="list-style-type: none"> • If the underlying storage array allocates physical LUNs by carving them from RAID groups, the LUNs should be allocated from different RAID groups. This eliminates contention for the underlying disks in the RAID groups as the Delphix engine distributes IO across its storage devices.
<p>The physical LUNs used for VMFS volumes and RDMs should be of the same type in terms of performance characteristics such as latency, RPMs, and RAID level.</p>	<ul style="list-style-type: none"> • The total number of disk drives that comprise the set of physical LUNs should be capable of providing the desired aggregate I/O throughput (MB/sec) and IOPS (Input/Output Operations per Second) for all virtual databases that will be hosted by the Delphix Engine.
<p>The physical LUNs used for VMFS volumes can be thin-provisioned in the storage array.</p>	<ul style="list-style-type: none"> • If the storage array allocates physical LUNs from storage pools comprising dozens of disk drives, the LUNs should be distributed evenly across the available pools.

Requirements	Notes
<p>For best performance, the LUNs used for RDMs should not be thin-provisioned in the storage array but should be thick-provisioned with a size equal to the amount of storage that will be initially allocated to the Delphix Engine. The RDM can be expanded in the future when more storage is needed.</p>	<ul style="list-style-type: none"> Using thin-provisioned LUNs in the storage array for VMFS volumes can be useful if adding storage to the Delphix engine in the future is anticipated. In this case, the LUNs should be thin-provisioned with a size larger than the amount of storage that will be initially allocated to the Delphix Engine. When appropriate, to add more storage to the Delphix engine, use vSphere to expand the size of the VMDKs. Be sure to specify that the additional storage is also thick-provisioned and eager-zeroed.

In addition to making sure the latest VMware patches have been applied, check with the organization's hardware vendor for updates specific to the hardware configurations.

5.7.9.5 Option 2: Elastic Data where Object storage is used for database storage and block storage is used for cache.

We support Elastic Data with on prem object storage for the database storage. Traditional disks as cache are used to reduce latencies for frequently read data and as temporary storage for synchronous writes before the writes are sent to object storage.

- For on prem object storage we currently support storage vendors that confirm to the following
 - s3 REST API compatibility
 - strong read-after-write consistency
 - supports s3 key id and secret access key authentication
 - perpetual key support
- On-premise object storage may require a security certificate to create secure connections between the Delphix engine and object storage. If a certificate is required, then it must be installed on the Delphix engine prior to configuring the storage. Refer to [Certificate management \(see page 980\)](#) for more information.
- Refer to [Initial setup \(see page 585\)](#) for additional details for setting up the Elastic Data Engine.

5.7.10 Additional VMware configuration notes

- Running Delphix inside of vSphere is supported.
- Using vMotion on a Delphix VM is supported.
- Device passthrough is not supported.

5.7.11 Procedure to install an OVA

Use the Delphix-supplied OVA file to install the Delphix Engine. The OVA file is configured with many of the minimum system requirements. The underlying storage for the install is assumed to be redundant SAN storage.

1. Download the OVA file from <https://download.delphix.com>¹⁶⁴. You will need a support login from your sales team or a welcome letter.
 - a. Navigate to the Delphix Product Releases/<Current Version>/Appliance Images page.
2. Login using the vSphere client to the vSphere server (or vCenter Server) where you want to install the Delphix Engine.
3. In the vSphere Client, click **File**.
4. Select **Deploy OVA Template**.
5. Browse to the OVA file.
6. Click **Next**.
7. Select a **hostname** for the Delphix Engine.
This hostname will also be used in configuring the Delphix Engine network.
8. Select the **data center** where the Delphix Engine will be located.
9. Select the **cluster** and the **ESX host**.
10. Select one (1) **data store** for the **Delphix OS**. This datastore can be **thin-provisioned** and must have enough free space to accommodate the 127GB comprising the Delphix operating system.
11.
 - a. For traditional block storage engines
 - i. Select four (4) or more **data stores** for Database Storage for the Delphix Engine. The Delphix Engine will stripe all of the Database Storage across these VMDKs, so for optimal I/O performance, each VMDK must be equal in size and be configured **Thick Provisioned - Eager Zeroed**. Additionally, these VMDKs should be distributed as evenly as possible across all four SCSI I/O controllers.
 - b. For Elastic data
 - i. The VMDK will be used as cache to reduce latencies for frequently read data and as temporary storage for synchronous writes before the writes are sent to object storage. For optimal I/O performance, each VMDK must be equal in size and be configured **Thick Provisioned - Eager Zeroed**. Make sure the disks satisfy the I/O needs of the engine. Eg: At 500 IOPS per 1GiB ratio, a 32 GiB volume can be configured to have the 16K IOPS limit. Two devices would be sufficient for the instance that requires 30K IOPS. You can always add disks later if the cache is insufficient. You can only reduce the cache by removing disks, so if you think you are over provisioning the cache, increase the number of disks used and reduce the size of each disk so that removal is possible at a later point in time.
12. Select the **virtual network** you want to use.
If using multiple physical NICs for link aggregation, you must use vSphere NIC teaming. Do not add multiple virtual NICs to the Delphix Engine itself. The Delphix Engine should use a single virtual network. For more information, see [Optimal network architecture for the Delphix engine \(see page 733\)](#).
13. Click **Finish**.
The installation will begin and the Delphix Engine will be created in the location you specified.

¹⁶⁴ <https://download.delphix.com/>

14. Once the installation has completed, power on the Delphix Engine and proceed with the initial system configuration as described in [Setting up network access to the Delphix engine](#) (see page 583)

5.8 Deployment for KVM

5.8.1 Overview

This article outlines the requirements for deploying the Delphix Engine via Linux KVM, as well as recommended configuration parameters.

The Delphix Engine is resource intensive from a compute, network, and storage perspective. If the Delphix Engine competes with other virtual machines on the same host for resources it will result in increased latency for all operations. As such, it is crucial that your KVM host is not over-subscribed, as this eliminates the possibility of a lack of resources for the Delphix Engine. This includes allowing a percentage of CPU resources for the hypervisor itself as it can de-schedule an entire VM if the hypervisor is needed for managing I/O or compute resources.

The KVM ecosystem includes many versions/variations. Delphix generally supports running on KVM, but does not explicitly qualify each vendor's KVM hypervisor solution. Rather, as Delphix is based on Ubuntu 20.04, Delphix supports running on any KVM hypervisor whose vendor supports the Ubuntu 20.04 guest operating system.

Delphix is supported on Nutanix AHV. Because AHV is based on KVM, all of the KVM content on this page also applies to Nutanix AHV.

Delphix disk storage capabilities are based on the backend storage provided. Performance, redundancy, and stability characteristics are determined by the hypervisor or Cloud provisioned storage.

5.8.2 Pre-requisites

1. The KVM provider must explicitly state that Ubuntu 20.04 is supported by their variation of KVM.

Most, if not all, KVM hypervisor providers should have public facing documentation which include support matrices for guest OS compatibility. If the KVM hypervisor provider does not state support for the Ubuntu version on which Delphix is based (currently 20.04), then Delphix cannot support the KVM provider.

As an example, Nutanix provides a publicly accessible [guest OS compatibility matrix](#)¹⁶⁵ for AHV. As of this writing, this matrix includes support for Ubuntu 20.04, and therefore Delphix supports deployment on Nutanix AHV. Oracle Linux also provides a publicly accessible [guest operating system support matrix](#)¹⁶⁶, which also declares support for Ubuntu 20.04. Because of that, Delphix does support deployment on Oracle Linux KVM. Another example is RedHat, which provides KVM virtualization support in a number of different contexts. While RedHat does not explicitly list Ubuntu in its [certified guest OS support matrix](#)¹⁶⁷, Ubuntu implicitly falls under RedHat's [third party support software policy](#)¹⁶⁸, and Delphix will support deployments in that environment.

2. A check of the Delphix appliance on the variation/version of KVM.

It is **required** that a Delphix representative works with the organization to check the Delphix appliance (and/or use case) on the specified KVM variation/version. This check will ensure that the software is compatible.

5.8.3 Virtual CPUs

Requirements	Notes
8 vCPUs	<ul style="list-style-type: none"> • CPU resource shortfalls can occur on an over-committed host as well as competition for host resources during high IO utilization. • CPU reservations are strongly recommended for the Delphix VM so that Delphix is guaranteed the full complement of CPUs even when resources are overcommitted. • It is suggested to use a single core per socket unless there are specific requirements for other VMs on the same KVM host.
Never allocate all available physical CPUs to virtual machines.	<ul style="list-style-type: none"> • A CPU for the KVM Server to perform hypervisor activities must be set aside before assigning vCPUs to Delphix and other VMs. • We recommend that a minimum of 8-10% of the CPUs available are reserved for hypervisor operation. (e.g. 12 vCPUs on a 128 vCore system).

¹⁶⁵ <https://portal.nutanix.com/page/documents/compatibility-interoperability-matrix/guestos>

¹⁶⁶ <https://docs.oracle.com/en/operating-systems/oracle-linux/kvm-user/kvm-AboutOracleLinuxKVM.html#kvm-linux-guest>

¹⁶⁷ https://access.redhat.com/articles/973163?extIdCarryOver=true&sc_cid=701f2000001OH6kAAG

¹⁶⁸ <https://access.redhat.com/third-party-software-support>

5.8.4 Memory

Requirements	Notes
128 GB vRAM (recommended) 64GB vRAM (minimum)	<ul style="list-style-type: none"> The Delphix Engine uses its memory to cache database blocks. More memory will provide better read performance. Memory reservations are required for the Delphix VM. The performance of the Delphix Engine will be significantly impacted by the over-commitment of memory resources in the KVM Server. Reservations ensure that the Delphix Engine will not be forced to swap pages during times of memory pressure on the host. A swapped page will require orders of magnitude more time to be brought back to physical memory from the KVM swap device.
Memory for the KVM Server to perform hypervisor activities must be set aside before assigning memory to Delphix and other VMs.	<ul style="list-style-type: none"> Failure to ensure sufficient memory for the host can result in a hard memory state for all VMs on the host which will result in a block for memory allocations.

5.8.5 Network

Requirements	Notes
Virtual ethernet adapter requirements.	<ul style="list-style-type: none"> Jumbo frames are highly recommended to reduce CPU utilization, decrease latency, and increase network throughput (typically 10-20% throughput improvement). A 10GbE NIC/network is recommended for performance dSource and VDB operations.
If the network load in the KVM Server hosting the Delphix engine VM is high, dedicate one or more physical NICs to the Delphix Engine.	<ul style="list-style-type: none"> Adding NICs only works if VMs are discovered using different interfaces. The NFS/iSCSI mounts will only use the network associated with the discovery. See General Network and Connectivity Requirements (see page 731) for information about specific port configurations, and Network Performance Configuration Options (see page 733) for information about network performance tuning.

5.8.6 SCSI controller

Notes
<p>When adding virtual disks, make sure that they are evenly distributing the load across the maximum of 4 virtual SCSI controllers. Spreading the disks across available SCSI controllers evenly will ensure optimal IO performance from the disks. For example, a VM with 4 SCSI controllers and 8 virtual disks should distribute the disks across the controllers as follows:</p>
<p>disk0 = SCSI(0:0) - System Disk on Controller 0 Port 0 (ignore for purposes of load balancing)</p>
<p>disk1 = SCSI(0:1) - Data Disk on Controller 0 Port 1</p>
<p>disk2 = SCSI(1:1) - Data Disk on Controller 1 Port 1</p>
<p>disk3 = SCSI(2:1) - Data Disk on Controller 2 Port 1</p>
<p>disk4 = SCSI(3:1) - Data Disk on Controller 3 Port 1</p>
<p>disk5 = SCSI(0:2) - Data Disk on Controller 0 Port 2</p>
<p>disk6 = SCSI(1:2) - Data Disk on Controller 1 Port 2</p>
<p>disk7 = SCSI(2:2) - Data Disk on Controller 2 Port 2</p>
<p>disk8 = SCSI(3:2) - Data Disk on Controller 3 Port 2</p>
<p>For load purposes, we generally focus on the Delphix storage (data disks) and ignore the controller placement of the system disk. IDE and SATA controllers are not supported on KVM platforms</p>

5.8.7 General storage

Delphix recommends using a minimum of four disks to run your Delphix Engine. One disk is used for the Delphix File System (DxFS) to ensure that its file systems are always consistent on disk without additional

serialization. The other three or more equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.

Requirements	Notes
Storage used for Delphix must be provisioned from storage that provides data protection.	<p>For example, using RAID levels with data protection features, or equivalent technology.</p> <p>The Delphix Engine does not protect against data loss originating at the hypervisor or SAN layers.</p> <p>When adding additional disks to the block storage pool, storage device initialization will not occur since it is not required on this hypervisor.</p> <p>For more information refer to, Optimal storage configuration parameters for the Delphix engine (see page 911).</p>

5.9 Deployment for Hyper-V

5.9.1 Overview

This article outlines the requirements for deploying the Delphix Engine on Hyper-V (including supported versions and instance configurations), as well as recommended configuration parameters for optimal performance.

Contact a Delphix representative to request this capability. Delphix will assist in assuring that all Hyper-V requirements are met to successfully run a Delphix Engine with the most appropriate configuration for the use case.

The Delphix Engine is intensive both from a network and a storage perspective. If the Delphix Engine competes with other virtual machines on the same host for resources it will result in increased latency for all operations. As such, it is crucial that your Hyper-V host is not over-subscribed, as this eliminates the possibility of a lack of resources for the Delphix Engine. This includes allowing a percentage of CPU resources for the hypervisor itself as it can de-schedule an entire VM if the hypervisor is needed for managing I/O or compute resources.

Delphix disk storage capabilities are based on the backend storage provided. Performance, redundancy, and stability characteristics are determined by the hypervisor or Cloud provisioned storage.

5.9.2 Supported versions

- Hyper-V Version: 10.0 and later
- Virtual Machine: Gen 1 only is supported

Note: Delphix currently does not support the migration/copy of a VM between hypervisor platforms.

5.9.3 Virtual CPUs

Requirements	Notes
8 vCPUs	<ul style="list-style-type: none"> • CPU resource shortfalls can occur on an Over-committed host as well as competition for host resources during high IO utilization. • CPU reservations are strongly recommended for the Delphix VM so that Delphix is guaranteed the full complement of CPUs even when resources are overcommitted. • It is suggested to use a single core per socket unless there are specific requirements for other VMs on the same Hyper-V host.
Never allocate all available physical CPUs to virtual machines.	<ul style="list-style-type: none"> • CPU for the Hyper-V Server to perform hypervisor activities must be set aside before assigning vCPUs to Delphix and other VMs • We recommend that a minimum of 8-10% of the CPUs available are reserved for hypervisor operation. (e.g. 12 vCPUs on a 128 vCore system).

5.9.4 Memory

Requirements	Notes
128 GB vRAM (recommended) 64GB vRAM (minimum)	<ul style="list-style-type: none"> The Delphix Engine uses its memory to cache database blocks. More memory will provide better read performance. Memory reservations are required for the Delphix VM. The performance of the Delphix Engine will be significantly impacted by the over-commitment of memory resources in the Hyper-V Server. Reservations ensure that the Delphix Engine will not be forced to swap pages during times of memory pressure on the host. A swapped page will require orders of magnitude more time to be brought back to physical memory from the Hyper-V swap device.
Memory for the Hyper-V Server to perform hypervisor activities must be set aside before assigning memory to Delphix and other VMs.	Failure to ensure sufficient memory for the host can result in a hard memory state for all VMs on the host which will result in a block for memory allocations.

5.9.5 Network

Requirements	Notes
Virtual ethernet adapter requirements.	<ul style="list-style-type: none"> SR-IOV is recommended for all virtual ethernet adapters that will be used for Delphix data I/O. Jumbo frames are recommended. A 10GbE NIC in the Hyper-V Server is recommended.
If the network load in the Hyper-V Server hosting the Delphix engine VM is high, dedicate one or more physical NICs to the Delphix Engine.	<ul style="list-style-type: none"> Adding NICs only works if VMs are discovered using different interfaces. The NFS/iSCSI mounts will only use the network associated with the discovery. See General network and connectivity requirements (see page 731) for information about specific port configurations, and Network performance configuration options (see page 733) for information about network performance tuning.

5.9.6 SCSI controller

Requirements	Notes
IDE Controller for the boot drive SCSI Controller for database storage	<p>Per Hyper-V Storage I/O Performance Tuning Guidelines¹⁶⁹; For optimal performance, it is recommended that you attach multiple disks to a single virtual SCSI controller and create additional controllers only as they are required to scale the number of disks connected to the virtual machine.</p> <p>For example, a VM with 3 virtual disks should distribute the disks across the single SCSI controller as follows:</p> <ul style="list-style-type: none"> • IDE Controller 1 <ul style="list-style-type: none"> • Boot Drive • SCSI Controller <ul style="list-style-type: none"> • disk1 • disk2 • disk3 <div style="border: 1px solid purple; padding: 10px; margin-top: 10px;"> <p> For load purposes, we generally focus on the Delphix storage (data disks) and ignore the controller placement of the system disk.</p> </div>

5.9.7 General storage

Delphix recommends using a minimum of four disks to run your Delphix Engine. One disk is used for the Delphix File System (DxFS) to ensure that its file systems are always consistent on disk without additional serialization. The other three or more equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.

¹⁶⁹ <https://learn.microsoft.com/en-us/windows-server/administration/performance-tuning/role/hyper-v-server/storage-io-performance>

Requirements	Notes
Storage used for Delphix must be provisioned from storage that provides data protection.	<p>For example, using RAID levels with data protection features, or equivalent technology.</p> <p>The Delphix Engine does not protect against data loss originating at the hypervisor or SAN layers.</p> <p>When adding additional disks to the block storage pool, storage device initialization will not occur since it is not required on this hypervisor.</p> <p>For more information refer to, Optimal storage configuration parameters for the Delphix engine (see page 911).</p>

5.9.8 Delphix storage options

There are two types of data that Delphix stores on disk which must be stored on NTFS volumes:

1. Delphix Engine System Disk Storage: This is the system boot drive.
2. Database Storage: stores data used by Delphix objects such as dSources and virtual databases (VDBs).

5.9.8.1 Delphix engine system disk storage

Requirements	Notes
The Delphix Engine disks must be stored on NTFS volume(s).	The volume for the Delphix Engine System Disk Storage is often created on the same volume as the Delphix VM definition. In that case, the volume must have sufficient space to hold the Delphix VM Configuration, the virtual disk for the system disk, and a paging area if a memory reservation was not enabled for the Delphix Engine.
The Delphix .vhdx file is configured for a 128GB system drive.	The volume where the .vhdx is deployed should, therefore, have at least 127GB of free space prior to deploying the .vhdx.

5.9.8.2 Database storage

In addition to making sure the latest Hyper-V patches have been applied, check with your hardware vendor for updates specific to your hardware configuration. VHDXs (virtual machine disks).

Requirements	Notes
A minimum of 3 VHDXs should be allocated for database storage.	Allocating a minimum of 3 VHDXs for database storage enables the Delphix File System (DxFS) to make sure that its file systems are always consistent on disk without additional serialization. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.
If using VHDXs: <ul style="list-style-type: none"> • Each VHDX should be the only VHDX on its NTFS volume • The VHDX volumes should be assigned to dedicated physical LUNs on redundant storage. 	Provisioning VHDXs from isolated volumes on dedicated physical LUNs: <ul style="list-style-type: none"> • Reduces contention for the underlying physical LUNs • Eliminates contention for locks on the volumes from other VMs and/or the Hyper-V Server Console
	If the underlying storage array allocates physical LUNs by carving them from RAID groups, the LUNs should be allocated from different RAID groups. This eliminates contention for the underlying disks in the RAID groups as the Delphix engine distributes IO across its storage devices.
The physical LUNs used for NTFS volumes should be of the same type in terms of performance characteristics such as latency, RPMs, and RAID levels.	The total number of disk drives that comprise the set of physical LUNs should be capable of providing the desired aggregate I/O throughput (MB/sec) and IOPs (Input/Output Operations per Second) for all virtual databases that will be hosted by the Delphix Engine
Disk types supported by the physical LUNs used for NTFS volumes are: Fixed-size and Dynamically expanding.	If the storage array allocates physical LUNs from storage pools comprising dozens of disk drives, the LUNs should be distributed evenly across the available pools.

5.9.9 Procedure for deploying with Hyper-V

5.9.9.1 Overview

This article outlines the procedure for deploying the Delphix Engine in Hyper-V.

5.9.9.2 Creating a Delphix engine VM

1. Download the image from <https://download.delphix.com>¹⁷⁰ and copy it to a VM directory.
2. Start the Hyper-V Manager and specify **Name** and **Location**, then select **Next**.
3. Select **Generation 1**, configure memory and then select **Next**.
Memory: 64 GB (minimum), 128 GB (recommended)
4. Set up Networking by selecting **vNIC**, then select **Next**.
5. Attach the downloaded image as a boot disk. Create a unique boot disk for each image. Please note that boot disks cannot be shared.
 - a. Use an existing virtual hard disk.
 - b. Browse to the location of VM.
 - c. Select the Image.
6. Select **Finish**, the VM will appear in the inventory.

5.9.9.3 Customize the VM by selecting **settings**

1. Delphix recommends having the IDE as the first device to boot from (under BIOS setting).
2. Adjust the number of CPUs (min 8).
3. Add a minimum of four equal-sized **Hard Drives** for the database storage. Use VHDX formatted disks. Recommend Fixed Size disk type. Please note that Differencing Disk Types are not supported.
4. Connect to the console and start the VM.
5. Once the installation has been completed, power on the Delphix Engine and proceed with the initial system configuration as described in [Setting up network access to the Delphix engine](#) (see page 583).

5.10 Deployment for AWS EC2

5.10.1 Overview

This article outlines the virtual machine requirements, including memory and data storage, for deploying the Delphix Engine on Amazon EC2 (Elastic Cloud Compute). Once the requirements listed on this page are reviewed, refer to the next articles in the AWS EC2 Deployment topic:

- [Prerequisites to Deploying in AWS](#) (see page 644)
- [Procedure for Deploying in AWS](#) (see page 646)

¹⁷⁰ <https://download.delphix.com/>

Delphix disk storage capabilities remain seamlessly operable. There are no additional limitations to your storage, unless otherwise imposed by the [respective] Hypervisor or Cloud environment.

5.10.2 Instance types

The following is a list of instance types that are supported to deploy Delphix on AWS EC2. Delphix periodically certifies new instance types, which will be added to the list here.

Requirements	Notes
<p>Memory Optimized instance families: The minimum requirements are listed below:</p> <ul style="list-style-type: none"> • 8 vCPUs minimum • 64 GB RAM minimum • 10 Gbps min (25 Gbps recommended) • Enhanced Networking • Processors: Intel or AMD (No ARM/Graviton) • Storage: SSD or NVMe (No HDD) <p>Recommended instance families:</p> <ul style="list-style-type: none"> • R4 • R5n • R5b • R6in • R6idn 	<ul style="list-style-type: none"> • Larger instance types provide more CPU, which can prevent resource shortfalls under high I/O throughput conditions. • Larger instances also provide more memory, which Continuous Data uses to cache database blocks. More memory will provide better read performance. • Delphix Elastic Data Engines (engines backed by object storage) will need more bandwidth than traditional engines (backed by EBS) because the s3 bucket used to store data is accessed over a network pipe that is shared with other engines activity. <p>Information on AWS instances¹⁷¹</p>

5.10.3 Network configuration

It is recommended to enable Enhanced Networking to maximize performance. For more information view [Enhanced Networking on Linux](#) (see page 1421). Note that the enhanced networking driver is included with Delphix software, and no steps need to be taken on the Delphix Engine to enable the feature other than rebooting.

¹⁷¹https://aws.amazon.com/ec2/instance-explorer/?ec2-instances-cards.sort-by=item.additionalFields.category-order&ec2-instances-cards.sort-order=asc&awsf.ec2-instances-filter-category=*all&awsf.ec2-instances-filter-processors=*all&awsf.ec2-instances-filter-accelerators=*all&awsf.ec2-instances-filter-capabilities=*all

Requirements	Notes
Virtual Private Cloud	<p>The Delphix Engine and all of the source and target environments must be deployed in a VPC network to ensure that private IP addresses are static and do not change when restarting instances.</p> <p>When adding environments to the Delphix Engine, use the host's VPC (static private) IP addresses.</p>
Static Public IP	<p>The EC2 Delphix instance must be launched with a static IP address; however, the default behavior for VPC instances is to launch with a dynamic public IP address – which can change whenever the instance restarts. If using a public IP address for the Delphix Engine, static IP addresses can only be achieved by using assigned AWS Elastic IP Addresses¹⁷².</p>
Security Group Configuration	<p>The default security group will only open port 22 for SSH access. The security group must be modified to allow access to all of the networking ports used by the Delphix Engine and the various source and target engines.</p> <p>See Network Performance Configuration Options (see page 733) for information about network performance tuning.</p> <p>See General Network and Connectivity Requirements (see page 731) for information about specific port configurations.</p>

5.10.4 EBS configuration

Deploying Delphix on AWS EC2 requires EBS volumes. Since EBS volumes are connected to EC2 instances via the network, other network activity on the instance can affect throughput to EBS volumes. Delphix recommends EBS General Purpose SSD (GP2 and GP3) or Provisioned IOPS SSD volumes to provide consistent and predictable storage performance. For more information on EBS volumes, see the [AWS documentation](#)¹⁷³ on the topic.

Recommendations	Notes
EBS Provisioned IOPS SSD Volumes (Highly Recommended)	<p>Delphix does not support the use of instance store volumes.</p> <p>Use EBS volumes with provisioned IOPs in order to provide consistent and predictable performance. The number of provisioned IOPs depends on the estimated IO workload on the Delphix Engine.</p> <p>Provisioned IOPs volumes must be configured with a volume size to provisioned IOPs per the EBS Volume Types¹⁷⁴ guidelines.</p>

¹⁷² <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/elastic-ip-addresses-eip.html>

¹⁷³ <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ebs-volume-types.html>

¹⁷⁴ <https://docs.aws.amazon.com/AWSEC2/19.0.0.0/UserGuide/ebs-volume-types.html>

Recommendations	Notes
EBS General Purpose SSD Volumes	<p>Delphix supports GP2 and GP3 General Purpose SSDs. You can now migrate your Amazon EBS volumes from GP2 to GP3. For more details on migration, see this Amazon documentation¹⁷⁵ on EBS Volumes Migration.</p> <p>Delphix Elastic Data (Engines backed by s3 storage) need gp3 or higher.</p>

5.10.5 General storage configuration

Requirements	Notes
General Storage Configuration	<p>Delphix recommends using storage disks that in sum, have enough storage and IOPS/throughput for your data and performance requirements. Planning ahead for the use of multiple storage disks for the Delphix File System (DxFS) is recommended as it will facilitate growing and shrinking DxFS more easily in the future should your storage needs change. If using multiple storage disks for DxFS, Delphix recommends using equally sized storage disks. Please consult your cloud provider's storage best practices for additional recommendations.</p> <p>For Delphix Continuous Cloud Engines backed by s3 object storage, read the section Delphix Elastic Data Engines (Engines backed by object storage) in Initial Setup (see page 585).</p> <p>For Regular engines (backed by EBS):</p> <ul style="list-style-type: none"> • Allocate initial storage equal to the size of the physical source database storage. For high redo rates and/or high DB change rates, allocate an additional 10-20 %. • All data storage volumes must be EBS volumes. <p>When adding additional disks to the block storage pool, storage device initialization will not occur since it is not required on this cloud.</p>

5.10.6 Additional AWS configuration notes

- Using storage other than EBS is not supported.
- Limits on the number of volumes are dictated by the EBS instance type, and is generally advised that over 40 can be expected to cause issue on Linux VMs. More information can be found in the [AWS](#)

¹⁷⁵ <https://aws.amazon.com/blogs/storage/migrate-your-amazon-ebs-volumes-from-gp2-to-gp3-and-save-up-to-20-on-costs/>

[Volume Limits](#)¹⁷⁶ and [AWS Volume Constraints](#)¹⁷⁷ articles. The maximum device limit imposed by AWS can be handled by the Delphix Engine.

- Cold HDD (sc1) volumes (not supported due to poor performance)
- Using fast storage for EBS volumes is supported and recommended, including (in order of decreasing speed):
 - Provisioned IOPS SSD volumes (recommended)
 - General Purpose SSD volumes (supported)
 - Throughput Optimized HDD (supported, not recommended due to performance)
- Use of EBS volumes encrypted at creation is supported (during initial deployment from AMI, as well as storage devices added post-deployment), but can have negative performance consequences. Conversion of existing EBS volumes is possible in AWS but is not supported in Delphix at this time.
- Cloud engines are only supported with IMDSV1 at this point in time.

5.10.7 Prerequisites to deploying in AWS

5.10.7.1 Overview

This article outlines the prerequisites for deployment of the Delphix Engine on AWS. The setup user should have experience launching and configuring instances in the Amazon Web Services environment. Review and complete the tasks in the next section before deployment.

5.10.7.2 Prerequisites

1. Review [Checklist of information required for installation and configuration](#) (see page 575).
2. Make sure that the Amazon account being used to deploy the Delphix Engine has an appropriate level of enablement to subscribe to the Delphix Engine for AWS subscription.
3. Determine which virtual private cloud (VPC) is being used when launching the virtualization instance. To maximize performance, deploy the Delphix Engine instance in the same VPC/subnet in which the virtual databases (VDBs) will be created.
 - a. Provisioning a VDB requires a compute instance running the same database engine as the source. Please note, however, that the target instance only needs storage to accommodate the OS, database platform binaries, etc., because Delphix delivers all of the data files.
4. Make sure that the necessary ports are open.
 - a. Using the Delphix Engine for AWS will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform:

¹⁷⁶ https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/volume_limits.html

¹⁷⁷ https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/volume_constraints.html

- i. [Network and connectivity requirements for oracle environments](#)¹⁷⁸
 - ii. [Network access requirements for SQL server environments](#) (see page 2158)
 - iii. [Network and connectivity requirements for SAP ASE base environments](#) (see page 1962)
 - iv. [Network and connectivity requirements for Db2 environments](#) (see page 1053)
5. Update Security Group settings to accommodate the necessary connections.
 - a. Select the same Security Group that the current (or future) non-production EC2 compute nodes utilize.
 - b. Modify the Security Group to allow access to all of the networking ports used by the Delphix Engine and the various source and target platforms. See links above for information about specific port configurations.
6. Allocate storage.
 - a. To properly size the initial storage capacity and determine the number and size of EBS Provisioned IOPs Volumes required, download and utilize the [Delphix-dynamic-data-platform-storage-calculator](#)¹⁷⁹.
It is helpful to first create a list of the data sources intended for making dSources. A data source is typically a production database linked to the Virtualization Engine, enabling to create virtual, full, read-write copies of the source within minutes. The list should include the database name, platform (for example, Oracle or SQL Server), current size (in GB), the estimated number of virtual copies, and retention period (in days) of snapshots (backup copies).
 - b. All data storage volumes must be EBS volumes. Delphix recommends using a minimum total of four disks to run the Delphix Engine. One disk is used for the boot device. The other four equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.
 - c. Provisioned IOPs EBS volumes are highly recommended.
7. During the Manual Deployment option, use the guidelines outlined in [Virtual machine requirements for AWS EC2 platform](#) (see page 640).

5.10.7.3 Geographic distribution in regions and availability zones

The latency will be directly related to not just the Availability Zone configuration, but more specifically the geographies of those zones. The latencies can vary from tens to hundreds of milliseconds if the zones are geographically diverse (US West to US East would certainly be expected to perform better than US West to Europe). AWS advertises that all AZs in a given region are interconnected with high-bandwidth and low-latency networking per [this AWS article](#)¹⁸⁰.

Applications that are performance-sensitive will benefit from colocating the target servers and Engine in the same region if possible. Another possibility is building a failover strategy for those highly sensitive servers, enabling them to failover to another AZ in the instance where an Engine needs to be failed over. The architecture selected and geographies will also naturally be dependent on your redundancy requirements

¹⁷⁸ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/4817635/Network+and+connectivity+requirements+for+Oracle+environments>

¹⁷⁹ <https://documentation.delphix.com/continuous-data-11-0-0-0/docs/overview-of-data-virtualization>

¹⁸⁰ https://aws.amazon.com/about-aws/global-infrastructure/regions_az/#Availability_Zones

(your organization may require geographically diverse failover options beyond the ~60 miles advertised within a region).

5.10.8 Procedure for deploying in AWS

5.10.8.1 Overview

This article outlines the procedure for deploying the Delphix Engine on AWS, using the Delphix Marketplace Image or Amazon Machine Image (AMI).

5.10.8.2 Procedure to install an AMI

Use the Delphix-supplied AMI file to install the Delphix Engine.

1. On the Delphix download site, select the AMI to be shared and accept the Delphix License agreement. Alternatively, use a link provided by the organization's Delphix solutions architect.
2. On the **Amazon Web Services Account Details** form presented:
 - a. Enter the AWS Account Identifier. To use the **GovCloud AWS Region**, be sure to enter the ID for the AWS Account which has GovCloud enabled.
 - b. Select which **AWS Region** that the AMI will be shared in. For an AMI shared in a different region, contact the organization's Delphix account representative to make the proper arrangements.
3. Click **Share**. The Delphix Engine will appear in the list of AMIs in AWS momentarily.

5.10.8.3 Subscribe to the Delphix virtualization engine marketplace image

1. Login to the AWS Console at <https://aws.amazon.com/console>.
2. Navigate to the AWS Marketplace.
3. In the **Search** field, enter **Delphix**.
4. Select the **Delphix DevOps Data Platform for AWS**. Select the appropriate offer based on the data you will ingest into the Delphix platform.
5. Review the information on the initial Marketplace page.
6. Click **Continue to Subscribe**.
7. Review the software subscription information and select the **Manual Launch** tab.
8. Select **Accept Software Terms**. Your subscription will take a few minutes to become enabled.
9. From the **Subscription** page, click **Return to Product Page**. There you will see **Launch with EC2 Console** enabled in all of the available regions.

5.10.8.4 Launching the Delphix engine

1. In the desired region, select **Launch with EC2 Console**. Launching will redirect to the standard EC2 instance launch process.
2. Select the size of the virtual machine to deploy. For supported instance types and capabilities, see [Virtual machine requirements for AWS platform](#) (see page 640).
3. Click **Next: Configure Instance Details**.
4. Configure instance details as follows:
 - a. Set the **number of instances** to **1**.
 - b. **Purchasing option** – Leave **Request Spot Instances** unchecked.
 - c. **Network** – Select the VPC into which the instance will be deployed.
 - d. **Subnet** – Select the Subnet into which the instance will be deployed.
 - e. **Auto-assign Public IP** – Select **Disable**.
 - f. **Placement group** – Optional. The default is **No placement group**.
 - g. **IAM Role** – None
 - h. **Shutdown behavior** – Stop
 - i. **Enable termination protection** – Yes (select checkbox). This ensures that the Delphix Engine is not accidentally terminated.
 - j. **Monitoring** – Optional
 - k. **EBS-optimized instance** – Yes (select checkbox)
 - l. **Tenancy** – Shared – Run a shared hardware instance
 - m. **Network Interfaces**– Eth0

Note : This option will not appear if a default subnet is chosen. In this case, the first option below will apply.

 - i. Auto-assign (default if using DHCP)
 - ii. Enter static IP in Primary IP field (recommended for consistency)
5. Click **Next: Add Storage**.
6. By default, the Delphix Virtualization instance includes a 150GB OS volume. Ensure that this volume is set as a **General Purpose SSD (GP2)** type.
7. For traditional Block storage based engines
 - a. Using the [Delphix Virtualization Engine Storage Calculator for AWS.xlsx](#)¹⁸¹, enter information from the predetermined inventory into the worksheet. This will automatically calculate the number, size, and IOPS required for the EBS volumes.

¹⁸¹ <https://delphixdocs.atlassian.net/wiki/download/attachments/255559791/Delphix%20Virtualization%20Engine%20Storage%20Calculator%20for%20AWS.xlsx?api=v2&cacheVersion=1&modificationDate=1729521953951&version=1>

Delphix Virtualization Engine - Storage Calculator for AWS Marketplace					
DB Name	DB Type	DB Source Size (GB)	Est. # of Virtual DBs	Retention for Snapshots (Days)	Delphix Storage (GB)
oradb1	Oracle	2500	5	14	3000
sqldb1	MS-SQL	1500	5	14	1800
sqldb2	MS-SQL	150	5	14	180
					0
					0
Totals		4150			4980
# of EBS Volumes					4
Size per Volume					1250
IOPs per Volume					1000

In the above example, there are three (3) source databases listed with their current sizes. Each is estimated to have 5 virtual copies as well as a 14-day retention period for snapshots/backups. The calculator indicates to add four (4) EBS-provisioned IOPS volumes, each being 1250GB with 1000 IOPS.

Note

This calculator is only for estimating the anticipated storage size and IOPS needs. A manual adjustment may be required prior to or after launch depending on storage and performance needs.

- b. For Elastic Data Engines (Refer to [Initial setup \(see page 585\)](#) for additional details) s3 bucket acts as the storage and EBS disks as cache are used to reduce latencies for frequently read data and as temporary storage for synchronous writes before the writes are sent to object storage. Make sure the disks satisfy the I/O needs of the engine. You can always add disks later if the cache is insufficient. You can only reduce the cache by removing disks, so if you think you are over provisioning the cache, increase the number of disks used and reduce the size of each disk so that removal is possible at a later point in time. When selecting disks for Elastic Data Engines:
 - i. gp3 disks are recommended as they offer good performance at a lower cost. At 500 IOPS per 1GiB ratio, a 32 GiB volume can be configured to have the gp3 volume 16K IOPS limit and 1000 MB/s throughput. For reference, r5n.8xlarge instance has a 30K IOPS and 850 MB/s throughput limits so two gp3 devices would be sufficient for the instance.
 - ii. io2 disks have lower latency at a higher cost. However, the lower latency is not beneficial once the instance IOPS or throughput limit is reached.
8. Click **Add New Volume**. The new volume will be created using the specifications in the estimation provided. The below values are sample values set for a Volume Type. See [EBS configuration \(see page 640\)](#) for related information.
- a. **Volume Type** – EBS
 - b. **Device** – Use default provided
 - c. **Size (GiB)** – 1250
 - d. **Volume Type** – Provisioned IOPS SSD (IO1) Delphix deploys as an EC2 instance on AWS using EBS volumes for storage. AWS provides the following options for Elastic Block Storage (EBS) storage volumes, namely
 - i. Standard
 - ii. General Purpose SSD (GP2)
 - iii. General Purpose SSD (GP3)

- iv. Provisioned IOPS SSD (IO1)
 - e. **IOPS** – 1000
 - f. **Delete on Termination** – Optional. If this option is not set and the Delphix Engine is terminated, the EBS volumes will persist, and they will need to be removed manually.
 - g. **Encrypted** – Optional
9. Follow the above procedure for adding as many EBS volumes as specified in the calculator. Based on the example above, the storage configuration would look as follows:

Step 4: Add Storage
Your instance will be launched with the following storage device settings. You can attach additional EBS volumes and instance store volumes to your instance, or edit the settings of the root volume. You can also attach additional EBS volumes after launching an instance, but not instance store volumes. [Learn more](#) about storage options in Amazon EC2.

Volume Type	Device	Snapshot	Size (GiB)	Volume Type	IOPS	Throughput (MB/s)	Delete on Termination	Encrypted
Root	/dev/xvda	snap-1d44a945	150	General Purpose SSD (GP2)	450 / 3000	N/A	<input checked="" type="checkbox"/>	Not Encrypted
EBS	/dev/sdb	Search (case-insensit)	1250	Provisioned IOPS SSD (IO1)	1000	N/A	<input type="checkbox"/>	<input type="checkbox"/>
EBS	/dev/sdc	Search (case-insensit)	1250	Provisioned IOPS SSD (IO1)	1000	N/A	<input type="checkbox"/>	<input type="checkbox"/>
EBS	/dev/sdd	Search (case-insensit)	1250	Provisioned IOPS SSD (IO1)	1000	N/A	<input type="checkbox"/>	<input type="checkbox"/>
EBS	/dev/sde	Search (case-insensit)	1250	Provisioned IOPS SSD (IO1)	1000	N/A	<input type="checkbox"/>	<input type="checkbox"/>

[Add New Volume](#)

General Purpose (SSD) volumes provide the ability to burst to 3000 IOPS per volume, independent of volume size, to meet the performance needs of most applications and also deliver a consistent baseline of 3 IOPS/GiB. Set my root volume to General Purpose (SSD).
Free tier eligible customers can get up to 30 GB of EBS General Purpose (SSD) or Magnetic storage. [Learn more](#) about free usage tier eligibility and usage restrictions.

[Cancel](#) [Previous](#) [Review and Launch](#) [Next: Tag Instance](#)

- 10. Verify the storage configuration matches the output from the calculator.
- 11. Click **Next: Tag Instance**.
- 12. To provide a name for the Delphix Virtualization Instance, enter it in the **Value** field corresponding to the **Key Name**.
- 13. Click **Next: Configure Security Group**.
- 14. Assign a security group. Do one of the following:
 - a. Create a new security group.
 - b. If an existing security group meets Delphix requirements, it can be selected. For more details on required and recommended ports for general Delphix usage, see [General network and connectivity requirements \(see page 731\)](#).
- 15. Click **Review and Launch**.
- 16. Verify the Delphix Virtualization Instance details and click **Launch**.
- 17. Proceed without a key pair.
- 18. Select the **I acknowledge** checkbox.
- 19. Click **Launch Instances**.
- 20. Click **View Instances**.

21. To complete the initial Delphix Virtualization Engine configuration, wait for the instance to be up and running. The status is available on the **Instances** page. Note that it can take up to 15 minutes for the first launch of Delphix, and even if the status of the server is “running” it may not yet be ready.

5.10.8.5 Configuring the Delphix engine

1. Connect to the running Delphix instance with a web browser. Use the IP address or DNS name noted in the Instance Description.
2. Upon successful connection, the browser will automatically redirect to the **Delphix Setup Page**.
3. Refer to the standard [product deployment instructions](#) (see page 585) to complete the Delphix deployment.

5.10.8.6 Logging in for the first time

On the first time login to the Delphix Engine, follow these steps:

1. Enter the default Administration User: **sysadmin**.
 2. Enter **sysadmin** for the password (when installing a new engine via AWS AMI, the initial sysadmin password is the AWS Instance ID).
- Note**
Find the <Instance ID> in the **Instances** section of the AWS EC2 Management Console.
3. Once redirected, enter the following as prompted:
 - a. **Email address** for the admin account.
 - b. A new **password**. This password will be used for the Engine Administrator with the username "admin".
 - c. Confirm the new password.

Note:

From now on, this is the password used to log in to the Delphix Engine Administrator interface to manage Datasets.

4. Click **Continue**.

5.10.8.7 Next steps

Congratulations! The Delphix Virtualization Engine should be successfully deployed in AWS.

Use Delphix documentation to learn how to:

- configure a database source
- configure target environments
- create virtual databases (VDBs)

5.10.9 AWS RDS Custom for Oracle and SQL Server

5.10.9.1 Overview

The Amazon Relational Database Service (Amazon RDS) makes it easy to set up, operate, and scale a relational database in the cloud. It allows organizations to automate time-consuming administration tasks such as hardware provisioning, database setup, patching, and backups. It frees focus that can be utilized on applications, eliminating extra overhead. Amazon RDS is available for Oracle and SQL Server, amongst other database services.

AWS has announced a new version of their RDS databases, thus, Delphix is adding AWS RDS Custom support for Oracle. AWS RDS Custom is an RDS service that allows Delphix to access the operating system and database level functions required to provision vDBs into the AWS RDS PaaS (Product as a Service) database service.

With AWS RDS Custom, organizations using Delphix can obtain the full benefits of PaaS and Delphix automation for their target environments.

- Users ingest data from production in RDS Oracle/SQL Server, mask the data, and provision secure copies back to RDS. All Delphix automation tools work and also manual operations via the UI.
- Delphix data compression and block sharing capabilities will allow organizations to potentially reduce their AWS RDS storage consumption.

Support for AWS RDS Custom is granted only on supported database and operating system versions.

Contact a Delphix representative to request this capability.

5.11 Deployment for Microsoft Azure

5.11.1 Overview

This article outlines the virtual machine requirements, including memory and data storage, for deploying the Delphix Engine on the Azure Public Cloud and Government Cloud. Once the requirements listed on this page are reviewed, refer to the next articles on Azure deployment:

- [Prerequisites to deploying in Microsoft Azure \(see page 654\)](#)
- [Procedure for deploying in Microsoft Azure \(see page 656\)](#)

Delphix disk storage capabilities remain seamlessly operable. There are no additional limitations to your storage, unless otherwise imposed by the [respective] Hypervisor or Cloud environment.

5.11.2 Instance types

Requirements	Notes
<p>Instance families: The minimum requirements are listed below:</p> <ul style="list-style-type: none"> • 8vCPUs minimum • 64GB RAM minimum • Network Bandwidth: 10Gbps min (25Gbps recommended) • Azure Accelerated Networking • Processors: Intel or AMD (No ARM) • Storage <ul style="list-style-type: none"> • SSD or NVMe (No HDD) <p>Recommended instance families:</p> <ul style="list-style-type: none"> • Dsv2-series • Dsv3-series • Esv3-series • Esv4-series • Esv5-series 	<ul style="list-style-type: none"> • Larger instance types provide more CPU, which can prevent resource shortfalls under high I/O throughput conditions. • Larger instances also provide more memory, which the Delphix Engine uses to cache database blocks. More memory will provide better read performance. • Delphix Elastic Data Engines (engines backed by blob storage) will need more bandwidth than traditional engines (backed by block storage) because the blob bucket used to store data is accessed over a network pipe that is shared with other engines activity. • Information on Azure instances¹⁸²

5.11.3 Network configuration

The use of Azure Accelerated Networking is supported for Delphix Engines and is recommended to maximize network performance. Accelerated Networking provides more bandwidth with more consistent and lower network latencies.

¹⁸² <https://learn.microsoft.com/en-us/azure/virtual-machines/sizes>

Requirements	Notes
Azure virtual network (VNet)	The Delphix Engine must have ≤ 1 ms of latency to the Target and Staging environments. Longer latencies are permitted between the Delphix Engine and Source environments, but may impact Snapsync timings. VNET peering may be used, as long as latency requirements are met. For very low latency requirements, consider Proximity Placement Groups for Delphix Engine, Target, and Staging.
Network security group (NSG)	The security group must be modified that allows access to all networking ports used by the Delphix Engine and the various source/target platforms. See General network and connectivity requirements (see page 731) for information about specific port configurations. See Network performance configuration options (see page 733) for information about network performance tuning.

5.11.4 Storage configuration

Requirements	Notes
General Storage Configuration	<ul style="list-style-type: none"> • Delphix recommends using storage disks that in sum, have enough storage and IOPS/throughput for your data and performance requirements. Planning ahead for the use of multiple storage disks for the Delphix File System (DxFS) is recommended as it will facilitate growing and shrinking DxFS more easily in the future should your storage needs change. If using multiple storage disks for DxFS, Delphix recommends using equally sized storage disks. Please consult your cloud provider’s storage best practices for additional recommendations. • Allocate initial storage equal to the size of the physical source databases. For high redo rates and/or high DB change rates, allocate an additional 10-20% storage. • Add storage when storage capacity approaches 30% free. • Maximize Delphix Engine RAM for a larger system cache to service reads. • When adding additional disks to the block storage pool, storage device initialization will not occur since it is not required on this cloud. • See, Delphix storage migration (see page 783).

Requirements	Notes
Azure Disk Storage	<ul style="list-style-type: none"> • The following Azure Disk types are supported (Premium SSDs or higher performing disks are recommended): <ul style="list-style-type: none"> • Standard SSD • Premium SSD • Premium SSD v2 • Ultra Disks • Devices up to 32TB are supported. • A maximum of 256TB is supported. • Cache setting: For Data disks, ReadWrite. For Elastic Data cache disks, NONE. • I/O requests of up to 256 kilobytes (KB) are counted as a single I/O operation (IOP) for provisioned IOPS volumes. • IOPS vary based on storage size with a maximum of 20,000 IOPS. • For Delphix Continuous Cloud Engines backed by object storage, read the section <i>Delphix Elastic Data Engines (Engines backed by object storage)</i> in Initial Setup (see page 585).

5.11.5 Extensions

Azure VM Extensions are not currently supported.

5.11.6 Prerequisites to deploying in Azure

5.11.6.1 Overview

This article outlines the prerequisites for deployment of the Delphix Engine on Azure. The setup user should have experience launching and configuring instances in the Microsoft Azure environment. Review and complete the tasks in the next section before deployment.

5.11.6.2 Prerequisites

1. Review [Checklist of information required for installation and configuration \(see page 575\)](#).
2. Determine which virtual private cloud (VPC) is being used when launching the Virtualization instance. To maximize performance, deploy the Delphix Engine instance in the same VPC/subnet where the virtual databases (VDBs) will be created.

-  Provisioning a VDB requires a compute instance running the same database engine as the source. Please note, however, that the target instance only needs storage to accommodate the OS, database platform binaries, etc., because Delphix delivers all of the data files.

3. Ensure that the necessary ports are open.

-  Using the Delphix Engine for Azure will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform:

1. [Network and Connectivity Requirements for Oracle Environments](#)¹⁸³
2. [Network Access Requirements for SQL Server](#) (see page 2158)

4. Update Security Group settings to accommodate the necessary connections.

- a. Select the same **Network Security Group** that the current (or future) non-production Azure virtual machines utilize.
- b. Modify the Network Security Group to allow access to all of the networking ports used by the Delphix Engine and the various source and target engines. See links above for information about specific port configurations.

5. Allocate storage.

-  It is helpful to first create a list of the data sources intended for making dSources. A data source is typically a production database linked to the Virtualization Engine, enabling to create virtual, full, read-write copies of the source within minutes. The list should include the database name, platform (for example, Oracle or SQL Server), current size (in GB), the estimated number of virtual copies, and retention period (in days) of snapshots (backup copies).

- Azure premium storage devices have different levels of guaranteed IOPs that vary from 120 to 20,000 IOPs. Refer to [Microsoft's documentation](#)¹⁸⁴ to ensure that the selected devices meet the requirements for your deployment. Ultra SSD disk storage is supported for performance-sensitive customers.
- It is highly recommended to use Azure managed disks.

¹⁸³ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/4817635/Network+and+connectivity+requirements+for+Oracle+environments>

¹⁸⁴ <https://docs.microsoft.com/en-us/azure/storage/storage-premium-storage#scalability-and-performance-targets>

- Use the guidelines outlined in [Deployment for Microsoft Azure \(see page 651\)](#)

5.11.7 Procedure for deploying in Azure

5.11.7.1 Overview

This article outlines the procedure for deploying the Delphix Engine in Microsoft Azure.

5.11.7.2 Deploying the Delphix engine

If you are deploying a cloud engine on Azure Blob please read the Delphix Elastic Data Engines [Initial setup \(see page 585\)](#) section before deploying the cloud engine.

1. Navigate to the Azure Marketplace at <https://¹⁸⁵azuremarketplace.microsoft.com¹⁸⁶>
2. In the **Search** field, enter **Delphix**.
3. Select the **Delphix Virtualization for Azure (3TB)** for an hourly subscription or **Delphix DataOps Platform for Azure** if you have existing licenses.
4. Review the information on the initial Marketplace page.
5. Click **GET IT NOW**.
6. Click **Create**.
7. Follow the creation wizard to deploy the Delphix Engine.
8. Provide the basic information for the Delphix Engine.
 - a. Select a name for the virtual machine.
 - b. For the OS disk type, select the desired disk type.
 - c. Enter a **username** and **password**.
Info : This information is never used but is part of the built-in wizard used by the marketplace. Any information provided in these fields is discarded.
 - d. Select your **Subscription, Resource group, and Location**.
 - e. Click **OK**.
9. Select the **Size** of the virtual machine you want to deploy. For supported instance types and capabilities, See [Virtual machine requirements for Azure platform \(see page 651\)](#)
Each instance type will determine the limits for:
 - Network bandwidth
 - Maximum data disk
 - Total IOPS
10. Click **Select**.

¹⁸⁵ <http://https/portal.azure.com>

¹⁸⁶ <http://azuremarketplace.microsoft.com>

11. Configure the **Settings** for this virtual machine:
 - a. Use managed disks.
 - b. Select or create a **Virtual Network** and **Subnet**.
 - c. Optional: select a **Public IP address** (this will make an engine accessible over the internet)
 - d. Select or create a **Network Security Group**.
 - e. **Extensions** and **High Availability sets** are not currently supported. Please ensure that no extensions or availability sets have been configured.
 - f. Enable **Boot diagnostics**.
12. Click **OK**.
13. Review the configuration in the **Summary** screen and click **OK**.
14. Review the offer details in the **Buy** screen and click **Purchase** to deploy the Delphix Engine.

5.11.7.3 Configuring the Delphix engine virtual machine

1. From the **Azure Portal** sidebar, select **Virtual Machines**. The running virtual machines will be displayed.
2. Click the virtual machine's **name** to open its detailed information.
3. Click **Disks** to open the detailed panel.
4. Click **Add data disk**.
5. Create a new device:
 - a. In the **Create disk** drop-down menu, select **Create managed disk**. This will open the managed disk wizard.
 - b. In the wizard, select from the available disk types: Standard, Premium, Premium SSD v2 and Ultra. Note, Premium SSD v2, Ultra SSD IOPS, and throughput limits can be configured independently of the volume size. Furthermore, disks can be added and removed to fit IOPS and throughput needs, but recalling that instance type may impose VM limits.
 - c. Select the size of the device to create. The device size will determine the IOPS limit for that device.
 - d. Click **Create**.
6. Once the device is created, change the **Host Caching** parameter for that device to **None**.
7. Repeat the above steps to create additional disks.
8. Once adding all the disks is complete, click **Save**.
9. Optional: modify the virtual machine's **Network Security Group**.
 - a. From the side panel of the virtual machine's detail screen, click **Network interfaces**.
 - b. Click the name of the network interfaces to modify.
 - c. From the **Network interface** details window, click the **Network security group** specified in the **Overview** pane. In the example below, the user would click **delphix-engine-nsg**:
 - d. From the **Network security group** details pane, modify the **Inbound security rules** and/or the **Outbound security rules** by selecting from the side panel and clicking **Add**.

- e. Add the appropriate rule and click **OK**. The screenshot below shows adding the inbound rule for the Delphix Session Protocol.
- f. Repeat the above steps for all the rules that should be added.

5.11.7.4 Configuring the Delphix engine

1. Connect to the running Delphix instance with a web browser. Use the Public IP address or DNS name noted in the **Network Interface** Panel. Upon successful connection, the browser will automatically redirect to the **Delphix Setup Page**.
2. Refer to the standard [product deployment instructions \(see page 585\)](#) to complete the Delphix deployment.

5.11.7.5 Next steps

Congratulations! The Delphix Virtualization Engine should be successfully deployed in Azure.

Use Delphix documentation to learn how to:

- configure a database source
- configure the target environments
- create virtual databases (VDBs)

5.11.8 Enabling Azure accelerated networking

5.11.8.1 Overview

This article describes how to enable Azure Accelerated Networking. If a VM was created without Accelerated Networking, enabling this feature on an existing VM is possible. The VM must meet the following prerequisites:

- VM must be a supported size for Accelerated Networking
- VM must be a supported Azure Gallery image (and kernel version for Linux)
- All individual VMs or VMs in an availability set must be stopped/deallocated before enabling Accelerated Networking on any NIC

For more information, please see the [Azure documentation](#)¹⁸⁷

5.11.8.2 Individual VMs and VMs in an availability set

Stop/deallocate the VM or, if an Availability Set, all the VMs in the Set:

¹⁸⁷ <https://docs.microsoft.com/en-us/azure/virtual-network/create-vm-accelerated-networking-cli>

- If the VM was created individually (without an availability set), only the individual VM needs to stop/deallocate to enable Accelerated Networking.
- If the VM was created with an availability set, all VMs contained in the availability set will need to stop/deallocate before enabling Accelerated Networking on any Network Interface Card (NIC).

Azure CLI

```
az vm deallocate \
  --resource-group myResourceGroup \
  --name myVM
```

Once stopped, enable Accelerated Networking on the NIC of the VM:

Azure CLI

```
az network nic update \
  --name myNic \
  --resource-group myResourceGroup \
  --accelerated-networking true
```

Restart the VM (or all VMs if using an availability set) and confirm that Accelerated Networking is enabled:

Azure CLI

```
az vm start --resource-group myResourceGroup \
  --name myVM
```

After the restart, the Mellanox VF (Virtual Function) device will be exposed to the VM.

5.12 Deployment for Google cloud platform

5.12.1 Overview

This article covers the virtual machine requirements, including memory and data storage, for the deployment of the Delphix Engine on Google Cloud Platform (GCP). Once the requirements listed on this page are reviewed, refer to the next articles on GCP deployment:

- [Prerequisites to deploying in GCP \(see page 662\)](#)
- [Procedure for deploying in GCP \(see page 663\)](#)

Delphix disk storage capabilities remain seamlessly operable. There are no additional limitations to your storage, unless otherwise imposed by the [respective] Hypervisor or Cloud environment.

5.12.2 Machine types

The following is a list of instance types that are supported to deploy Delphix on GCP. Delphix periodically certifies new instance types, which will be added to the list here.

Recommendations	Notes
<p>General-purpose machine families.</p> <p>The minimum requirements are listed below:</p> <ul style="list-style-type: none"> • 8vCPUs minimum • 64GB RAM minimum • 10Gbps min (25Gbps recommended) • Processors: Intel or AMD (No ARM) • Storage <ul style="list-style-type: none"> • SSD or NVMe (No HDD) <p>Recommended instance families:</p> <ul style="list-style-type: none"> • N2 standard • N2 high-mem 	<ul style="list-style-type: none"> • The Delphix Engine most closely resembles a storage appliance and performs best when provisioned using a storage-optimized instance type. • Larger instance types provide more CPU, which can prevent resource shortfalls under high I/O throughput conditions. • Larger instances also provide more memory, which the Delphix Engine uses to cache database blocks. More memory will provide better read performance. <p>Information on GCP general-purpose machines¹⁸⁸</p>

5.12.3 Network configuration

Requirements	Notes
Virtual private cloud	<p>The Delphix Engine and all of the source and target environments must be deployed in a VPC network to ensure that private IP addresses are static and do not change when restarting instances.</p> <p>When adding environments to the Delphix Engine, use the host's VPC (static private) IP addresses.</p>

¹⁸⁸ <https://cloud.google.com/compute/docs/general-purpose-machines>

Requirements	Notes
Static public IP	The GCP Delphix instance must be launched with a static IP address; however, the default behavior for VPC instances is to launch with a dynamic public IP address – which can change whenever the instance restarts. If using a public IP address for the Delphix Engine, static IP addresses can be assigned using the Google cloud documentation ¹⁸⁹
Security group configuration	The default security group will only open port 22 for SSH access. The security group must be modified to allow access to all of the networking ports used by the Delphix Engine and the various source and target engines. See Network performance configuration options (see page 733) for information about network performance tuning. See General network and connectivity requirements (see page 731) for information about specific port configurations.

5.12.4 Storage configuration

Requirements	Notes
General storage configuration	<p>Delphix recommends using storage disks that in sum, have enough storage and IOPS/throughput for your data and performance requirements. Planning ahead for the use of multiple storage disks for the Delphix File System (DxFS) is recommended as it will facilitate growing and shrinking DxFS more easily in the future should your storage needs change. If using multiple storage disks for DxFS, Delphix recommends using equally sized storage disks. Please consult your cloud provider’s storage best practices for additional recommendations.</p> <p>Allocate initial storage equal to the size of the physical source database storage. For high redo rates and/or high DB change rates, allocate an additional 10-20 %.</p> <p>Add storage when storage capacity approaches 30% free.</p> <p>When adding additional disks to the block storage pool, storage device initialization will not occur since it is not required on this cloud.</p> <p>For Delphix Continuous Cloud Engines backed by object storage, read the section Delphix Elastic Data Engines (Engines backed by object storage) in Initial Setup (see page 585). Block storage for caching requires SSD Persistent Disk or higher performance volumes for caching.</p>

¹⁸⁹ <https://cloud.google.com/compute/docs/ip-addresses/reserve-static-external-ip-address>

5.12.5 Prerequisites to deploying in GCP

5.12.5.1 Overview

This article outlines the prerequisites for deployment of the Delphix Engine on GCP. The setup user should have experience launching and configuring instances in the Google Cloud Platform environment. Review and complete the tasks in the next section before deployment.

5.12.5.2 Prerequisites

1. Review the [Checklist of information required for installation and configuration](#) (see page 575)
2. Make sure that the Google account being used to deploy the Delphix Engine has an appropriate level of enablement for the **Delphix virtualization for GCP** subscription.
3. Determine which virtual private cloud (VPC) is being used when launching the virtualization instance. To maximize performance, deploy the Delphix Engine instance in the same VPC/subnet in which the virtual databases (VDBs) will be created.

Note:

Provisioning a VDB requires a compute instance running the same database engine as the source. Please note, however, that the target instance only needs storage to accommodate the OS, database platform binaries, etc., because Delphix delivers all of the data files.

4. Make sure that the necessary ports are open.

Note:

Using the Delphix Engine for GCP will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform.

- a. [Network and Connectivity Requirements for Oracle Environments](#)¹⁹⁰
 - b. [Network and Connectivity Requirements for SQL Server Environments](#) (see page 2158)
 - c. [Network and Connectivity Requirements for SAP ASE Base Environments](#) (see page 1954)
 - d. [Network and Connectivity Requirements for Db2 Environments](#) (see page 1053)
5. Update Security Group settings to accommodate the necessary connections.
 - a. Select the same Security Group that the current (or future) non-production EC2 compute nodes utilize.
 - b. Modify the Security Group to allow access to all of the networking ports used by the Delphix Engine and the various source and target platforms. See links above for information about specific port configurations.
 6. Allocate storage.

¹⁹⁰ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/4817635/Network+and+connectivity+requirements+for+Oracle+environments>

- a. To properly size the initial storage capacity and determine the number and size of Provisioned IOPs Volumes required, first create a list of the data sources intended for making dSources. A data source is typically a production database linked to the Virtualization Engine, enabling to create virtual, full, read-write copies of the source within minutes. The list should include the database name, platform (for example, Oracle or SQL Server), current size (in GB), the estimated number of virtual copies, and retention period (in days) of snapshots (backup copies).
- b. Delphix recommends using a minimum total of four disks to run the Delphix Engine. One disk is used for the boot device. The other four equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.

5.12.5.3 Additional GCP configuration notes

- Delphix supports both Zonal and Regional SSD persistent disks.

5.12.6 Procedure for deploying in GCP

5.12.6.1 Overview

This article outlines the procedure for deploying the Delphix Engine using a tar.gz file in Google Cloud Console or in Google Cloud Marketplace.

5.12.6.2 Deployment in Google cloud console

1. Download the latest **Delphix Platform for GCP** tar.gz file from <https://download.delphix.com/>.
2. Create a **GCP storage bucket** and upload the tar.gz file from the first step.
3. Once the upload is complete, navigate to **Compute Engine > Images** and select **Create Image**.
4. In the **Create Image** dialog, provide the following information.
 - a. Image Name
 - b. Source: Cloud Storage File
 - c. Select the bucket and newly uploaded Delphix File.
 - d. Location: Multi-Regional or Regional. (To deploy Delphix in multiple regions - select **Multi-Region**)
 - e. Family: Optional
 - f. Description: Optional
 - g. Labels: Optional
 - h. Encryption: Select based on the organization's policy
 - i. Click **Create**. (Creating the image could take some time)
5. Once the image creation is complete, select the newly created image and create an instance from it.
6. Configure the instance creation screen with the following items.

- a. Identify and select the region and zone to run Virtual Databases.
- b. Choose a supported machine type, commensurate with the expected workload.
- c. Change/modify the **Boot Disk** to **SSD Persistent Disk**. (Defaults to **Standard Persistent Disk**)
- d. Add **Data Disks** (minimum of four recommended) with a total size at least equal to the total source DB sizes. Be sure to utilize SSD Persistent Disks.
- e. Update Networking, commensurate with the Network and Subnet(s) on which the target non-production instances reside. Note, a “target” is an instance running the DB platform identical to the source DBs.
- f. Once all of the necessary instance information has been configured, select **Create**.
- g. Wait for the instance to be created/available and connect to the newly deployed Engine using the assigned IP/hostname via the support web browser.

5.12.6.3 Deployment in Google cloud marketplace

1. Login to the **Google Cloud Marketplace**.
2. In the **Search** field, enter **Delphix**.
3. Select the **Delphix Data Virtualization for GCP (3TB)**.
4. Review the information on the initial Marketplace page.
5. Click **Launch**.
6. Review the deployment configuration and software subscription information.
7. Accept Google Cloud’s and Delphix Corp’s Terms of Service.
8. Click **Deploy**, which will start the deployment of the instance.
9. After the deployment, add equally-sized data disks to the instance.

5.12.6.4 Configuring the Delphix engine

1. Connect to the running Delphix instance with a web browser. Use the IP address or DNS name noted in the Instance Description. Upon successful connection, the browser will automatically redirect to the **Delphix Setup Page**.
2. Refer to the standard [product deployment instructions \(see page 585\)](#) to complete the Delphix deployment.

5.12.6.5 Next Steps

Congratulations! The Delphix Virtualization Engine should be successfully deployed in Google Cloud Platform.

Use Delphix documentation to learn how to:

- configure a database source
- configure the target environments

- configure virtual databases (VDBs)

5.13 Deployment for OCI

5.13.1 Overview

This article outlines the virtual machine requirements, including memory and data storage, for deploying the Delphix Engine on Oracle Cloud Infrastructure (OCI). Once the requirements listed on this page are reviewed, refer to the next articles on OCI deployment:

- [Prerequisites to deploying in OCI \(see page 669\)](#)
- [Procedure for deploying in OCI \(see page 670\)](#)

Delphix disk storage capabilities remain seamlessly operable. There are no additional limitations to your storage, unless otherwise imposed by the [respective] Hypervisor or Cloud environment.

5.13.2 Compute image types

Delphix distributes product images for OCI using the QCOW2 image type. Compute Images must be imported into OCI using the Paravirtualized launch mode; currently, images using the Emulated launch mode are not supported.

5.13.3 Supported shapes

The following is a list of shapes that are supported to deploy Delphix on OCI.

Requirements	Notes
<p>Compute shapes</p> <p>The minimum requirements are listed below:</p> <ul style="list-style-type: none"> • 8vCPUs minimum • 64GB RAM minimum • Network Bandwidth: 10 Gbps min (25 Gbps recommended) • Processors: Intel or AMD (No ARM) • Storage <ul style="list-style-type: none"> • SSD or NVMe (No HDD) <p>Recommended compute shapes:</p> <ul style="list-style-type: none"> • VM.Standard2 • VM.Standard3.Flex • VM.Standard.E[3,4,5].Flex 	<ul style="list-style-type: none"> • The Delphix Engine most closely resembles a storage appliance and performs best when provisioned using a storage-optimized shape. • Larger shapes provide more CPU, which can prevent resource shortfalls under high I/O throughput conditions. • Larger shapes also provide more memory, which the Delphix Engine uses to cache database blocks. More memory will provide better read performance. • For more information on OCI shapes, refer to OCI shapes¹⁹¹.

5.13.4 Network configuration

Requirements	Notes
Virtual cloud network (VCN)	<ul style="list-style-type: none"> • The Delphix Engine and all of the source and target environments must be deployed in a VCN to ensure that private IP addresses are static and do not change when restarting instances. • By default, OCI subnets are considered public. When defining a subnet, it is recommended to set it as private. Unless required by the environment, the VCN should not include a Public Subnet. • When adding environments to the Delphix Engine, use the host's VCN (static private) IP addresses.
Static private IP	<ul style="list-style-type: none"> • The Delphix instance should be launched with a static private IP address. For security reasons, it is encouraged to avoid configuring the engine with a Public IP address; however, it could be passable to use a dynamic Public IP address in addition to a static Private IP address if the environment requires such access.

¹⁹¹ https://docs.oracle.com/en-us/iaas/Content/Compute/References/computeshapes.htm#Compute_Shapes

Requirements	Notes
Security rules configuration	<ul style="list-style-type: none"> • OCI allows two firewall features: Network Security Groups (NSGs) and Security Lists. Oracle recommends the use of NSGs over Security Lists because NSGs let the VCN subnet architecture be separate from the application security requirements. More information can be found in this Oracle documentation¹⁹² • A VCN will use a Security List to define default rules. By default, the security list will only open port 22 for SSH access. The Security List must be modified, or new NSGs created, to allow access to all of the networking ports used by the Delphix Engine and the various source and target engines. • This dual implementation of firewall or security rules may be different from other clouds, please see OCI documentation for best practices. • See Network performance configuration options (see page 733) for information about network performance tuning. • See General network and connectivity requirements (see page 731) for information about specific port configurations.

¹⁹² https://docs.cloud.oracle.com/en-us/iaas/Content/Network/Concepts/securityrules.htm#Security_Rules

5.13.5 General storage configuration

Requirements	Notes
General storage configuration	<ul style="list-style-type: none"> • Delphix recommends using storage disks that in sum, have enough storage and IOPS/throughput for your data and performance requirements. Planning ahead for the use of multiple storage disks for the Delphix File System (DxFS) is recommended as it will facilitate growing and shrinking DxFS more easily in the future should your storage needs change. If using multiple storage disks for DxFS, Delphix recommends using equally sized storage disks. Please consult your cloud provider's storage best practices for additional recommendations. • Allocate initial storage equal to the size of the physical source database storage. For high redo rates and/or high DB change rates, allocate an additional 10-20 %. • Add storage when storage capacity approaches 30% free. • Must use Block Volume for data storage. • Block Volumes must be attached using Paravirtualized mode. • When adding additional disks to the block storage pool, storage device initialization will not occur since it is not required on this cloud.
OCI storage configuration	<ul style="list-style-type: none"> • Currently supported Shapes only support Block Volumes; File Storage is not supported. • Paravirtualized block devices are required; currently, iSCSI devices are not supported. • Elastic Performance Configuration Options (aka Volume Performance Policy): use Higher Performance. • For Delphix Continuous Cloud Engines backed by object storage, read the section Delphix Elastic Data Engines (Engines backed by object storage) in Initial Setup (see page 585). <ul style="list-style-type: none"> • Block storage for caching requires a minimum of 200G Higher Performance volumes for caching.

5.13.6 Additional OCI configuration notes

- When running low on storage space, Delphix recommends adding additional equivalently sized block storage volumes, or devices, instead of resizing existing volumes.
- If existing storage volumes must be expanded, this must be done using the “online” resizing strategy specified in OCI documentation; “offline” storage resizing is not supported and may lead to unexpected downtime. If an existing storage volume is expanded, use the Setup or sysadmin

interface to expand each storage “device” or volume. The additional storage, as a result of a resize, will not be available for use until the storage devices are explicitly instructed to make use of the additional space.

- If expanding storage volumes, it is recommended that all volumes are expanded to the same size. When storage volumes or devices are the same size, the Delphix product is able to balance I/O distribution among the disks for optimal performance.
- Hot removal of storage volumes is not supported.

5.13.7 Prerequisites to deploying OCI

5.13.7.1 Overview

This article outlines the prerequisites for deployment of the Delphix Engine on OCI. The setup user should have experience launching and configuring instances in the Oracle Cloud Infrastructure environment. Review and complete the tasks in the next section before deployment.

5.13.7.2 Prerequisites

1. Contact a Delphix representative to request this capability. Delphix will assist in assuring that all Oracle Cloud requirements are met to successfully run a Delphix Engine with the most appropriate configuration for the use case.
2. Review the [Checklist of information required for installation and configuration](#) (see page 575)
3. Review Oracle's [Creating an instance documentation](#)¹⁹³
4. Make sure that the Oracle account being used to deploy the Delphix Engine has an appropriate level of permissions to upload files to a Bucket in Object Storage, and use that object to produce a Custom Image.
5. Determine which virtual cloud network (VCN) is being used when launching the virtualization instance. To maximize performance, deploy the Delphix Engine instance in the same VCN/subnet in which the virtual databases (VDBs) will be created.

Note:

Provisioning a VDB requires a compute instance running the same database engine as the source. Please note, however, that the target instance only needs storage to accommodate the OS, database platform binaries, etc., because Delphix delivers all of the data files.

6. Make sure that the necessary ports are open.

Using the Delphix Engine for OCI will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform.

¹⁹³ <https://docs.oracle.com/en-us/iaas/Content/Compute/Tasks/launchinginstance.htm>

- [Network and Connectivity Requirements for Oracle Environments](#)¹⁹⁴
 - [Network and Connectivity Requirements for SQL Server Environments](#) (see page 2158)
 - [Network and Connectivity Requirements for SAP ASE Environments](#) (see page 1962)
 - [Network and Connectivity Requirements for Db2 Environments](#) (see page 1053)
7. Update Security Group (or Security List) settings to accommodate the necessary connections.
 - a. Select the same Security Group that your current (or future) non-production compute nodes utilize.
 - b. Modify the Security Group to allow access to all of the networking ports used by the Delphix Engine and the various source and target platforms. See [Oracle Network Security Groups](#)¹⁹⁵
 8. Allocate storage.
 - a. To properly size the initial storage capacity and determine the number and size of Provisioned IOPs Volumes required, first create a list of the data sources intended for making dSources. A data source is typically a production database linked to the Virtualization Engine, enabling to create virtual, full, read-write copies of the source within minutes. The list should include the database name, platform (for example, Oracle or SQL Server), current size (in GB), the estimated number of virtual copies, and retention period (in days) of snapshots (backup copies).
 - b. Delphix only supports using Block Volume devices for data storage. These block devices must be attached to the Delphix Engine using the Paravirtualized attach mode (iSCSI is not currently supported). Block Volumes must be provisioned in the same Availability Domain as the Delphix Engine, otherwise, they will not be discoverable. Block Volumes should be configured to use the “[Higher performance](#)”¹⁹⁶ performance option. All Block Volumes attached to a single Delphix Engine should be of the same size. A minimum of four (4) Block Volumes should be attached to a Delphix Engine.
 9. During the Manual Deployment option, use the guidelines outlined in [Virtual machine requirements for OCI](#) (see page 665)

5.13.8 Procedure for deploying in OCI

5.13.8.1 Overview

This article outlines the procedure for deploying the Delphix Engine in Oracle Cloud Infrastructure.

5.13.8.2 Download and verify the Delphix engine image

1. Contact an account manager to request access to the OCI variant of the Delphix product.

¹⁹⁴ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/4817635/Network+and+connectivity+requirements+for+Oracle+environments>

¹⁹⁵ <https://docs.cloud.oracle.com/en-us/iaas/Content/Network/Concepts/networksecuritygroups.htm?Highlight=security>

¹⁹⁶ <https://docs.cloud.oracle.com/en-us/iaas/Content/Block/Concepts/blockvolumeperformance.htm>

2. Follow the link given by the Delphix solutions architect. Download the **Delphix_x.x.x.x_...Standard_OCI.qcow2** file and the **SHA256SUMS** file.
3. Once both files have finished downloading and are in the same directory, run the following command to verify the download:

```
$ grep -i OCI.qcow2 ./SHA256SUMS | sed -E 's,Appliance_Images/(Controlled_Availability/)?, ,g' | sha256sum --check
```

5.13.8.3 Upload the Delphix engine image as an object

1. Authenticate with OCI and navigate to the [Infrastructure console](#)¹⁹⁷
2. Use the navigation menu to reach the [Object storage buckets, core infrastructure, page](#)¹⁹⁸ (Menu > Object Storage > Object Storage).
3. Set the **List Scope Compartment**. This will depend on the organization's strategy for managing OCI resources.
4. [Create a storage bucket](#)¹⁹⁹ or select an existing bucket.
5. Click the blue **Upload** button.
6. In the **Upload Objects** modal window, specify an optional prefix and choose the OCI specific QCOW2 file that was previously downloaded.
7. Click the blue **Upload** button.

5.13.8.4 Creating a custom compute image from an object

1. Authenticate with OCI and navigate to the [Infrastructure console](#)²⁰⁰
2. Use the navigation menu to reach the [Compute custom images, core infrastructure, page](#)²⁰¹ (Menu > Compute > Custom Images).
3. Set the **List Scope Compartment**.
4. Click the blue **Image Import** button.
5. In the **Import Image** modal window, select a suitable compartment in the **Create In Compartment** field that conforms to the organization's strategy on managing OCI resources.
6. In the **Name** field enter a unique name to identify the Custom Compute Image (using the same name as the image object from the previous step is recommended). Upload the Delphix Engine Image as an Object.
7. For **Operating System** select **Linux**.

¹⁹⁷ <https://console.us-phoenix-1.oraclecloud.com/>

¹⁹⁸ <https://console.us-phoenix-1.oraclecloud.com/object-storage/buckets>

¹⁹⁹ https://docs.cloud.oracle.com/en-us/iaas/Content/GSG/Tasks/addingbuckets.htm#Putting_Data_into_Object_Storage

²⁰⁰ <https://console.us-phoenix-1.oraclecloud.com/>

²⁰¹ <https://console.us-phoenix-1.oraclecloud.com/compute/images>

8. Next, identify an object by specifying its Compartment, Bucket, and Object Name. Or, specify an Object Storage URL.
Note:
The Object Details will identify this value as **URL Path (URI)**.
9. For **Image Type** select **QCOW2**.
10. For **Launch Mode** select **Paravirtualized Mode**.
11. For organizations that have a tagging policy for cloud-based resources, expand the **Tagging Options** section, and define tags.
12. Click the blue **Import Image** button.

5.13.8.5 Launching the Delphix engine

1. Authenticate with OCI and navigate to the [Infrastructure Console](#)²⁰²
2. Use the navigation menu to reach the [Compute instances, core infrastructure, page](#)²⁰³ (Menu > Compute > Instances).
3. Set the **List Scope Compartment**.
4. Click the blue **Create Instance** button.
5. In the **Create Compute Instance** window pane, specify a unique name for the VM.
6. For the **Create In Compartment** field, select a suitable compartment that conforms to the organization's strategy on managing OCI resources.
7. In the **Image or operating system** section, click the **Change Image** button. Switch to the **Custom Images** tab. Find the Delphix image that corresponds to the instance being deployed. Click the blue **Select Image** button.
Note:
If the Delphix Custom Image is not visible, look for the **Change Compartment** option near the top of the current window pane.
8. Each Availability Domain has its own quota, it is ok to use AD-1, AD-2, or AD-3 - but, be sure to make note of which Availability Domain is being used.
Note:
Compute Instances and attached Storage will need to be in the same Availability Domain.
9. In the **Shape** section, click the **Change Shape** button. For **Instance type**, specify **Virtual Machine**. Select an OCI Shape that is supported by Delphix.
10. Continue on to the **Configure networking** section.
 - a. If the network is not specified correctly, it is likely that firewall issues will occur. In this case, please consult the organization's IT or DevOps team. If the organization is using Network Security Groups (NSGs), mark the **Use Network Security Groups to Control Traffic** checkbox

²⁰² <https://console.us-phoenix-1.oraclecloud.com/>

²⁰³ <https://console.us-phoenix-1.oraclecloud.com/compute/instances>

after consulting the appropriate teams. Last, select the **Do Not Assign a Public IP Address** radio button.

11. The **Boot Volume** section can be skipped.
12. In the **Add SSH Keys**, select the **No SSH Keys** radio option. The Delphix product is a closed appliance and manages users independently.
13. In general, all of the Advanced Options can be skipped. For organizations that have a tagging policy for cloud-based resources, expand into the Advanced Management section, and look for the **Tagging** sub-section to define tags.
14. Click the blue **Create** button - wait about 2-5 minutes for the Delphix Engine instance to boot.

5.13.8.6 Create block storage volumes

1. Authenticate with OCI and navigate to the [Infrastructure console](#)²⁰⁴
2. Use the navigation menu to reach the [Block volumes, core infrastructure, page](#)²⁰⁵ (Menu > Block Storage > Block Volumes).
3. Set the **List Scope Compartment**.
4. Click the blue **Create Block Volume** button.
5. In the **Create Block Volume** modal window, specify a unique name for this Block Volume. It can be helpful if this name is descriptive or identifies the VM it is intended to be attached to and ends in a sequence number.
6. For the **Availability Domain**, this value **MUST** be the same Availability Domain used for the Delphix Engine instance, otherwise, this volume will not be available for use.
7. In the **Volume Size and Performance** section, select the **Custom** option. Set the size of the volume to be sufficiently large (with room for growth) to support the databases that will be virtualized, or masked, by this Delphix Engine. Set the **Default Volume Performance** to the **Higher Performance** setting.
8. A **Backup Policy** is not required and can be left blank or **No Backup Policy Selected**. However, depending on the organization's needs, consider selecting a Backup Policy.
9. For **Encryption**, the default option of **Encrypt Using Oracle-Managed Keys** is permissible. Optionally, for independent encryption keys, use the **Encrypt Using Customer-Managed Keys** option.
10. For organizations that have a tagging policy for cloud-based resources, expand the **Tagging Options** section and define tags.
11. Uncheck the checkbox that says **View Detail Page After This Block Volume is Created**. This will prevent navigating away from the Block Volumes page because multiple Block Volumes will need to be created at the same time.
12. Click the blue **Create Block Volume** button.

²⁰⁴ <https://console.us-phoenix-1.oraclecloud.com/>

²⁰⁵ <https://console.us-phoenix-1.oraclecloud.com/block-storage/volumes>

13. A Delphix Engine requires a minimum of four equally sized Block Volumes for data storage. Repeat Steps 4-12 as many times as necessary.

5.13.8.7 Attach block storage volumes

(For an Elastic Data engine, the block storage will be used for caching. See additional details in the Delphix Elastic Data Engines section in [Initial setup \(see page 585\)](#))

1. Authenticate with OCI and navigate to the [Infrastructure console](#)²⁰⁶
2. Use the navigation menu to reach the [Block volumes, core infrastructure, page](#)²⁰⁷ (Menu > Block Storage > Block Volumes).
3. Set the **List Scope Compartment**.
4. From the list of pre-existing Block Volumes, identify the resources being attached to the Delphix Engine and wait until the volume state becomes Available.
5. Select one of the **Block Volumes** to enter the **Block Volume Details** page.
6. On the left-hand side, locate the **Resources** menu and select **Attached Instances**.
7. If the Block Volume has not been previously attached to another VM, selecting the blue **Attach to Instance** button will be available.
8. In the **Attach to Instance** modal window, specify the **Attachment Type** as **Paravirtualized**. Currently, iSCSI is not supported.
9. For **Access Type** use the **READ/WRITE** option.
10. Next, identify a Delphix Engine by selecting an instance or by specifying an instance OCID. If the Delphix Engine instance is not shown in the **Select an Instance** drop-down menu, the **Change Compartment** option could be needed. Block Volumes can only be attached to VM instances that were created in the same Availability Domain - if these values do not match, either re-provision Block Volumes or the Delphix Engine in the correct Availability Domain.
11. Click the blue **Attach** button.
12. Repeat Steps 4-11 until all associated Block Volume resources have been attached to the Delphix Engine instance.

5.13.8.8 Configuring the Delphix engine

1. Connect to the running Delphix Engine instance with a web browser. Use the IP address or FQDN noted in the Instance Description. Upon successful connection, the browser will display a login prompt to enter the Delphix Setup Page.
2. Refer to the standard [product deployment instructions \(see page 585\)](#) to complete the Delphix deployment.

²⁰⁶ <https://console.us-phoenix-1.oraclecloud.com/>

²⁰⁷ <https://console.us-phoenix-1.oraclecloud.com/block-storage/volumes>

5.13.8.9 Next steps

Congratulations! The Delphix Virtualization Engine should be successfully deployed in OCI.

Use Delphix documentation to learn how to:

- configure a database source
- configure target environments
- create virtual databases (VDBs)

5.14 Deployment for IBM cloud

5.14.1 Overview

This article covers the virtual machine requirements, including memory and data storage, for the deployment of the Delphix Engine on IBM Cloud. Once the requirements listed on this page are reviewed, refer to the next articles on GCP deployment:

- [Prerequisites for deploying in IBM Cloud \(see page 678\)](#)
- [Procedure for deploying in IBM Cloud \(see page 679\)](#)

Delphix disk storage capabilities remain seamlessly operable. There are no additional limitations to your storage, unless otherwise imposed by the [respective] Hypervisor or Cloud environment.

5.14.2 Supported profiles

The following is a list of profiles that are supported to deploy Delphix on IBM Cloud.

Requirements	Notes
<p>Memory instance families.</p> <p>The minimum requirements are listed below:</p> <ul style="list-style-type: none"> • 8vCPUs minimum • 64GB RAM minimum • 10Gbps min (25Gbps recommended) • Processors: Intel or AMD (No ARM) • Storage <ul style="list-style-type: none"> • SSD or NVMe (No HDD) <p>Recommended instance families:</p> <ul style="list-style-type: none"> • mx2 	<ul style="list-style-type: none"> • The Delphix Engine most closely resembles a storage appliance and performs best when provisioned using a storage-optimized profile. • Larger profiles provide more CPU, which can prevent resource shortfalls under high I/O throughput conditions. • Larger profiles also provide more memory, which the Delphix Engine uses to cache database blocks. More memory will provide better read performance. <p>Information on IBM Cloud instances²⁰⁸</p>

5.14.3 Network configuration

Requirements	Notes
Virtual server instances	<ul style="list-style-type: none"> • Deploy the Delphix Engine and all of the source and target environments in the same VPC network. • When adding environments to the Delphix Engine, use the host's VPC IP addresses.
Security configuration	<ul style="list-style-type: none"> • The default security group will only open port 22 for SSH access. The security group must be modified to allow access to all of the networking ports used by the Delphix Engine and the various source and target engines. • See Network performance configuration options (see page 733) for information about network performance tuning. • See General network and connectivity requirements (see page 733) for information about specific port configurations. • Reference: IBM cloud security and compliance²⁰⁹ documentation

Port Requirements

Using the Delphix Engine for OCI will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform.

²⁰⁸ <https://cloud.ibm.com/docs/vpc?topic=vpc-profiles&interface=ui>

²⁰⁹ <https://cloud.ibm.com/docs/security-compliance?topic=security-compliance-getting-started>

- [Network and connectivity requirements for Oracle environments](#)²¹⁰
- [Network and connectivity requirements for SQL Server environments](#)²¹¹
- [Network and connectivity requirements for SAP ASE environments \(see page 1962\)](#)

5.14.4 General storage configuration

Requirements	Notes
General storage configuration	<ul style="list-style-type: none"> • Delphix recommends using storage disks that in sum, have enough storage and IOPS/throughput for your data and performance requirements. Planning ahead for the use of multiple storage disks for the Delphix File System (DxFS) is recommended as it will facilitate growing and shrinking DxFS more easily in the future should your storage needs change. If using multiple storage disks for DxFS, Delphix recommends using equally sized storage disks. Please consult your cloud provider's storage best practices for additional recommendations. • Allocate initial storage equal to the size of the physical source database storage. For high redo rates and/or high DB change rates, allocate an additional 10-20 %. • Add storage when storage capacity approaches 30% free. • When adding additional disks to the block storage pool, storage device initialization will not occur since it is not required on this cloud. • Reference: IBM block storage documentation²¹²

5.14.5 Additional IBM configuration notes

- Expandable volume is a beta feature that is available for evaluation and testing purposes. This feature is available in the US South, US East, London, and France regions. Contact an IBM Sales representative if interested in getting access at <https://cloud.ibm.com/docs/vpc?topic=vpc-expanding-block-storage-volumes> .
- After performing an "online" resize/expansion of a storage volume using IBM Cloud tools, then use the Delphix sysadmin interface to "Expand" the storage device; otherwise, the newly allocated storage space, from the resize/expansion, will not be used.
- Resize/expansion of a storage volume using IBM Cloud is not supported while the Delphix engine is in a stopped state.

²¹⁰ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/4817635/Network+and+connectivity+requirements+for+Oracle+environments>

²¹¹ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/4817635/Network+and+connectivity+requirements+for+Oracle+environments>

²¹² <https://cloud.ibm.com/docs/vpc?topic=vpc-block-storage-profiles#tiers-beta>

²¹² <https://cloud.ibm.com/docs/vpc?topic=vpc-block-storage-profiles#tiers-beta>

- Removing a storage volume should be done while the machine is running. First use the Delphix sysadmin CLI interface to “Unconfigure” the storage device, then remove it from IBM Cloud.

5.14.6 Prerequisites for deploying in IBM Cloud

5.14.6.1 Overview

This article outlines the prerequisites for deployment of the Delphix Engine on IBM Cloud. The setup user should have experience launching and configuring instances in the IBM Cloud environment. Review and complete the tasks in the next section before deployment.

5.14.6.2 Prerequisites

1. A Delphix software license is required. New users should [contact Delphix](#)²¹³ to get started.
2. Review the [Checklist of information required for installation and configuration](#) (see page 575)
3. Review IBM's [cloud documentation](#)²¹⁴ for IBM Cloud-specific information.
4. Determine which virtual private cloud (VPC) is being used when launching the virtualization instance. To maximize performance, deploy the Delphix Engine instance in the same VCN/subnet in which the virtual databases (VDBs) will be created. **Note:** Provisioning a VDB requires a compute instance running the same database engine as the source. Please note, however, that the target instance only needs storage to accommodate the OS, database platform binaries, etc., because Delphix delivers all of the data files.
5. Make sure that the necessary ports are open. **Note:** Using the Delphix Engine for GCP will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform.
 - [Network and connectivity requirements for Oracle environments](#)²¹⁵
 - [Network access requirements for SQL server](#) (see page 2158)
 - [Network and connectivity requirements for SAP ASE environments](#) (see page 1962)
 - [Network and connectivity requirements for Db2 environments](#) (see page 1053)
6. Update Security Group settings to accommodate the necessary connections.
7. Select the same Network Security Group that your current (or future) non-production Azure virtual machines utilize.

²¹³ <https://www.delphix.com/company/contact>

²¹⁴ <https://cloud.ibm.com/docs>

²¹⁵ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/4817635/Network+and+connectivity+requirements+for+Oracle+environments>

8. Modify the Security Group to allow access to all of the networking ports used by the Delphix Engine and the various source and target platforms. See the links above for information about specific port configurations.
9. Allocate storage.

It is helpful to first create a list of the data sources from which you intend to make dSources. A data source is typically a production database that you link to the Delphix Engine, enabling you to create virtual, full, read-write copies of the source within minutes. The list should include the database's name, platform (for example, Oracle or SQL Server), current size (in GB), the estimated number of virtual copies, and retention period (in days) of snapshots (backup copies).

- a. All data storage disks must be comprised of Premium Storage devices.
- b. Delphix recommends using a minimum total of four disks to run the Delphix Engine. One disk is used for the boot device. The other four equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queuing more I/O operations to its storage.
- c. Premium storage devices have different levels of guaranteed IOPs that vary from 120 IOPs to 7500 IOPs. Please refer to IBM Cloud documentation to ensure that the selected devices will meet the requirements for your deployment.
- d. Use the guidelines outlined in Procedure for Deploying in IBM Cloud.

5.14.7 Procedure for deploying in the IBM Cloud

5.14.7.1 Overview

This article outlines the procedure for deploying the Delphix Engine in IBM Cloud. There are two methods for deploying a Delphix Engine in the IBM Cloud using the [Software Catalog](#)²¹⁶ or Manually Uploading the Delphix Image

5.14.7.2 Deploying from the IBM software catalog

1. Navigate to the [IBM Software Catalog](#)²¹⁷ and search for Delphix.
2. Select the Delphix Data Virtualization Tile or Masking Tile for the Masking product.
3. Scroll down to the Deployment Values section and input specifics for the environment.

²¹⁶ <https://cloud.ibm.com/catalog#software>

²¹⁷ <https://cloud.ibm.com/catalog#software>

Required parameters	Description
hostname	The name of the VSI used to deploy Delphix.
profile	Compute profile to be used for deploying Delphix (see recommended profiles).
ssh_key	Public SSH key is to be used when provisioning the VSI.
subnet_id	The id of the subnet where the VSI will be provisioned.
volumecount	Number of block storage volumes
volumeprofile	Block storage profile to use (recommended is >= 10 IOPS/GB)
volumesize	Block storage volume size.
vpcname	Name of the VPC where the VSI is provisioned.
zone	VPC zone to provision the environment.

5.14.7.3 Downloading the Delphix image

 Contact an account manager to request access to the IBM variant of the Delphix product.

1. Follow the link given by the Delphix solutions architect. Download the **Delphix_Verson...._Standard_IBM.qcow2** file and the **SHA256SUMS** file.
2. Once both files have finished downloading and are in the same directory, run the following command to verify the download:

```
$ grep -i IBM.qcow2 ./SHA256SUMS | sed -E 's,Appliance_Images/(Controlled_Availability/)?, ,g' | sha256sum --check
```

5.14.7.4 Uploading the Delphix engine image as an object

1. Authenticate with the IBM Cloud and navigate to the [Dashboard](#)²¹⁸
2. Use the navigation menu to reach the [Resource List page](#)²¹⁹. The Resource List page can be navigated from the Dashboard by clicking on **Storage** within the Resource Summary pane.
3. Expand Storage from the menu and select the appropriate resource group. Depending on the organization's strategy for managing IBM resources, [creating a resource group](#)²²⁰ may be required.
4. [Create a storage bucket](#)²²¹ or select an existing bucket.
5. Click the blue **Upload** button and select **Files**.
6. When the pop-up menu appears, select the **Transfer Type**. Aspera High-Speed Transfer is required for large files, the plugin will need to be installed. It will automatically navigate through the steps to install the plugin.
7. In the **Upload Files** (objects) window, click on the **Select Files** (objects) button and choose the **IBM-specific QCOW2** file that was previously downloaded.
8. Click the **Upload** button.

5.14.7.5 Creating a custom image

1. Authenticate with IBM Cloud and navigate to the [Dashboard](#)²²²
2. Use the navigation menu to reach the [Custom images page](#)²²³ for VPC within the VPC infrastructure (IBM Cloud pull-down menu > VPC Infrastructure > Custom images).
3. Click the blue **Create** button.
4. In the **Import Custom Image** page, specify a unique name for the image.
5. From the **Resource Group** drop-down, select the organization's resource group.
6. Optional: In the **Tags** section, provide appropriate [tags](#)²²⁴ to organize resources.
7. Select the appropriate **Region**.
8. Select the **Cloud Object Storage** bucket containing the uploaded image by navigating to **Instances > Location > Bucket** from the drop-down menus. The downloaded **QCOW2** image should appear in the pane below the three drop-down menus.

²¹⁸ <https://cloud.ibm.com/>

²¹⁹ <https://cloud.ibm.com/resources>

²²⁰ https://cloud.ibm.com/docs/account?topic=account-rgs#create_rgs

²²¹ <https://cloud.ibm.com/docs/cloud-object-storage/getting-started.html#gs-create-buckets>

²²² <https://cloud.ibm.com/>

²²³ <https://cloud.ibm.com/vpc-ext/compute/images>

²²⁴ <https://cloud.ibm.com/docs/account?topic=account-tag>

9. Within the **Operating System** section, click on the **Ubuntu Linux** tile and select **ubuntu-18-04-amd64** from the drop-down menu.
10. Once all the parameters are entered, in the right pane click on the blue button to import custom image.

5.14.7.6 Launching the Delphix engine

1. Authenticate with IBM Cloud and navigate to the [Dashboard](#)²²⁵
2. Use the navigation menu to reach the [Virtual server Instances page](#)²²⁶ within the VPC Infrastructure (IBM Cloud pull-down menu > VPC Infrastructure > Virtual Server Instances). Note: To maximize performance, deploy the Delphix Engine instance in the same VPC/subnet in which you will create your virtual databases (VDBs).
3. Click the blue **Create** button.
4. In the **New Virtual Server** for VPC page, specify a unique name for the VM.
5. From the **Virtual Private Cloud** drop-down, select the organization's VPC.
6. From the **Resource Group** drop-down, select the organization's resource group.
7. Optional: In the **Tags** section, provide appropriate [tags](#)²²⁷ to organize resources.
8. Select the **Location** of the IBM Cloud resources.
9. In the **Operating System** section, click on the **Select Custom Image** link within the Custom Image block.
10. In the pop menu, select the IBM-specific image previously uploaded.
11. Within the **Profile** section, click on **View** all profiles. Select one of the supported instance types and click **Save**.
12. The **User Data** section can be skipped.
13. The **Boot Volume** section can be skipped since it would already have the default values.
14. Creating block storage volumes can be done at a later time and will be discussed in the next section.
15. Continue on to the **Network Interfaces** section. If a subnet is already configured in the zone and VPC, then this section will already have a default network interface. Otherwise, create a subnet with the appropriate security groups. If the network is not specified correctly, it is likely that firewall issues will occur. In this case, please consult the organization's IT or DevOps team. If the organization is using Network Security Groups (NSGs), mark the **Use Network Security Groups to Control Traffic** checkbox after consulting the appropriate teams. Last, select the **Do Not Assign a Public IP Address** radio button.
16. Click the **Create virtual server instance** button on the right panel. This will take a couple of minutes.

²²⁵ <https://cloud.ibm.com/>

²²⁶ <https://cloud.ibm.com/vpc-ext/compute/vs>

²²⁷ <https://cloud.ibm.com/docs/account?topic=account-tag>

5.14.7.7 Creating block storage volumes

1. Authenticate with IBM Cloud and navigate to the [Dashboard](#)²²⁸
2. Use the navigation menu to reach the [Block Storage Volumes](#)²²⁹ within VPC Infrastructure (IBM Cloud pull-down menu > VPC Infrastructure > Block Storage Volumes).
3. Click the blue **Create** button.
4. In the **Block Storage Volume for VPC** modal window, specify a unique name for this Block Volume. It can be helpful if this name is descriptive or identifies the VM it is intended to be attached to and ends in a sequence number.
5. From the **Resource Group** drop-down, select the organization's resource group.
6. Optional: In the **Tags** section, provide appropriate [tags](#)²³⁰ to organize resources.
7. Select the **Location** of the IBM Cloud resources.
8. Enter the required **IOPS**. The recommended supported IOPS is 10/GB.
9. Enter the storage size in GB. Set the size of the volume to be sufficiently large, with room for growth, to support the databases that will be virtualized, or masked, by this Delphix Engine.
10. Keep the **Encryption** settings at default, e.g. Provider Managed.
11. Click the blue **Create Volume** button.
12. Delphix recommends using a minimum total of four disks to run the Delphix Engine. One disk is used for the boot device. The other four equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queuing more I/O operations to its storage. Repeat Steps 3-11 as many times as necessary.

5.14.7.8 Attaching block storage volumes

1. Authenticate with IBM Cloud and navigate to the [Dashboard](#)²³¹
2. Use the navigation menu to reach the [Block storage volumes](#)²³² within VPC Infrastructure (IBM Cloud pull-down menu > VPC Infrastructure > Block Storage Volumes).
3. From the list of pre-existing **Block Volumes**, identify the volumes attaching to a Delphix Engine and wait until the volume state becomes Available.
4. Note that the volumes being attached have **Attachment Type** set as a hyphen.
5. Select the right side of the volume row menu, then select **Attach to Instance**.

228 <https://cloud.ibm.com/>

229 <https://cloud.ibm.com/vpc-ext/storage/storageVolumes>

230 <https://cloud.ibm.com/docs/account?topic=account-tag>

231 <https://cloud.ibm.com/>

232 <https://cloud.ibm.com/vpc-ext/storage/storageVolumes>

6. In the **Attach Virtual Server Instance** modal window, select the virtual server instance (Delphix Engine) from the drop-down menu.
7. Click on the blue **Attach Volume** button.
8. Repeat Steps 3-7 until all associated **Block Volume** resources have been attached to the Delphix Engine instance.

5.14.7.9 Configuring the Delphix engine

1. Connect to the running Delphix Engine instance with a web browser. Use the IP address or DNS name noted in the Instance Description. Upon successful connection, the browser will display a login prompt to enter the **Delphix Setup Page**.
2. Refer to the standard [product deployment instructions](#) (see page 2394) to complete the Delphix deployment.

5.14.7.10 Next steps

Congratulations! The Delphix Virtualization Engine should be successfully deployed in IBM Cloud.

Use Delphix documentation to learn how to:

- [configure the database source](#) (see page 1080)
- [configure target environments](#) (see page 2369)
- [create virtual databases \(VDBs\)](#) (see page 1080)

5.15 Hotfix information

5.15.1 Overview

If there are any hotfixes installed for the Delphix Engine, the list can be accessed via the system administrator CLI with the following commands.

```
engine> cd system
engine system> ls
....
hotfixes: [HF-111]
....
```

6 Configuration

6.1 Configuration

Once you have deployed Delphix in the infrastructure of your choice, you will need to manage the settings of each Delphix Engine. The configuration section covers everything you need to do and know about Delphix settings and system administration. Each Delphix engine has its own settings, user profiles, policies, and many other configuration parameters. The majority of these are managed per engine, but increasingly will be managed via the Central Managed service. There are also many administrative functions you may need to manage, such as storage and capacity utilization, system monitoring integrations, and Support bundle upload. You may also want to change your engine's configuration, such as adding new storage disks, authentication mechanisms, or network properties.

6.1.1 [Registration management](#)

Each Delphix Engine can be registered via our internal system, typically for association with the Delphix Support team. Learn how to ensure up-to-date registration of your Delphix Engines.

6.1.2 [User and authentication management](#)

There are various user types and configurations to consider when using Delphix. Learn how to set up users, and manage authentication mechanisms such as Single Sign-on and Kerberos.

6.1.3 [Network and DNS management](#)

You may want to manage and configure certain network services, such as DNS, for Delphix. Here we specify general network and connectivity requirements and detail how to test network performance.

6.1.4 [Capacity and resource management](#)

Delphix will be responsible for managing many different data sources and data types. Learn storage and quota best practices, as well as the different options to optimally manage capacity.

6.1.5 [Monitoring and log management](#)

Using both Delphix and its associated datasets will generate many types of logs. Here, we explain the types of logs that Delphix creates as well as the monitoring tool integrations, such as SNMP and Splunk.

6.1.6 Performance analytics management

Delphix offers various performance analytics tools to help users monitor throughput, latency, and other key metrics. Learn how to leverage these tools and architect your Delphix deployment for optimal performance.

6.1.7 Starting, stopping, and restarting your engine

Occasionally, you may need to reboot or stop your Delphix engine, here, you will find steps to securely and safely restart your engines.

6.1.8 Usage data management

The Delphix User-click Analytics feature is a lightweight method to capture how users interact with Delphix product user interfaces. User-click Analytics may also be disabled via the UI.

6.2 Registration management

Registering your Delphix Engines is a prerequisite for serviceability from the Delphix Support team. Registration allows Delphix Support to access the engine and properly diagnose and identify any issues during support cases. It is important to manage your registration regularly in order to ensure the security of Support access, as described in the section below.

Registering a Delphix Engine with support is different from registering it with Data Control Tower, *formerly* Central Management. For more information refer to [Data Control Tower](#)²³³

The registration code contains an encrypted key that only Delphix can decrypt, which is unique for each engine. Delphix uses this key to generate one-time authentication codes that authorized Support personnel can use to log into the engine during support sessions.

6.2.1 Retrieving the Delphix engine registration code

To enable Delphix Support, you may perform registration either during the initial setup of the Delphix Engine. If you want to register later, you may retrieve the registration code from the system setup portal.

1. You can retrieve the Delphix Engine Registration Code during the Initial Setup or later through the Delphix Setup application after logging in as a system administrator.
2. In the Registration panel, click View.
3. The Registration Code is displayed in the bottom half of the Registration window.

²³³ <https://dct.delphix.com/docs/latest/>

4. If your local workstation is connected to the external Internet, you can auto-register the Delphix Engine:
 - a. Enter your Delphix Support Username and Support Password.
 - b. Click Register.
5. If external connectivity is not immediately available, you must register manually.
 - a. Copy the Delphix Engine registration code
 - b. Log in with your support credentials at <https://register.delphix.com>²³⁴
 - c. Paste the Registration Code and click Register.

Following registration, you will receive an email confirming the registration of your Delphix Engine

6.2.2 Regenerating the Delphix engine registration code

Delphix recommends that you regenerate the registration code every six months to rotate the secret key in order to maximize the Support Security of the Delphix Engine.

Procedure

1. Log into the CLI (command-line interface) of the Delphix Engine with the sysadmin credentials.
2. Type `/registration/regenerate` and hit enter.
3. Type `commit` and hit enter. After a few seconds, the new code will be displayed.
4. Re-register the engine with this new code.

Failing to re-register the Delphix Engine after regenerating the registration code may prevent Support personnel from accessing the engine. In such a case, a support session cannot begin until the engine has been re-registered with the new registration code.

6.3 User and authentication management

There are two main topics in this section:

- Managing users and groups who will access and manage Delphix.
- Configuring various authentication mechanisms to access both Delphix and connected environments and datasets.

This section covers the following topics:

- [Users and groups](#) (see page 688)
- [Authentication mechanisms](#) (see page 703)

²³⁴ <https://register.delphix.com/>

6.3.1 Users and groups

6.3.1.1 User types and user management

There are three user types in the Delphix user model: the system administrator, the Delphix user, and the Self-service user.

Username must start with a letter and contain only alphanumeric characters, hyphens, underscores, and/or periods.

6.3.1.1.1 System administrators

System administrator users are responsible for managing the Delphix Engine itself, but not the objects (Environments, dSources, VDBs) within the server. For example, a system administrator is responsible for setting the time on the Delphix Engine and its network address, restarting it, creating new system administrator users (but not Delphix users), and other similar tasks.

A user called sysadmin is the default system, administrator user. While this user can be suspended, it may not be deleted. When the Delphix Management application first launches, this user can log in using the username sysadmin and password sysadmin.

To create or modify system administrators, first, log in to Delphix Setup and navigate to the Users section of the homepage. Here, you can:

- **Add new** system administrators with the plus sign
- **Change** system administrator passwords with the pencil icon
- **Delete** system administrators with the trashcan icon
- **Suspend** system administrators with the pause button
- **Reinstate** system administrators with the play button

6.3.1.1.2 Delphix users

Delphix users are responsible for managing the environments and datasets within Delphix, such as dSources, virtual databases (VDBs), users, groups, and related policies and resources.

A Delphix user can be marked as a Engine Administrators. Engine Administrators have three special privileges:

- They can manage other Delphix users
- They implicitly have Owner privileges for all Delphix objects
- They can create new groups and new environments

The default Delphix user provided with a Delphix Engine is a Engine Administrators and is called admin. Like the sysadmin user, the admin cannot be deleted. When the Delphix Management application launches,

the admin user can log in using the password specified during the initial setup when Delphix was first launched.

Only these two users require password-based authentication. Also, other users may use other mechanisms such as LDAP or Kerberos, as described in [Configuring and managing kerberos \(see page 713\)](#) and [Configuring and using LDAP with the Delphix Engine \(see page 706\)](#).

6.3.1.1.3 Self-service users

Delphix Self-Service has two types of users: the admin user and the data user.

Admin users have full access to all report data and can configure Delphix Self-Service, additionally, they can:

- Use the Delphix Engine to add/delete users
- Change tunable settings
- Add/delete tags
- Create and assign data templates and containers

Data users have access to production data provided in a data container. The data container provides these users with a playground in which to work with data using the Self-Service Toolbar.

For more information on Self-service users, visit our [Self-service documentation \(see page 2451\)](#).

6.3.1.2 User privileges for Delphix objects

The user roles on Delphix objects consist of four types, which the Engine Admin user assigns: Provisioner, Owner, Data Operator, and Reader. These privileges apply both to objects, such as dSources and Virtual Databases (VDBs), and to groups, which are containers that hold those objects.

The Engine Administrators user can assign privileges to groups, dSources, and VDBs. Privileges are inherited, meaning that privileges assigned to a group are effective for the dSources and VDBs contained in that group.

If a user does not have a privilege in relation to an object or group, then he or she has no visibility into that object or group.

Roles and Privileges for Delphix Objects

Role	Object privileges	Group privileges
Owner	<ul style="list-style-type: none"> • Can provision VDBs from owned dSources and VDBs • Can perform Virtual to Physical (V2P) from owned dSources and VDBs • Can access statistics on the dSource, VDB, or snapshot such as usage, history, and space consumption • Can refresh or rollback VDBs • Can snapshot dSources and VDBs • Can start, stop, or re-start VDBs • Can drop VDBs 	<ul style="list-style-type: none"> • Can provision VDBs from all dSources and VDBs in the group • Can refresh or rollback all VDBs in the group • Can snapshot all dSources and VDBs in the group • Can perform Virtual to Physical (V2P) from owned dSources and VDBs • Can view Templates for policies. • Can not create, edit, or delete a policy template from the policy page. • Can assign Owner privileges for dSources and VDBs • Can access the same statistics as a Provisioner, Data Operator, or Reader • Can start, stop, or re-start VDBs
Provisioner	<ul style="list-style-type: none"> • Can access statistics on the dSource, VDB, or snapshot such as usage, history, and space consumption • Can provision VDBs from dSources and VDBs 	<ul style="list-style-type: none"> • Can access statistics on all dSources, VDBs, or snapshots in the group such as usage, history, and space consumption • Can provision VDBs from all dSources and VDBs in the group
Data Operator	<ul style="list-style-type: none"> • Can access statistics on the dSource, VDB, or snapshot such as usage, history, and space consumption • Can refresh or rollback VDBs • Can snapshot dSources and VDBs 	<ul style="list-style-type: none"> • Can access statistics on all dSources, VDBs, or snapshots in the group such as usage, history, and space consumption • Can refresh or rollback all VDBs in the group • Can snapshot all dSources and VDBs in the group
Reader	<ul style="list-style-type: none"> • Can access statistics on the dSource, VDB, or snapshot such as usage, history, and space consumption 	<ul style="list-style-type: none"> • Can access statistics on all dSources, VDBs, or snapshots in the group such as usage, history, and space consumption

Role	Object privileges	Group privileges
Self-Service Only	<ul style="list-style-type: none"> • In the Delphix Self Service UI this user can: <ul style="list-style-type: none"> • Refresh • Restore • Bookmark • Reset • Branch • Stop/Activate • Share 	

6.3.1.3 Managing groups

Creating groups helps you manage policies and privileges over objects within that group. When privileges are created for users at the group level, those privileges apply to all objects of that type within the group. When new objects are created or added to the group, the policies and privileges you have created at the group level will be applied to them.

- [Assigning group and object ownership](#) (see page 692)
- [Adding and deleting groups](#) (see page 692)

6.3.1.4 Authentication mechanisms

Delphix supports a variety of authentication mechanisms to connect to several different interfaces and systems. For example, you can connect via the UI using the default users described above, or you can connect to the CLI using an API token.

There are three categories of authentication related to Delphix: the Delphix UI, the Delphix CLI/API, and external systems such as Kerberos access to connected source and target hosts. Below are detailed pages related to each of these three sections:

- UI authentication:
 - Data Control Tower, formerly Central Management
 - Username and password
 - LDAP: Directory-based authentication to Delphix engines rather than the default local access
 - Single Sign-on: Integration and support for identity providers to authenticate users on a per engine basis using SAML2-SSO.
- CLI authentication:
 - Username and password
 - Auto-authentication via SSH keys: to automatically sign in to the Delphix CLI without requiring user-input credentials
- API authentication

- Username and password
- API Tokens (for Delphix Engines registered with [Data control tower](#)²³⁵)
- OAuth2 JSON Web Tokens
- External systems:
 - Username and password
 - SSH keys
 - Kerberos: Authentication for environments and data sources using Kerberos

Kerberos support

Kerberos support is for access to connected environments, rather than the Delphix engine itself. This is an advanced topic and will require a solid understanding of Delphix concepts and architecture.

6.3.1.5 Assigning group and object ownership

This topic describes how to assign group and object ownership to users in the Delphix Domain.

1. Log into the **Delphix Management** application.
2. Select **Manage > Users**.
3. For an existing user, select a user then select the edit icon.
4. Click **Next**.
5. In the **Privileges** tab assign **Owner** or **Provisioner** rights for groups or objects within groups. You do not have to assign a specific owner or auditor right for each object.
6. Click Next when finished.
7. For new users, refer to [Users and Groups](#) (see page 688). When you click **Submit**, the User Profile manager will reload, and then you can follow steps 4 - 6 to assign privileges.

6.3.1.6 Adding and deleting groups

This topic describes how to add and delete groups within the Delphix Domain.

²³⁵ <https://dct.delphix.com/docs/latest/>

User terminology for Delphix admin has been changed to engine admin.

The default domain user created on Delphix Engines is now **admin** instead of `delphix_admin`. When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling `delphix_admin`.

6.3.1.6.1 Adding a group

1. Log into the **Delphix Management** application.
2. From the **Manage** menu, select **Datasets**.
3. Select the **plus** icon and then select **Add Dataset Group**.
4. Enter a **Group Name** and an optional description.
5. Click **Add**.

At least one group must exist

At least one group must always exist on the Delphix Engine in order to link a dSource. If you delete the last group, you will need to create a new group in order to create a dSource.

6.3.1.6.2 Deleting a group

1. Log into the **Delphix Management** application as a user with **Engine Admin** privileges or group **OWNER** privileges for the target group.
2. From the **Datasets** panel, select the target group.
3. Click the **Trash Can** icon.
4. Click **Delete**.

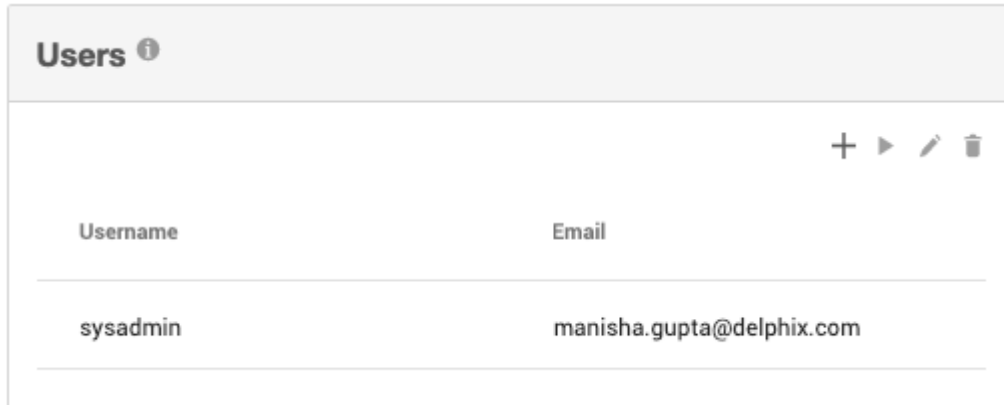

**Deleting groups containing objects**

A group cannot be deleted if it contains VDBs or dSources. All databases within a group must be deleted prior to deleting the group.

6.3.1.7 Managing system administrators

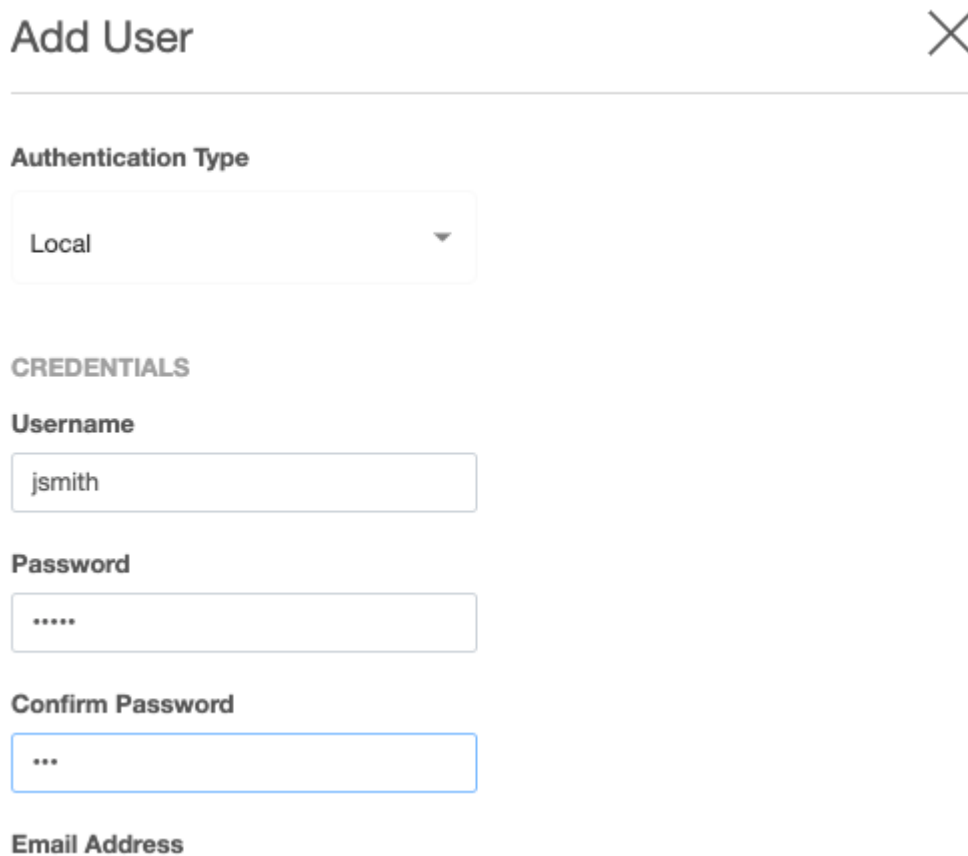

6.3.1.7.1 Adding a new system administrator

1. Launch the **Setup** application.
2. From the **Dashboard** select the **+** icon located in the **Users** card next to the filter field.

Users ⓘ	
Username	Email
sysadmin	manisha.gupta@delphix.com

3. Enter the required information.

Email Address

USER DETAILS**First Name****Last Name****Phone (Work)****Phone (Cell)****Phone (Home)**

Cancel

Save

4. Click **Save**.

6.3.1.7.2 Deleting and suspending system administrators

1. Launch the **Delphix Setup** application and log in using the **sysadmin** (or another system administrator) credentials.
2. In the **User** panel, click the user you want to suspend or delete.
3. Suspend the user by clicking the **pause** icon

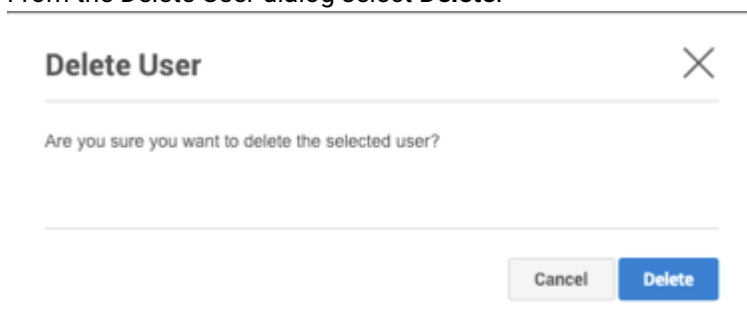

- Once the user has been paused you can delete the user by clicking the **trash can**.

- From the Delete User dialog select **Delete**.

Suspending the sysadmin user

The sysadmin user is a required user for the Delphix Engine. This user cannot be deleted but can be suspended. Suspending the sysadmin user prevents that user from being able to log into **Delphix Setup** or to the console via **ssh**.

6.3.1.7.3 Reinstating system administrators

1. Launch the **Delphix Setup** application and login using system administrator credentials.
2. In the **User** panel, click on the name of the user you want to reinstate.
3. Reinstall the user by clicking the **enable user** icon

The screenshot shows the Delphix Admin interface. At the top, there are navigation tabs: Environments, Monitor, Settings, Admin (selected), and Audit. Below the tabs, the breadcrumb path is 'Home > Admin > Users'. The main heading is 'Admin' with two buttons: 'Add User' and 'Generate New Key'. Below this is the 'Users' section, which contains a table with columns: User, Last Name, First Name, Email, Type, Edit, and Delete. The table has one row for the 'admin' user, with email 'manisha.gupta@delp...' and Type 'Administrator'. The 'Delete' icon for the 'admin' user is highlighted with a red box. On the left side, there is a sidebar menu with options: Users (selected), Email Notification, Utilization, Logs, and About. At the bottom, there is a footer with navigation links: Environments | Monitor | Settings | Admin | Audit, and the Delphix logo 'D E L P H I X'.

6.3.1.7.4 Changing system administrator passwords

1. Launch the **Delphix Setup** application and log in using **sysadmin** level credentials.
2. In the **User** panel, click the user whose password you want to change.

3. Select the **Edit** icon.
4. Enter the new password fields.

5. Click **Save**.

6.3.1.7.5 Adjust session timeout (command-line only)

Configuring session timeout for System Setup users is not available in the GUI. As such, the only method is via CLI using the commands below.

```
Delphix> user
Delphix user> select sysadmin
Delphix user 'sysadmin'> ls
Properties
  type: User
  name: sysadmin
  apiUser: true
  authenticationType: NATIVE
  emailAddress: user.name@domain.com
  enabled: true
  firstName: (unset)
  homePhoneNumber: (unset)
  isDefault: true
  lastName: (unset)
  locale: en-US
  mobilePhoneNumber: (unset)
  passwordUpdateRequest: NONE
  principal: sysadmin
  publicKey: (empty)
  reference: USER-1
  sessionTimeout: 30min
  userType: SYSTEM
  workPhoneNumber: (unset)

disable
enable
updateCredential
Delphix user 'sysadmin'> update
Delphix user 'sysadmin' update *> set sessionTimeout=180
Delphix user 'sysadmin' update *> commit
```

6.3.1.8 Managing Delphix users

This section describes how to manage users. Here, you can learn how to:

- [Add Users \(see page 0\)](#)
- [Edit, Delete and Suspend Users \(see page 0\)](#)
- [Manage Profile Information \(see page 0\)](#)
- [Delphix User Account Lockouts \(see page 0\)](#)

6.3.1.8.1 Adding users

6.3.1.8.1.1 Prerequisites

If you intend to validate user logins using LDAP authentication, make sure a system administrator has configured LDAP.

6.3.1.8.1.2 Procedure

1. Launch the **Delphix Management** application.
2. Click **Manage**.
3. Select **Users**.
4. Click plus icon to **Add User**.
5. Enter the mandatory fields **Username**, **Email Address**, and **New Password** for the new user.
 - a. Rules for creating a username:
 - Must be between 1 to 256 characters.
 - Can be just letters, just numbers, or just any of the following special characters (_ , - , . , @) or a combination of all of these. For example, a username could be just "@".
 - Can start with any of the above-listed characters and is case-sensitive.Your password has no restrictions.
6. Select the **User Type**.
7. Click **Next**.
8. In the **Privileges** tab enter the privileges for the user.
9. Click **Next** and review the summary.
10. Click **Submit**.

Assigning owner and provisioner privileges

Assigning owner privileges at the group level conveys ownership privileges over all objects in that group. Click the **expand** icon next to each group name to see all objects in that group. You can also assign ownership privileges only for specific objects in a group. You do not have to assign owner or auditor privileges for all Delphix objects, only those for which you want to grant the user-specific access.

6.3.1.8.2 Editing, deleting, and suspending users

The delphix_admin user

The user named **delphix_admin** cannot be deleted since this is a user created by the Delphix Engine. However, you can suspend it.

When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling delphix_admin.

1. Launch the **Delphix Management** application.
2. Select **Manage > Users**.
3. Click the user's name to open the user's profile panel.
4. Click the **disable** icon to disable the user.
5. Click the **trash can** icon to delete the user.

Deleting a user cannot be undone.

6.3.1.8.3 Managing individual profile information

1. After logging in, click your name in the menu bar.
2. Click **Profile**.
3. Edit profile information as necessary.
4. Select options for the event level that will trigger a notification email.
5. Select a time period for **Session Timeout**.
6. Click **Password** to edit your password.
7. Click **OK** when finished.
8. Click **Privileges** to see your privileges (Auditor or Owner) for Delphix objects.

6.3.1.8.4 Delphix user account lockouts

6.3.1.8.4.1 User account lockouts

This feature applies to all kinds of users – Delphix and LDAP. It also applies to usernames that do not correspond to any user in the system. A user who enters a wrong password three times in a row is "locked out" (i.e., unable to continue attempting to log in) for an initial period of 30 seconds. After three more bad login attempts, the user must wait 60 seconds, then 90 seconds, and so on.

6.3.1.8.4.2 Troubleshooting a user account lockout

The initial wait time for any future lockouts is reset to 30 seconds when the user successfully logs in or when an administrator resets the user's password. When an administrator resets a locked-out user's password, the user can immediately attempt to log in.

6.3.1.8.5 Self-service password reset

This feature allows users to independently reset their forgotten passwords to reduce the need for administrator intervention.

The password reset functionality is integrated into the login interface. Users will find a **Forgot Password?** link on the login page, which initiates the password reset process. This feature's availability can be controlled through a feature flag, and a configurable validity period for password reset tokens is implemented.

Additional notes

- Non-admin users can reset their passwords without needing administrator assistance.
- Users are required to validate their email identity for password resets, linking each user account with an email address.

6.3.1.8.5.1 Security considerations

- Self-service password reset should record source network addresses for complete audit records.
- Requests from unsecured clients (HTTP) are automatically blocked, ensuring password reset is only accessible through secure connections (HTTPS).
- Rate-limiting and monitoring are implemented to prevent abuse and to ensure secure handling of password reset requests.

6.3.1.8.5.2 User interface

- **Login page:** A *Forgot Password?* link directs to the password reset request page.
- **Password reset request page:** Users enter their username or associated email address. Upon submission, an automated response indicates that password reset instructions will be sent to the registered email if the provided information matches an account.
- **New password setting page:** Users will be prompted to enter and confirm a new password, adhering to the engine's password policy requirements.

Additional notes

- **Password Reset Validity:** Administrators can configure the validity period for password reset tokens.
- **Password Reset Emails:** These emails include a unique token for resetting the password, an explanation of the token's validity period, and guidance for users who did not initiate the reset request.

6.3.1.9 Managing individual profile information

This topic describes how individual users can manage personal settings such as personal information, passwords, event notifications, and session timeouts. It also describes how users can view their privileges for Delphix objects.

6.3.1.9.1 Procedure

1. After logging in, click your name in the menu bar.
2. Click **Profile**.
3. Edit profile information as necessary.
4. Select options for the event level that will trigger a notification email.
5. Select a time period for **Session Timeout**.
6. Click **Password** to edit your password.
7. Click **OK** when finished.
8. Click **Privileges** to see your privileges (Auditor or Owner) for Delphix objects.

6.3.2 Authentication mechanisms

There are various authentication mechanisms that Delphix supports besides signing in via username and password to engines via the GUI, CLI or API. Below, you'll find documentation for the following capabilities:

- Auto-authentication via SSH keys: to automatically sign in to the Delphix CLI without requiring user-input credentials
- LDAP: Directory-based authentication to Delphix engines rather than the default local access.
- Single Sign-on: Integration and support for identity providers to authenticate users.
- Kerberos: Authentication for environments and data sources using Kerberos.
- OAuth2: Offers an alternative, password-less authentication method for API access to the Delphix Engine.

Kerberos support

Kerberos support is for access to connected environments, rather than the Delphix Engine itself. This is an advanced topic and will require a solid understanding of Delphix concepts and architecture.

6.3.2.1 How to setup auto-authentication

Generally, users need to enter a username and password when logging into the Delphix CLI. There are situations in which users may find entering a password cumbersome, or manual password entry may not be possible. These situations can be alleviated by setting up auto-authentication for the Delphix CLI.

There are two basic steps:

1. Generate a public and Private RSA key pair.
2. Register the public key with the specific Delphix Engine user.

There are two methods available:

- PuTTY
- OpenSSH with OpenSSL

If the examples provided do not work for you, you may need to consult your SSH documentation, we can only provide support for the Delphix Engine side of the connection. In both examples we grant password less login to the **sysadmin** user to host **Delphix5010**.

6.3.2.1.1 Using PuTTY

You will need both **putty.exe** and **puttygen.exe** for this.

Launch **puttygen.exe**

Set the **Type of key to generate** to *SSH-2 RSA* and the **Number of bites in generated key** to a suitable value such as *2048*. Click **Generate**

Once it has generated the key pair, leave the password fields blank and save the public and private keys to file.

Add the full contents of the public key to each Delphix Engine user you want to allow automatic login for.

```
Delphix5010> user Delphix5010 user> select sysadmin Delphix5010
user 'sysadmin'> update Delphix5010 user 'sysadmin' update> set
publicKey="ssh-rsa
AAAAB3NzaC1yc2EAAAABJQAAAQEajdQYr1WU6UPr6FZqyt3eKNJEkAe8IdKQ8hcuBwa3HvRVmUuv0L
ykm5AYQLIW0B33aWusr0o+2FVTzt3/6G1lLCf7wfhCShlJsYgwgMHeEGjixK5tacFCD8r+8dALaXlv
8u0lddK0A2LPXbCCCIRL7IyVEnlSbUFY8s+E/
2R3owy5XSbLJLE1e15m1lQP0yUuQddAh25ruWR+1HHSaWG3p+wof0h6l7czkEcq7fPjtAZvivX90e8
Ggt6JQ8bv6td7aJW0bU2Y9YY0HLLHot7NQ4AT/
0tXSRKAG8sIdL7tY9hbHMNRftCLzfn7mL+Qk8TjUYni3JGB4Vyi0bmkj6nHQ== rsa-
key-20160309" Delphix5010 user 'sysadmin' update> commit
```

1. In Putty, create a profile that uses the private key. In the PuTTY Connection settings set **SSH > Auth** > *Private key file for authentication* to the private key file you just generated
2. Next, still in the PuTTY Connection settings set **Data > Auto-login username** to `sysadmin@SYSTEM`.
3. Test the connection by setting the connection hostname as you normally would for PuTTY and click **Open**.

```
Connection > SSH . Auth
```

6.3.2.1.2 Using OpenSSH with open SSL

Generally, OpenSSH will already have default public and private keys that can be used, if not (or the default keys are password locked) you can create them this way. OpenSSH is required but OpenSSH will take care of the background OpenSSH stuff for you.

1. Create your RSA key pair to a bit length suitable for your security needs (2048 is commonly required for recent security audits)

```
$ ssh-keygen -b 2048 -t rsa -P ' ' -f /etc/ssh/ssh_host_rsa_key
```

Results in a matching public file called `/etc/ssh/ssh_host_rsa_key.pub` If you want to create different key pairs, just specify a different file path.

2. Add the full contents of the public key (`/etc/ssh/ssh_host_rsa_key.pub` in this example) to each Delphix Engine user you want to allow automatic login for.

```
Delphix5010> user Delphix5010 user> select sysadmin Delphix5010
user 'sysadmin'> update Delphix5010 user 'sysadmin' update> set
publicKey="ssh-rsa
AAAAB3NzaC1yc2EAAAABJQAAAQEajdQYr1WU6UPr6FZqyt3eKNJEkAe8IdKQ8hcuBwa3HvRVmUuv0L
ykm5AYQLIW0B33aWusr0o+2FVTzt3/6G1lLCf7wfhCShlJsYgwgMHeEGjixK5tacFCD8r+8dALaXlv
8u0lddK0A2LPXbCCCIRL7IyVEnlSbUFY8s+E/
2R3owy5XSbLJLE1e15m1lQP0yUuQddAh25ruWR+1HHSaWG3p+wof0h6l7czkEcq7fPjtAZvivX90e8
Ggt6JQ8bv6td7aJW0bU2Y9YY0HLLHot7NQ4AT/
0tXSRKAG8sIdL7tY9hbHMNRftCLzfn7mL+Qk8TjUYni3JGB4Vyi0bmkj6nHQ== rsa-
key-20160309" Delphix5010 user 'sysadmin' update> commit
```

3. Test no password login on the command line from your client.

```
$ ssh -i /etc/ssh/ssh_host_rsa_key sysadmin@Delphix5010
```

6.3.2.2 Configuring and using LDAP with the Delphix engine

Using LDAP with the Delphix Engine requires the following:

- configure the Delphix Engine to use LDAP
- add LDAP users in the Delphix Management application

6.3.2.2.1 Configuring LDAP on the Delphix engine

1. From the Delphix Setup application configure the LDAP server with the Delphix Engine by selecting Modify in the Authentication section.

2. Enter the information about the LDAP Authentication Server. This must be an LDAP server that is configured for authentication. This information should come from the LDAP admin who runs the server. As a general rule only use simple auth. If using SSL/TLS typically use port 636 and import a certificate. If not using SSL/TLS, use port 389 and you will not need a certificate. If the remote LDAP server has disabled anonymous access and the user is trying to use SSL/TLS, the user will be unable

to import the certificate. If this occurs file a support case so that Delphix Support can help manually upload the certificate.

Note:

Import Server certificate option may import more than one certificate. It is recommended to import the CA certificate in the TrustStore and then click the Test Connection option to validate. For more information on adding a certificate in the TrustStore, refer to [TrustStore Settings \(see page 1004\)](#).

Test Connect will issue an anonymous login request to the LDAP server. If the LDAP server has disabled anonymous access the test will fail. Test the server by adding a valid LDAP user and try logging in.

Authentication ✕

Use LDAP

LDAP Server **Port**

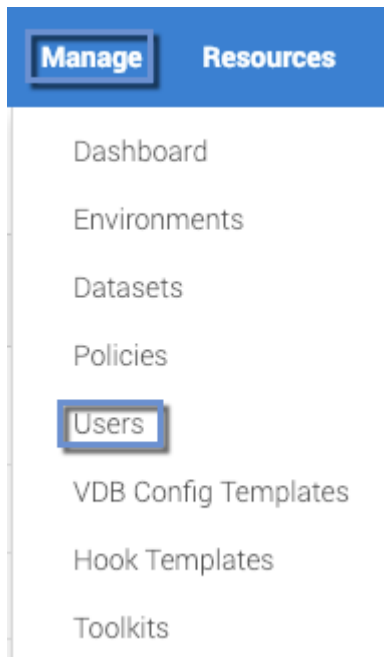

Protect LDAP traffic with SSL/TLS

Authentication

3. After updating the information and clicking the **Save** button, the *Authentication Service* section should reflect the proper information.

6.3.2.2.2 Create a new LDAP user account

1. Login to the Delphix Management application and go to **Manage > Users** to add a new user.

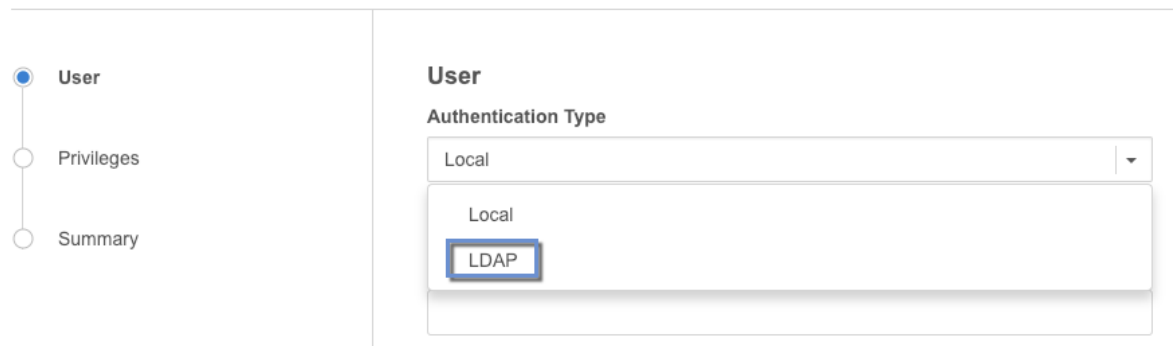

2. In the **Users** screen, click the **Add User** icon

and choose **LDAP** as the *Authentication Type*.

Add User

3. Fill out the data fields and decide if the user will be a *Delphix Admin*. For more info on the *Delphix Admin* setting please see [Managing System Administrators](#) (see page 694). When adding the principal, it is mandatory to specify the entire DN of the user to be added.

Each entry in an LDAP tree has a unique identifier; its Distinguished Name (DN). This consists of its Relative Distinguished Name (RDN), constructed from some attribute(s) in the entry, follow the parent entry's DN. Think of the DN as the full file path and the RDN as its relative filename in its parent folder (e.g. if /foo/bar/myfile.txt is the DN then myfile.txt would be the RDN). Some users prefer to use the term fully qualified DN to emphasize that a proper DN should include all of the components.

6.3.2.2.1 Example of LDAP tree in which the base is:

dc=example,dc=com

and people are stored in a People subtree with RDN:

ou=people

and each individual is keyed by the cn (common name) attribute.

An example DN in this case would be: cn=Tony,ou=people,dc=example,dc=com

When adding an LDAP user you will be asked for the following information:

- Principal - which is the DN from above
- email address
- username - used to login into Delphix

A password is no longer required because it will authenticate against the password already stored in the LDAP entry, which is presumably known to the individual already. It is probably best if someone familiar with the LDAP tree and using it for authentication were involved at least initially to help understand how to describe the fully qualified DN for users.

6.3.2.2.3 Using Microsoft AD as an LDAP server

Using Microsoft AD as a modified LDAP server is also possible. Microsoft AD allows some shortcuts in the specification of the DN when binding.

Examples:

- <domain>\<user logon name>
- <user logon name>@<domain>.com

As with generic LDAP, it is probably best if someone familiar with using the AD LDAP instance for authentication was involved.

User**User Type**

Standard User

jwatson

Email Address

john.watson@delphix.com

When users log in, they will enter the username as chosen above, and the password that matches the principal entered above.

6.3.2.3 Configuring single sign-on

6.3.2.3.1 Overview

Continuous Data and Continuous Compliance Engines above version 5.3.3 support authentication via the SAML 2.0 standard (SP initiated and IdP initiated).

This page provides instructions on how to set up Single Sign-on (SSO) on the Data Engine. Single Log-out (SLO) is not supported. This means that logging out of a Data Engine will not terminate sessions on other Data Engines, nor will it terminate the IdP session.

6.3.2.3.2 Identity provider configuration

The steps to configure an Identity Provider (IdP) are specific to each IdP product (e.g. Okta, OneLogin, PingFederate). The terminology may vary, but one SAML 2.0 application (or SP connection) will need to be created for each Data Engine. The engine does not expose a metadata document. The following attributes must be entered:

- **ACS URL (Assertion Consumer Service URL):** `http(s)://<delphix-engine>/sso/response`

- Delphix strongly recommends that HTTPS is used instead of HTTP for all UI and API communication with the Data Engine. For HTTPS or the automatic HTTP to HTTPS redirect, use the `https://` scheme in the ACS URL, otherwise use the `http://` scheme. Refer to the [CLI Cookbook: Changing HTTP and HTTPS web connections](#)²³⁶ page on how to set up HTTPS.
- **SAML Bindings:** Data Engines support the POST and redirect bindings.
- **Audience Restriction (SP entity ID, Partner's Entity ID):** The audience restriction must be set to the entity id configured in the Delphix Server via the Delphix Setup (see below). The default value is `https://<Delphix Server ID>` where **<Delphix Server ID>** is a 36-character hexadecimal string of the form `xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxx`. See the [Determining the Delphix Server ID and Host Name](#)²³⁷ for more on the Delphix Server ID.
 - If the Data Engine does not exist or is unreachable, enter a temporary value (such as `delphix-sp-id`) to later be replaced by the actual Delphix Server ID.
- **Signature policy:** The Data Engine does not sign authentication requests; it requires that either the responses, assertions, or both are signed.
- **Name ID:** The SAML `NameID` attribute must be set to the email address of the user. See the *User management when SSO is enabled* section below for more information.

The SP initiated flow must be enabled in the IDP.

6.3.2.3.3 New engine configuration

Follow this procedure when installing a new Data Engine.

1. Connect to the Data Engine at `http://<DataEngine>/login/index.html#serverSetup` . The **Delphix Setup** application will launch when connecting to the server.
2. Enter the **sysadmin** login credentials; this account has a default username of **sysadmin** and password of **sysadmin**.
3. In the Authentication step of the Delphix Setup wizard, check the **use SAML/SSO** box and enter the required information:
 - a. The entity id is a unique identifier of the Data Engine for SSO providers. The default value is **https://<Delphix Server ID>**, where **<Delphix Server ID>** is a 36-character hyphen-separated string in the form of 8 chars, 4 chars, 4 chars, 4 chars, and 12 chars (e.g. `00000000-0000-00aa-aa00-0000aa0000aa`). This is just an identifier; there is no resource at that URL. This value can be changed to any string, but note that some identify providers require this to have a URL format.
 - b. The IdP metadata is an XML document that must be exported from the application created in the IdP (see the *Identity provider configuration* section above).
 - c. Optional **Advanced** settings include the **response skew time**, which is the maximum time difference allowed between a SAML response and the engine's current time, in seconds. If not set, it defaults to 120 seconds. The **maximum age of IdP authentication** indicates how far in

²³⁶ <https://cd.delphix.com/docs/19.0.0.0/cli-cookbook-changing-http-and-https-web-connectio>

²³⁷ <https://cd.delphix.com/docs/19.0.0.0/determining-the-delphix-server-id-and-host-name>

the past to accept authentications to the identity provider, in seconds. If not set, it defaults to 86,400 seconds (one day).

4. Complete the remaining setup steps as usual.

6.3.2.3.4 Existing engine configuration

Follow this procedure to enable SSO on an already configured engine.

1. Connect to the Data Engine at `http://>>`. The **Delphix Setup** application will launch once connected to the server.
2. Enter the **sysadmin** login credentials.
3. In the **Authentication** tile, select **Modify**.

4. In the Authentication dialog, check the use SAML/SSO box, then enter the entity id (if not using the default), IdP metadata, and the optional advanced time settings (described in the *New engine configuration* section).

Engine type

If this is an upgraded engine, make sure the engine type is set from the banner of the ServerSetup application dashboard.

6.3.2.3.5 User management when SSO is enabled

Access to the Delphix Setup application is not affected by the use of SSO, it only affects access to the Delphix Management Application and Compliance Application. When SSO is enabled, authentication to the Delphix Management Application or Compliance Application UIs are performed via SAML/SSO instead of a combination of username and password. Non-administrators can no longer change their email address.

An administrator must create a Delphix user for each user to whom access via SSO must be granted. The Delphix user can be used to assign roles and permissions. The email address of the Delphix user is used to match users authenticated via SAML/SSO and must be set to the exact value defined in the IdP. This same value is used in the `NameID` attribute of the SAML response. Supported `NameID` formats are as follows.

```
urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified  
urn:oasis:names:tc:SAML:1.1:nameid-format:emailAddress
```

If multiple Delphix users share an email address, all Delphix users will have access to the SAML/SSO session.

Once SSO is enabled, usernames and passwords (LDAP or locally stored) still need to be used for API access, and newly created user will have API access disabled by default.

6.3.2.3.6 API access

Neither the API access for use in scripts and integrations nor the Continuous Data CLI access requires SSO. Instead, username and password (optionally with LDAP integration) authentication must be used for API or CLI access. When SSO is enabled on a Data Engine, new users by default will have no API access and no password. Administrators can enable API access for any user through the User Management or Masking UIs. The user's password or LDAP credentials are used for API authentication.

Users created before enabling SSO will maintain their API access. Users with API access but no email address are useful for scripts or integration via the API – they cannot be used to log in via the UI. When SSO is enabled, only administrators can change or set email addresses.

A user with API access may also log in via SAML into an SSO-enabled engine through the UI when they have an email set.

6.3.2.3.7 Troubleshooting

If authentication via SSO fails with a message stating that the issue time is either too old or in the future, the error is due to the time on the Data Engine not being in sync with the time of the Identity Provider server. If the time on the Data Engine is not correct, correct the time settings manually or configure NTP. Alternatively, update the response skew time parameter (see the *Existing engine configuration* section).

If authentication via SSO fails with a message stating that the authentication to the Identity Provider is too old, re-authenticate with the identity provider or adjust the maximum age parameter (see the *Existing engine configuration* section).

6.3.2.4 Configuring and managing kerberos

Version 6.0.7.0 or later recommended for kerberos

Any Delphix Engine intending to leverage Kerberos credentials should be running version 6.0.7.0 or later. Versions 6.0.0.0-6.0.6.1 may encounter issues in authentication ticket renewal, causing Environment and Dataset job failures. More information can be found in this Delphix [Knowledge base](#)²³⁸ article.

This section covers the following topics :

- [Delphix kerberos implementation](#) (see page 714)
- [SSH implementation](#) (see page 716)
- [Kerberos requirements](#) (see page 718)
- [Configuring kerberos](#)²³⁹

6.3.2.4.1 Delphix kerberos implementation

Version 6.0.7.0 or later recommended for Kerberos

Any Delphix Engine intending to leverage Kerberos credentials should be running version 6.0.7.0 or later. Versions 6.0.0.0-6.0.6.1 may encounter issues in authentication ticket renewal, causing Environment and Dataset job failures. More information can be found in this Delphix [Knowledge Base](#)²⁴⁰ article

6.3.2.4.1.1 Shared infrastructure/ticket management

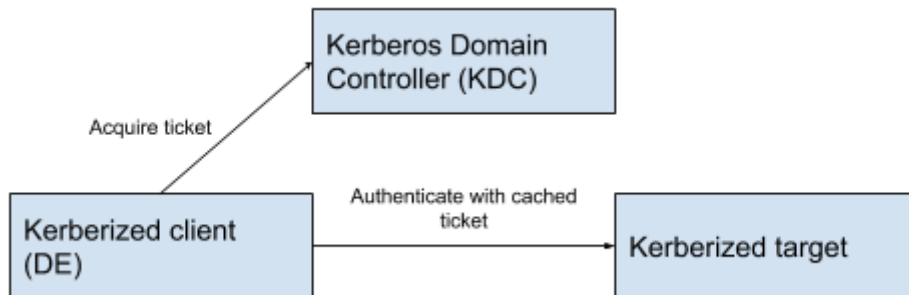

The Delphix Engine (DE) has a single Kerberos principal shared between all connections to the host (SSH, ASE JDBC, etc).

²³⁸ [https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Authentication_Using_Kerberos_Credentials_Fails_on_Delphix_versions_6.0.0-6.0.6.1_\(KBA7495\)](https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Authentication_Using_Kerberos_Credentials_Fails_on_Delphix_versions_6.0.0-6.0.6.1_(KBA7495))

²³⁹ <https://delphixdocs.atlassian.net/wiki/pages/createpage.action?fromPageId=255558189&linkCreation=true&spaceKey=CD&title=Configuring+Kerberos>

²⁴⁰ [https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Authentication_Using_Kerberos_Credentials_Fails_on_Delphix_versions_6.0.0-6.0.6.1_\(KBA7495\)](https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Authentication_Using_Kerberos_Credentials_Fails_on_Delphix_versions_6.0.0-6.0.6.1_(KBA7495))

6.3.2.4.1.2 Overview of the authentication process

1. The client acquires a ticket from the Kerberos Domain Controller (KDC) (e.g. `kinit <principal>`) which it stores locally.
2. The client uses a ticket from KDC to authenticate with the target (e.g., `ssh-` or `JDBC` authentication using `gssapi` to pass the cached ticket acquired in step 1).

Kerberos master/replica KDCs

Kerberos supports a master/replica system with multiple KDCs running on different hosts. This is used for High Availability (HA) or to provide faster service via a local node in dispersed network environments. Delphix supports a list of KDCs for the Kerberos realm to which it has been joined.

Delphix infrastructure to support the authentication process

Kerberized environment user

Delphix has introduced a `KerberosCredential` type that indicates the global Kerberos principal to be used for authentication, rather than user-specific credentials.

Keytab based authentication

It is possible to use `kinit` with a keytab file instead of password-based authentication to acquire tickets. This is similar in principle to passwordless SSH authentication and allows Delphix to function in the customer's environment without storing any passwords on the Delphix Engine. It does, however, put us at the mercy of the customer's keytab expiration policy.

The Delphix Engine creates a background thread that periodically checks the expiration of the cached Kerberos credentials. If the credentials have expired, it calls `kinit` using the keytab that was provided.

Keytab file storage

Keytab file data is sent via a web service API as a Base64 encoded string. This is then decoded back to the binary file and persisted on local storage on the Delphix Engine with root user ownership permissions.

6.3.2.4.1.3 Default behavior

Default Kerberos ticket refresh configuration:

- Delphix checks if the TGT-cached Kerberos ticket should be refreshed every hour.
- The TGT-cached ticket for the global Delphix principal will be refreshed if it expires in less than two hours. The default values can be changed by Delphix Support.

6.3.2.4.2 SSH implementation

The management stack uses sshj+gssapi to pass already-generated Kerberos tickets to the Kerberized sshd on the source/target side if prompted to do so by the end-user passing a Kerberized environment user to existing wrapper functions.

ⓘ The only thing changing from password-based or regular passwordless SSH authentication is the authentication step. Command execution remains unchanged.

6.3.2.4.2.1 SAP ASE, Oracle, and DB2 connections

Delphix connects to SAP ASE, Oracle, and DB2 instances using the two listed mechanisms below. This example configuration uses an SAP ASE instance.

- via isql process
- via the jConnect JDBC driver

When connecting via isql Delphix uses the “-V” parameter rather than specifying a username/password. The “-V” option uses the Kerberos principal in the current user’s cached credentials file. Delphix relies on the end customer to configure this appropriately for their environment (for example, the cached credentials could be populated by a PAM module during login). Delphix also expects that the `KRB5CCNAME` is set appropriately or the credential cache is in the host default location.

When connecting via JDBC, Delphix uses additional connection options:

`REQUEST_KERBEROS_SESSION=true&SERVICE_PRINCIPAL_NAME=` . By default, the instance Service Principal Name (SPN) is identical to the instance name for authentication. Delphix allows the instance SPN to be manually set on a per-repository basis to allow for non-default values. The jConnect JDBC driver connects using the cached credentials that were obtained as described in the Shared infrastructure/Ticket Management section.

For example, if the instance name is `ASE_INSTANCE_1` and has been configured to use `REALM.COM` , then the instance will attempt to authenticate with the KDC using `ASE_INSTANCE_1@REALM.COM` . However, this is configurable and can be specified either via an environment variable or a command-line option to the

data server process. If an environment variable is used to configure the SPN, the instance must be manually discovered via web service APIs or the Delphix CLI.

6.3.2.4.3 Kerberos requirements

6.3.2.4.3.1 Prerequisites

Basic requirements prior to the configuration:

- MIT Kerberos 1.4.4 KDC
- Kerberos REALM name
- Global Kerberos principal name (specified without trailing @REALM name)
- Global Kerberos principal keytab data encoded as a base 64 string
- KDC hostnames and port numbers (one or more in priority list order)

6.3.2.4.3.2 Environment requirements

Version 6.0.7.0 or later recommended for Kerberos

Any Delphix Engine intending to leverage Kerberos credentials should be running version 6.0.7.0 or later. Versions 6.0.0.0-6.0.6.1 may encounter issues in authentication ticket renewal, causing Environment and Dataset job failures. More information can be found in this Delphix [Knowledge Base](#)²⁴¹ article.

The following hosts and software versions are required:

- A source host with the following configuration:
 - A running SAP ASE, Oracle, or DB2 instance.
 - A database to link from and its corresponding full database dump.
 - The Delphix principal is able to access the SAP ASE instance and SSH onto the host as per our product documentation (see [Requirements for SAP ASE \(see page 1954\)](#)).
 - The credential cache for the Delphix principal is populated and kept current. The environment variable KRB5CCNAME is set to the location for a credential cache. Login to the Adaptive Server via " isql_r64 -V -R>><> " or " isql_r -V -R>><> " or otherwise make sure that " isql " points to either " isql_r64 or isql_r " so that " "isql -V -R>><> works.
- A staging host with the following configuration:
 - A running SAP ASE, Oracle, or DB2 instance with the same version as the source instance.

²⁴¹ [https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Authentication_Using_Kerberos_Credentials_Fails_on_Delphix_versions_6.0.0-6.0.6.1_\(KBA7495\)](https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Authentication_Using_Kerberos_Credentials_Fails_on_Delphix_versions_6.0.0-6.0.6.1_(KBA7495))

- The Delphix principal is able to access the SAP ASE instance and SSH onto the host as per our product documentation (see [Requirements for SAP ASE \(see page 1954\)](#)).
- The credential cache for the Delphix principal is populated and kept current. The environment variable `KRB5CCNAME` is set to the location for a credential cache. Login to the Adaptive Server via `" isql_r64 -V -R>><> "` or `" isql_r -V -R>><> "` or otherwise make sure that `" isql "` points to either `" isql_r64 or isql_r "` so that `" isql -V -R>><> "` works.
- A target host to create a VDB on. Configuration details:
 - A running SAP ASE, Oracle, or DB2 instance with the same version as the source instance.
 - The Delphix principal is able to access the SAP ASE instance and SSH onto the host as per our product documentation (see [Requirements for SAP ASE \(see page 1954\)](#)).
 - The credential cache for the Delphix principal is populated and kept current. The environment variable `KRB5CCNAME` is set to the location for a credential cache. Login to the Adaptive Server via `" isql_r64 -V -R>><> "` or `" isql_r -V -R>><> "` or otherwise make sure that `" isql "` points to either `" isql_r64 or isql_r "` so that `" isql -V -R>><> "` works.

6.3.2.4.3.3 Supported databases and Kerberos configurations

For detailed Kerberos support please refer to [Kerberos Support Matrix \(see page 516\)](#)

Delphix Engine 5.3.2.0 is the first generally available customer release to support Kerberos on a subset of supported OS' with SAP ASE, Oracle, and DB2 databases.

With the Delphix Engine 5.3.2.0 release, many of the previously unsupported GUI functions now function when Kerberos is enabled. See [Configuring Kerberos via the UI \(see page 719\)](#) below for details, including limitations.

6.3.2.4.4 Configuring Kerberos during engine setup

Version 6.0.7.0 or later recommended for Kerberos

Any Delphix Engine intending to leverage Kerberos credentials should be running version 6.0.7.0 or later. Versions 6.0.0.0-6.0.6.1 may encounter issues in authentication ticket renewal, causing Environment and Dataset job failures. More information can be found in this Delphix [Knowledge Base²⁴²](#) article.

²⁴² [https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Authentication_Using_Kerberos_Credentials_Fails_on_Delphix_versions_6.0.0-6.0.6.1_\(KBA7495\)](https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Authentication_Using_Kerberos_Credentials_Fails_on_Delphix_versions_6.0.0-6.0.6.1_(KBA7495))

For using the kerberos authentication along with another authentication,

1. In the **Virtualization Setup** wizard, Click **Next** on the **Welcome** screen.
2. Complete the following tabs as you normally would.
3. In the **Network Authorization** tab, select the **Use Kerberos authentication to communicate with the remote hosts** checkbox.
4. Provide values in the following fields:

- **Realm**
- **Principal**
- In the **Keytab** field, enter the key in a base64 encoded format.

Note:

You must provide the key must in a single line. For example, you can use the following command to view the base64 representation of the Keytab key.

```
echo "$(base64 --wrap=0 <keytab>)"
```

6.3.2.4.5 Add a Kerberos environment

Version 6.0.7.0 or later recommended for Kerberos

Any Delphix Engine intending to leverage Kerberos credentials should be running version 6.0.7.0 or later. Versions 6.0.0.0-6.0.6.1 may encounter issues in authentication ticket renewal, causing Environment and Dataset job failures. More information can be found in this Delphix [Knowledge Base](#)²⁴³ article

It is possible to create a Unix/Linux Standalone environment with Kerberos authentication.

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu, select **Environments**.
3. Then click on the plus icon to open a wizard to create a new environment.
4. Select your **Host OS** and **Server Type**, then select **Next**.
5. Under **Login Type**, select **Kerberos Authentication**.
6. If **Discover SAP ASE** is enabled, ASE DB Kerberos authentication will be available, select **Kerberos Authentication**.

Discover SAP ASE

Enabled

Login Type

Username and Password

Kerberos Authentication

7. Select **Submit**.

6.3.2.4.5.1 Changing the environment user

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu, select **Environments**.
3. Select an Environment, the **Details** tab allows you to see Environment information.
4. On the grid of Environment Users, you can see existing users. Click the **plus icon**, to add a new user.
5. It is now possible to create a user with Kerberos Authentication. There can only be one Kerberos user per environment. The Principal is taken to the Kerberos Configuration.

It is possible to set the Kerberos user as Primary.

²⁴³ [https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Authentication_Using_Kerberos_Credentials_Fails_on_Delphix_versions_6.0.0-6.0.6.1_\(KBA7495\)](https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Authentication_Using_Kerberos_Credentials_Fails_on_Delphix_versions_6.0.0-6.0.6.1_(KBA7495))

6.3.2.4.5.2 Changing SAP ASE DB user and DB password

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu, select **Environments**.
3. Select an Environment, the **Details** tab allows you to see Environment information.
4. Click the SAP ASE Information **pencil** icon.

5. Click the edit icon and edit ASE DB User and ASE DB Password.
6. Click the **checkmark** to save.

6.3.2.4.5.3 Updating environment notes

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu select **Environments**.
3. Select an Environment, the **Details** tab allows you to see Environment information.
4. Under **SAP ASE Information**, you can see **Notes**. To edit click the **pencil** icon.
5. Click the **checkmark** to save.

6.3.2.4.5.4 Changing host address, SSH port number, and toolkit path

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu select **Environments**.
3. Select an Environment, the **Details** tab allows you to see Environment information.
4. Click the **pencil** icon located next to **Attributes** to edit the Host Address or SSH Port number or Toolkit Path.
5. Select the **checkmark** to save.

6.3.2.4.6 Adding and linking a dSource

6.3.2.4.6.1 Adding a dSource

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu select **Environments**.
3. Select an Environment and click the **Databases** tab. This tab provides details on all the available repositories.
4. Click on the **Add dSource** link.

5. Click on a **Data Source**, then select **Kerberos Authentication**.

6. Complete all remaining fields, and then click **Submit**.

6.3.2.4.6.2 Linking a dSource

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu select **Datasets**.
3. Select a **Dataset**.
4. From the Actions menu located on the top-right select **Link dSource**.

All information in the Link dSource screen is automatically filled in with the data you previously selected.

6.3.2.5 Configuring OAuth2 authentication for API access

6.3.2.5.1 Overview

This article provides instructions on how to set up Open Authorization 2.0 (OAuth2) on the 6.0.11 Delphix Engine. OAuth2 offers an alternative, password-less authentication method for API access to the Delphix Engine.

Delphix Engine (Masking and Virtualization) version 6.0.11.0 supports authentication using JSON Web Tokens (JWTs) issued by a known authorization server or identity provider (IdP). It is necessary for JWTs to contain a claim that can be used to associate an authentication request with a user that exists in the Delphix Engine. This article describes how to configure the Delphix Engine to validate tokens and associate token claims with Delphix Engine users.

The authentication feature described in this section differs from the API token authentication feature supported by Delphix Engines registered with Data Control Tower (*formerly* Central Management). For more information on API token authentication, refer to [Data Control Tower](#)²⁴⁴

6.3.2.5.2 Configuration options

The following options for configuring OAuth2 for the Delphix Engine are available in the Delphix CLI (as the sysadmin user, under `service; oauth2`) as well as via the API endpoint `/resources/json/delphix/service/oauth2`.

²⁴⁴ <http://dct.delphix.com/docs>

Option	Description	Default (if applicable)
<code>audience</code>	Specifies the expected value of the audience claim (<code>aud</code>) of JWTs indicating that the tokens are intended for this particular Delphix engine.	<code>api://delphix</code>
<code>enabled</code>	Specifies whether the OAuth2 feature should be enabled.	<code>false</code>
<code>issuerURI</code>	(Required) Specifies the base location or identifier of the authorization server (IdP) which the Delphix Engine will use to validate incoming JWTs.	
<code>jwkSetURI</code>	Specifies the URI used to retrieve the JSON Web Key (JWK) set, if supported by the authorization server (IdP).	
<code>tokenSkewTime</code>	Specifies the maximum time difference (in seconds) allowed between the validity period of a JWT and the engine's current time.	<code>60</code>
<code>userIdClaim</code>	Specifies which claim in a JWT should be used by the Delphix Engine (in conjunction with the <code>userMatchingFieldType</code> setting) to associate a token with a user configured on the Delphix Engine. The default (<code>sub</code>) corresponds to the subject claim of the token.	<code>sub</code>
<code>userMatchingFieldType</code>	Specifies which property of a Delphix Engine user will be used to match with the claim (specified in <code>userIdClaim</code>) of a JWT. The Delphix Engine can be configured to match users based on a user's <code>name</code> , <code>emailAddress</code> , or <code>principal</code> properties.	<code>PRINCIPAL</code>

These options may also be set in the Delphix Setup application. Please refer to the following procedures for configuring OAuth2 parameters for new or existing Delphix Engines.

OAuth2 Use OAuth2 access tokens

Issuer URI

`https://myissuer.com`

URI of the OAuth Authorization issuer.

Audience

`api://delphix`

The intended audience of the access tokens issued by the Authorization Server for Delphix Engine access.

User Identifying Claim

`sub`

The claim in a token that should be used to associate a JWT with a Delphix Engine user.

Show advanced

**6.3.2.5.2.1 New engine configuration**

Follow this procedure to configure OAuth2 on a new Delphix Engine.

1. Connect to the Delphix Engine at `http://>>`. The **Delphix Setup** application will launch when connecting to the server.
2. Enter the **sysadmin** login credentials; this account has a default username of **sysadmin** and password of **sysadmin**.
3. In the Authentication step of the Delphix Setup wizard, check the **Use OAuth2 access tokens** box and configure the OAuth2 settings as desired. (Refer to the table above for more information on these settings.)
4. Complete the remaining setup steps as usual.

6.3.2.5.2.2 Existing engine configuration

Follow this procedure to configure OAuth2 on an existing Delphix Engine.

1. Connect to the Delphix Engine at `http://>>`. The **Delphix Setup** application will launch when connecting to the server.
2. Enter the **sysadmin** login credentials.
3. In the **Authentication** tile, select **Modify**.

4. In the Authentication dialog, check the **Use OAuth2 access tokens** box and configure the OAuth2 settings as desired. (Refer to the table above for more information on these settings.)

6.3.2.5.3 Example of API access using OAuth2 token

1. Obtain a JWT from the Authorization Server (IdP). (The details for this process will vary depending on the IdP vendor.) For the purposes of this example, the contents of the token are stored in the environment variable `t`.
2. Access the oauth2-login API endpoint of the Delphix Engine, providing the OAuth2 token. In this example the session information is stored in the file `cookies.txt` in the working directory. For Virtualization Engines the oauth2-login API endpoint is `/virtualization/api/oauth2-login`. For Masking Engines the oauth2-login API endpoint is `/masking/api/oauth2-login`.

Virtualization API Endpoint Example

```
h=<engine address>; curl -i -X POST $h/virtualization/api/oauth2-login -H
"Authorization: Bearer $t" -b cookies.txt -c cookies.txt -H 'Content-Type:
application/json' -d '{"type": "APISession", "version": {"type":
"APIVersion", "major": 1, "minor": 11, "micro": 11}}'
```

Masking API Endpoint Example

```
h=<engine address>; curl -i -X POST $h/masking/api/oauth2-login -H
"Authorization: Bearer $t" -H 'Content-Type: application/json' -b cookies.txt
-c cookies.txt
```

3. Refer to the saved `cookies.txt` file in subsequent `curl` invocations. The example below can be used to list the users configured on the Delphix Engine.

Virtualization API Example

```
curl -X GET -b cookies.txt -c cookies.txt -H 'Content-Type: application/json'
$h/resources/json/delphix/user
```

Masking API Example

```
# Store authorization code returned by /masking/api/oauth2-login in $m
curl -i -X GET -b cookies.txt -c cookies.txt -H 'Content-Type: application/
json' -H "Authorization: $m" $h/masking/api/v5.1.11/users
```

6.3.2.5.4 CLI access using OAuth2 token

When OAuth2 is enabled, CLI logins will prompt the user to supply either an OAuth2 access token or a password to authenticate:

CLI Access Prompt with OAuth2 Enabled

```
$ ssh myengine -l admin
Enter access token or press enter to provide a password:
```

To authenticate using an OAuth2 token, paste its contents when this prompt is shown. As with API authentication, the OAuth2 token must be current (not expired) and must contain a claim that can be associated with a valid Delphix Engine user, based on the **userIdClaim** and **userMatchingFieldType** values set on the Delphix Engine.

To bypass OAuth2 authentication and use password authentication, press **Enter** when this prompt is shown and a conventional password prompt will be displayed.

6.3.2.5.5 User matching policy

If the **userIdClaim** component of a JWT matches more than one Delphix Engine user (for example, if **userMatchingFieldType** is set to **EMAIL_ADDRESS**, and the same email address is associated with multiple Delphix Engine users), the oldest user account (by time of creation) will be authenticated.

Suggestion

To ensure all users can be authenticated using OAuth2, make sure that the property specified in **userMatchingFieldType** is populated and unique for all Delphix Engine users.

6.3.2.5.6 HTTPS Proxy Configuration

If the OAuth2 identity provider cannot be directly reached by a Delphix Engine, a HTTPS proxy may be used. The sysadmin user can create or modify HTTPS proxy settings via the CLI/API endpoint `service; proxy`, or in the **Delphix Setup** application by selecting to modify the **Outbound Connectivity** tile, checking the **Configure web proxy** box, and entering the host, port, and (optionally) username and password of the proxy server.

6.4 Network and DNS management

You may want to manage and configure certain network services, such as DNS, for Delphix. Here we specify general network and connectivity requirements, as well as detail how you can test network performance. General Network and Connectivity Requirements.

This section covers the following topics:

- [General network and connectivity requirements \(see page 731\)](#)
- [Network performance configuration options \(see page 733\)](#)
- [Determining the Delphix server ID and host name \(see page 747\)](#)
- [Configuring multiple DNS domain names in DNS search list \(see page 750\)](#)
- [How to change the IP address of the Delphix engine \(see page 753\)](#)
- [How to change the hostname of the Delphix engine \(see page 755\)](#)
- [How to change the DNS server of the Delphix engine \(see page 757\)](#)
- [Configuring a second network interface \(see page 758\)](#)

6.4.1 General network and connectivity requirements

6.4.1.1 Overview

This topic covers the general network and connectivity requirements for the Delphix Engine, including connection requirements, port allocation, and firewall and Intrusion Detection System (IDS) considerations. For platform-specific network and connectivity requirements, see the relevant topics under the **Requirements** section for each platform.

6.4.1.2 General outbound from the Delphix engine port allocation

Protocol	Port numbers	Use
TCP	25	Connection to a local SMTP server for sending email
TCP/UDP	53	Connections to local DNS servers
UDP	123	Connection to an NTP server
UDP	162	Sending SNMP TRAP messages to an SNMP Manager
TCP	443	HTTPS connections from the Delphix Engine to the Delphix Support upload server

Protocol	Port numbers	Use
TCP/UDP	636	Secure connections to an LDAP server
TCP	8415	Connections to a Delphix replication target. See Configuring Replication (see page 2412)
TCP	50001	Connections to source and target environments for network performance tests.

6.4.1.3 General inbound to the Delphix engine port allocation

Protocol	Port number	Use
TCP	22	SSH connections to the Delphix Engine
TCP	80	HTTP connections to the Delphix GUI
UDP	161	Messages from an SNMP Manager to the Delphix Engine
TCP	443	HTTPS connections to the Delphix Management Application
TCP	8415	Delphix Session Protocol connections from all DSP-based network services including Replication, SnapSync for Oracle, V2P, and the Delphix Connector.
TCP	50001	Connections from source and target environments for network performance tests via the Delphix CLI.

6.4.1.4 Firewalls and intrusion detection systems (IDS)

Production databases on source environments (for dSources) are often separated from the non-production environment by firewalls. Firewalls can add milliseconds to the latency between servers. Accordingly, for best performance, there should be no firewalls between the Delphix Engine and the virtual database (VDB) target environments. If the Delphix Engine is separated from a source environment by a firewall, the firewall must be configured to permit network connections between the Delphix Engine and the source environments for the application protocols (ports) listed above.

Intrusion detection systems (IDSs) should also be made permissive to the Delphix Engine deployment. IDSs should be made aware of the anticipated high volumes of data transfer between dSources and the Delphix Engine.

6.4.2 Network performance configuration options

This section covers the following topics:

- [Optimal network architecture for the Delphix engine \(see page 733\)](#)
- [Network operations using the Delphix session protocol \(see page 736\)](#)
- [Network performance test tool interface \(see page 739\)](#)
- [Working with dataset performance \(see page 744\)](#)
- [Network performance expectations and troubleshooting \(see page 745\)](#)

6.4.2.1 Optimal network architecture for the Delphix engine

This topic describes basic network performance considerations for the Delphix Engine.

6.4.2.1.1 Network architecture and latency

All VDB I/O operations are serviced over the network. Delphix uses NFS as the primary transport for Oracle VDBs, and iSCSI for MS SQL VDBs. The network architecture, latency, and capacity between the Delphix Engine and the target environment are key network components for improving the performance of a Delphix deployment. The latency between the Delphix Engine and the source environment is not relevant for the best performance of VDBs.

For optimal performance of VDBs, round-trip latency between the Delphix Engine and the target environment should be kept under 1 millisecond, and preferably in the range of 300 microseconds. If network latency exceeds 500 microseconds, the VDBs will not perform as well as a database connected to physical storage.

Latency can be introduced by having to route the network packets across multiple networks, or by the presence of routers, switches, and firewalls between the Delphix Engine and the target environment. Best practices to reduce network latency include:

- Keep the Delphix Engine on the same subnet as the target environment
- Reduce the number of hops between the Delphix Engine and the target environment
 - Reduce the number of switches in the network. Each switch can add 50 - 100 microseconds of latency to the network.
 - Reduce the number of routers in the network. Each router can add 500 - 1000 microseconds of latency in a network, and the round trip for an I/O operation could increase by as much as 1 - 2 milliseconds.
- There should be no firewalls between the Delphix Engine and the target environment.
- When linking the Delphix Engine to a source database across a WAN, consider the time needed for the initial link and load. It may be necessary to schedule the load operation as multiple steps across multiple days.

A common WAN deployment architecture

Deployment of the Delphix engine on Separate sub-nets

6.4.2.1.2 Network throughput and bandwidth

Network throughput measures the rate at which data can be sent continuously between two servers on a network. Network throughput is affected by network latency, but the dominant factor affecting throughput is the bandwidth of the network. As a point of comparison, consider the bandwidth available for three types of Ethernet networks:

Ethernet type	Network Bandwidth
100Mb Ethernet (100Base-T)	~=10MB/sec
Gigabit Ethernet (GbE)	~=100MB/sec
10 Gigabit Ethernet (10GbE)	~=1GB/sec

Low network throughput can impact the Delphix Engine in a number of ways:

- Increasing the amount of time it takes to perform a SnapSync operation, both for initial load and subsequent regular snapshots

- Managing LogSync operations in a high change environment
- Poor VDB performance when an application is performing large sequential I/O operations, such as sequential table scans for reporting or business intelligence, or RMAN backups of the VDB.

Delphix Engine throughput must exceed the sum of the peak I/O loads of all VDBs. Delphix incorporates an I/O-Collector toolkit to collect I/O data from each production source database and pre-production server.

Best practices to improve network throughput include:

- Use 10 Gigabit Ethernet (10GbE)
- Use a dedicated storage network

If you are concerned about your network throughput, you can test it with the built-in CLI tool for network testing.

6.4.2.2 Network operations using the Delphix session protocol

This topic describes how the Delphix Engine uses the Delphix Service Protocol (DSP) for network operations, and how this affects features such as replication, V2P, and SnapSync.

6.4.2.2.1 Overview

Delphix Session Protocol, or DSP, is a communication protocol that operates at the session and presentation layer in the Open Systems Interconnection (OSI) model.

Application Layer	application specific logic
Presentation Layer	data encoding, digest, compression, encryption
Session Layer	connection management, error recovery, security, remote operation
Transport Layer	end-to-end connection, message segmentation, sequencing, reliability, flow control
Network Layer	packet fragmentation, routing, logical addressing
Data Link Layer	physical addressing
Physical Layer	media, signal, binary transmission

DSP supports the request-reply pattern for communication between two networked peers. In contrast to the traditional remote procedure call (RPC) models, which focus exclusively on low-level details such as data encoding and wireframing, DSP implements a generic session layer that supports a number of advanced functionalities desired for network communication, including:

- Full-duplex remote operation execution and end-to-end cancellation support
- Advanced connectivity model with connection trunking and ordered delivery

- Fault resilience with automatic connection and session recovery, exactly-once semantics, and optional data digest
- High performance with concurrent execution, session flow control, optional data compression, and bandwidth throttling
- Built-in security support with pluggable SASL authentication mechanisms and optional TLS encryption
- Asynchronous model for session management and remote operation

Most of the features above are essential to the proper operation of a distributed application and yet non-trivial to implement. By offering them in the framework, we can significantly simplify the development of enterprise quality distributed applications.

DSP is officially registered with the [Internet Assigned Numbers Authority](http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.txt)²⁴⁵ under the service name `dplx-sp` and port number 8415.

Currently, DSP supports Java language binding and provides a java based service framework for distributed applications.

6.4.2.2.2 Key concepts

The foundation of DSP is built on top of a few key abstractions, namely, **exchange**, **task**, **nexus**, and **service**. For an overview of how DSP works and the features it provides, let's start with these abstractions.

An **exchange** refers to an application-defined protocol data unit which may be a request or a response. DSP supports the request-response pattern for communication. For each request sent, there is a corresponding response that describes the result of the execution. An application protocol is made up of a set of exchanges.

A **nexus** (a.k.a., session) refers to a logical conduit between the client and server application. In contrast, a transport connection (a.k.a., connection) refers to a "physical" link. A nexus has a separate naming scheme from the connection, which allows it to be uniquely and persistently identified independently of the physical infrastructure. A nexus has a different lifecycle than the connection. It is first established over a leading connection. After it comes into existence, new connections may be added and existing ones removed. It must have at least one connection to remain operational but may live on even after all connections are lost. Nexus lifecycle management actions, such as create, recover, and destroy, are always initiated by the client with the server remaining passive.

A nexus has dual channels, namely, the fore channel and the backchannel. The fore channel is used for requests initiated from the client to the server, and the backchannel from the server to the client. From a request execution perspective, the nexus is full-duplex and the channels are functionally identical, modulo the operational parameters that may be negotiated independently for each channel. A channel supports a number of features for request processing, such as ordered delivery, concurrent execution, remote cancellation, exactly-once semantics, and throughput throttling.

A **service** refers to a contract that consists of all exchanges (both the requests and the corresponding responses) defined in an application protocol. Given the full-duplex nature of request execution in DSP, part of the service is fulfilled by the server and the remaining by the client, where the client and server are from the nexus management perspective.

A **task** implements a workflow that typically involves multiple requests executed in either or both directions over the nexus. A task is a self-contained building block, available in the form of a sharable module including both the protocol exchanges and implementation, that can be easily integrated into other application

²⁴⁵ <http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.txt>

protocols. A library of tasks may significantly simplify distributed application development by making it more of an assembly experience.

The following is a diagram that illustrates the key abstractions and how they are related to each other.

6.4.2.2.3 Security

As a network protocol, DSP is designed with security in mind from the onset. It supports strong authentication as well as data encryption. It follows a session-based authentication model which requires each connection to authenticate before it is allowed to join the session. Authentication is performed using the Simple Authentication and Security Layer (SASL) framework, a standard-based pluggable security framework. The currently supported SASL mechanisms include DIGEST-MD5, PLAIN with TLS, CRAM, and ANONYMOUS. Optionally, TLS encryption may be negotiated between the client and the server for data privacy.

6.4.2.2.4 Performance

DSP offers a number of features to enable the support for high-performance network applications. For example, it allows multiple requests to be exchanged in both directions simultaneously, which provides effective pipelining of data transfer to minimize the impact of network latency while ensuring the total ordering at the same time. It supports trunking that can effectively aggregate the throughput across multiple connections, which is crucial for a long fat network (LFN) and 10GigE. It also provides optional compression support which boosts performance over a bandwidth-limited network. We have observed, through both internal benchmarking and in customer environments, DSP-based applications delivering multi GigE in an ideal environment and getting a performance boost of as much as x10 in bandwidth-limited settings.

6.4.2.2.5 Resiliency

DSP automatically recovers from transient connection loss without any application involvement. It may also detect random data corruption on the wire and automatically recovers from it. In both cases, outstanding requests are retried once the fault condition is resolved.

DSP offers control over a remotely executing request. Once a request is initiated, the application may cancel it at any time before completion. In the rare event of a session loss, a new session creation request will be held until the old session has been reinstated. It ensures that we never leave any unknown or unwanted activities on the remote side and provides better predictability and consistency guarantees over an otherwise unreliable network.

6.4.2.2.6 Diagnosability

Application exceptions encountered during remote execution of a request are communicated back to the initiator through DSP. A standard Java API is used to facilitate the handling of remote exceptions that is in many ways identical to local ones.

DSP provides detailed information and statistics at the session level. The information may be used to examine the state of the session as well as diagnose performance problems. It is currently exposed via an internal support tool called the JMX tool.

6.4.2.2.7 Supported applications

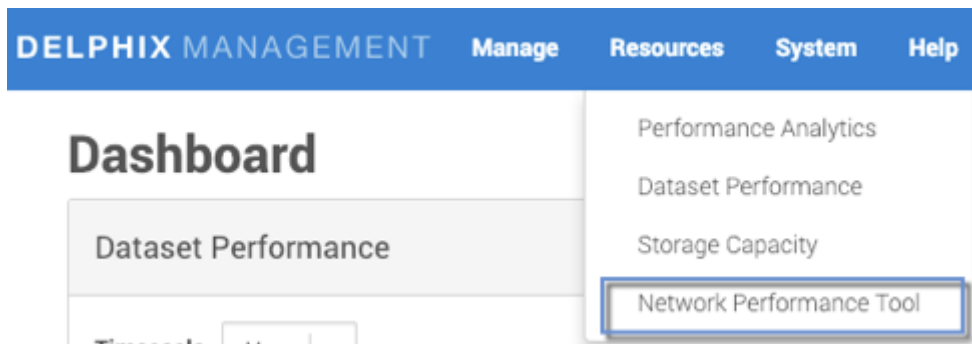

Replication is the first feature to take advantage of DSP. It has been rebuilt on top of DSP and shipping in the field since 3.1. In the latest release, a number of host-based applications, such as SnapSync, V2P, and Delphix connector, use DSP as well.

6.4.2.3 Network performance test tool interface

6.4.2.3.1 Accessing the network performance test tool

To access the Network Performance Test Tool:

1. In the top navigation bar, click **Resources**.
2. Select **Network Performance Tool**.

The **Network Performance Tool** page will appear. There are two tabs: **Testing** and **History**.

Network Performance Tool

Testing History

Select Test Type

Latency - between this engine and a selected environment

Throughput - between this engine and a selected environment

DSP

Environment

Hawk ...

Address

bbdhcp-AHCI-58503.dcenter.delphix.com

Number of requests to send

20

Request size (bytes)

16

[Run Test](#)

6.4.2.3.2 The testing tab

On the **Testing** tab, you can select one of three test types:

Test type	Parameters required
Latency	<ul style="list-style-type: none"> Environment – If you selected an environment in the Datasets panel, this field will auto-populate. See below for instructions on changing the selected environment. Number of requests to send Request size (bytes)
Throughput	<ul style="list-style-type: none"> Environment Duration – in seconds Number of connections Direction – Select either Transmit or Receive Block size (bytes)
Delphix session protocol	<ul style="list-style-type: none"> Target Engine Username Password Duration – in seconds Block size (bytes) Number of connections Queue depth Direction – Select either Transmit or Receive Traffic Options

6.4.2.3.2.1 CLI

This command provides both `remoteHost` and `remoteAddress`:

```
env.name network test latency create *> ls
Properties
  type: NetworkLatencyTestParameters
  remoteAddress: (unset)
  remoteHost: (unset)
  requestCount: 20
  requestSize: 8B
```

This is an important distinction, as the latency test has no requirement for an address to be connected to a known Environment, since it is a simple ping test. The Throughput tests are dependent, but Latency tests should use the correct values for remoteAddress and remoteHost.

6.4.2.3.2 Selecting an environment

For either a Latency or Throughput test, you must select an environment. If you selected an environment in the **Datasets** panel, this field will auto-populate. If you need to select a different environment:

1. Next to the **Environment** field, click the button with three dots.

Network Performance Tool

Testing History

Select Test Type

target-l	target-l.dlpxdc.co

Cancel OK

3. Click **OK**.

6.4.2.3.2.3 Running and canceling a network performance test

To run a test:

1. Enter all the required parameters.
2. Click **Run Test**.
3. To cancel the test click **Cancel**.

6.4.2.3.3 The history tab

In the **History** tab, you can view the results of all previous tests you have run.

1. Select the radio button for the type of test for which you want to see the results:
 - a. Latency, or
 - b. Throughput, or
 - c. Delphix Session Protocol
2. Optional: sort the tests by clicking one of the column headings.
3. Click the particular test for which you want to see the results.
The details of that test will appear.
4. Click **OK** to return to the **History** tab.

6.4.2.3.4 Delphix session protocol test from primary engine to replication engine

Delphix uses the DSP protocol to communicate between primary and replication engines.

1. Login to Delphix Management application using an Engine administrator account.
2. Click the **Resource** menu and select **Network Performance Tool**.
3. Select the **Delphix Session Protocol** option.
 - a. Select Engine option to run the DSP test between a primary engine and a replication engine.
 - b. Provide hostname or IP address of the replication engine.
 - c. Provide admin user credentials for the replication engine. The user name must not include @DOMAIN or other qualifiers.
 - d. Enter a **Duration** in seconds (30 default).
 - e. Enter **Block Size** in bytes.
 - f. Enter the **Number of Connections** (optional).
 - g. Provide **Queue Depth**.
 - h. Select Direction - **Transmit** or **Receive**.
 - i. **Enter Traffic Options by selecting either Use compression or Use encryption.**
 - j. Click the **Run Test** button.

6.4.2.4 Working with dataset performance

6.4.2.4.1 Accessing the dataset performance graph

1. Log into the Delphix Management application.
2. In the **Resources** menu, select **Dataset Performance**.
3. Use the controls described below to view statistics and their related graphs.

6.4.2.4.2 General graph display and controls

Dataset Performance

Timescale: Select from hour, 6 hours, day

View: View data by top 5 consumers or by the 75% percentile

Dateline: Displays timestamps of data points in the graph.

Timeline selector: Specifies the start and end time for the currently displayed data. The range displayed is controlled by selecting the slider. Drag the slider to view statistics for the specific time.

Graph legend: If more than one set of information is presented on the graph, Graph Legend displays a description and color for each set.

Dataset table: Displays the information for each Dataset in a table format. Selecting a Dataset link takes you to the Dataset Status page.

Export: Exports the displayed table data.

6.4.2.5 Network performance expectations and troubleshooting

6.4.2.5.1 Overview

Once you have run your [network performance tests](#) (see page 2771) to each source and target environment, you should confirm that they meet expectations. Corporate networks commonly leverage 10Gbps "line speeds" between servers. Although networks are shared environments, switching infrastructure is typically used to isolate traffic between different hosts, with the goal of allowing each host to reach its potential. While many environments perform within the 70-90% range of line speed, in well-maintained environments we can see 90%+ line speed.

In some circumstances, you can exceed typical expectations by implementing more best practice recommendations – for example, putting two VMs on the same hypervisor (e.g. ESX) host, in the same chassis or blade enclosure, or when teamed (bonded) NIC cards are used for extra bandwidth. Furthermore, when Jumbo Frames are implemented correctly, they provide a substantial improvement.

If your network is not meeting expectations, you will almost always need help from someone whose role is focused on networking to help arrive at a root cause. You may also need to obtain temporary access to other VMs and/or physical hosts to isolate some issue(s). Additionally, you may need the help of Delphix Support or Professional Services to perform some tests from the Delphix Engine to systems that are not already connected environments within the Delphix product. (The CLI test will only work for environments connected to the Delphix Engine).

With assistance or not, you can do a number of things to narrow down the potential causes of poor performance between two systems by a process of elimination. Below are some high-level steps to consider. Keep in mind that network throughput will always represent the least performant component, so many of the steps below are intended to help isolate which component may be performing poorly.

6.4.2.5.2 Troubleshooting and information gathering questions in rough order of priority - record and share your answers

1. Have all source/target tuning settings been applied?
 - a. Is AIX in scope? LSO / LRO can have a significant impact, as can Jumbo Frames (see below)
2. What is the link speed on the hosts in question? Is NIC teaming / bonding / LACP in use?
 - a. Linux: `ethtool <device>`
 - b. Solaris: `dladm show-phys`
 - c. Windows: `wmic NIC where "NetEnabled='true'" get "Name,Speed"`
3. What are the test results with greater or fewer connections in parallel?
4. Can we test throughput to alternate servers? (See below)
5. What is the overall latency? What is the latency to each (OSI layer 3) hop? Is there one hop that consistency has a higher cost? (check the latency with ping and hops with traceroute)
6. How many devices (OSI layer 2) are in the path? Your network team will need to help you identify these devices.

- a. Note: Only Layer 3 devices will show up when reviewing a traceroute however each layer two devices can impact traffic and each needs to be configured when implementing jumbo frames
 - b. Example devices in path to physical server: 1. virtual NIC -> 2. Virtual switch (ESX) -> 3. Chassis NIC -> 4. Rack switch -> 5. Core Switch -> 6. Rack Switch -> 7. Physical NIC
 - c. Example devices in path to virtual server: 1. virtual NIC -> 2. Virtual switch (ESX) -> 3. Chassis NIC -> 4. Rack switch -> 5. Chassis NIC -> 6. Virtual Switch (ESX) -> 7. Virtual NIC
7. What is the average network utilization on each hop? Is there congestion on any hop? (Network team will need to review)
 8. Is QoS / VirtualConnect / 802.1p enabled? At what threshold will it engage? (Network team will need to review)
 9. Is there a firewall or any deep packet inspection in the route? (Network team will need to review)
 10. Are Jumbo Frames enabled on any or all hops? E.g. Delphix Engine, Virtual NIC, Virtual switch, and all hops down to the destination. (Network team will need to review)
 - a. We have seen Delphix installations often benefit 10-20% from Jumbo frames, but certain platforms (such as AIX) can benefit much more dramatically
 - b. Note that JF enablement on two hosts without confirming all the network pieces are properly enabled will result in VERY poor performance
 - c. Test Jumbo Frames via with "Do Not Fragment" flag from the remote host to the Delphix Engine.
 - d. Note that typical MTU Jumbo Frame setting is 9000 bytes, although some vendors recommend a little above or below this.
 - e. The test below is at 8000, but you can test larger from there. Our goal is primarily to ensure that a number substantially larger than 1500 and somewhat close to the 9000 "de facto" standard is working.
 - f. Whenever two hosts connect, they perform a handshake called Path MTU negotiation, where they agree on the highest MTU they both support. This is how we avoid impact when communicating to hosts with differing MTUs.
 - g. `Linux$ ping -M do -s 8000 [Delphix_Engine_IP]`
 - h. `Windows> ping -f -l 8000 [Delphix_Engine_IP]`
 - i. `Solaris v10-# traceroute -F [Delphix_Engine_IP] 8000 ("Do Not Fragment" not supported by ping on Solaris until v11)`
 - j. `Solaris v11+# ping -s -D [Delphix_Engine_IP] 8972`
 11. Depending on the results above, a dedicated network or VLAN may help. Consider if that is an option for you. (Your network team will need to review)

6.4.2.5.2.1 Testing throughput testing to alternate servers

This will help isolate where a problem may be.

1. Delphix to Server A – already known

2. Delphix to Server B – physical; helps us see if there is a problem with the original server NIC or physical network settings
3. Server B to Server C – physical; helps us see if there is a problem with the Delphix server NIC or physical network settings
4. Delphix to Server D – virtual; helps us see if there is a problem with the virtual network or Delphix settings
5. Server D to Server E – virtual; same host; helps us see if there is a problem with the virtual network on the host
6. Server D to Server F – virtual; different host; helps us see if there is a problem with the virtual network

6.4.2.5.3 Conclusion

If you need further help, please contact Delphix Support or Professional Services to assist in getting the best performance possible from your environment.

6.4.3 Determining the Delphix server ID and host name

On occasion, it may be necessary to locate the **Delphix Server ID** and **Hostname**.

The Delphix Engine ID and Delphix Server ID are synonymous. The GUI currently uses "Server," and that is the terminology that will be used in this document.

The **Delphix Server ID** uniquely identifies each Delphix Engine. It is a 36-character hexadecimal string of the form **xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxx**. You can view the Delphix Server ID in the Server Setup application, the Delphix Management application, or by using the Command Line Interface (CLI) method.

The **Hostname** is a name you assign. It typically matches the IP (DNS) name assigned to the Delphix Engine. The hostname can only be viewed by using the System Setup application or the CLI method.

6.4.3.1 Server setup application method

Login to the Delphix Setup application with sysadmin-level credentials:

1. Access the Delphix Engine through the URL: `http://<Delphix Engine>/ServerSetup.html` where `<DelphixEngine>` is the DNS name or IP address of the Delphix Engine for which you wish to find the Delphix Server ID and hostname.
2. Enter a valid **Username**.
3. Enter a valid **Password**.
4. Click **Log In**.

On the **Dashboard** screen, there is a **System Summary** panel in the lower-left portion of the screen. The **Server ID** field displays the Delphix Server ID, in this example **564D39A8-5077-C9D0-9EFD-82E848EBDAB6**.

System Summary ⓘ	
Server ID	564D39A8-5077-C9D0-9EFD-82E848EBDAB6
Manufacturer	VMware
Model	Virtual_disk
Serial	6000c2907f0001dd8000c240feee5b8c
Processor	2 x 2.90GHz
Memory	7.3GB
Features	XPP, MDD
Default locale	en-US

The Delphix Engine Hostname is located on the same screen, in the **Network** panel. The **Delphix Engine Hostname** field displays the hostname information.

Network ⓘ	Modify
Network Interface ens160	
Interface Configured Yes	
Jumbo Frames Enabled No	
IP Address Type DHCP	
IP Address 10.43.3.98	
Subnet Mask 255.255.0.0	
Default Gateway 10.43.0.1	
DNS Domain Name delphix.com	
DNS Servers 172.16.101.11, 172.16.105.2	
Hostname js532.dcenter	

6.4.3.2 Delphix admin application

The Delphix Server Hostname is not available from this view but typically matches the IP (DNS) name assigned to the Delphix Engine.

Login to the Delphix Management application with delphix_admin level credentials:

1. Access the Delphix Engine through the URL: `http://<Delphix Engine>/Server.html` where `<DelphixEngine>` is the DNS name of the IP address of the Delphix Engine for which you wish to find the Delphix Server ID.
2. Enter a valid **Username**.
3. Enter a valid **Password**.
4. Click **Log In**.
5. Under **System Summary**, the **Server ID** field displays the Delphix Server ID.

6.4.3.3 CLI method

1. Use SSH to access your Delphix Engine: `ssh <userid>@<delphix_engine>` where `<userid>` is a user ID with either `delphix_admin-` or `sysadmin-` level credentials.
2. Enter a valid password if prompted for one.
3. Enter `system ls`.

You will see an output similar to this example:

```
Properties
  type: SystemInfo
  apiVersion:
    type: APIVersion
    major: 1
    micro: 0
    minor: 5
  buildTimestamp: 2015-02-24T09:24:58.000Z
  buildTitle: Delphix Engine 4.2.0.1
  buildVersion:
    type: VersionInfo
    major: 4
    micro: 0
    minor: 2
    patch: 1
  configured: true

```

The **Delphix server ID** is shown as the `uuid` property at the bottom of the output, and the **Hostname** is displayed in the `hostname` property.

4. Enter `exit` to leave the command-line interface.

6.4.4 Configuring multiple DNS domain names in DNS search list

This topic describes the steps to configure multiple DNS domain names in the DNS search list.

6.4.4.1 Procedure

Perform the following steps to configure multiple DNS domain names in the DNS search list.

1. Launch the Delphix Engine Setup interface using the sysadmin credentials.
2. Navigate to the **Network** widget and click **Modify**.
3. Under **DNS SERVICES**, use the **DNS Domain Name** and **DNS Servers** boxes for adding multiple DNS domain name configurations.

Network ✕

Configure network interfaces and services. Modifying the settings of network interfaces and default gateway may cause the Delphix Engine to be unreachable from the browser. It is recommended that such configuration be done from the Command Line Interface on the system console after a successful install.

NETWORK INTERFACES

ens192	Configured	Settings
---------------	------------	--------------------------

ROUTING

Default Gateway

10.43.0.1

DNS SERVICES

Set up DNS (Domain Name System) if you have a DNS Server in your environment. This will allow you to use names that will resolve into IP addresses when configuring components for your Delphix Engine.

Delphix Engine Hostname

sean6090.dcol2.delphix.com

DNS Domain Name ⓘ

delphix.com, test.com

DNS Servers ⓘ

172.16.101.11, 172.16.105.2

Cancel

Save

Each domain name needs to be separated by a comma.

If `.local` DNS domains are in use, then you must add these explicitly to the list of DNS domains configured in order for name resolution to be successful. Multiple `.local` subdomains can be added as desired (for example, `dev.company.local`), or "local" can simply be added to the DNS domain configuration to enable all `.local` domains to be successfully looked up in DNS. Multicast DNS is not currently supported by the Delphix Engine

In order to understand if there is more than one domain name in the search list, check for "DNS Suffix Search List" from the output of `ipconfig /all` in the Windows Server:

```
C:\Program Files\Delphix\DelphixConnector\connector>ipconfig /all

Windows IP Configuration

Host Name . . . . . : 10-43-13-231
Primary Dns Suffix . . . . . : ad.delphix.com
Node Type . . . . . : Hybrid
IP Routing Enabled. . . . . : No
WINS Proxy Enabled. . . . . : No
DNS Suffix Search List. . . . . : ad.delphix.com
                                   delphix.com
                                   dcenter.delphix.com
```

or check for " search " in `/etc/resolv.conf` on a Linux server:

```
[root@rhel62 ~]# cat /etc/resolv.conf search delphix.com nameserver
192.168.0.1
```

6.4.4.2 To update DNS using the CLI:

1. Log into the CLI as `sysadmin` and navigate to `service > dns`.

```
ssh sysadmin@yourengine
> service
> dns
```

2. List the current DNS configuration and `update` to add new configurations.

```
> ls
> update
> set domain=xxx.xxx, xxx.xxx
```

3. **Commit** the action and verify the new list.

```
> commit
> ls
```

For example:

```
delphix> /service dns
delphix service dns> ls

Properties
```

```

type: DNSConfig
domain: delphix.com
node: (unset)
servers: 192.168.0.1

Operations
update

delphix service dns> update
delphix service dns update *> set
domain=delphix.com,one.delphix.com,two.delphix.com
delphix service dns update *> commit
delphix service dns>
delphix service dns> ls

Properties
type: DNSConfig
domain: delphix.com,one.delphix.com,two.delphix.com
node: (unset)
servers: 192.168.0.1

Operations
update

delphix service dns>

```

6.4.5 How to change the IP address of the Delphix engine

6.4.5.1 Changing the IP address

1. Stop all running VDBs by clicking the **Stop** button on the VDB card.
2. Disable all dSources.
3. You can use either the command-line interface or the Delphix Setup application to change the IP address of the Delphix Engine.
 - a. To use the command-line interface, follow the instructions described in [Setting Up Network Access to the Delphix Engine \(see page 583\)](#)
 - b. To use the Delphix Setup application, go to **System > Server Setup** in the Delphix Management interface, or click **Server Setup** in the Delphix Engine login screen.
 - i. In the **Network** panel, click **Modify**.
 - ii. Under **DNS Services**, enter the new IP address.
 - iii. Click **OK**.
4. Refresh all Environments by clicking the **Refresh** Symbol on the Environments screen.

5. Enable all dSources.
6. Start all VDBs by clicking the **Start** button on the VDB card.

6.4.5.2 Changing the IP address via CLI

1. Stop all running VDBs by clicking the **Stop** button on the VDB card.
2. Disable all dSources.
3. Log into the Delphix CLI using your *sysadmin* account. You can find instructions on how to do this in the [Connecting to the CLI \(see page 2553\)](#) article.

```
delphix> network
delphix network> interface
delphix network interface> ls
NAME
vmxnet3s0
delphix network interface> select vmxnet3s0
delphix network interface 'vmxnet3s0'> get
  type: NetworkInterface
  name: vmxnet3s0
  addresses:
    0:
      type: InterfaceAddress
      address: 10.1.2.3/24
      addressType: STATIC
      enableSSH: true
      state: OK
  dataNode: DATA_NODE-34
  device: vmxnet3s0
  macAddress: 0:c:29:32:96:a3
  mtu: 1500
  mtuRange: 60-9000
  reference: NETWORK_INTERFACE-vmxnet3s0-DATA_NODE-34
  state: OK
```

4. Run the update command and update the address to the new IP address for the Delphix Engine.

```
delphix network interface 'vmxnet3s0'> update
delphix network interface 'vmxnet3s0' update *> edit addresses.0
delphix network interface 'vmxnet3s0' update addresses.0 *> get
Properties
  type: InterfaceAddress
  address: 172.16.151.154/24
  addressType: STATIC
  enableSSH: true
```

```
delphix network interface 'vmxnet3s0' update addresses.0 *> set address=10.1.2.4/24
delphix network interface 'vmxnet3s0' update addresses.0 *> get
  type: InterfaceAddress (*)
  address: 10.1.2.4/24 (*)
  addressType: STATIC (*)
  enableSSH: true (*)
```

5. Commit the operation.

```
delphix network interface 'vmxnet3s0' update addresses.0 *> commit
delphix network interface 'vmxnet3s0'> get
  type: NetworkInterface
  name: vmxnet3s0
  addresses:
    0:
      type: InterfaceAddress
      address: 10.1.2.4/24
      addressType: STATIC
      enableSSH: true
      state: OK
  dataNode: DATA_NODE-34
  device: vmxnet3s0
  macAddress: 0:c:29:32:96:a3
  mtu: 1500
  mtuRange: 60-9000
  reference: NETWORK_INTERFACE-vmxnet3s0-DATA_NODE-34
  state: OK
```

6. Re-enable the VDBs and dSources running from the engine.

6.4.6 How to change the hostname of the Delphix engine

6.4.6.1 Changing the hostname

Perform the following steps to change the hostname of a Delphix engine.

Currently, it is only possible to change the hostname via the Command Line Interface (CLI).

1. Stop all running VDBs by clicking the **Stop** button on the VDB card.
2. Disable all dSources.

3. Log into the Delphix CLI using your **sysadmin** username and password. If you are using the same interface that you connected to the CLI on, it will interrupt the connection. Therefore, it is recommended to log in to the CLI on the console.

```
ssh sysadmin@yourdelphixengine
```

4. Run the following commands.

```
d\px01> network
d\px01 network> setup
d\px01 network setup> ls
Properties
  defaultRoute: 192.168.0.1
  dhcp: false
  dnsDomain: plb.internal
  dnsServers: 192.168.0.111,198.142.152.164,198.142.152.165
  hostname: d\px01
  primaryAddress: 192.168.0.109/24

Operations
update
d\px01 network setup> update
d\px01 network setup update *> set hostname=newhostname
d\px01 network setup update *> commit
```

5. If DHCP is being used, the Delphix Engine will expect the Hostname to be provided by the DHCP server. As such, there will be no property 'hostname' to update. This process requires changing the IP addressing configuration from DHCP to static address configuration. To proceed you will need to take the following action (making sure that there is no conflict between your DHCP server and the changes you are implementing).

```
d\px01 network setup> update
d\px01 network setup update *> set dhcp=false
d\px01 network setup update *> set hostname=newhostname
d\px01 network setup update *> commit
newhostname network setup> update
newhostname network setup update *> set dhcp=true
newhostname network setup update *> commit
newhostname network setup> ls
Properties
  defaultRoute: 192.168.0.1
  dhcp: true
  dnsDomain: plb.internal
  dnsServers: 192.168.0.111,198.142.152.164,198.142.152.165
  hostname: newhostname
  primaryAddress: 192.168.0.109/24
```

6. Re-enable the VDBs and dSources running from the engine.

6.4.7 How to change the DNS server of the Delphix engine

When DHCP is enabled on the Delphix Engine, the DNS server cannot be changed in the GUI. In this case, the DNS server can be changed in the command-line interface (CLI). If the IP address, net mask, or any other properties of the network interface itself are not changed, then VDBs do not need to shutdown. Login via Hypervisor Console for the Delphix Engine virtual machine is optional.

Use the commands below and enter the address of a server or a comma-separated list of addresses in replace of the example servers.

```
ssh -l sysadmin DelphixEngineName
Password:
DelphixEngineName> service dns
DelphixEngineName service dns> update
DelphixEngineName service dns update *> set servers=1.1.1.1,2.2.2.2
DelphixEngineName service dns update *> commit
DelphixEngineName service dns> exit
```

If DHCP is disabled and the address is static, the DNS server can be updated via the GUI.

1. Login to **Delphix Setup** with the appropriate credentials.
2. Locate the **Network** tile in the Dashboard and select **Modify**.

The screenshot shows the Delphix Setup web interface. At the top, there is a navigation bar with 'DELPHIX SETUP', 'Dashboard', 'Preferences', 'Support Bundle', and 'Help'. On the right, there are 'Actions 0' and a user profile icon. The main content area is divided into several panels:

- System Summary:** Lists hardware details like Server ID, Manufacturer, Model, Serial, Processor, and Memory.
- Network:** The central focus, showing configuration for interface 'en'. It includes fields for MTU (1500), IP Address Type (STATIC), IP Address (10), Subnet Mask (25), Default Gateway (10), DNS Domain Name (delphix.com), DNS Servers (17), and Hostname (ryan). A blue box highlights the 'Modify' button in the top right corner of this panel.
- User-click Analytics:** Status is 'Disabled'.
- SMTP Server:** Status is 'Disabled' with a warning that SMTP functionality is reduced.
- Registration:** Shows 'Engine UUID' and 'Status' with a 'View' link.

3. Scroll down in the **Network** window.
4. Use the **DNS Domain Name** and **DNS Servers** boxes for new configurations.

Network ✕

ROUTING

6.4.8 Configuring a second network interface

This topic describes how to configure a static IP address on a second network interface.

6.4.8.1 Procedure

Perform the following steps to configure a second network interface.

1. Launch the Delphix Engine Setup interface using the sysadmin credentials.
2. Navigate to the **Network** widget and click **Modify** to view the available network interfaces, and select the new interface to be configured.
3. Click the **Settings** button next to the network interface that you want to configure.

Network ✕

Configure network interfaces and services. Modifying the settings of network interfaces and default gateway may cause the Delphix Engine to be unreachable from the browser. It is recommended that such configuration be done from the Command Line Interface on the system console after a successful install.

NETWORK INTERFACES

ens256	Not configured	Settings
ens224	Not configured	Settings
ens192	Configured	Settings

- The **Network Interface Settings** screen appears. Select the checkbox before **Enabled** to enable the network.

Network Interface Settings ✕

ens224

Enabled

DHCP Static

IP Address

Subnet Mask

MTU ⓘ

Cancel
Save

- Select one of the following: **DHCP** or **Static** and enter the **IP address** and **Subnet Mask** address in the respective fields.
- MTU**: Enter a value for the MTU field. This is the maximum size in bytes of a packet that can be transmitted on this interface.
- Click **Save** to save the settings.

6.5 NFSv4 configuration

6.5.1 Overview

This article shows which OS versions support NFSv4. NFSv4 is enabled by default, but the target/staging hosts require additional configuration changes before it can be used.

Redhat/SLES: "NFSv4 Only - Enabling Recover Lost Locks" section under [Linux/Redhat/CentOs](#) (see page 922)

AIX: [IBM AIX](#) (see page 922) article.

OS version	NFSv4 support
RHEL 6.4 or later	Supported
SLES 11.4 or later	Supported
AIX 7.1, 7.2	Supported
Solaris 11	Supported

If these target host configurations are not set, the engine will choose NFSv3. The provided reason (e.g., "OS not supported") that is shown for choosing NFSv3 over NFSv4 can be observed under the Status tab of the selected VDB in the Delphix Engine GUI. Additional information is provided in this tab for datasets and current values.

6.5.2 Dataset status tab NFS reasons

NFS Reason	Notes
Default	NFSv4 is used by default for client mounts.
Old RedHat	NFSv4 is used with RedHat versions 6.4 and newer.
Unsupported OS	NFSv4 is not supported for HP-UX clients.
DNFS	Oracle Direct NFS (dNFS) is in use by the database. NFSv4 is supported by dNFS with Oracle versions 12c and newer. Additionally, due to Oracle bug 33596056, dNFS does not work with NFSv4 in Oracle versions 19.12-19.15 and 21.1-21.6.

NFS Reason	Notes
Tunable Override	The nfs.version tunable is set to force NFSv3 mounts.
Configuration Override	Appears with default operation, implies that a configuration parameter has changed.
No Recover Lost Locks	On Linux hosts, if the required recover_lost_locks setting is not enabled for the NFS client, then NFSv4 cannot be used.
Incomplete v4 Config	On AIX hosts, if the nfsrgrd daemon is not running or reverse DNS lookup is missing, then NFSv4 cannot be used.

6.5.3 NFSv4-Only mode

A Delphix Engine can be configured only to use [NFSv4](#) (see page 760) and disable NFSv3 services.

Behavioral Differences Compared Automatic (default):

- If NFSv4 is not supported on the mount, then the Delphix Engine will fail to mount the VDBs and return a user exception with the reason "NFSv4 is not supported".
- If dNFS is enabled, the Delphix Engine will attempt to use NFSv4 in Oracle versions 19.12-19.15 and 21.1-21.6 despite Oracle bug 33596056. Additional details are in this [KB](#)²⁴⁶.

If NFSv3 is enabled, it will be turned off when the option is set:

- If existing VDBs on a continuous data engine are using NFSv3, they will go down since the mounts will no longer serve data once the option is set.
- If the Continuous Compliance Engine is using NFSv3 via [remote mounts](#)²⁴⁷, they can no longer access data once the option is set.

This configuration is available via the [System Administration CLI](#) (see page 2586)

²⁴⁶ [https://support.delphix.com/Continuous_Data_Engine_\(formerly_Virtualization_Engine\)/Oracle/Provision_fails_due_to_%22ORA-00600%3A_internal_error_code%2C_arguments%3A_%5Bksfdodm_libgetattr%5D%22_\(KBA9251\)](https://support.delphix.com/Continuous_Data_Engine_(formerly_Virtualization_Engine)/Oracle/Provision_fails_due_to_%22ORA-00600%3A_internal_error_code%2C_arguments%3A_%5Bksfdodm_libgetattr%5D%22_(KBA9251))

²⁴⁷ <https://masking.delphix.com/docs/latest/managing-remote-mounts-for-vm-continuous-complianc>

6.6 Capacity and resource management

Delphix will be responsible for managing many different data sources and data types. As such, it is critical to understand how to manage your capacity and storage resources within each Delphix engine. Learn storage and quota best practices, as well as the different options to optimally manage capacity.

This section covers the following topics:

- [An overview of capacity and performance information \(see page 762\)](#)
- [Setting quotas \(see page 774\)](#)
- [Deleting objects to increase capacity \(see page 777\)](#)
- [Adding, expanding, and removing storage devices \(see page 779\)](#)
- [Delphix storage migration \(see page 783\)](#)
- [Managing source data \(see page 796\)](#)
- [An overview of held space \(see page 797\)](#)

6.6.1 An overview of capacity and performance information

This topic describes the Delphix Engine performance reservoir and capacity threshold warnings and various ways to obtain information about capacity and resource usage for the Delphix Server.

6.6.1.1 The performance reservoir and capacity threshold warnings

In order to obtain the best performance and continued operations, the Delphix Engine requires a certain amount (minimum 512GB) of free space of the total quota for storage space. As storage capacity approaches this threshold, the following system faults occur:

- When **85%** of the total storage quota is reached or **1536GB** of free space is remaining (whichever is less), a **Warning** fault is triggered. You can resolve this fault by deleting objects in the Delphix Engine, adding storage, or changing policies, as described in the topics [Adding, expanding, and removing storage devices \(see page 779\)](#), [Deleting objects to increase capacity \(see page 777\)](#). Additionally, refreshing target databases will clear the space the engine uses to track changes over time for each DB.

Note:

When a **Warning** fault is first raised, it will not impact the functioning of the system. However, there may be an impact to Oracle LogSync and SQL Server Validated sync when a **Warning** fault is seen as storage usage decreases following a **Critical** storage usage fault.

- When **90%** of the total storage quota is reached or **1024GB** of free space is remaining (whichever is less), a **Critical** fault is triggered. You cannot ignore or resolve this fault. This fault will have a significant impact on the system's behavior such as:
 - All pending link, sync, refresh, and provisioning processes will be canceled, and no new operations can be initiated
 - Scheduled replication processes will first check for capacity on the target engine and hold data (replication currently in progress to the engine will not be halted)
 - Policy operations such as SnapSync, snapshot, and refresh are suspended for **all** databases

- dSources stop pulling in new changes. LogSync is suspended for all **Oracle dSources**. Validated sync is disabled for **SQL Server** dSources.
- No virtual database (VDB) snapshots can be taken.
- When **95%** of the total storage quota is reached or **512GB** of free space is remaining (whichever is less), a second **Critical** fault is triggered. This fault will have a significant impact on the system's behavior and certain dSources and VDBs will stop in order to maintain data integrity. For example, SQL Server VDBs will shut down.

As the free space of the system improves, the following functionalities can be automatically or manually resumed.

- When the system falls below **95%** of the total storage quota, you can manually start SQL Server VDBs that had stopped
- When the system falls below **90%** of the total storage quota:
 - SQL Server VDBs that had stopped will automatically start
 - New link, sync, refresh and provisioning operations are allowed
 - Policy operations such as SnapSync, Snapshot, and Refresh resume for all databases
- When the system falls below **85%** of the total storage quota
 - dSources start pulling in new changes from their corresponding data sources. LogSync is resumed for **Oracle dSources**. Validated sync is enabled for **SQL Server** dSources.

For more information, see [Setting quotas \(see page 774\)](#)

6.6.1.2 Ways to view capacity usage

You can access capacity and performance information for the Delphix Engine through several different means, including the **Dashboard** view, and the **Storage Capacity** screen.

6.6.1.2.1 The dashboard view

You can access the **Dashboard** view in the **Delphix Management** application by clicking **Dashboard** in the Manage menu. Note that the Dashboard view provides only summary information about capacity and performance. You must access the **Storage Capacity** and **Dataset Performance** screens in the **Resources** menu to manage storage space and database objects.

The Dashboard view provides more detailed information about the overall performance of the Delphix Engine:

- **Storage Capacity** - the amount of physical storage available and what is currently used
- **TimeFlow Ratio** - see above
- **VDB Ratio** - a measure of the amount of physical space that would be occupied by the database content against the amount of storage occupied by that same database content as VDBs.
- **Dataset Performance** - the amount of network bandwidth available and the amount that VDBs are currently utilizing, as well as information about specific VDB network usage

6.6.1.2.2 The storage capacity screen

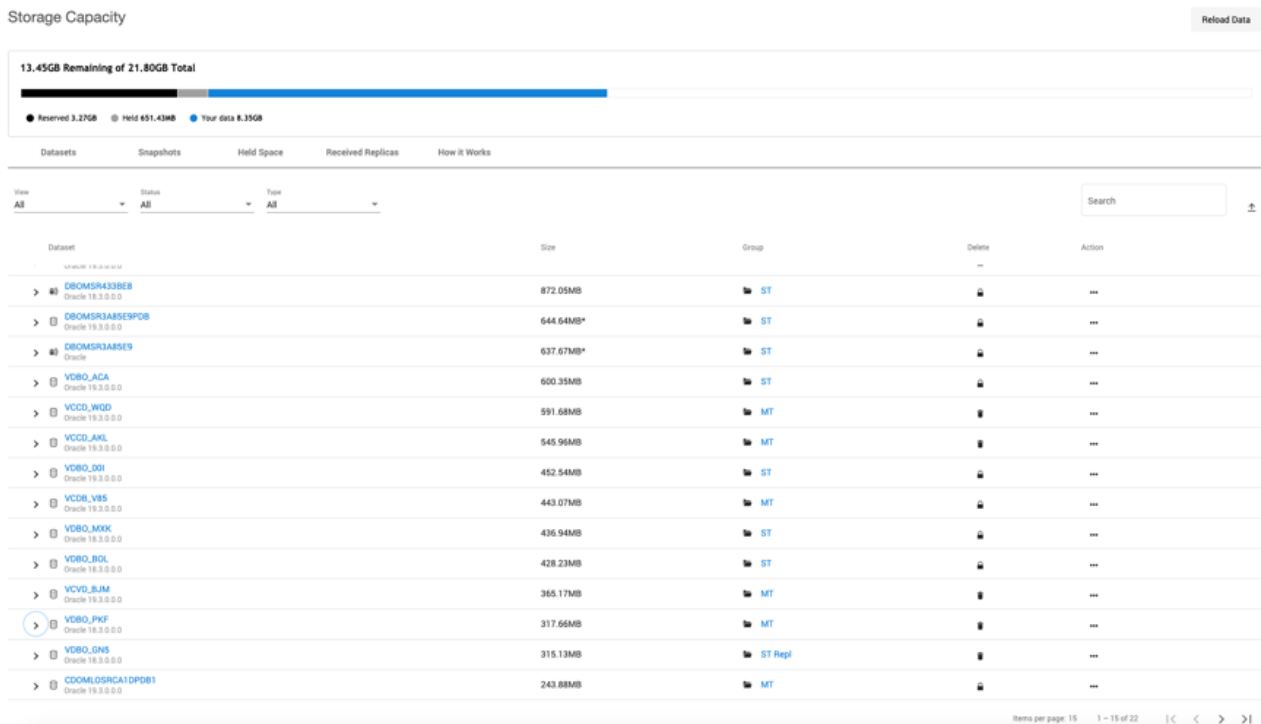

You can access the **Storage Capacity** screen through the **Resources** menu in the **Delphix Management** application. The **Storage Capacity** screen now has an improved format the interface makes it easier to identify which datasets are consuming the most space on your Delphix Engine.

Major additions in 6.0.6:

- Users can now see what’s pinning a held space and batch delete the dependencies to free it up.

What’s changed 6.0.6:

- Snapshot Delete dialog now shows a tree of “prerequisites” and “dependencies” that must have operations performed on them / be deleted in order to enable the deletion of the locked root snapshot.
- The Snapshot Delete dialog now automates the steps.
- Held Space shown in the table now represents deadbeat Timeflows rather than Containers

For more information please refer to [Using and understanding the storage capacity screen](#) (see page 764)

6.6.1.3 Using and understanding the storage capacity screen

The **Storage Capacity** screen can be reached via the **Capacity** item in the **Resources** menu. This screen shows how storage capacity is allocated for dSources, VDBs, and Snapshots, permitting storage space to be reclaimed through the deletion of objects and Snapshots.

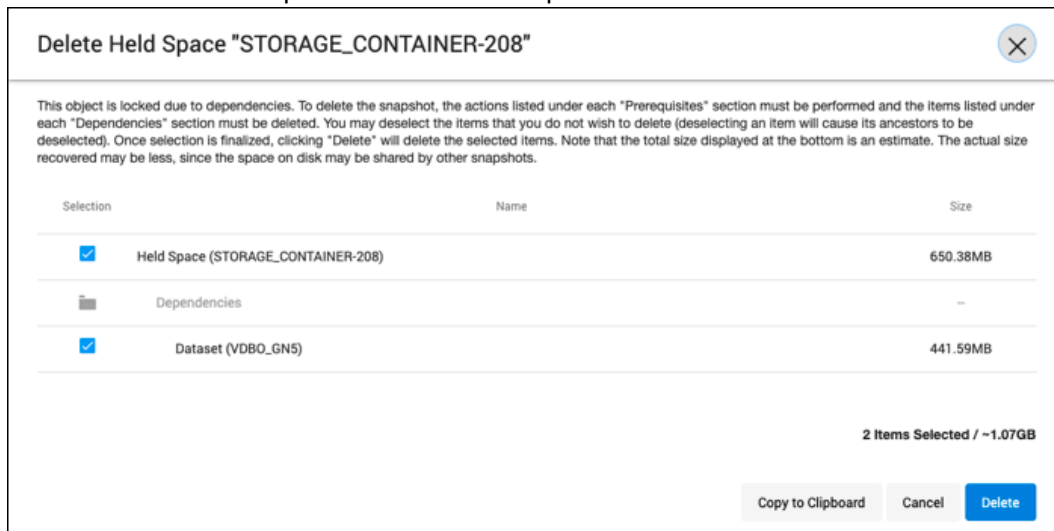

1 Storage Capacity screen

1. Select the **Reload Data** button to clear the capacity cache and refresh the page. This operation could take several minutes to clear the cache of a large Data Engine. During this operation, the Capacity page is not available.
2. The usage graph provides a visual representation of the distribution of storage consumption across the Data Engine.
 - **Reserved** – The amount of reserved space is hard-coded to be 10% (maximum up to 1TB) of the system capacity and cannot be changed. The system has a 90% consumption cap.
 - **Held** – Total held space size.
 - **Your data** – User data (snapshot, log, etc.), which includes a shared space.

Currently, this only includes dataset space. It does not include space of the engine metadata.

3. Click a tab to view one of the following tables:

- **Datasets** – This tab shows a list of datasets on the engine ordered by the size of the dataset. You can filter the list by whether the dataset is a VDB or dSource, locked or unlocked, and the type. The drop-down drawer of each dataset shows metadata about the corresponding dataset. If the dataset has descendants, the drop-down drawer will also show the list of **first-level** descendants. Use the Action menu (...) to delete or refresh a dataset. If a dataset has descendants, the delete column will show a lock icon that opens a dialog explaining why the dataset is locked. Replicated datasets are excluded.
- **Snapshots** – Rows are always sorted by descending size with a link to the dataset page for the Snapshot’s parent dataset. Snapshots created from Replicas are excluded. The drop-down drawer for each snapshot shows the latest snapshot date of the dataset that this snapshot is from. If a snapshot has any descendants or cannot be deleted due to descendants, the delete column will show a locked icon indicating this snapshot is locked. Clicking on the lock icon will display the snapshot why-locked dialog. Freshly created Snapshots are not displayed, as this table is not updated automatically.
- **Held space** – Provides a list of Held Space on the engine. You can search the held spaces by their names (in this case their references). As shown in the screenshot, you can see what takes up space and batch delete the dependencies to free it up.

- **Received replicas** – Provides a list of namespaces sorted by descending size. This tab is updated automatically (except the size). The drop-down drawer lists groups inside of each replica, sorted by size.
 - **How it works** – Provides general information about storage, retention policy, and manual deletion.
- Filters available are table-specific and do not apply to the content inside a drawer.
 - **View** – Dataset type (VDB, dSource, vFiles, etc.)
 - **Status** – Locked/unlocked for deletion
 - **Type** – Database type (Oracle, SQL Server, AppData, etc.)
 - **Search** – Search by name (case insensitive)
 - Select the export icon to export the information in the grid to a .csv file. Only the page you are viewing will be exported.

6. The **table** section displays a set of information about objects tracked by the Data Engine. The information displayed varies depending on the selected tab.

Datasets	
Dataset	Dataset type as an icon and name. Datasets created from replicas are excluded and deleted datasets have a strike-through name.
Size	Space actually used by the object.
Group	The name of the Dataset Group.
Delete	Either a trashcan or a lock icon will be shown. The trashcan opens a confirm/delete dialog, Oracle users can select to provide credentials. The lock icon explains why the selected object cannot be deleted.
Action	Refresh actions that can be taken against the dataset. <ul style="list-style-type: none"> • Refresh N/A • Refresh Dataset
Snapshots	
Timestamp	The timestamp reflecting when the snapshot was taken.
Size	Space actually used by the snapshot.
Dataset	The name of the dataset.
Group	The name of the Dataset Group.
Delete	Either a trashcan or a lock icon will be shown. The trashcan opens a confirm/delete dialog. The lock icon explains why the selected object cannot be deleted.
Held space	
Object	The name of the object.
Size	Space actually used by the object.

Delete	For held space, every row has a lock icon for opening the why-locked dialog.
Received replicas	
Namespace	Once replication is complete, the target engine will create a received replica, also known as a namespace.
Size	The amount of space used by the Namespace.

- The dataset table or snapshot drawer provides information on dependent or descendant. The inner dependency table is direct children only and has the same behavior as the outer table. Filter or sorting from the outer table does not apply to the inner table.

The screenshot shows a user interface for a database instance named 'dbdhcp2.gli' (Oracle 11.1.0.7.0) with a total size of 482.95MB. The 'Dependent Datasets' section contains the following table:

Dataset	Size	Group	Delete	Action
VDB-1 Oracle 11.1.0.7.0	134.11MB	gli	[Delete Icon]	...
Parent VDB Oracle 11.1.0.7.0	133.97MB	gli	[Delete Icon]	...

Below the table, a summary of storage metrics is displayed:

Current Copy Size	443.55MB
DB Log Size	19.75MB
Total Snapshot Size	19.57MB
Temp File Size	0.00B
Shared Snapshot Space	0.00B

The **Delete dataset dialog** – This dialog provides information on why a dataset cannot be deleted. It displays **all** descendants of a dataset, as well as any self-service objects on any of the descendant datasets. You can trace the chain of descendants from the current dataset all the way to leaf datasets. Click **Copy to Clipboard** to copy the list of descendants to the clipboard.

Delete Dataset DBOMSR433BE8

Unable to delete dataset DBOMSR433BE8

DATASET DBOMSR433BE8 IS LOCKED DUE TO THE FOLLOWING DEPENDENCIES:

VDB "VDBO_MXK" has been provisioned from it

VDB "VDBO_BOL" has been provisioned from it

Self Service template "MultiSourceTemplate" has a reference to it

DATASET VDBO_MXK IS LOCKED DUE TO THE FOLLOWING DEPENDENCIES:

Self Service container "MultiCont1" has a reference to it

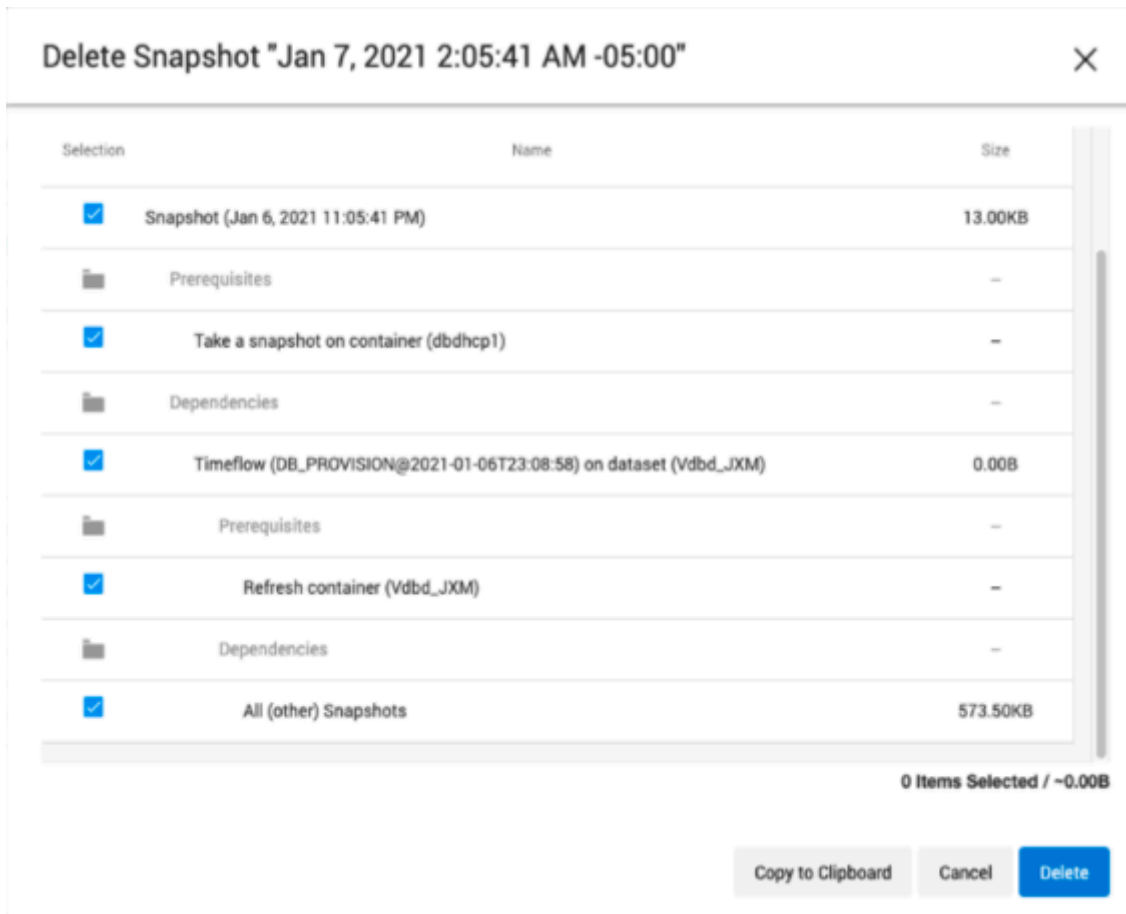

DATASET VDBO_BOL IS LOCKED DUE TO THE FOLLOWING DEPENDENCIES:

Self Service container "MultiCont2" has a reference to it

Copy to Clipboard

Close

The **Delete Snapshot dialog** – The new snapshot dialog provides the complete steps on how to unlock the locked snapshot for deletion. It also allows users to select descendants and batch delete them. The dialog shows a tree of **prerequisites** and **dependencies** that must have an operation performed or be deleted in order to enable the deletion of the locked root snapshot. **Prerequisites** refer to operations that must be performed before the associated object can be deleted. Examples of prerequisite operations include: removing a keep-forever retention policy from a snapshot, deleting a Self-Service bookmark, or refreshing a dataset. **Dependencies** refer to objects that must be deleted before the parent object can be deleted. There is also a special **All (other) Snapshots** dependency item. This item represents all children snapshots of the parent Timeflow, which will also need to be removed, minus those with a dedicated row in the table.

6.6.1.4 Understanding Delphix disk usage

Within the Delphix Timeflow, incremental restore points are called Snapshots. Delphix Snapshots use a shared block architecture to provide all the functionality of daily full backups using only a tiny percentage of the storage for full backups. Because shared block architectures are not common, a "common sense" understanding of how storage is associated with a Snapshot can be misleading.

- The size of a Snapshot is defined to be the size of changes that are unique to that Snapshot. In other words, changed blocks that are only associated with that one Snapshot.
- The latest Snapshot will always have 0 sizes initially, as there are no changes associated with it, nothing has changed since the Snapshot was taken, so there is no space used by unique changes.
- A block can be shared by multiple Snapshots if the block has not changed between the creation of those Snapshots. Any blocks that are shared amongst multiple Snapshots are accounted for in the shared Snapshot Space total.

The following screenshot provides an example of disk usage.

Dataset	Size	Group	Delete	Action										
CDOMSHSRD97A <small>Oracle 18.3.0.0.0</small>	1.14GB	test		...										
<table border="1"> <tr> <td>Current Copy Size</td> <td>1.01GB</td> </tr> <tr> <td>DB Log Size</td> <td>18.80MB</td> </tr> <tr> <td>Total Snapshot Size</td> <td>118.12MB</td> </tr> <tr> <td>Temp File Size</td> <td>0.00B</td> </tr> <tr> <td>Shared Snapshot Space</td> <td>Not available</td> </tr> </table>					Current Copy Size	1.01GB	DB Log Size	18.80MB	Total Snapshot Size	118.12MB	Temp File Size	0.00B	Shared Snapshot Space	Not available
Current Copy Size	1.01GB													
DB Log Size	18.80MB													
Total Snapshot Size	118.12MB													
Temp File Size	0.00B													
Shared Snapshot Space	Not available													
> CDOMSHTG661F <small>Oracle 18.3.0.0.0</small>	1.02GB	test		...										
> VDBO_OBA <small>Oracle 18.3.0.0.0</small>	1,009.71MB	test		...										
> DBOMSRBBD0C8C <small>Oracle 18.3.0.0.0</small>	922.83MB	test		...										
> CDOMLOSRSB5A3 <small>Oracle 18.3.0.0.0</small>	891.08MB	Untitled		...										
> CDOMLOTG4F5E <small>Oracle 18.3.0.0.0</small>	859.85MB	Untitled		...										

- **Current Copy Size:** The current copy size is the amount of space used on the Delphix Engine by the VDBs data but across all the Time flows.
- **DB Log Size:** The DB log size is the size for archive log files.
- **Temp File Size:** This field is currently not active (for future use).
- **Container Size:** The container size is the size of the whole dataset.
- **Total Snapshot Size:** The total snapshot size is the size of all snapshots combined, including anything shared.
- **Shared snapshot space:** The shared snapshot space is the space shared by snapshots.

6.6.1.5 Reviewing historical capacity from the CLI

You can retrieve historical capacity data through the Delphix Command Line Interface (CLI).

If your Delphix Engine is a new engine you would log in as Engine Admin and ssh admin@your engine. Engines created before 5.3.1 and upgraded to 5.3.1 or later will retain their old username 'delphix_admin'. To avoid complications Delphix recommends creating users with an admin role and then disabling delphix_admin.

6.6.1.5.1 Process

1. Log in as Delphix Admin (or an account with admin privileges)

```
ssh delphix_admin@yourengine
```

2. Navigate to capacity system historical

```
delphix > capacity system historical
```

3. Then you can list a start and end date for the utilization

```
delphix capacity system historical > list startDate=<time> endDate=<time>
```

For example, looking at the system space utilization, we can show 8 hours starting Sep 1 with the following:

We can also set the output detail level to different granularity, which is based on **seconds**.

```
delphix> capacity
delphix capacity> system
delphix capacity system> historical
delphix capacity system historical> list startDate=2016-09-01T00:00:00.000Z
endDate=2016-09-01T08:00:00.000Z
TIMESTAMP SOURCE.ACTUALSPACE VIRTUAL.ACTUALSPACE
2016-09-01T00:25:11.359Z 5.05TB 9.58TB

```

6.6.2 Setting quotas

This topic describes how to set quotas for database objects.

1. Log into the **Delphix Management** application.
2. Select **Manage > Datasets**.
3. For setting a quota for a dataset, select the **Configuration** tab for the dataset. (For setting quota for a group, skip this step.)
4. Select the **Policies** tab and from the Quota tile and select **Customize this policy**.

5. In the **Quota Policy** window enter the amount of storage space you want to allocate for a quota.

6. Click **Save** to set the amount.

 **Quotas and Low Space Errors**

Be very careful setting quotas. As a group or virtual database (VDB) approaches the quota level, snapshots may fail and logs may not be captured, causing LogSync to fail.

6.6.2.1 Quota thresholds²⁴⁸

The following is a table of the thresholds and a description of the actions taken at each threshold. This behavior is generic across all engines.

²⁴⁸ <https://docs.delphix.com/display/VDR/Quota+Thresholds>

Thresholds	Default ranges	Actions taken
Critical	Quota \geq 95%	<ul style="list-style-type: none"> • Disable VDBs and dSources under quota (for a group quota, everything inside gets disabled). • Disallow jobs detailed in the DB actions table below. • Cancel all in-flight jobs listed in the DB actions table except for enabling. • Poll every minute.
Resume	95% > Quota \geq 90%	<ul style="list-style-type: none"> • VDBs and dSources disabled by critical quotas will not be automatically re-enabled (DBs can still be manually re-enabled). • Resume fault is triggered if the quota has fallen from the critical threshold and if a DB was disabled from hitting the critical threshold. • Warning fault is triggered. • Poll every 3 minutes.
Warning	90% > Quota \geq 80%	<ul style="list-style-type: none"> • Warning fault is triggered. • VDBs and dSources disabled from hitting critical quota will be re-enabled. • Poll every 3 minutes.
Safe	80% > Quota	<ul style="list-style-type: none"> • VDBs and dSources disabled from hitting critical quota will be re-enabled. • Poll every 5 minutes.

If a DB was disabled prior to reaching the **critical** quota, it will not be automatically re-enabled when falling to an acceptable range or when the quota is removed.

6.6.2.2 Disallowed database actions when in quota critical threshold

Here is a table of the actions that are not allowed when the quota is in the critical threshold.

DB actions table

Target is group	Target is not group
<ul style="list-style-type: none"> • Refresh target in the group. • Sync target in the group. • Link into the group. • Provision into the group. • Enable target in the group. 	<ul style="list-style-type: none"> • Refresh target in the group. • Sync target in the group. • Enable target in the group.

If a **critical** quota is placed on a target, dSources, and VDBs can still provision to groups that are quota below the **critical** threshold.

6.6.3 Deleting objects to increase capacity

This topic describes how to delete database objects to create additional capacity.

Regularly deleting unused or outdated objects is a standard practice in Delphix Continuous Data Engine administration. This practice is especially important to prevent low space errors, which can cause the Delphix Continuous Data Engine to stop. The Delphix Continuous Data Engine holds a maximum of 750 objects. Perform the following steps to delete the objects:

1. Log into the **Delphix Management** application.
2. Select **Resources > Storage Capacity**.
3. Next to the object you want to delete, select the **Trashcan**.
4. In the **Delete** dialog, select **Force Delete**. Oracle users will have the option to provide additional credentials.

Delete Dataset Child VDB ✕

Are you sure you want to delete dataset "Child VDB"?

Force Delete

Provide privileged credentials

Cancel Delete

5. Click Delete.

Dependencies

If there are dependencies on the snapshot, you will not be able to delete the snapshot-free space; the dependencies rely on the data associated with the snapshot. These items are displayed with a lock icon next to the name.

Delete Dataset dbdhcp1
✕

Unable to delete dataset dbdhcp1

Dataset dbdhcp1 is locked due to the following dependencies:
VDB "C3" has been provisioned from it
VDB "C1" has been provisioned from it

Dataset C3 is locked due to the following dependencies:
VDB "C4" has been provisioned from it
VDB "C6" has been provisioned from it
Self Service template "JSDataTemplate(C3)" has a reference to it

Dataset C4 is locked due to the following dependencies:
VDB "C5" has been provisioned from it
Self Service container "JSContainer(C4)" has a reference to it

Dataset C1 is locked due to the following dependencies:
VDB "C2" has been provisioned from it

Close

6.6.4 Adding, expanding, and removing storage devices

- =
Multiple Device Removal in the Delphix Engine 6.0.12.0 and higher version introduces a breaking kernel module change that requires a reboot to load the new module. Therefore, a deferred reboot engine upgrade operation will be unable to remove devices until a reboot is performed.

6.6.4.1 Prerequisites

For expanding a storage device after initial configuration, first make sure to add capacity to it using the storage management tools available through the device's operating system. For example, capacity can be added in vSphere using the **Edit system settings**.

- =
VMware Hypervisor (vSphere)

Rebooting the Delphix Engine to add/expand storage is not typically necessary when using vSphere.

The guidelines for adding initial storage using all 4 virtual SCSI controllers should cause the Delphix Engine to see new storage without a reboot. However, if the new storage is leveraging a new virtual SCSI controller, the Delphix Engine will need a reboot to detect the new storage. See [Deployment for VMware](https://delphixdocs.atlassian.net/continuous-data-11-0-0-0/docs/deployment-for-vmware)²⁴⁹ for more information.

6.6.4.2 Adding or increasing storage and/or cache

If it is available you can add more storage devices to the Delphix Engine.

1. Launch the **Delphix Setup** application and log in using the **sysadmin** credentials.
2. In the **Storage** section of the **Server Setup Summary** screen, click **Modify**.
3. For engines backed by disks
 - a. Under the **Block Storage** tab, the Delphix engine should automatically detect any new storage devices. If a newly added storage device does not appear in the **Storage** section of the **Server Setup Summary** screen, click **Rediscover**.
 - b. Select the **Enable** check box before the device name to add the device to the storage pool and click **Save**.
4. For Delphix Elastic Data Engines
 - a. You can modify the maximum amount of data that can be stored by the s3 storage under the **Object Storage** tab.
 - b. The **Block Storage** tab lets you modify the number of EBS volumes used for cache. Please see step 3 above.
5. Click **Save**.

6.6.4.3 Expanding a storage/cache device

1. Launch the **Delphix Setup** application and log in using the **sysadmin** credentials.
2. In the **Storage** section of the **Server Setup Summary** screen, click **Modify**.
3. Under the **Block Storage** tab, select **Expand** for each device that you want to expand. The **Expand** checkbox appears next to the name of devices that have added capacity (in other words, the underlying LUN has been expanded), and the **Unused** column indicates how much capacity is available for each device.

Note:

It is imperative that the VMDKs created and assigned to the Delphix Engine do not exceed the capacity of the backing datastore. Any 'overcommitment' of storage resources can be expected to cause an unplanned outage, and may not be recoverable.

²⁴⁹ <https://delphixdocs.atlassian.net/continuous-data-11-0-0-0/docs/deployment-for-vmware>

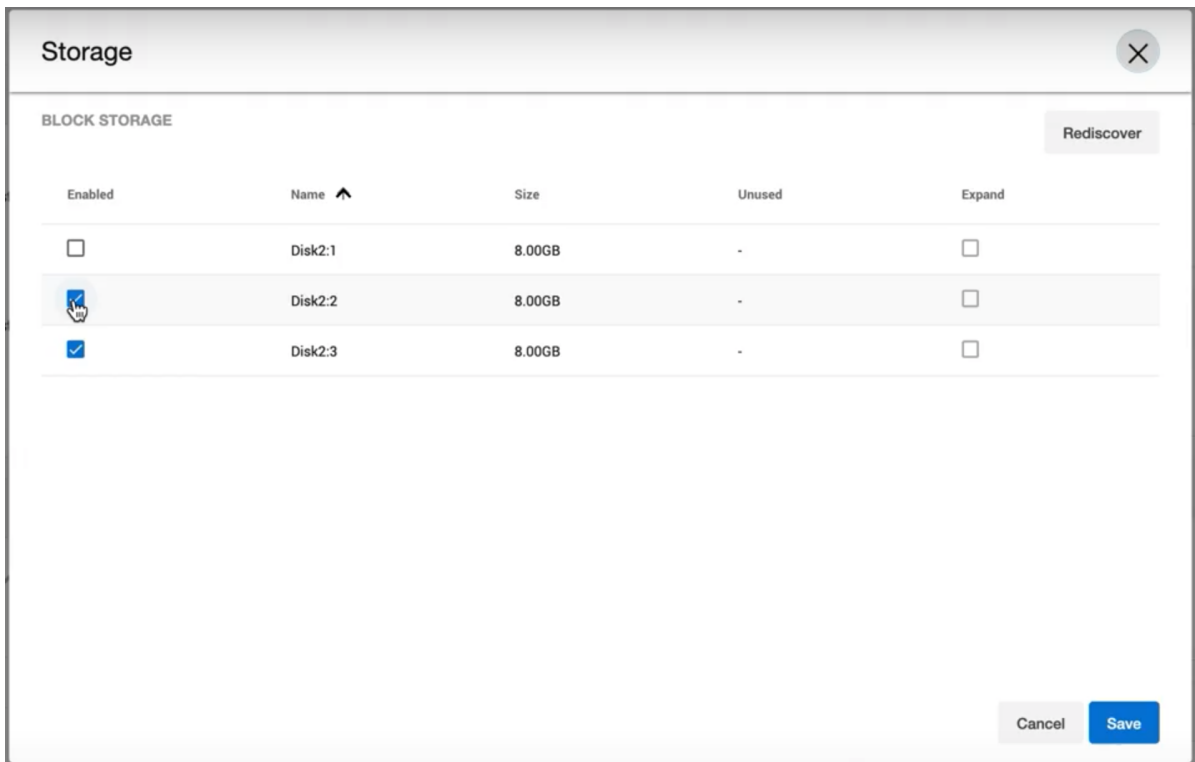

4. Click **Save**.

6.6.4.4 Removing device storage

1. Launch the **Delphix Setup** application and log in using the **sysadmin** credentials.
2. In the **Storage** section of the **Server Setup Summary** screen, click **Modify**.

3. In the **Block Storage** tab, uncheck the **Enable** box for any storage device that will be removed.
 - a. A minimum of 10GB of object storage is required, thus, a device or devices must be enabled to accommodate for at least 10GB. This will give an error otherwise.

4. Once the desired storage devices are disabled, click **Save**.
5. The removal will appear as a job in the **Running Actions** section.

6.6.5 Delphix storage migration

6.6.5.1 Getting started

Delphix storage migration allows you to remove storage devices from your Delphix Engine, provided there is sufficient unused space, thus allowing you to repurpose the removed storage device to a different server. You can also use this feature to migrate your Delphix Engine to different storage by adding the new storage devices and then removing the old storage devices.

Feature compatibility

This feature is only compatible with Delphix Engine Releases 5.0.4 and later. This feature is not supported on Delphix Elastic Data Engines (engines backed by blob/object storage).

Possible Migration Methods

Method	Pros	Cons
Delphix Storage Migration	<ul style="list-style-type: none"> • Good for migrating storage that was accidentally added to the engine or added to the engine improperly (wrong size). • May reduce fragmentation if new storage is added to replace old disks. • Good for migrating a small amount of storage (e.g.: < 10 TB). 	<ul style="list-style-type: none"> • With Delphix versions prior to 5.3, this mapping table can consume 2-3GB of RAM for every 1TB of allocated data that is migrated, if the disk being removed has a high level of fragmentation. From version 5.3, DxFs will migrate the data in larger blocks, comprising both allocated and unallocated space. This allows for significantly fewer mapping entries, with memory usage typically reduced to 50-100MB per TB of allocated data that is migrated. • May increase fragmentation on remaining disks if no new disks are added. • Depending on the size of the disk and storage performance this method could be less performant than other methods. • Each device removed could take longer than the previous one as data is remapped across the remaining disks. • The maximum number of 20 devices can be removed in releases prior to Delphix version 5.1.
vMotion	<ul style="list-style-type: none"> • Fast 	<ul style="list-style-type: none"> • If there is high fragmentation on the existing disks, this is copied to the new disks.

Method	Pros	Cons
Delphix Replication	<ul style="list-style-type: none"> • Data is completely rewritten from one Delphix Engine to another which significantly reduces fragmentation on the new Delphix Engine. • Replication can be configured to limit the impact on the network (compression and bandwidth). • Replication is resumable from network disruptions, on in the event of replication source or target stack/host restarts. It is currently NOT possible to manually suspend/resume a replication job. 	<ul style="list-style-type: none"> • Depending on the number of objects to replicate as well as network and storage performance, this method could be considered slow. • This does require an outage to "migrate" the objects from the replication source Delphix Engine to the replication target Delphix Engine - outage time depends on several factors like the number of objects, incremental replication time, time to enable/disable objects, etc. • Only migrates storage objects like VDBs/dSources, and dependent environment information. Other items like users/policies/events/job history/config templates are NOT replicated.

6.6.5.2 Understanding Delphix storage migration

Delphix storage migration is a multi-step process:

1. Identify a storage device for removal. The device you choose will depend on your use case.
 - a. To remove extra storage that is unused, you can select any device for removal. For best performance, select the device with the least allocated space; typically, this is the device that you added most recently. The allocated space is defined by the `usedSize` property of the storage device:

```
test-env@delphix 'Disk10:2'> ls
Properties
```

```

type: ConfiguredStorageDevice
name: Disk10:2
bootDevice: false
configured: true
expandableSize: 0B
model: Virtual disk
reference: STORAGE_DEVICE-6000c293733774b7bb0e4aea83513b36
serial: 6000c293733774b7bb0e4aea83513b36
  size: 8GB
  usedSize: 7.56MB
vendor: VMware

```

- b. To migrate the Delphix Engine to new storage, add storage devices backed by the new storage to the Delphix Engine. Then remove all the devices on the old storage.
2. Use the Delphix command-line interface (CLI) to initiate the removal of your selected device.
 3. Data will be migrated from the selected storage device to the other configured storage devices. This process will take longer the more data there is to move; for very large disks, it could potentially take hours. You can cancel this step if necessary.
 4. The status of the device changes from **configured** to **unconfigured** and an alert is generated to inform you that you can safely detach the storage device from the Delphix Engine. After this point, it is not possible to undo the removal, although it is possible to add the storage device back to the Delphix Engine.
 5. Use the hypervisor to detach the storage device from the Delphix Engine. After this point, the Delphix Engine is no longer using the storage device, and you can safely re-use or destroy it.

6.6.5.3 Limitations of Delphix storage migration

After removal, the Delphix Engine uses memory to track the removed data. In the worst-case scenario, this could be as much as 2-3 GB of memory per TB of used storage. Note that this is used storage; the overhead of removing a 1TB device with only 500MB of data on it will be much lower than the overhead of removing a 10GB device with 5GB of data on it.

6.6.5.4 User interface

Delphix storage migration is currently available exclusively via the CLI. There are two entry points.

- `verifyStorageDeviceRemoval` - Verifies available pool space and available memory.
- `startStorageDeviceRemoval` - Kicks off job, detailed discussion of job concurrency/recovery.

6.6.5.5 Device removal for storage migration

 **Do not remove a configured storage device**

Do not remove a configured storage device or reduce its capacity. Removing or reducing a configured storage device will cause a fault with the Delphix Engine, and will require the assistance of Delphix Support for recovery.

1. Identify which device you want to remove.
 - a. If you are using a VMware **RDM** disk, note the UUID of the device by looking at its name in the vSphere GUI. For more information, see the [Getting the UUID of a RDM Disk from VMware, via the vSphere GUI](#)²⁵⁰ article.
 - b. If you are using a VMware **virtual** disk, note the UUID of the device via the vSphere API. See the section of this [VMware KB article](#)²⁵¹ on how to get the UUID of your virtual disk.
 - c. In EC2, note the attachment point – e.g., `/dev/sdf`.
 - d. In KVM, note the UUID.
2. Login to the Delphix CLI as a **sysadmin** user.
3. Navigate to the storage/device directory with `cd storage/device`.
4. Select one or more devices to remove and make note of the name (e.g., select "Disk10:2" and "Disk10:3").

```
test-env@delphix storage/device> ls
Objects
NAME          CONFIGURED  SIZE  EXPANDABLESIZE
Disk10:2      true        8GB   0B
Disk10:0      true        24GB  0B
Disk10:1      true        8GB   0B
Disk10:3      true        8GB   0B
```

5. (For VMware only) Confirm the disk selection is correct by validating that the serial matches your UUID:

```
test-env@delphix storage device 'Disk10:2'> ls
Properties
type: ConfiguredStorageDevice
name: Disk10:2
bootDevice: false
configured: true
expandableSize: 0B
model: Virtual disk
reference: STORAGE_DEVICE-6000c2909ccd9d3e4b5d62d733c5112f
serial: 6000c2909ccd9d3e4b5d62d733c5112f
size: 8GB
usedSize: 8.02MB
vendor: VMware
```

²⁵⁰ <https://delphixdocs.atlassian.net/wiki/pages/resumedraft.action?draftId=6230802>

²⁵¹ http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1033370

6. Navigate to `storage/remove` . Run `verify` and set the devices to be removed, as shown below.

```
test-env@delphix storage remove > verify
test-env@delphix storage remove verify *> set devices="Disk10:2,Disk10:3"
test-env@delphix storage remove verify *> commit
  type: StorageDeviceRemovalVerifyResult
  newFreeBytes: 15.85GB
  newMappingMemory: 3.14KB
  oldFreeBytes: 23.79GB
  oldMappingMemory: 0B
```

7. Navigate to `storage/remove` . Run `start` and set the devices to be removed, as shown below.

```
test-env@delphix storage remove > start
test-env@delphix storage remove start *> set devices="Disk10:2,Disk10:3"
test-env@delphix storage remove start *> commit
  Dispatched job JOB-4
  STORAGE_DEVICES_START_REMOVAL job started.
  STORAGE_DEVICES_START_REMOVAL job completed successfully.
```

Note : This does not signify that the device migration has been completed. A `STORAGE_DEVICE_REMOVAL` job will start for each device to be removed, which handles the data migration from that disk.

8. Wait for device evacuation to complete. Alternatively, you can cancel the evacuation.

Note:

Do not detach the device from the Delphix Engine in your hypervisor until the data evacuation is completed.

You can monitor the progress of the `STORAGE_DEVICE_REMOVAL` job in the Management GUI under **System >Jobs**.

9. Once the device evacuation has been completed, the job will finish and a fault will be generated. Detach the disks from your hypervisor and the fault will clear on its own. An example of the fault created is shown below.

The screenshot shows the 'DELPHIX MANAGEMENT' interface with a 'Faults' section. The 'Current' tab is active, displaying a table with one entry: a WARNING for 'Device evacuation completed' on 'Disk2:2' at 'Nov 2, 2021 1:54 PM'. A detailed view of this warning is shown on the right, including the date, title, target, details, and user action: 'Remove the device from the hypervisor.' At the bottom of the detailed view, there are 'Resolving and Ignoring' buttons.

Using VMDKs

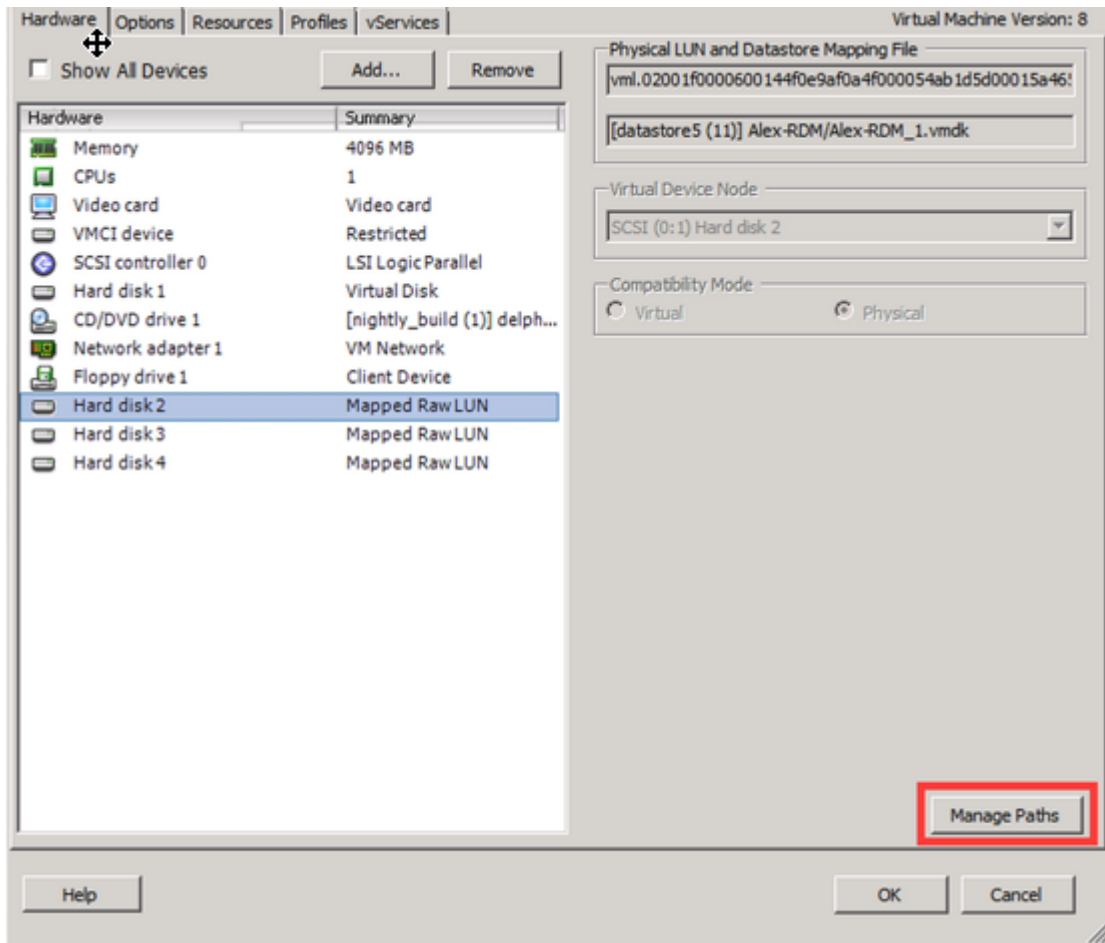

When using VMDKs, deleting the wrong VMDK could cause data loss. Therefore, it is highly advisable to detach the device, then verify that the Delphix Engine continues to operate correctly, and lastly delete the VMDK.

6.6.5.6 Getting the UUID of an RDM disk from VMware via the vSphere GUI.

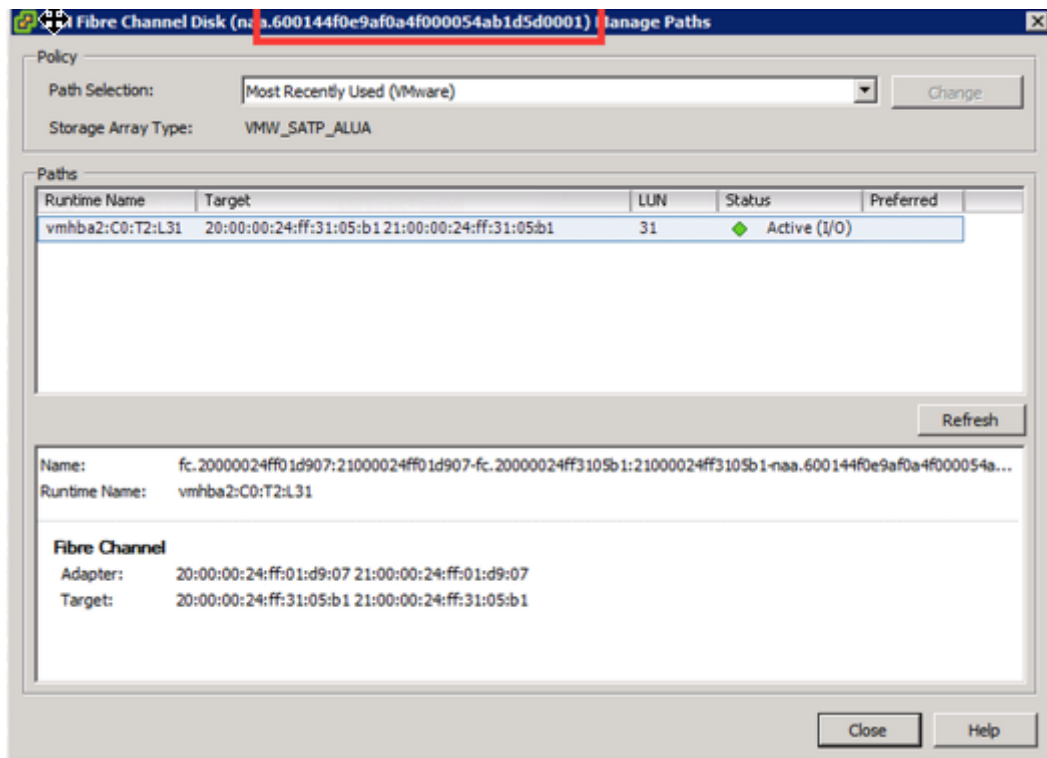

In the event that the disk serial number displayed in Delphix does not match the UUID in VMware, the Delphix Engine must be powered off and back on in order to make VMware provide the correct values to the guest operating system (Delphix). This has been necessary when using **vmkfstools** with **setuuid**. When forcing the guest OS to re-read the SCSI sense data for the device, VMware still provides the original values. Even after a simple reboot VMware still provides the previous UUID values. It was not until the VM was explicitly powered off and back on did VMware present the new UUID values to the guest. After which the UUIDs matched between the **vmkfstools getuuid** command and the CLI output.

In the ESX graphical user interface (GUI), select your **VM**.

1. Click **Edit settings**.
2. If not already displayed, select the **Hardware** tab.
3. Select the **device** you want to remove.
4. Click **Manage Paths**.

The UUID of the device appears in the title bar, as seen below.

6.6.5.7 Getting the UUID of a VMDK from VMware, via ssh to the ESX server

1. ssh onto the ESX server as the root user.
2. Navigate to the directory containing the .vmdk files for the Delphix VM.

Use the 'vmkfstools -J getuuid <.vmdk filename>' command to obtain the UUID, for example:

```
/vmfs/volumes/25894daa-f7b2b044/delphix01-2356 # vmkfstools -J getuuid
delphix01-2356_1.vmdk
UUID is 60 00 C2 91 01 bc 8e 72-31 a4 cd b0 b3 f6 e5 74
```

6.6.5.8 Getting the UUID of a VMDK from VMware, via VMware PowerCLI

```
PS C:\> Connect-VIServer -Server durban -Protocol https -Username root -Password
root_password
```

```
Name          Port  User
----          -
durban        443  root
```

```
PS C:\> Get-VM delphixVM | Get-HardDisk | select name,filename,@{name="UUID";expr={$_.extensiondata.backing.uuid}}
```

Name	Filename
UUID	-----
----	-----

Hard disk 1	[zfs_delphixVM] dlpX-5.1.9.0-432-61155cf.
.. 6000C294-a115-0327-e417-02560d86e944	
Hard disk 2	[zfs_delphixVM] dlpX-5.1.9.0-432-61155cf.
.. 6000C299-38fe-5050-1eb2-1ee6db62b257	
Hard disk 3	[zfs_delphixVM] dlpX-5.1.9.0-432-61155cf.
.. 6000C294-662d-c674-8957-03e0514b7006	
Hard disk 4	[zfs_delphixVM] dlpX-5.1.9.0-432-61155cf.
.. 6000C29d-0719-1072-0f85-96da2efef4a3	

```
PS C:\> Disconnect-VIServer
```

Confirm

Are you sure you want to perform **this** action?

Performing operation "Disconnect VIServer" on Target "User: root, Server: durban, Port: 443".

6.6.5.9 In-place block-to-object storage migration

6.6.5.9.1 Introduction

The Elastic Data product uses object storage to provide a cost-effective and flexible medium for storing an engine's data without compromising performance for most workloads. From version 15.0.0.0 and later, it is possible for a sysadmin to migrate an engine's storage pool residing in local block storage to object storage backends, in-place and with no downtime.

If your kernel version is below 15.0, you cannot perform an in-place block-to-object storage migration. To enable this feature, you must first run a full upgrade to version 15.0 or higher.

6.6.5.9.2 Prerequisites

The migration process requires:

- An object storage endpoint with access credentials where the data from the block-based storage pool will be migrated to. The object storage backend needs to be supported by the Continuous Data Engine (e.g. AWS S3, Azure Blob, OCI Object Storage, and various on-prem solutions).
- One or more high performance block device(s), to be used as an object storage cache during and after the migration is finalized. Disks that are currently configured in your Continuous Data Engine cannot be used for this purpose.

6.6.5.9.3 Limitations

In-place migration is an irreversible operation. Once started, it cannot be stopped, nor paused, nor reversed.

Additionally, during the migration process, sysadmins are not able to add or remove block devices for data storage. Cache device removal is not allowed either while the migration is in progress. Cache device additions are allowed at any time (e.g. to improve performance during or after the migration).

6.6.5.9.4 Other methods of migration

An alternative to this feature would be replicating data to a new engine that was created with an object storage-backed pool from the start. This approach has some potential drawbacks:

- **This migration path is not viable for engines that already use replication.**
- **The process is complex and potentially error-prone.** The sysadmin would need to: Create a new VM, start the replication, notify their users, update infrastructure to use the new VM, and finally delete the old VM.
- **Infrastructure requirements temporarily double.** While transitioning, the sysadmin needs to use double the infrastructure that would normally be needed. This can be a tough requirement to meet when multiple product engines need to be migrated.
- **There is downtime involved.** If the write-load of the transitioning VMs is high, sysadmins may need to plan some downtime for finalizing replication and switching users over to the new VM.
- **The process can be time-consuming.** Multi-TB storage pools may take too long to migrate, as the network is involved in two places: replication and writes to the object storage. An in-place migration only involves the network when writing to the object storage.

6.6.5.9.5 Instructions

The following example walks through a migration in AWS for a storage pool migrating from EBS Volumes to S3. Please adjust the steps for your cloud platform accordingly.

1. Add one or more high-performance block device(s) to your engine from the cloud console or hypervisor to be used as a cache. In this example, two gp3 EBS Volumes have been added to a demo VM.
2. Login to the Delphix CLI as a **sysadmin** user.

3. Navigate to the storage/device directory with `cd storage/device`. Type `ls` to list all devices currently detected by the VM and find the name of the block device you just added.

```
ip-10-110-196-27> cd storage/device
ip-10-110-196-27 storage device> ls
Objects
NAME  BOOTDEVICE  CONFIGURED  SIZE  EXPANDABLESIZE  FRAGMENTATION  ALLOCATING
xvda  true  true  70GB  0B  NA  true
xvdb  false  true  100GB  0B  54%  true
xvdc  false  true  100GB  0B  58%  true
xvdd  -  false  50GB  -  -  -
xvde  -  false  50GB  -  -  -
```

In the above sample, the devices just added stands out because they are the only non-configured ones; `xvdd` and `xvde`.

4. Navigate to the `/storage/migrate` directory with `cd /storage/migrate/`. Type `start` to start the migration API form and (optionally) `ls` to list all fields that are required for submitting the migration job.

```
ip-10-110-196-27 storage device> cd /storage/migrate/
ip-10-110-196-27 storage migrate> start
ip-10-110-196-27 storage migrate start *> ls
Properties
  type: BlobObjectStore
  accessCredentials: (unset)
  cacheDevices: (unset)
  configured: false
  container: (unset)
  endpoint: (unset)
  size: (unset)
```

5. Set the correct `type` of object storage (in this case `S3ObjectStore`) with the `set` command:

```
ip-10-110-196-27 storage migrate start *> set type=S3ObjectStore
```

6. Set the access credential type and info (this can vary by hypervisor/cloud provider).
 - a. Using AWS instance profile authentication is simple and can be done with a single command:

```
ip-10-110-196-27 storage migrate start *> set
accessCredentials.type=S3ObjectStoreAccessInstanceProfile
```

- b. If access key credentials are preferred, then the access ID and its respective key should be specified:

```
ip-10-110-196-27 storage migrate start *> set
accessCredentials.type=S3ObjectStoreAccessKey
ip-10-110-196-27 storage migrate start *> set
accessCredentials.accessId=<redacted>
ip-10-110-196-27 storage migrate start *> set
accessCredentials.accessKey=<redacted>
```

7. Input the object storage's endpoint and related info (the fields may vary based on the hypervisor/ cloud provider object storage that you want to connect to):

```
ip-10-110-196-27 storage migrate start *> set endpoint=https://s3-us-
west-2.amazonaws.com
ip-10-110-196-27 storage migrate start *> set region=us-west-2
ip-10-110-196-27 storage migrate start *> set bucket=delphix-data
ip-10-110-196-27 storage migrate start *> set size=500G
```

-  The `size` field is the storage quota that the sysadmin can use to limit the engine's usage of the object storage backend. The sysadmin can change that value post-migration as needed if their storage requirements change.

8. Finally, set the cache to the new devices that were added in step one (see name of devices in step three):

```
ip-10-110-196-27 storage migrate start *> set cacheDevices=xvdd,xvde
```

9. (Optional) Type `ls` once more to verify that all your info is entered correctly:

```
ip-10-110-196-27 storage migrate start *> ls
Properties
  type: S3ObjectStore (*)
  accessCredentials:
    type: S3ObjectStoreAccessKey (*)
    accessId: ***** (*)
    accessKey: ***** (*)
  bucket: delphix-data (*)
  cacheDevices: xvdd, xvde (*)
  configured: false
  endpoint: https://s3-us-west-2.amazonaws.com (*)
  region: us-west-2 (*)
  size: 50GB (*)
```

10. Type `commit` to submit the migration job (warning, this is an irreversible operation - see Limitations section). If there is something wrong with the credentials, the connectivity of the VM, or any of the above parameters that you typed above, the command will fail and give a helpful message. Otherwise, if everything is correct, you will see the message below:

```
ip-10-110-196-27 storage migrate start *> commit
Dispatched job JOB-23
OBJECT_STORE_MIGRATE job started for "unknown".
OBJECT_STORE_MIGRATE job for "unknown" completed successfully.
```

The above means that the job submission was successful and it is running in the background. There are a couple of ways to track the job's progress. The easiest way is viewing the Actions Panel in the sysadmin UI (see [Viewing actions status](#)²⁵² for more details).

The other way is through the CLI by typing `cd /storage/migrate` and then running `ls` :

```
ip-10-110-228-202 storage migrate> ls
Properties
  type: ObjectStoreMigrationStatus
  mappingMemory: 0B
  startTime: 2023-08-25T23:48:03.077Z
  state: ACTIVE
  total: 20.13MB
```

²⁵² <https://cd.delphix.com/docs/latest/viewing-action-status>

6.6.6 Managing source data

The **Managed source Data** dashboard tile provides an aggregate sum of the size of ingested source databases. This helps to understand the total amount of data per-engine that is managed by Delphix.

Managed Source Data refers to the size of the source data that is ingested and managed by the Delphix Engine. It is the physical, allocated size of the source database.

Today, the value displayed represents the source data size for Oracle, SQL Server, and SAP ASE databases. Since this value is a measure of source size, it is not affected by Delphix constructs or operations, e.g. the sizes of dSources, VDBs, snapshots. Since the intent is to measure the size of the sources, data from replication or Selective Data Distribution are not included in the sum for the engine. The total usage is displayed in gigabytes.

When an admin (Delphix Management Application) or sysadmin (Delphix Setup) login to the Delphix Engine they will have access to the Managed Source Data tile (shown below) from their dashboard.

Selecting the **View** link located on the top-right takes users to the Managed Source Data page. This page provides a detailed breakdown of the total usage and can also be reached via **Resources > Managed Source Data** from the navigation bar.

Blue question marks indicate:

- A “fallback” value is being used in the sum: A fallback value is used when sources are unavailable at the time when the usage query is made (e.g., the source is disabled), a “fallback” value is used in the sum. The fallback value refers to the last usage value Delphix collected while connected to the source.
- Sources that are not included in the sum: These are source types for which Delphix does not currently collect data (for example, sources like EBS, DB2, HANA, PostgreSQL).

Hovering over the **blue question marks**, a tooltip appears to describe the exact situation (whether or not Delphix used historical data/fallback values or if the source for collection is unsupported).

Managed Source Data

Managed Sources How It Works

Name	Last collected	Space used	Type Of Data
CDOMSHSRD97A	Sep 29, 2021 12:24 PM	2.22 GB	Oracle
DBOMSRBDC6C	Sep 29, 2021 12:24 PM	2.12 GB	Oracle
CDOMLOTG4FSE	Sep 20, 2021 2:00 PM	1.69 GB	Oracle
CDOMSHSRD97APDB1	Sep 29, 2021 12:24 PM	773.63 MB	Oracle
CDOMSHSRD97APDB2	Sep 29, 2021 12:24 PM	763.63 MB	Oracle
CDOMSHSRD97APDB3	Sep 29, 2021 12:24 PM	763.63 MB	Oracle
CDOMLOTG4FSEPDB3	Sep 20, 2021 2:00 PM	762.84 MB	Oracle
Delphix_Admin	Sep 17, 2021 10:30 PM	3.88 MB	MSSQL Server
CDOMLOSRS5A3PDB1	Sep 29, 2021 12:24 PM	Copy query	Oracle

Total Space Used

9.03 GB*

Sep 29, 2021

MSSQL Server	3.88 MB
Oracle	9.02 GB

*Space usage data is available when Delphix sources are able to be monitored.

To search the **Managed source Data** table, enter the name of the data source you are looking for. The grid will refresh to display the selected data source. Select to refresh data to get updated space usage information. To export the information provided in the grid to a .csv file select.

Backend data refresh

The backend data refreshes at a regular interval but does not trigger a UI refresh.

6.6.7 An overview of held space

6.6.7.1 Scenario description

The existence of a Held Space is not indicative of an issue but rather a representation of an underlying storage dependency.

There are four scenarios that can create Held Space.

6.6.7.1.1 Scenario 1:

The first scenario can occur when you replicate a dSource to a second engine, which we'll call a Replication Target.

If you then provision a VDB from the Replication Target, and the dSource is subsequently deleted from the Replication Source, you will create a Held Space when that delete replicates to the Replication Target engine.

When this happens, the deleted dSource is removed from the target, but its storage remains held because it is needed by the replica provisioned VDB.

Replication Held Space (Scenario 1)

Held Space can be viewed in the **Storage Capacity** screen by selecting the Held Space tab.

Object	Size
STORAGE_CONTAINER-96	74.49MB

6.6.7.1.2 Scenario 2:

The second scenario can occur in the context of a snapshot that is in use by a Delphix Self-Service branch or bookmark.

The snapshot may be removed via policy, but until the branches and/or bookmarks that leverage that snapshot are removed, its space will be held.

6.6.7.1.3 Scenario 3:

The third scenario can occur during Selective Data Distribution where a masked VDB that is provisioned from a dSource is replicated to a Replication Target.

The metadata objects relating to the dSource could contain sensitive information like hostnames, user names, and passwords. Hence they are not replicated to the Replication Target. The data belonging to the dSource is replicated after redacting any sensitive information. This redacted data shows up as held space.

6.6.7.1.4 Scenario 4:

The fourth scenario is caused by a failed or interrupted Replication job and results in held space on the Replication source engine. During replication, all data blocks to be replicated are serialized for transfer. Once the transfer is complete, the serialized data is released.

However, if a Replication job fails, the serialized data is retained until the next successful Replication job execution, or the Replication Profile is deleted - whichever happens first.

In a scenario where dSource and VDB snapshots in the serialized data reach the Retention Policy limit before the Replication job successfully executes, that snapshot data will become held space. This is most likely to happen if either of the following is true:

- A failed Replication job goes a long time before being successfully re-run.
- Replication schedules are configured with a period that is longer than one or more Retention Policies.

6.7 Monitoring and log management

Using both Delphix and its associated datasets will generate many types of logs. Monitoring these logs are a key component of good diagnosability. Here, we explain the types of logs that Delphix creates as well as the monitoring tool integrations we support, such as SNMP and Splunk.

This section covers the following topics:

- [Configuring SNMP \(see page 800\)](#)
- [Viewing action status \(see page 809\)](#)
- [Viewing jobs \(see page 811\)](#)
- [System faults \(see page 813\)](#)
- [Accessing audit logs \(see page 819\)](#)
- [Creating support logs \(see page 822\)](#)
- [Setting support access control \(see page 613\)](#)
- [Setting syslog preferences \(see page 825\)](#)
- [Support access audit logs \(see page 827\)](#)
- [Diagnosing connectivity errors \(see page 830\)](#)
- [Email \(SMTP\) alert notifications \(see page 832\)](#)
- [Splunk integration \(see page 850\)](#)
- [Fluentd plugin service for API modules \(see page 841\)](#)

6.7.1 Configuring SNMP

This topic describes how to configure SNMP.

Starting with version 6.0.6.0 the Delphix Engine adds support for SNMP version 3 by implementing the User Security Model (USM) of the SNMP version 3 (SNMPv3) specification. Version 3 of SNMP adds stronger security compared to version 2.

When SNMP v2 is configured and enabled, SNMP v1 is also configured and enabled. Similarly, v2 is configured and enabled with v3. This is a known behavior of the net-snmp package used to implement SNMP on the engine.

USM replaces the community string as in SNMP version 2 with user records. The Delphix engine can both receive and send SNMP version 3 messages only by using the USM security model. The USM model provides more security over version 2 by hashing passwords and encrypting the payload.

The Delphix Engine includes an SNMPv3 agent that is only capable of responding to read-only operations, such as GET messages using the User Security Model. USM users can be configured via the GUI, CLI, or API. Each user is composed of a username, authentication password, authentication protocol, privacy password, and a privacy protocol.

The Delphix Engine is also capable of sending alerts and faults over SNMP with the User Security Model. Messages are sent identically as with SNMP version 2 except that the USM model is used to authenticate and encrypt the alert message against a customer's manager. Users will need to properly configure their managers to receive messages. The use of the test function can be used to test configuration.

6.7.1.1 Prerequisites

There are no prerequisites for enabling SNMP to provide system status. The following are prerequisites for sending alerts to an external SNMP manager.

- At least one SNMP manager must be available and must be configured to accept SNMPv2 InformRequest notifications.
- Delphix's MIB (Management Information Base) files must be installed on the SNMP manager or managers. These MIB files describe the information that the Delphix Engine will send out. They are attached to this topic.

File name	Content-type	File Size
DELPHIX-ALERT-MIB.txt ²⁵³	text/plain	5 kB

File name	Content-type	File Size
DELPHIX-MIB.txt ²⁵⁴	text/plain	0.8 kB

6.7.1.2 Configuring SNMP for v2

1. On the Delphix Engine login screen, select **Delphix Setup**.
2. In the Delphix Setup login screen, enter the **sysadmin** username and password.
3. Click **Log In**.
4. From the **Delphix Setup**, select **Preferences > SNMP Configuration**.

5. Select **Enable**.
6. Select **SNMP Version 2**.

²⁵⁴ <https://delphixdocs.atlassian.net/wiki/download/attachments/254642432/DELPHIX-MIB.txt?api=v2&cacheVersion=1&modificationDate=1729522018544&version=1>

System Location ⓘ

7. In **Community string**, enter the community string. It is the string that SNMP clients must provide in order to be authorized to retrieve SNMP information from the Delphix Engine.
8. OPTIONAL: change the following settings:
 - a. **Authorized network** – The set of client IP addresses (in CIDR notation) authorized to retrieve SNMP information from the Delphix Engine. To allow all clients, set this to 0.0.0.0/0 (the default). To prevent all clients from connecting, set this to the loopback address, 127.0.0.1/32.
 - b. **System location** – A free-form text description of the Delphix Engine's physical location. This is provided as the value for MIB-II OID.
9. Click **Save** to commit the SNMP configuration.

6.7.1.3 Configuring SNMP for v3

1. On the Delphix Engine login screen, select **Delphix Setup**.
2. In the Delphix Setup login screen, enter the **sysadmin** username and password.
3. Click **Log In**.
4. From the **Delphix Setup**, select **Preferences > SNMP Configuration**.

5. Select **Enable**.
6. Select **SNMP Version 3** (recommended).
7. Click **Save** to commit the SNMP configuration.

6.7.1.3.1 Configure SNMP version 3 agent

After enabling SNMP and choosing version 3, the SNMP agent can be configured with the User Security Model (USM) users.

1. Click on **System Status**.
2. Click on the **+** to show the **New SNMP USM User Information** dialog.

New SNMP USM User Information

3. Provide the following information for the user:
 - a. **Username** - A string representing the name of the user.
 - b. **Authentication method** - An indication of whether messages sent on behalf of this user can be authenticated, and if so, the type of authentication protocol that is used. Users can select from:
 - MD5** -the HMAC-MD5-96 authentication protocol.
 - SHA** -the HMAC-SHA-96 authentication protocol.
 - c. **Authentication passphrase** - If messages sent on behalf of this user can be authenticated, this key will be used with the authentication key for use with the authentication. This field requires a minimum of 8 characters.
 - d. **Encryption method** - Provides support for data confidentiality. The designated portion of an SNMP message is encrypted and included as part of the message sent to the recipient. Users can select from
 - AES** - Advanced Encryption Standard
 - DES** - Data Encryption Standard
 - e. **Encryption passphrase** - If messages sent on behalf of this user can be encrypted, this key will be used with the encryption method for use with the authentication. This field requires a minimum of 8 characters.
4. Click **Save** to add your user.

6.7.1.3.2 Configuring SNMP version 3 managers

1. Click on the **Warnings and Alerts** tab.
2. Choose the **Severity** of the alerts that are sent via SNMP. The severity is ranked in order from most restrictive to least restrictive: critical, warning, and informational. Setting the severity critical will only include critical alerts while setting to informational will cause an informational, warning and critical alerts to be sent over SNMP to all managers.
3. Click **+** to add a manager to show the **New SNMP manager information** dialog.

New SNMP Manager Information

4. Provide the following information:
 - a. **Username** - A string representing the name of the user.
 - b. **Host address** - Host or IP address.
 - c. **Port** - Port used by the SNMP Engine.
 - d. **Authentication method** - An indication of whether messages sent on behalf of this user can be authenticated, and if so, the type of authentication protocol that is used. Users can select from:
 - MD5** -the HMAC-MD5-96 authentication protocol.
 - SHA** -the HMAC-SHA-96 authentication protocol.
 - e. **Authentication passphrase** - If messages sent on behalf of this user can be authenticated, this key will be used with the authentication key for use with the authentication. This field requires a minimum of 8 characters.
 - f. **Encryption method** - Provides support for data confidentiality. The designated portion of an SNMP message is encrypted and included as part of the message sent to the recipient. Users can select from
 - AES** - Advanced Encryption Standard
 - DES** - Data Encryption Standard
 - g. **Encryption passphrase** - If messages sent on behalf of this user can be encrypted, this key will be used with the encryption method for use with the authentication. This field requires a minimum of 8 characters.
5. By default, TRAP messages are sent and require the agent's authoritative engine id for the user to be configured with the SNMP engine ID from the Delphix Engine, which can be obtained via the CLI. Click Use **Inform instead of Trap** to use INFORM messages, which are more reliable and require less configuration at the expense of higher network traffic.
6. Click **Save**.

6.7.1.4 CLI: viewing SNMP engine ID

6.7.1.5 Supported MIBs

The Delphix software can be configured to send SNMP traps when Delphix alerts are generated as described in the procedure above. In order to process these traps in your SNMP manager software, you will need the base Delphix MIB and the Delphix Alert MIB.

In addition to generating traps, the Delphix Engine supports read-only access to the following MIBs for basic system monitoring purposes.

- The following MIB-II object hierarchies are defined in [RFC 1213](#)²⁵⁵:
 - system (OID .1.3.6.1.2.1.1): Provides basic system identity information
 - interfaces (OID .1.3.6.1.2.1.2): Provides network interface information including I/O statistics
 - IP (OID .1.3.6.1.2.1.4): IP protocol information including IP addresses configured, routes, and IP statistics
- The following UCD objects defined in <http://www.net-snmp.org/docs/mibs/ucdavis.html>
 - memory usage (OID .1.3.6.1.4.1.2021.4)
 - CPU usage (OID .1.3.6.1.4.1.2021.11)
 - Disk I/O statistics (OID .1.3.6.1.4.1.2021.13.15)

6.7.1.6 Examples

The following examples assume that you have enabled SNMP on a Delphix Engine named example.company.com, and have set the community string to "public".

1. Walking the MIB-II objects using the net-snmp snmpwalk tool:

```
$ snmpwalk -v 2c -c public example.company.com
SNMPv2-MIB::sysDescr.0 = STRING: Delphix Engine 5.1.6.0 DelphixOS 5.1.2017.03.2
4
SNMPv2-MIB::sysObjectID.0 = OID: SNMPv2-SMI::enterprises.41028
DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks: (476432) 1:19:24.32
SNMPv2-MIB::sysContact.0 = STRING: administrator@company.com
SNMPv2-MIB::sysName.0 = STRING: example.company.com
SNMPv2-MIB::sysLocation.0 = STRING: VM Host
...
```

2. Walking Disk read and write I/O statistics:

```
$ snmpwalk -v 2c -c public example.company.com .1.3.6.1.4.1.2021.13.15.1.1.12
UCD-DISKIO-MIB::diskIONReadX.1 = Counter64: 11310593921
UCD-DISKIO-MIB::diskIONReadX.2 = Counter64: 334
```

²⁵⁵ <https://tools.ietf.org/html/rfc1213>

```

UCD-DISKIO-MIB::diskIONReadX.3 = Counter64: 334
UCD-DISKIO-MIB::diskIONReadX.4 = Counter64: 865912605
UCD-DISKIO-MIB::diskIONReadX.5 = Counter64: 867599133
UCD-DISKIO-MIB::diskIONReadX.6 = Counter64: 865339677
UCD-DISKIO-MIB::diskIONReadX.7 = Counter64: 11309258752
UCD-DISKIO-MIB::diskIONReadX.8 = Counter64: 0
UCD-DISKIO-MIB::diskIONReadX.9 = Counter64: 1822880256
seb-laptop:~$ snmpwalk -v 2c -c public example.company.com .1.3.6.1.4.1.2021.1
3.15.1.1.13
UCD-DISKIO-MIB::diskIONWrittenX.1 = Counter64: 22337830400
UCD-DISKIO-MIB::diskIONWrittenX.2 = Counter64: 0
UCD-DISKIO-MIB::diskIONWrittenX.3 = Counter64: 0
UCD-DISKIO-MIB::diskIONWrittenX.4 = Counter64: 45118203392
UCD-DISKIO-MIB::diskIONWrittenX.5 = Counter64: 45137660928
UCD-DISKIO-MIB::diskIONWrittenX.6 = Counter64: 45139064320
UCD-DISKIO-MIB::diskIONWrittenX.7 = Counter64: 22337830400
UCD-DISKIO-MIB::diskIONWrittenX.8 = Counter64: 0
UCD-DISKIO-MIB::diskIONWrittenX.9 = Counter64: 33023515648

```

3. Retrieving the system uptime:

```

$ snmpget -v 2c -c public example.company.com .1.3.6.1.2.1.1.3.0
DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks: (1453172) 4:02:11.72

```

6.7.2 Viewing action status

This page describes how to view the status of actions for the Data Engine.

To view the status of actions that are currently running on the Data Engine, open the **Action sidebar**. To view details of currently-running and completed jobs, open the **Dashboard**.

6.7.2.1 Action sidebar procedure

1. Login to the **Delphix Management** or **Delphix Setup** application.
 - a. Depending on the width of the window, the **Action sidebar** may be automatically displayed on the right of the screen.
2. To see the **Action sidebar**, click **Actions** on the top navigation bar.

6.7.2.2 Description

The **Action sidebar** consists of two sections. The top section lists actions that are currently running on the Data Engine. The bottom section, labeled **Recently completed**, contains actions that have recently been completed.

Each action is initially collapsed and only presents the title of the action. Click an action to expand it and see more details such as progress, elapsed time, and a description of the operation in progress.

The following is an example of the **Action sidebar** when an Enable action is running.

When an action has been completed it will move down to the bottom of the panel under **Recently completed**, as shown in the screenshot below with a Refresh action.

If you are a Delphix Admin or a System Admin, you will be able to see all the actions of your respective application. If you are not an admin user, you will only see actions you have permission to see.

6.7.2.3 Sub-action

Each action may contain one or several sub-actions which represent the execution of a subset of the action itself. Click an action to see its sub-actions and their respective details. Note that the list of sub-actions is created dynamically during the execution of the action.

The following is an example of an **Environment Refresh** action and its sub-actions.

6.7.2.4 Errors

When an error condition occurs during the execution of an action, the background color of the action box becomes red, and the action remains in the top section until you dismiss it.

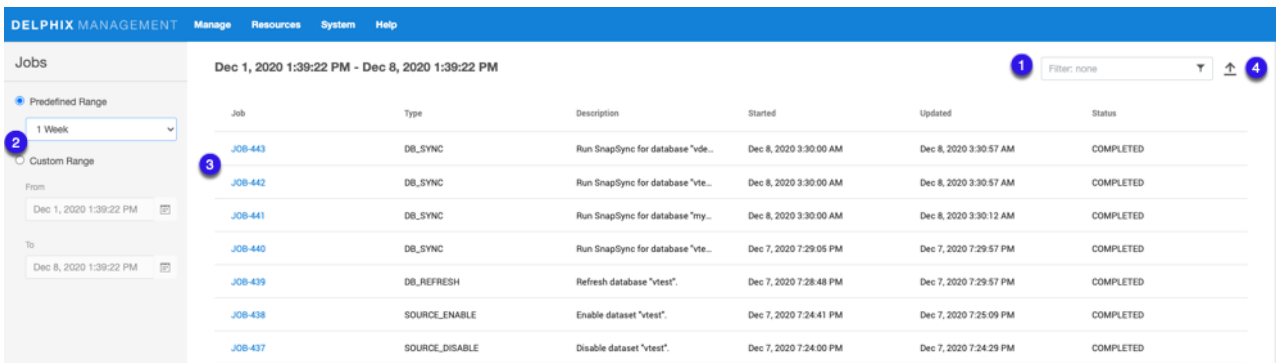

- Click the **action** title to expand it.
 - The action will expand to display a description of the error, suggestions to resolve it, and sometimes the raw output of command execution.
- To dismiss the action, click the **X** next to the action displaying an error.

The following is an example of an action failure shown in the **Action sidebar**.

6.7.3 Viewing jobs

Login to the **Delphix management** application using **admin** credentials. From the **System** menu select **Jobs**. The **Jobs** panel displays all jobs that have been initiated by the Data Engine, in addition to their status.

1. Enter filter text to reduce the results to only those rows matching the text entered.
2. Customize results by selecting from a **Predefined Range** or from a **Custom Range**.

3. Select a job to view more details.

4. Click the **Export** button to download the current page of results to a file of comma-separated values (CSV).

Job retention

The Jobs panel retains records of the most recent 10,000 jobs that have been initiated by the Data Engine. Delphix administrators may use the **job/retention** CLI to retain a larger number of jobs.

6.7.4 System faults

6.7.4.1 Overview

The Faults screen provides information on states and configurations that may negatively impact the functionality of the Delphix Engine and which can only be resolved through active user intervention. When you login to the **Delphix management** application as admin, the number of outstanding system faults appears on the right-hand side of the navigation bar at the top of the screen. Faults serve as a record of all issues impacting the Delphix Engine and can never be deleted. However, ignored and resolved faults are not displayed in the faults list.

The **Faults** screen as shown below has two tabs, **Current** and **Archive**.

Severity	Diagnosed	Title	Target
WARNING	Dec 19, 2018 2:32 AM	TCP slot table entries below recommended minimum	bbdhcp-AHCI-58503.dcenter.delphix.com
WARNING	Dec 19, 2018 2:32 AM	TCP WMEM default is below the recommended value	bbdhcp-AHCI-58503.dcenter.delphix.com
WARNING	Dec 19, 2018 2:32 AM	TCP RMEM default is below the recommended value	bbdhcp-AHCI-58503.dcenter.delphix.com
WARNING	Dec 18, 2018 2:23 PM	Invalid database credentials	Boomerang
WARNING	Dec 18, 2018 9:52 AM	TCP slot table entries below recommended minimum	bbdhcp-tgt-AHCI-58503.dcenter.delphix.com
WARNING	Dec 18, 2018 9:52 AM	TCP WMEM default is below the recommended value	bbdhcp-tgt-AHCI-58503.dcenter.delphix.com
WARNING	Dec 18, 2018 9:52 AM	TCP RMEM default is below the recommended value	bbdhcp-tgt-AHCI-58503.dcenter.delphix.com
WARNING	Dec 18, 2018 9:40 AM	Incorrect toolkit owner	bbdhcp-AHCI-58503.dcenter.delphix.com
WARNING	Dec 18, 2018 9:39 AM	Incorrect toolkit owner	bbdhcp-tgt-AHCI-58503.dcenter.delphix.com

System Faults screen

1. The number of system faults.

2. The **Faults** screen has two tabs, **Current** and **Archive**. Details of the selected fault are displayed on a card located to the right of the fault list. In the **Archive** tab, you can switch between **Resolved** or **Ignored** faults and reset all ignored faults.

3. Selecting **Refresh (Manual)**, will refresh the faults table manually, or you can select one of the other available options from the drop-down menu, available options include; Manual, 1 Second, 1 Minute, 5 Minutes.

(Note: as there is no longer a Refresh button on the screen, you must select Refresh (Manual) to refresh the screen.

4. To search the **Faults** table, enter the name of the object you are looking for. The grid will refresh to display the selected object. You can also sort using the column headings.

Resolve All will resolve all the faults in your system.

Select to expand or close the objects in the grid.

Select to export the information provided in the grid to a.csv file.

5. You can select and resolve multiple faults; the card panel will display how many of each type are selected. For example:

There are 2 WARNING items selected

There are 0 CRITICAL items selected

6. Details for the selected fault are displayed on a card. You can resolve or ignore faults by selecting the appropriate link at the bottom of the card.

Resolving and Ignoring Faults

Ignoring a fault will also ignore future faults of that exact type against the same object, so that future fault conditions will not be re-diagnosed even if the fault condition persists or recurs. No further notifications will be received for that specific fault condition. It is advisable to only ignore faults when the following criteria are met:

- The fault is caused by a well-understood issue that cannot be changed.
- Its impact on the Delphix Engine is well understood and does not require action.

For example, if you think that knowing about this error in the future will be important, use "Resolve" rather than "Ignore". If you reset ignored items, this clears all ignored faults, but it leaves them as resolved and does not restore the actual fault. For reset ignored faults, new faults against the same object will no longer be ignored and you will again receive notifications. Examples: If you ignore a fault "Unable to ping host" for target "192.168.1.1", Delphix ignores "Unable to ping host" errors against target 192.168.1.1. You will never see the "Unable to ping host" fault again for that target 192.168.1.1 unless you reset ignored items. Similarly, some faults are raised against snapshots which are part of a dSource. Ignoring those errors only ignores similar errors for that exact snapshot. Tomorrow's snapshot could produce the fault again.

6.7.4.2 Delphix object-based environment monitor faults

Delphix now has a self-contained Java-based discovery infrastructure that consolidates with environmental monitoring, communicates via a common framework, and is able to provide feedback.

The environment monitor previously only created faults for "hosts" and "sources." There are several faults that more logically apply to other Delphix objects, such as repositories, which are DB install files. Posting them against sources results in fault duplication. The environment monitor now posts faults against – and re-associates the offending faults with – the correct objects. Consequently, users see fewer errors that are easier to diagnose.

6.7.4.3 Viewing faults

To view the list of active system faults:

1. In the top navigation bar, click **System** then **Faults**.
2. In the Faults screen, click any fault in the list to expand it and see its details.
The details for the selected Fault will be displayed in the details card located on the right.

Each fault comprises six parts:

- **Severity** – How much of an impact the fault will have on the system. A fault can have a severity of either **Warning** or **Critical**.
 - A **Warning Fault** implies that the system can continue despite the fault but may not perform optimally in all scenarios.
 - A **Critical Fault** describes an issue that breaks certain functionality and must be resolved before some or all functions of the Delphix Engine can be performed.
- **Date** – The date that the Delphix Engine diagnosed the fault.
- **Title** – A short descriptive summary of the fault
- **Target** – The object against which the fault was posted. Faults will be posted against the host for incorrect environment configurations, sources for problems with the database, and repositories for issues with the installation.
- **Details** – A detailed summary of the cause of the fault
- **User action** – The action you can take to resolve the fault

6.7.4.4 Addressing faults

After viewing a fault and deciding on the appropriate course of action, you can address the fault through the user interface (UI). You can mark a fault as **Ignored** or **Resolved**. If you have fixed the underlying cause of the fault, mark it as **Resolved**. Note that if the fault condition persists, it will be detected in the future and re-diagnosed. You can mark the fault as **Ignored** if it meets the following criteria:

- The fault is caused by a well-understood issue that cannot be changed
- Its impact on the Delphix Engine is well understood and acceptable

In this case, the fault will not be re-diagnosed even if the fault condition persists. You will receive no further notifications.

To address a fault follow the steps below.

1. In the top menu bar, click **Faults**.
2. In the list of faults, click a **fault date/name** to view the fault details.
3. If the fault condition has been resolved, click **Resolve**.
Note that if the fault condition persists it will be detected in the future and re-diagnosed.
4. If the fault condition describes a configuration with a well-understood impact on the Delphix Engine that cannot be changed, you can ignore the fault by clicking **Ignore**.
Note that an ignored fault will not be diagnosed again even if the underlying condition persists.

By default, when a **critical or warning fault** occurs, the Delphix Engine immediately sends an email to the Engine Administrator (**admin**). Make sure you have configured an SMTP server and defined an appropriate email address for Engine Administrator (**admin**). See [Initial Setup \(see page 585\)](#) for more information.

Critical or warning alert emails

By default, emails will also be sent for **critical or warning alerts** (aka events). You can modify the default behavior by changing the alert profile with the CLI. See the [CLI Cookbook Creating Alert Profiles](#) (see page 2602) for more information.

6.7.4.5 Fault lifecycle example

Below is an image of the fault card for the fault "TCP slot table entries below the recommended minimum."

The image shows a warning fault card with the following content:

- WARNING** (with a yellow warning icon)
- Date**: Dec 19, 2018 2:32 AM
- Title**: TCP slot table entries below recommended minimum
- Target**: bbdhcp-AHCI-58503.dcenter.delphix.com
- Details**: The TCP sunrpc.tcp_slot_table_entries property is currently set to '16' which is below the recommended minimum value of 128.
- User Action**: Raise the sunrpc.tcp_slot_table_entries value to at least 128.
- At the bottom left: [? Resolving and Ignoring](#)
- At the bottom right: [Resolve](#) [Ignore](#)

The **Details** section of the fault explains that the sunrpc.tcp_slot_table_entries property is set to a value that is below the recommended minimum of 128. The **User action** section instructs you to adjust the value of the sunrpc.tcp_slot_table_entries property upward to the recommended minimum. The process for adjusting this property differs between operating systems. To resolve the underlying issue, search "how to adjust

sunrpc.tcp_slot_table_entries" using a search engine and find that the second result is a [link](#)²⁵⁶ to the Delphix community forum describing how to resolve this issue. After following the instructions applicable to your operating system, return to the Delphix UI and mark the fault **resolved**.

6.7.4.6 Viewing system faults

6.7.4.6.1 System events overview

The event log interface has been improved to provide filtering, sorting, and exporting.

Timestamp	Severity	Target	Status	Description	Event
Jan 2, 2019 2:38:05 PM	INFORMATIONAL	dbdhcp2-dbdh_661-15451552...	Job complete	SOURCE_STOP job for "dbdhc...	alert.jobs.complete.object

Dec 26, 2018 7:05:43 PM	WARNING	system	Unexpected management rest...	The management service is st...	alert.system.startup.manage...
Dec 26, 2018 3:22:03 PM	WARNING	system	Unexpected management rest...	The management service is st...	alert.system.startup.manage...

Event Viewer screen filtered for warning events

In the **Event Viewer** window, you can:

1. Enter filter text to reduce the results to only those rows matching the text entered. In the example above, we are filtering for "warning."
2. Click the **Export** button to export your results to a .csv file.
3. Click a column header to sort rows by the values found in that column.

²⁵⁶ https://community.delphix.com/delphix/topics/tip_of_the_day_tuning_the_kernel_nfs_client_for_rhel4_through_rhel6_3_and_delphix

The first time you click a header, rows will sort in ascending order. Clicking the same header a second time will sort the rows in descending order. Clicking the same header a third time will restore the results to their default sort order.

6.7.4.6.2 Procedure

1. Launch the **Delphix Management** application.
2. Click **System**.
3. Select **Events**.
4. Select a time range.

6.7.4.6.3 Sorting and filtering

Optional: You can enter filter text to reduce the results to only those rows matching the text entered.

Text matching is limited to the following columns:

- Severity
- Status
- Description

You can click on a table column header to sort rows by the values found in that column.

The first time you click a header, rows will sort in ascending order. Clicking the same header a second time will sort the rows in descending order. Clicking the same header a third time will restore the results to their default sort order.

Click the page navigation buttons to advance through large result sets.

6.7.4.6.4 Column resizing and tooltips

If you wish, you can resize column widths to better fit the data to the available screen space. To resize a column:

1. Hover the mouse over a column separator found in the header. This will cause the mouse pointer to change shape.
2. Click and drag and the column separator to the desired position. Dragging to the left will reduce the column width. Dragging to the right will increase the width.
3. Release the mouse button.

The screenshot shows the 'Audit' section of the Delphix Management application. On the left, there is a sidebar with 'Predefined Range' set to '1 Hour' and 'Custom Range' options for 'From' (Jan 2, 2019 1:45:54 PM) and 'To' (Jan 2, 2019 2:45:54 PM). The main area displays a table for the time range 'Jan 2, 2019 1:45:54 PM - Jan 2, 2019 2:45:54 PM'. The table has columns: Timestamp, User/Policy, Action, and Description. A blue arrow points to the separator between the 'Action' and 'Description' columns, with a tooltip that reads: 'To change the width of a column, hover over the column separator.' A search box with 'USER_LOGIN' and a refresh icon is visible in the top right.

Timestamp	User/Policy	Action	Description
Jan 2, 2019 2:23:14 PM	admin	USER_LOGIN	Log in as user "admin" from IP "172.16.116.59".
Jan 2, 2019 1:47:13 PM	sysadmin	USER_LOGIN	Log in as user "sysadmin" from IP "172.16.116.59".

Alternatively, you can auto-size a column to fit the widest value of the current page:

1. Hover the mouse over a column separator found in the header. This will cause the mouse pointer to change shape.
2. Double click the column separator.

Values that do not fit within their column will be truncated with an ellipses (...). Hover the mouse over any value to see a tooltip rendering the complete, non-truncated value.

6.7.4.6.5 Exporting results

Click the **Export** button to download the current page of results to a file of comma-separated values (CSV).

6.7.5 Accessing audit logs

This topic describes how to access audit logs. The audit log provides a record of all actions that were initiated by a policy or user, regardless of whether that action was successful.

6.7.5.1 Overview

Audit logs provide a record of all actions that were initiated by a policy or user, regardless of whether that action was successful. The audit log interface has been improved to provide filtering, sorting, and exporting.

Hover over a description to see a tooltip

6.7.5.5 Exporting results

Click the icon to download the current page of results to a file of comma-separated values (CSV).

6.7.6 Creating support logs

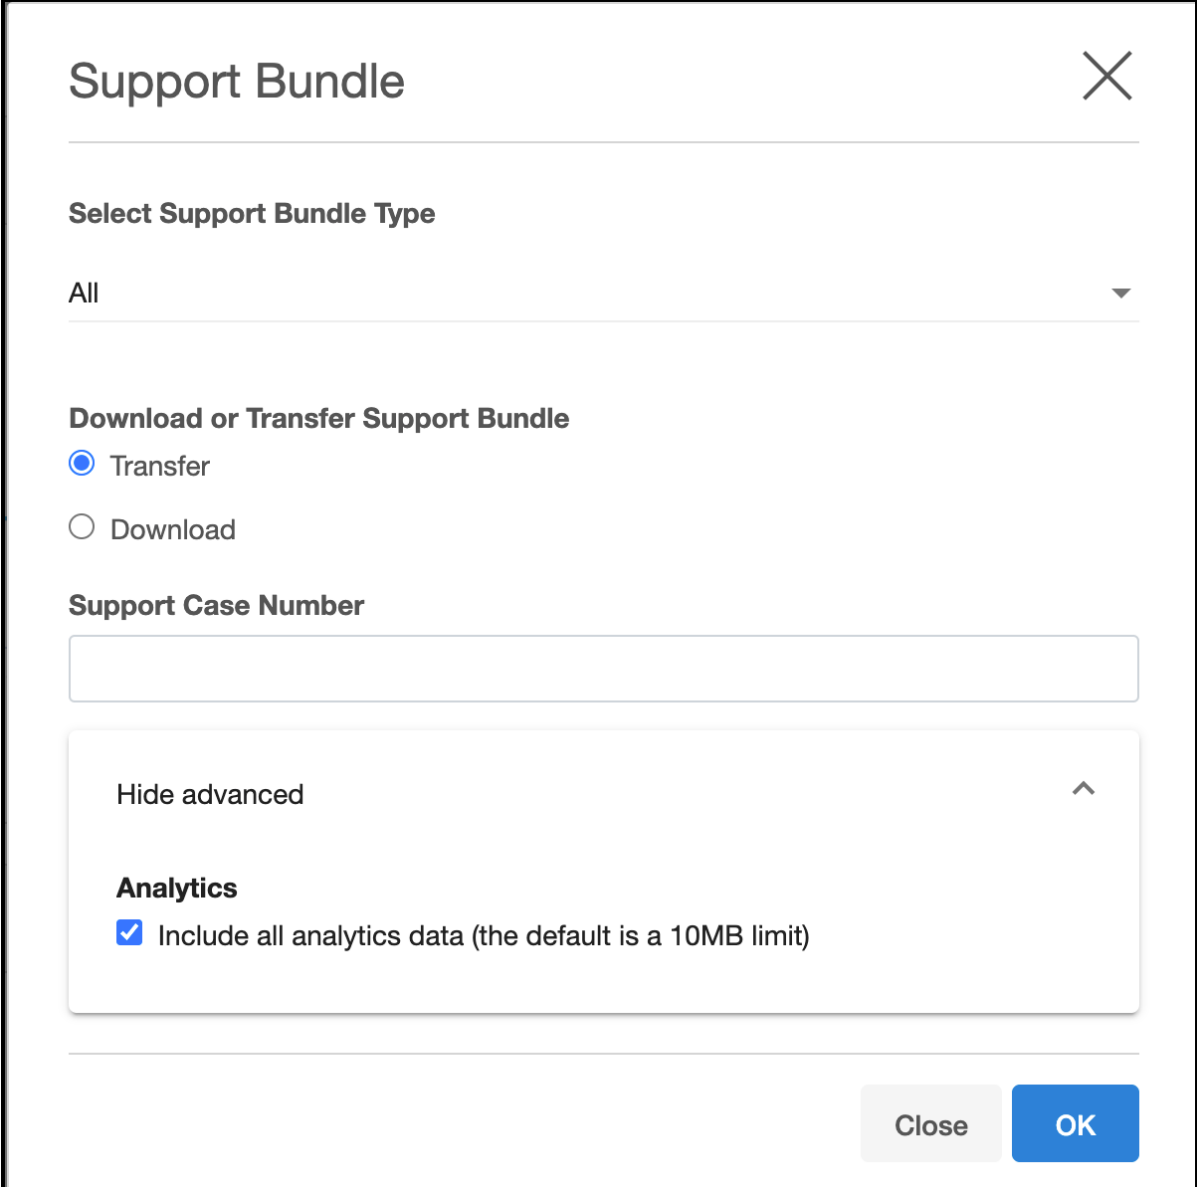

This topic describes how to create support bundles and manage server access control for Delphix Support.

Support bundles are used by Delphix as diagnostic tools for resolving Delphix Engine issues. Support bundles can be transferred directly to Delphix Support or downloaded. Customer-specific data is redacted or obfuscated where possible in the support bundle information. All passwords and personal data are either encrypted or omitted. This is an outbound-only connection from the Delphix Engine.

6.7.6.1 Using the GUI

1. Log into the **Delphix Management** appliance as an Engine administrator.
2. Click **Help**.
3. Select **Support Logs**.

4. The **Support Bundle** dialog appears.

The screenshot shows a dialog box titled "Support Bundle" with a close button (X) in the top right corner. Below the title bar, there is a section "Select Support Bundle Type" with a dropdown menu currently set to "All". Underneath is a section "Download or Transfer Support Bundle" with two radio buttons: "Transfer" (selected) and "Download". Below that is a "Support Case Number" text input field. A "Hide advanced" section is expanded, showing an "Analytics" section with a checked checkbox for "Include all analytics data (the default is a 10MB limit)". At the bottom right, there are "Close" and "OK" buttons.

5. Select **Download** or **Transfer**.
- If you select **Download**, then the support logs will be downloaded as a compressed ".tar" file into a folder on your workstation.
 - If you select **Transfer**, then the support logs will be uploaded over HTTPS to Delphix Support. If you have configured an HTTP Proxy, it will be used to send the support logs.
 - If there is a support case involved, then please enter the case number to associate the logs to the case.
6. Click on **Show advanced** and select **Analytics**. This will include all the analytics data (default, up to 10MB) in the Support Bundle.
7. Click **OK**.

- a. If you selected **Download** and have the compressed ".tar" file in a folder on your workstation, please **upload** that file to Delphix Support via the website at <http://upload.delphix.com>²⁵⁷.
- b. If there is a support case involved, then please enter the case number (again) to associate the logs to the case.

You can also access support log functionality in the **ServerSetup** application using **sysadmin** credentials. Click **Support Bundle** in the top menu bar.

6.7.6.2 Using the CLI

1. ssh into your Delphix Engine.

```
ssh <sysadmin_user>@<delphixengine>
```

2. Run the upload operation.

```
delphix > service
delphix service > support
delphix service support > bundle
delphix service support bundle > upload
```

3. Commit the operation.

```
delphix service support bundle upload *> commit
```

6.7.7 Setting support access control

This topic describes how to set the Support Access Control for Delphix Support. Support access control enables Delphix Support to access your instance of the Delphix Engine for a defined period of time using an access token.

1. Log into the **Delphix Setup** application using **sysadmin** credentials.
2. Click **Server Preferences**.
3. Select **Support Access**.
4. Click **Enable**.

²⁵⁷ <http://upload.delphix.com/>

5. Set the time period during which you want to allow Delphix Support to have access to your instance of the Delphix Engine.
6. Click **Generate Token**.
Provide the token to Delphix Support to enable access to your server.

6.7.8 Setting syslog preferences

Syslog is a widely used standard for message logging. It permits the separation of the software that generates messages, the system that stores them, and the software that reports and analyzes them. Delphix makes use of Syslog as one of the standard mechanisms, along with SNMP and email, to distribute important user and system events, such as alerts, faults, and audits. In the case of Delphix, each Delphix Engine acts as a Syslog client which propagates the events to a centralized Syslog server.

The network protocol over which the Delphix Engine communicates with the Syslog server is standardized in [RFC 5424](https://tools.ietf.org/html/rfc5424)²⁵⁸. As a protocol, it supports using either UDP ([RFC 5426](https://tools.ietf.org/html/rfc5426)²⁵⁹) or TCP ([RFC 6587](https://tools.ietf.org/html/rfc6587)²⁶⁰) as the underlying transport and optional TLS mapping has been introduced to encrypt the messages over the wire for security purposes ([RFC 5425](https://tools.ietf.org/html/rfc5425)²⁶¹). However, as of this release, we only support Syslog over UDP with no encryption, which implies that Syslog messages are always sent in the clear and may be lost during transmission and delivered out of order due to the limitations of UDP.

To configure for Syslog support, you must specify the communication endpoint to which the Syslog server listens, which includes the hostname or IP address of the Syslog server and an optional port number. The latter defaults to 514 according to the Syslog standard but it can be changed if necessary.

System and user events generated by Delphix are always forwarded immediately to the Syslog server, which ensures the timely delivery of important events that may require immediate action.

A couple of different output formats are supported for messages delivered over Syslog, namely, TEXT and JSON. The TEXT format is the default. To change the message format, as of this release, you must do so via the CLI.

1. Log into the **Delphix Setup** application using **sysadmin** credentials.
2. Select **Preferences > Syslog Configuration**.

3. Select the severity level of the messages you want to be sent to the Syslog server.

258 <https://tools.ietf.org/html/rfc5424>

259 <https://tools.ietf.org/html/rfc5426>

260 <https://tools.ietf.org/html/rfc65>

261 <https://tools.ietf.org/html/rfc5425>

4. Click the **pencil** icon next to **Syslog Servers** and then in the **Syslog Configuration** window select the plus icon.
5. Enter the Syslog server hostname/IP address and port number.

6.7.8.1 Severity levels for syslog messages

This topic discusses the Syslog reporting feature of the Delphix Engine, along with severity levels.

Syslog is a widely used standard for message logging. It permits the separation of the software that generates messages, the system that stores them, and the software that reports and analyzes them. Delphix makes use of Syslog as one of the standard mechanisms, along with SNMP and email, to distribute important user and system events, such as alerts, faults, and audits. In the case of Delphix, each Delphix Engine acts as a Syslog client which propagates the events to a centralized Syslog server.

Every Syslog message is attached to a severity level. As the name suggests, the severity level describes the severity of the event in question.

Audit Logs

Audit records are Informational Syslog messages. If you would like to forward Audit records, choose Severity Level Informational.

Severity levels

Every Syslog message is attached to a severity level number. Delphix defines the severity of Syslog messages in accordance with RFC 3164. There are eight severity levels available, as follows:

Numerical Code	Severity
0	Emergency: system is unusable
1	Alert: action must be taken immediately
2	Critical: critical conditions
3	Error: error conditions
4	Warning: warning conditions
5	Notice: normal but significant condition
6	Informational: informational messages
7	Debug: debug-level messages

When setting up the Syslog settings for your Delphix Engine, you have the ability to choose what alerts to report. The severity levels above are available for users to select. Once you select a severity level, the Delphix Engine will send messages of the same or higher severity (i.e., the same or lower number) to your Syslog server. Therefore, there is no reason to select more than one severity. For example, if the "Notice" severity level is selected, all events less severe than Notice (Informational and Debug) will not be reported. If you want all events to be reported via Syslog, the Debug severity level should be chosen.

6.7.9 Support access audit logs

This topic describes how terminal session audit logging works within the Delphix OS. These logs contain keystroke by keystroke recordings of all terminal activity during a given shell session initiated by a super user (Delphix support).

6.7.9.1 Overview

Super user activity by Delphix support is recorded to an individual log file for each shell session. Each log file is named using the format **session_<shell user ip>_<epoch timestamp>**. The contents of the logs include commands entered into the shell and the output of those commands. Timestamps are additionally prepended to each line of the log to facilitate assessing the timeline of events.

 Session logs created during a super user shell session are kept forever unless deleted by a Delphix engine SYSTEM user.

6.7.9.2 Listing the session audit logs

Super user session logs can be reviewed/deleted through the CLI or API and downloaded through the API only. Any DOMAIN or SYSTEM user can list the current logs or download a given log file but only SYSTEM users can delete them. To review a list of the session logs currently present on a Delphix engine:

1. Login to the **Delphix CLI** using **admin** or **sysadmin** credentials.
2. Navigate to **superuser session** and press enter.
3. Use **list** or **ls** to view the files.

```
ip-12-345-678-90 superuser session> ls
Objects
NAME                                IPADDRESS      STARTTIMEUTC
DURATION
session_123.45.678.90_1686923517171 123.45.678.90 2023-06-16T13:51:57.171Z 20sec
session_123.45.678.90_1686923559856 123.45.678.90 2023-06-16T13:52:39.856Z 439sec
session_123.45.678.90_1686924008788 123.45.678.90 2023-06-16T14:00:08.788Z 87sec
```

Here is an example of calling the list API directly using curl:

```
curl -b ~/cookies.txt -X GET "http://mydelphixengine.myorg.com/resources/json/delphix/superuser/session"
```

6.7.9.3 Downloading a session audit log

Any DOMAIN or SYSTEM user can download a super user session log file via the Delphix API. Here is an example of calling the download API using curl:

```
curl -v -O -J "http://mydelphixengine.myorg.com/resources/json/delphix/superuser/session/download?sessionLogName=session_123.45.678.90_1686923517171" -b ~/cookies.txt
```

6.7.9.4 Reviewing a session audit log

It is recommended that session logs be viewed through a program such as **cat**, which is capable of interpreting control characters. This is because the logs not only include key strokes and terminal output, but also the control characters that dictate how that output was formatted and displayed, ensuring that the logs reflect what was actually seen during the shell session as accurately as possible. It is also possible to view the logs using any text editor, but in most cases this will be more difficult to read because the control characters themselves will be visible. Here is a snippet from a brief session log as it might be displayed by **cat**:

```
[2023-06-16T13:52:28.061Z] delphix:~$ echo testing 123
[2023-06-16T13:52:28.062Z] testing 123
[2023-06-16T13:52:30.599Z] delphix:~$ exit
```

Note that each line of the log includes a timestamp. This timestamp is prepended to each line as the log is written. It is not from the session terminal output, but rather is provided to more conveniently assess the timeline of a given session. The timestamp is generated in the instant before a given command is executed rather than when the prompt was first printed to the terminal to maximize its accuracy.

6.7.9.5 Limitations

Shell activity that involves opening a pager or buffer (e.g. **less**, **more**, **vi**, etc.) may not be fully reflected in the session log, though the command that initiates the pager/buffer will be present. For example, if a super user opens a file in **vi** for editing, the line to open the file would be present, followed by the next command run after **vi** was closed.

6.7.9.6 Deleting a session audit log

These audit logs are meant to live as long as they are needed, and thus are not governed by a retention policy. Should you wish to delete a log this can be done by SYSTEM users only through the Delphix CLI or API. To use the CLI:

1. Login to the **Delphix CLI** using **sysadmin** credentials.
2. Navigate to **superuser session** and press enter.
3. Review the current log files using **list** or **ls**
4. Select the log file that you wish to delete.
5. Use **list** or **ls** to review the log details and confirm this is the log you want to delete.
6. Type **delete** and press enter.
7. Type **commit** and press enter to delete the log.

```
ip-12-345-678-90 superuser session> select "session_123.45.678.90_1686923517171"
ip-12-345-678-90 superuser session 'session_123.45.678.90_1686923517171'> ls
```

Properties

```
type: SuperuserSession
name: session_123.45.678.90_1686923517171
duration: 20sec
ipAddress: 123.45.678.90
reference: SUPERUSER_SESSION-session_123.45.678.90_1686923517171
startTimeUTC: 2023-06-16T13:51:57.171Z
```

Operations

delete

```
ip-12-345-678-90 superuser session 'session_123.45.678.90_1686923517171'> delete
ip-12-345-678-90 superuser session 'session_123.45.678.90_1686923517171' delete *>
commit
```

```
ip-12-345-678-90 superuser session> ls
```

Objects

NAME	IPADDRESS	STARTTIMEUTC	DURATION
session_123.45.678.90_1686923559856	123.45.678.90	2023-06-16T13:52:39.856Z	439sec
session_123.45.678.90_1686924008788	123.45.678.90	2023-06-16T14:00:08.788Z	87sec

The delete API can also be called directly. Unlike the download API, delete requires the session log reference, which is always SUPERUSER_SESSION-<log name>. Here is an example of calling the delete API using curl:

```
curl -X POST "http://mydelphixengine.myorg.com/resources/json/delphix/superuser/session/SUPERUSER_SESSION-session_123.45.678.90_1686923517171/delete" -b ~/cookies.txt
```

6.7.10 Diagnosing connectivity errors

Prior to the 5.1 release, when the Delphix Engine ran into an error operating on an external database or environment, it reported the immediate error that it had encountered; there was no mechanism for automatic analysis of the root causes of failures. The 5.1 release included infrastructure for automatic diagnosis of errors. When one of these errors occurs, the Delphix Engine now launches a set of tests to locate the root cause of the problem and present the result of the diagnosis. This will help you easily identify the true sources of errors such as closed ports or misconfigured router.

6.7.10.1 Failed actions

The Delphix Engine communicates failures in two different manners: actions that fail to complete, and faults. To view failed actions:

1. In the top right-hand corner of the Delphix Management application, click **Actions**.
2. For more information about why the action failed, click the (i) icon to show the error dialog.

The following shows a popup message with more information about the problem and what actions to take to resolve it. For some errors, the Delphix Engine will be able to diagnose the problem further and display this extra information under **Diagnosing Information**. In the screenshot above, the job failed because the Delphix Engine was unable to lookup the host address.

6.7.10.2 Viewing active faults

A fault symbolizes a condition that can affect the performance or functionality of the Delphix Engine and must be addressed. Faults can be either warnings or critical failures that prevent the Delphix Engine from functioning normally. For example, a problem with a source or target environment can cause SnapSync or LogSync policy jobs to fail. Faults will show up as active as long as:

- The error is still occurring, or
- You have chosen to manually resolve it or ignore it

For example, if a background job fails, it will create a fault that describes the problem. To view any active faults:

- In the top right-hand corner of the Delphix Management interface, click **Faults**.

This brings the Faults screen listing all active faults.

Faults

Title
Incorrect toolkit owner

Target
hana-virtual-tgt.dlpxdc.co

Details
The owner of the Delphix toolkit installation directory '/var/tmp' is not 'hdbadm'.

User Action
Check the owner of the toolkit directory.

🔄 Resolving and Ignoring
Resolve
Ignore

1 to 21 of 21 | < > Page 1 of 1 > > |

The screenshot above illustrates a fault with regard to a failure to a TCP slot table entry. The Delphix Engine will mark an object with a warning triangle to indicate that it is affected by an external problem. You can view more details of the fault by looking at the active faults and their fault effects.

6.7.11 Email (SMTP) alert notifications

6.7.11.1 Overview

The configuration for SMTP-based alert notifications has two components:

- The configuration of an SMTP gateway by the Delphix system administrator
- The configuration of one or more alert profiles (if needed)

6.7.11.2 Configuring the SMTP gateway

Before email-based alerts can function properly, many organizations require that an SMTP gateway is configured, through which all outbound email is sent.

1. Contact the appropriate administrator for your site in order to determine the SMTP gateway settings.
2. Login to the **Delphix setup** application as **sysadmin** or another user with system administrator privileges.
3. On the Dashboard screen, locate the **Outbound connectivity** section, and click **modify**.

Outbound Connectivity ⓘ [Modify](#)

Web Proxy
Disabled
⚠ Web proxy not configured

Phone Home
Disabled

User-click Analytics
Disabled

SMTP Server
Disabled
⚠ SMTP not configured - functionality reduced: Not able to send or receive events and notifications.

Outbound Connectivity for SMTP Gateway

4. If not checked already, check the box next to **Use an existing SMTP server**.

Outbound Connectivity

WEB PROXY
The Web Proxy Server will be used to communicate with Delphix Corp. for support, troubleshooting, upgrades, updates, and patches.

Configure web proxy

PHONE HOME SERVICE
If enabled, this service will automatically send a minimal support bundle once a day to the Delphix support site over HTTPS. This will help with future support and troubleshooting. A connection to the internet, either directly or via web proxy is required.

Enable phone home service

USER-CLICK ANALYTICS
If enabled, this service will automatically send a stream of anonymous, non-personal metadata describing user interaction with the product's user interface. This data will help us to better understand how our products are being used, and to improve our products and services.

Enable Usage Analytics

SMTP
Configure the Delphix Engine's SMTP sending service to enable email notifications. Your sysadmin email will be used for receiving system reports, events, and fault notifications.

Use an existing SMTP server
Enable email notifications for faults and events

Server Name or IP Address	Port

SMTP Authentication

From Email Address
noreply@delphix.com

SMTP Send Timeout
60
Maximum timeout to wait, in seconds, when sending mail.

Test Email Address
Comma-separated list of Test Email Address

5. At a minimum, enter the required information:
 - a. SMTP Server Name of IP Address
 - b. SMTP port
 - c. From Email Address This will be the email address from which all alert emails will be sent.
6. In **Test Email Address**, enter the same email address to verify that you are able to receive email properly.
7. Click **Save** to save changes.

For further information, see the “Outbound Connectivity” section of [Initial Setup \(see page 585\)](#)

6.7.11.3 Alert profiles

The Delphix Engine can send out email notifications when alerts happen. Alert profiles control this functionality.

An alert profile is composed of two things:

- **Filter Specification:** A filter, or combination of filters, that specifies which alerts are of interest.

- **Alert Action:** This specifies the email addresses to which the Delphix Engine will send an email when an alert matches the filter specification.

By default, the Delphix Engine has a single alert profile configured with the following parameters:

- Filter Specification: Match any alert with a severity level of **CRITICAL** or **WARNING**.
- Alert Actions: Send an email to the address defined for user **admin**.

Default domain user

The default domain user created on Delphix Engines is now **admin** instead of `delphix_admin`. When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling `delphix_admin`.

Using the CLI, it is possible to:

- Modify the system default alert profile
- Create additional profiles in addition to the default one
- Set multiple actions for a single profile, such as "email `delphix_admin`" and "email `user1@mycompany.com`".

6.7.11.3.1 Simple filters

- Filtered by Owner of alerts target – for example, objects owned by user 1

6.7.11.3.2 Complex filters

Complex filters combine/modify other sub-filters:

- "And" filter – Used when all conditions defined must be met for the filter to notify the user with an email
- "Or" filter – Used when either one or the other of the conditions defined in the filters must be met for the filter to notify the user with an email
- "Not" filter – Used to exclude items

6.7.11.3.3 Limitations

- This is a CLI feature.
- Alert Profiles do not override permission settings. If you do not have Read permission on an object then your alert profile will never get triggered for that object's alerts, regardless of your filter settings.

The following CLI examples will run through how to create these three filters. Each example provides three different methods of setting up a profile. These include the following:

- A simple profile
- A profile with two filters
- A complicated profile

For more information, see [CLI Cookbook: Creating Alert Profiles](#) (see page 2602)

6.7.11.4 A simple profile

A simple profile approach matches the Delphix out-of-the-box default alert profiles. To create a simple alert profile using the CLI as seen in the figure below, go into the alert profile section of the command-line interface (CLI) and create a new profile. Line four prompts the engine to send an email when the filters are triggered. The following three command lines refer to the filter specifications. Follow two severity levels: warning and critical. This will trigger an email alert when any warning or critical events occur.

```
delphix > cd alert
delphix alert > cd profile
delphix alert profile > create
delphix alert profile create > set actions.0.type=AlertActionEmailUser
delphix alert profile create > set filterSpec.type=SeverityFilter
delphix alert profile create > set filterSpec.severityLevels.0=CRITICAL
delphix alert profile create > set filterSpec.severityLevels.1=WARNING
delphix alert profile create > commit
```

Simple Alert Profile example in the CLI

6.7.11.5 A compound alert profile

Creating a compound alert profile in the CLI will combine two filters together. This profile triggers an email about any alert on objects owned by the `delphix_admin` plus any other alert that is critical. The compound alert profile creates two filters. The first one will be the target owner filter, which in this case is **admin**. The second filter is the severity filter, allowing users to match anything that is critical. Combine these two filters using the OR logic so that if any of the sub-filters match, the whole filter matches. An example of this can be seen in the figure below.

Alert Profile using OR logic

While working in the CLI, the first four lines describe a simple alert profile. The distinction between simple and compound alert profiles is that in a compound profile, the top-level filter uses an OR filter with sub-filters for target owner and severity level, as seen in line five of the figure below.

```
delphix > cd alert
delphix alert > cd profile
```

```

delphix alert profile > create
delphix alert profile create > set actions.0.type=AlertActionEmailUser
delphix alert profile create > set filterSpec.type=OrFilter
delphix alert profile create > set filterSpec.subFilters.0.type=TargetOwnerFilter
delphix alert profile create > set filterSpec.subFilters.0.owners.0=delphix_admin
delphix alert profile create > set filterSpec.subFilters.1.type=SeverityFilter
delphix alert profile create > set filterSpec.subFilters.1.severityLevels.0=CRITICAL
delphix alert profile create > commit

```

A Compound Alert Profile

6.7.11.6 Complex alert profile

A complex alert profile uses the profile filter created in the compound alert profile and modifies it. For the example shown in the figure below, you have a VDB named `test_instance` that you do not need any emails about. The following commands will create an effective filter.

1. Create an OR filter with two sub filters: target owner and event type.
2. Create a NOT filter that will exclude the VDB (`test_instance`) from which you do not want to receive notifications.
3. Use the AND logic to combine all these filters together, as seen below.

Complex Alert Profile

Below is an example of the command lines used to set up this complex profile.

```

delphix > cd alert
delphix alert > cd profile
delphix alert profile > create
delphix alert profile create > set actions.0.type=AlertActionEmailUser
delphix alert profile create > set filterSpec.type=AndFilter
delphix alert profile create > set filterSpec.subFilters.0.type=NotFilter

```

```

delphix alert profile create > edit filterSpec.subFilters.0.subFilter
delphix alert profile create filterSpec.subFilters.0.subFilter > set
type=TargetFilter
delphix alert profile create filterSpec.subFilters.0.subFilter > set targets.0=test_i
nstance
delphix alert profile create filterSpec.subFilters.0.subFilter > back
delphix alert profile create > set filterSpec.subFilters.1.type=OrFilter
delphix alert profile create > set filterSpec.subFilters.1.subFilters.0.type=TargetOw
nerFilter
delphix alert profile create > set filterSpec.subFilters.1.subFilters.0.owners.0=delp
hix_admin
delphix alert profile create > set filterSpec.subFilters.1.subFilters.1.type=Severity
Filter
delphix alert profile create > set filterSpec.subFilters.1.subFilters.1.severityLevel
s=CRITICAL
delphix alert profile create > commit

```

Complex Alert Profile CLI

6.7.11.6.1 Creating alert profiles

1. SSH into your engine's CLI using your delphix_admin username and password

```
ssh delphix_admin@yourdelphixengine
```

2. Start creating your new profile. After logging in to get to the alert section enter alert.

```

delphix > alert
delphix alert > profile
delphix alert profile > create
delphix alert profile create > ls

```

3. Set Action(s) Use **AlertActionEmailList** if you want to specify a list of email addresses for this profile.

```

delphix alert profile create > set actions.0.type=AlertActionEmailList
delphix alert profile create > set actions.0.addresses.0=<email address to send
to>
delphix alert profile create > set actions.0.addresses.1=<additional email
address>
delphix alert profile create > set actions.0.addresses.2=<additional email
address>

```

Or, use **AlertActionEmailUser** if you just want the emails to go to the email address associated with this Delphix user.

```
delphix alert profile create > set actions.0.type=AlertActionEmailUser
```

It is possible to add more than one action here, so you may use both **AlertActionEmailList** and **AlertActionEmailUser** if desired.

4. Set filter Here is an example of setting a simple severity filter. With this filter, emails will be sent for any **CRITICAL** or **WARNING** alerts.

```
delphix alert profile create > set filterSpec.type=SeverityFilter
delphix alert profile create > set filterSpec.severityLevels.0=CRITICAL
delphix alert profile create > set filterSpec.severityLevels.1=WARNING
```

Here is an example of setting a simple target-owner filter. With this filter, emails will be sent for any alert whose target is owned by delphix_admin.

```
delphix alert profile create > set filterSpec.type=TargetOwnerFilter
delphix alert profile create > set filterSpec.owners.0=delphix_admin
```

Here is an example of a compound filter. With this filter, we combine the above two filters – an email is sent when an alert is **CRITICAL** or **WARNING**, and the alert's target is owned by delphix_admin.

```
delphix alert profile create > set filterSpec.type=AndFilter
delphix alert profile create > set filterSpec.subFilters.0.type=SeverityFilter
delphix alert profile create > set filterSpec.subFilters.0.severityLevels.0=CRITICAL
delphix alert profile create > set filterSpec.subFilters.0.severityLevels.1=WARNING
delphix alert profile create > set filterSpec.subFilters.1.type=TargetOwnerFilter
delphix alert profile create > set filterSpec.subFilters.1.owners.0=delphix_admin
```

5. Commit your changes

```
delphix alert profile create > commit
```

6.7.11.6.2 Profile filters

As seen above, you can use different filter types to customize which alerts the Delphix Engine will send emails about. The various filter types are listed below.

6.7.11.6.2.1 Simple filters

Filter type	Purpose	Example	Allowed Values
SeverityFilter	Match based on the alert's severity level (critical, warning, informational)	severityLevels.0=CRITICAL severityLevels.1=WARNING This would match any alert whose severity level is CRITICAL or WARNING.	1 or more of: <ul style="list-style-type: none"> • CRITICAL • WARNING • INFORMATIONAL
EventFilter	Match based on the alert's event type.	eventTypes.0=fault.* This would match any alert that is generated due to a newly-raised fault on the engine.	One or more text entries, optionally using the * wildcard.
TargetFilter	Match based on the alert's target.	targets.0="Group/DB" This would match any alert whose target is the database "DB" located in the group "Group".	Any object in the system. 1 or more objects may be specified.
TargetOwnerFilter	Match based on the owner of the alert's target.	owners.0=delphix_admin This would match any alert whose target's owner is the delphix_admin user.	Any user in the system. 1 or more users may be specified.

6.7.11.6.2.2 Compound filters

These filters combine/modify the behavior of other filters, called "subfilters". The subfilters may be of any type (simple or complex).

Filter Type	Purpose	Number of subfilters required
AndFilter	This filter matches if all subfilters match	2 or more
OrFilters	This filter matches if any subfilter matches.	2 or more
NotFilter	This filter matches if the subfilter does not match.	1

6.7.11.6.3 Action types

With the `AlertActionEmailUser` type, notification emails will be sent to the email address of the user who owns the alert profile.

With the `AlertActionEmailList` type, a list of email addresses must be specified in the "addresses" array. Notification emails will be sent to these addresses.

6.7.11.6.4 Email format options

You can send plain text as well as structured JSON. JSON can be useful for constructing solutions that will parse the email and perform further actions (notify, escalate, log).

To change the format, while updating an alert profile:

```
delphix alert profile ALERT_PROFILE-X update > set actions.0.format=<JSON|TEXT>
```

6.7.12 Fluentd plugin service for API modules

6.7.12.1 Overview

The Delphix Fluentd plugin service assisted in a feature that provided options for configuring a Delphix engine that forwards events and metrics to a Splunk host. Delphix has developed methods to extend this capability for use with other monitoring packages (ELK Stack, Datadog, etc.). Fluentd plugins provide a mechanism to customize the Delphix engine's forwarding capabilities for output to other data consumers.

The Fluentd plugin is a tar file with a configuration template, including any gem files that are required to execute the directives in the configuration file. Once the plugin is uploaded, the configuration occurs by collecting user input for the variables required by the template. The interfaces will have changed since the set of variables needed is now mutable from plugin to plugin. Splunk configuration will be available out of the box with no additional plugins. This feature uses one UI for all Fluentd configurations.

The current implementation is limited to one data consumer at a time. Only one plugin, in addition to the default `SplunkHec` plugin, can be uploaded. This is an intended simplification for the initial Fluentd release version.

6.7.12.2 Technical details

6.7.12.2.1 Architectural diagram

High Level Overview

6.7.12.2.2 GUI, API or CLI changes (if any)

APIs with a corresponding CLI for uploading plugins and Fluentd configuration have been added. The service/insight/plugins API displays the plugins that are available.

```

service insight plugins> ls

Objects  REFERENCE          PLUGIN          GEMS  ATTRIBUTEDEFINITIONS
SCHEMADEFINITION

FLUENTD_PLUGIN-1      splunkHec  ...           ...
...

Operations
    
```

```
requestUploadToken
```

The splunkHec plugin appears by default and cannot be deleted. Additionally, the requestUploadToken operation provides a token needed to upload a plugin via the data/upload API. If a second plugin is uploaded, it will appear in the list. Before a third plugin could be uploaded, the second must be selected and deleted.

The following curl commands illustrate the use of the API to upload a plugin:

```
curl -s -X POST -k --data @- http://<engine-name>/resources/json/delphix/session -c ~/cookies.txt -H "Content-Type: application/json" <<EOF
```

```
{
  "type": "APISession",
  "version": {
    "type": "APIVersion",
    "major": 1,
    "minor": 4,
    "micro": 3
  }
}
```

```
}
```

```
EOF
```

```
curl -s -X POST -k --data @- http://<engine-name>/resources/json/delphix/login -b ~/cookies.txt -c ~/cookies2.txt -H "Content-Type: application/json" <<EOF
```

```
{
  "type": "LoginRequest",
  "username": "sysadmin",
  "password": "sysadmin",
  "target": "SYSTEM"
}
```

```
}
```

```
EOF
```

```
curl -s -X POST -k --data @- http://<engine-name>/resources/json/delphix/service/insight/plugins/requestUploadToken -b ~/cookies2.txt -H "Content-Type: application/json" <<EOF
```

```
Returns the token e.g: {"type":"OKResult","status":"OK","result":{"type":"FileUpload
Result","url":"/resources/json/delphix/data/upload","token":"59346df5-3ecd-4ced-
afbf-97acefa156dc"},"job":null,"action":null}
```

```
curl -b ~/cookies2.txt -X POST -F "file=@/Users/blewis/ws/far-dev/
splunk_host_port.far" -F "token=<token>" http://<engine-name>/resources/json/delphix/
data/upload
```

The service/insight/plugins API displays the tokens that are available.

An example for creating a configuration with the default splunkHec plugin:

```
service insight configuration> create

service insight configuration create *> set plugin=splunkHec; set enabled=true; edit
attributes

service insight configuration create attributes *> add; set name=hec_host; set
value=http://vmname-splunkhost.delphix.com; back

service insight configuration create attributes *> add; set name=hec_port; set
value=8088; back;

service insight configuration create attributes *> add; set
type=FluentdSecretAttribute;

service insight configuration create attributes 2 *> set name=hec_token; set
secretValue=bb75c032-bdea-4c19-b152-d158cf13e019; back

service insight configuration create attributes *> add; set name=eventsIndex; set
value=delphix_events; back;

service insight configuration create attributes *> add; set name=protocol; set
value=https; back

service insight configuration create attributes *> add; set
name=metricsPushFrequency; set value=60; back

service insight configuration create attributes *> add; set name=metricsIndex; set
value=delphix_metrics; back

service insight configuration create attributes *> add; set name=eventsPushFrequency;
set value=60; back;

service insight configuration create attributes *> ls

```

Creating default splunkHec configuration from GUI

1. Login as a sysadmin user and select **Fluentd Configuration** under the Preferences menu.

2. The splunkHec plugin appears in the dropdown by default.

Fluentd Configuration ✕

Select a plugin Configuration
splunkHec + 🗑️

protocol _____

Close Save

- 3. Additional plugins can be added by using the + button on the right.

4. The new plugin uploaded can be viewed in the dropdown menu and selected to add a configuration.

5. The delete button on the right can be used to delete a selected plugin.
6. The name of fields for configuration would be the same as those provided in the uploaded plugin file.

7. The configuration can be saved by clicking the save button on the bottom.
8. When loading an existing configuration on UI, the secret fields are masked.

6.7.12.2.3 Troubleshooting

Occasionally, the fluentd service might fail to start or encounter problems when sending logs to the remote data consumer. Typical explanations might include syntax errors in the plugin's config file or network configuration problems on the data consumer server. Such issues are generally reflected by error output in the `fluent.log` file, which can be accessed for download via the `/service/fluentd/plugins/downloadFluentdLog` API endpoint. Here is an example of downloading the log via curl:

```
curl -v -O -J "$delphix_engine/resources/json/delphix/service/fluentd/plugins/downloadFluentdLog" -b ~/cookies.txt
```

- Fluentd rotates its logs once they have reached a certain maximum size to avoid memory issues should they grow too large. While unlikely, it is possible that the logs might be rotated in the midst of an ongoing issue you are trying to diagnose. If this occurs, it may be necessary to wait some time and retry the log download so that useful information is included.

6.7.12.2.4 Implementation

Secret attributes have been introduced in order to protect private data such as passwords and tokens. In the CLI and API, they are identified by the **FluentdSecretAttribute** type. In plugins, attribute names in the config file template beginning with **_secret** indicate secret data.

6.7.12.2.5 Known issues

Fluentd runs in a systemd container to limit negative side-effects from a bad plugin. More security can be added to this container by running as a non-root user, in addition to limiting the size of the log and buffer files it can write.

6.7.12.3 Splunk integration

Delphix enables self-monitoring/diagnosability of Delphix Engines by providing native integration with Splunk Enterprise. By providing details about your Splunk instance, you can allow Delphix to send structured JSON logs to Splunk that capture activity on the Delphix engine(s). These logs include Delphix events (Actions, Job Events, API Events, Faults, and Alerts) as well as performance metrics (CPU, disk, network, TCP, dataset, NFS, iSCSI) and capacity metrics. Delphix Insight enables extensible search and visualization of actionable information and provides a centralized, comprehensive view of Delphix activity (including the ability to cross-reference information from multiple Delphix engines) on a platform that allows building your own operational intelligence for your Delphix installation.

This section covers the following topics:

- [Configuring splunk \(see page 850\)](#)
- [Using search \(see page 853\)](#)

6.7.12.3.1 Configuring splunk

6.7.12.3.1.1 Prerequisites

Before you configure the Delphix Engine you will need to configure and make a note of the following in Splunk:

Please refer to the [Splunk documentation](#)²⁶² for detailed steps on how to configure your values.

Supported Splunk versions

Delphix only supports Splunk Enterprise 6.3.0 or higher.

1. In the Splunk web **UI Enable SSL** (this is optional but best practice for security) in your global HTTP Event Collector (HEC) settings.
2. The **Splunk hostname** or **IP Address**.
3. The **HEC Port** number for your Splunk instance (default 8088).
4. Enable the HTTP Event Collector on Splunk, and create a new **HEC Token** with a new Splunk index set as an allowed index for the token. Make sure **Enable Indexer Acknowledgement** is **unchecked** for the token. **Warning** : If you wish, you can use a separate Splunk index for performance and capacity metrics (otherwise, the same index will be used for both events and metrics). If you are using Splunk 7.0+, it is recommended that you create this second index as a special “Metrics” type index that is optimized for indexing and searching metrics data.
5. Note the **HEC Token Value** and the **Allowed Indexes** for the token.

The following table provides an example of the data you will need.

Attribute	Sample data
Splunk Server IP address	192.168.8.8
Splunk Server HEC Port Number	8088
Splunk HEC Token	12345678-1234-1234-1234-1234567890AB
Index Name for Events	delphix_events
Index Name for Metrics	delphix_metrics

²⁶² http://docs.splunk.com/Documentation/Splunk/7.1.1/Data/UsetheHTTPEventCollector#Configure_HTTP_Event_Collector_on_Splunk_Enterprise

6.7.12.3.1.2 Configuring Delphix for Splunk

1. Log in to the **Delphix Server Setup UI** as the sysadmin.
2. From the **Preferences** menu select **Fluentd Configuration**.
3. In the Fluentd Configuration window, enter your Splunk values, using the default **splunkHec** plugin configuration.

Host	Splunk hostname or IP address
HEC Port	The TCP port number for the Splunk HTTP Event Collector (HEC)
HEC Token	The token for the Splunk HTTP Event Collector (HEC)

Host	Splunk hostname or IP address
Events Index	The Splunk Index events will be sent to. It must be set as an allowed index for the HEC token.
Metrics Index	The Splunk Index metrics will be sent to. If none is specified then the Main Index will be used for metrics as well. It must be set as an allowed index for the HEC token.
Events Push Frequency	The frequency at which the Events will be pushed to Splunk. Specified in seconds.
Metrics Push Frequency	The frequency at which the Performance Metrics will be pushed to Splunk. Specified in seconds
Protocol	What protocol to use (HTTP or HTTPS) when connecting to Splunk. Must match your HTTP Event Collector settings in Splunk.

4. Click **Save** to enable the Splunk configuration and begin sending all new Actions, Job Events, Faults, Alerts, and Metrics to your Splunk instance.

6.7.12.3.1.3 Testing Your Connection to Splunk

Delphix will send a test event to Splunk once you have clicked **Save**. If this test does not receive an OK response, the configuration will not be saved and you will be prompted to fix the issue. There is no need to separately test the connection when using the Delphix UI. However, there is also an option for explicitly testing your SplunkHec configuration via the CLI at `service fluentd configuration testSplunkHec` or by using the API at the `/delphix/service/fluentd/configuration/testSplunkHec` endpoint.

6.7.12.3.2 Using search

Use the search to analyze your data and enumerate items in a metrics index. For more about searching a metrics index, refer to the [Splunk²⁶³](#) documentation.

6.7.12.3.2.1 Search examples - Metrics

The following examples provide information on viewing Metrics on Splunk 7.x

To get a list of all Metrics:

²⁶³ <http://docs.splunk.com/Documentation/Splunk/7.0.3/Metrics/Search>

```
| mcatalog values(metric_name)
```

To get a list of all dimensions of a given metric - say CPU utilization percentage:

```
| mcatalog values(_dims) where metric_name="system.cpu.util.pct"
```

To view the average values of overall CPU utilization percentage across all hosts with a span of 30 seconds:

```
| mstats avg(_value) WHERE index=delphix_metrics AND metric_name=system.cpu.util.pct
span=30s
```

You can also display results in a chart with CPU wildcard:

```
| mstats perc85(_value) AS val85 avg(_value) AS val where metric_name="system.cpu.*"
span=1s by data.kernel, data.user, data.idle
| eval total='data.kernel' + 'data.user' + 'data.idle'
| eval sys_pct=(('data.kernel'/total) * 100)
| eval usr_pct=(('data.user'/total) * 100)
| eval idle_pct=(('data.idle'/total) * 100)
| timechart span=10m avg(val) as "cpu.overall", avg(val85) as "cpu.overall 85th
Percentile", avg(sys_pct) as "cpu.system", avg(usr_pct) as "cpu.user", avg(idle_pct)
as "cpu.idle"
```

This type of search can be used to stack different CPU metrics that add up to 100%. Here is a sample screenshot of the above “stack different CPU metrics” from the Delphix Engines.

6.7.12.3.2.2 Search examples - events

The following queries demonstrate some basic visualizations of various Delphix events. The **delphix_index** value should be replaced with the name of the **Main Index** provided in during Delphix Setup. These examples serve as useful starting points that can be expanded to include other relevant data. See [Events Format](#) (see page 0) for a full description of the structure of each type of event.

Display event statistics per host

Search

```
index="delphix_index" | stats
count(eval(source="delphix.events.action.completed" OR
source="delphix.events.action.started" OR
source="delphix.events.action.waiting" )) AS ACTIONS
```

```
count(eval(source="delphix.events.fault.posted")) AS FAULTS
count(eval(source="delphix.events.alert" )) AS ALERTS
count(eval(source="delphix.events.job.event" )) AS JOBS BY host
```

6.7.12.3.2.3 Search examples - event formats

The Actions, Job Events, Faults, and Alerts that Delphix sends to Splunk are structured according to predefined [JSON schemas](#)²⁶⁴

JSON schemas for events

The following set of [JSON schemas](#)²⁶⁵ define the shape of each Splunk event, including which properties are expected to exist for each event type and what those properties mean. Some of these .json files are used as shared building blocks to define the other schemas; the top-level schemas which define each distinct event type are **Action.json**, **Alert.json**, **JobEvent.json**, **Fault.json**, and **FaultEffect.json**.

Below key-values are Splunk event metadata - This follows GeneralSplunkHeader.json - schema and GeneralSplunkEvent.json
GeneralSplunkHeader.json

```
{
  "$schema": "http://json-schema.org/draft-04/schema#",
  "type": "object",
  "properties": {
    "time": {
      "description": "The time the event was logged. The default time format is epoch time format, in the format <sec>.<ms>.",
      "type": "number"
    }
  }
}
```

²⁶⁴ <http://json-schema.org/>

²⁶⁵ <http://json-schema.org/>

```

    },
    "host": {
      "description": "The system's hostname. Will be the host value assigned to
the event data in Splunk.",
      "type": "string"
    },
    "source": {
      "description": "For example mgmt.event.action. Will be the source value
to assigned to the event data in Splunk.",
      "type": "string"
    },
    "sourcetype": {
      "description": "The sourcetype value to assign to the event data.",
      "type": "string"
    },
    "index": {
      "description": "The name of the index by which the event data is to be
indexed.",
      "type": "string"
    }
  },
  "required": ["time", "host", "source", "sourcetype", "index"]
}

```

GeneralSplunkEvent.json

```

{
  "$schema": "http://json-schema.org/draft-04/schema#",
  "type": "object",
  "properties": {
    "systemUniqueId": {
      "description": "The UUID of the system.",
      "type": "string"
    },
    "systemVersion": {
      "description": "The release version of the system.",
      "type": "string"
    }
  },
  "required": ["systemUniqueId", "systemVersion"]
}

```

Action.json

```

{
  "$schema": "http://json-schema.org/draft-04/schema#",

    }
}
}
}

```

6.7.12.3.2.4 Types of events

Delphix uses the **source** field in Splunk to designate the type of each event. Here is a full list of the possible values of the **source** field for events, along with an explanation of when each event is generated and the name of the corresponding JSON schema that describes the event structure.

source	Explanation	Schema
delphix.events.action.started	Action has started running.	Action.json
delphix.events.action.waiting	Action has moved to the WAITING state.	Action.json
delphix.events.action.completed	Action has completed successfully.	Action.json
delphix.events.action.failed	Action has failed.	Action.json
delphix.events.action.canceled	Action has been canceled.	Action.json
delphix.events.job.event	Job Event has been generated in response to a Job progress update.	JobEvent.json

source	Explanation	Schema
delphix.events.fault.posted	Fault has been posted.	Fault.json
delphix.events.fault.resolved	Fault has been resolved.	Fault.json
delphix.events.fault.ignored	User has chosen to ignore a fault.	Fault.json
delphix.events.fault.unignored	User has chosen to “unignore” a previously ignored fault.	Fault.json
delphix.events.fault.effect.posted	Fault Effect has been posted as a downstream effect of some Fault.	FaultEffect.json
delphix.events.fault.effect.resolved	Fault Effect has been resolved as a result of its cause being resolved.	FaultEffect.json
delphix.events.fault.effect.ignored	Fault Effect has been ignored when a user chose to ignore its cause.	FaultEffect.json
delphix.events.fault.effect.unignored	Fault Effect has been “unignored” when a user chose to unignore its previously ignored cause.	FaultEffect.json
delphix.events.alert	Alert has been posted.	Alert.json

6.7.12.3.2.5 Search examples - metric formats

JSON schemas for metrics

GeneralMetricEvent.json

```
{
  "$schema": "http://json-schema.org/draft-04/schema#",
  "type": "object",
  "properties": {
    "systemUniqueId": {
      "description": "The UUID of the system.",
      "type": "string"
    },
    "systemVersion": {
```

```

        "description": "The release version of the system.",
        "type": "string"
    },
    "event": {
        "description": "A tag that indicates this Event is a metric.",
        "type": "string",
        "enum": ["metric"]
    }
},
"required": ["systemUniqueId", "systemVersion", "event"]
}

```

A schema that is common for all metrics, the “data” nested JSON object contents varies depending on the metric:

CommonMetric.json

```

{
  "$schema": "http://json-schema.org/draft-04/schema#",
  "definitions": {
    "CommonMetric": {
      "type": "object",
      "properties": {
        "name": {
          "description": "The name of the metric.",
          "type": "string"
        },
        "time": {
          "description": "The timestamp of the metric when it was collected.
The default time format is epoch time format, in the format <sec>.<ms>.",
          "type": "number"
        },
        "value": {
          "description": "The numeric value of the metric.",
          "type": "number"
        },
        "type": {
          "description": "The type of measurement.",
          "type": "string",
          "enum": ["counter", "g", "value", "summary"]
        },
        "data": {
          "description": "JSON object having further details on the metric.
Contents depends on the actual metric.",
          "type": "object"
        }
      }
    }
  },
  "type": "object",
  "title": "CommonMetric",

```

```

    "allOf": [{ "$ref": "GeneralSplunkHeader.json#" }],
    "properties": {
      "event": {
        "type": "object",
        "allOf": [{ "$ref": "#/definitions/CommonMetric" }, { "$ref":
"GeneralMetricEvent.json#" }]
      }
    }
  }
}

```

6.7.12.3.2.6 Metrics format

Metrics Format is the combination of the two tables below (metadata + metric specific key-values).

JSON key	Value type	Description	Example	Comments
source	String	Dotted name hierarchy for insight source.	delphix.metrics.xyz	This is the “source” value assigned to an event data in Splunk.
index	String	Splunk metrics index name	insight_metrics	Splunk Index name
host	String	Hostname/IP	<u>pk-insight.dc2.delphix.com</u>	Could also serve as a tag in other time-series data (like opentsdb)
event	<i>“metric”</i>	Describes what kind of event this is.	n/a	Signifies this Splunk event is a “Metric”.
sourcetype	<i>“_json”</i>	Data format	n/a	Used for Splunk Indexed field extractions
systemUniqueId	String	The UUID of the system	"423f22db-4ee9-6ebe-ff0f-884ffdc351f7"	
systemVersion	String	The release version of the system	5.2.5.0	

And the general key-values specific to an Insight metric are:

JSON key	Value type	Description	Example	Comments
name	String	Pseudo hierarchical dotted format of the metric name.	system.cpu.util.pct system.disk.ops.count system.net ²⁶⁶ .total.bytes	A metric name: <ul style="list-style-type: none"> • is alphanumeric (underscore & dot allowed) • has <i>prefix</i> that points to the source of the data (like <i>system.cpu</i>) • has <i>suffix</i> that describes the unit (when it can) • an aggregate/summary metric would have <i>total</i> as part of suffix for example.
time	UNIX time notation (epoch)	Timestamp	1525399950	UNIX epoch time format.
value	Numeric value of the metric	The actual measurement	85.17 (system.cpu.util.pct)	Numeric only
type	String (Enum): <ul style="list-style-type: none"> • counter, • gauge, • summary 	Type of the measurement	counter gauge summary	This field could be used to identify what kind of value a metric is presenting (like a “gauge” for cpu metric implies the values will fall into a range of 0-100% - similarly a “summary” would imply the value is an “accumulated value” like network utilization)

266 <https://system.net/>

JSON key	Value type	Description	Example	Comments
data	JSON Object	Dimensions of the metric (if any).	<pre>{ "read_latency": 0.98, "ops_write": 20, "ops_read": 30, "write_latency": 0.55, }</pre>	<p>Has additional info about a metric (called "Dimensions" in Splunk)</p> <p>Has different key-vals depending on a given metric</p> <p>Like for CPU: it can have key-vals to like "kernel", "user"</p> <p>For disk: can have latency/throughput, operation name</p>

6.7.12.3.2.7 Summary of all the current metrics

Metric name	Metric value	Metric dimensions (data.xxx below)
system.cpu.util.pct	cpu utilization percentage aggregated across all cpus	user, kernel, idle
system.disk.ops.count	disk read/write operations aggregated across all disk instances	count, op (read/write), latency, avgLatency, throughput
system.net²⁶⁷ .total.bytes	network utilization - total bytes (in + out) of a given network interface	networkInterface, inBytes, outBytes, inPackets, outPackets
system.nfs.ops.count	nfs read/write operations aggregated across all instances	count, op (read/write), latency, avgLatency, throughput
system.iscsi.ops.count	iscsi read/write operations aggregated across all instances	count, op (read/write), latency, avgLatency, throughput

²⁶⁷ <https://system.net/>

Metric name	Metric value	Metric dimensions (data.xxx below)
<i>system.tcp.total.bytes</i>	tcp connection statistics aggregated by service (nfs/iscsi/dsp etc)	congestionWindowSize, inBytes, inUnorderedBytes, localAddress, outBytes, receiveWindowSize, remoteAddress, retransmittedBytes, roundTripTime, sendWindowSize, service unacknowledgedBytes, unsentBytes
<i>system.dataset.total.bytes</i>	dataset performance - total number of bytes read + written per dataset (dsource/vdb etc)	dataset, nread, nwritten, type (virtual, dsource, staging)
<i>system.capacity.source.size</i>	overall system capacity - actual used space in bytes	actualSpace, totalSpace, activeSpace, actualSpace, descendantSpace, logSpace, manualSpace, policySpace, syncSpace, timeflowUnvirtualizedSpace, unownedSnapshotSpace, unvirtualizedSpace
<i>system.capacity.consumer.size</i>	consumer capacity - actual used space in bytes per consumer (vdb/pdb etc)	syncSpace, descendantSpace, activeSpace, timeflowUnvirtualizedSpace, objectType, dSource, actualSpace, groupName, manualSpace, unownedSnapshotSpace, unvirtualizedSpace, logSpace, policySpace, consumerName

6.7.12.4 Creating Fluentd plugins

The Delphix Fluentd service includes built-in support for sending data to Splunk, but the feature can be extended to other data consumers through the use of plugins that can be uploaded to a Delphix engine for use by Fluentd. These plugins can be adopted from various widely available options, such as those found at <http://rubygems.org>, but only require a few specific gem files and a configuration file to tell Fluentd where and how to send metrics to your platform of choice.

6.7.12.4.1 Delphix Fluentd plugin structure

The expected file structure of a Delphix Fluentd plugin is simple: A root folder containing a properly configured `fluent.conf.stg` file, and a `/gems` subfolder with the necessary `.gem` files. Delphix Fluentd plugins are simpler than a typical Fluentd plugin because of Delphix's native Fluentd integration, which comes with a variety of Ruby gems that are used by many standard plugins. Additionally, the Delphix Fluentd service requires only the dependency gem files (i.e. the files ending with a `.gem` extension). Additional files that come with a downloaded plugin should be removed.

6.7.12.4.2 Pre-installed Fluentd ruby gems

To minimize the surface area of uploads to a given Delphix engine, all `.gem` files that are already present on the Delphix OS should also be removed from your plugin before upload. Here is a list of the provided gems that should be removed from your `/gems` folder, if present:

```
addressable (2.8.1)
async (1.30.3)
async-http (0.59.2)
async-io (1.34.0)
async-pool (0.3.12)
aws-eventstream (1.2.0)
aws-partitions (1.650.0)
aws-sdk-core (3.164.0)
aws-sdk-kms (1.58.0)
aws-sdk-s3 (1.116.0)
aws-sdk-sqs (1.51.1)
aws-sigv4 (1.5.2)
benchmark (default: 0.1.0)
bigdecimal (default: 2.0.0)
bindata (2.4.14)
bundler (2.3.18, default: 2.1.4)

webhdfs (0.10.2)
```

```
webrick (1.7.0, default: 1.6.1)
xmlrpc (0.3.0)
yajl-ruby (1.4.3)
yaml (default: 0.1.0)
zip-zip (0.3)
zlib (default: 1.1.0)
```

Note that many gems have similar names but may still require your plugin to work. For example, `opensearch-api.gem` from the list above is distinct from `opensearch-transport.gem`. While gem version clashes can sometimes occur when there are duplicate gems found during installation, there is often no harm in including additional gem files, but it is recommended to eliminate as many non-essential gems as possible before uploading.

6.7.12.4.3 Setting up a Fluentd configuration file

Besides requiring the necessary gems to connect to a given data consumer, Fluentd needs a configuration file to know where and how to send the data it has received from Delphix. The Fluentd Configuration GUI in Delphix also uses the configuration file to determine what parameters should be displayed to the system administrator during setup. The configuration file should be named `fluent.conf.stg` and must be placed in your plugin's root folder. Each data consumer requires specific syntax to connect with Fluentd. Consult the documentation of your data consumer of choice when creating your `fluent.conf.stg` file. Here is an example configuration file template, which must be customized depending on the requirements of your chosen data provider (`Splunk`, `elasticsearch`, etc.):

```
/*
 * Copyright (c) 2023 Delphix. All rights reserved.
 */

delimiters "^", "^"

/*
 * This template is used by the Delphix management stack to auto-generate the final
 * configuration used

```

Fluentd defaults to using JSON formatting for its output plugins. Refer to Fluentd documentation for including a formatter plugin in your config should you require an alternative.

6.7.12.4.4 Readyng the plugin for upload

Here is an example of what a plugin for `elasticsearch 7` might look like after taking the above steps:

```
$ ls ./elasticsearch-7
fluent.conf.stg gems

$ ls ./elasticsearch-7/gems/

elasticsearch-7.17.1.gem elasticsearch-api-7.17.1.gem elasticsearch-transport-7.17.1.gem
fluent-plugin-elasticsearch-5.1.4.gem
```

Delphix Fluentd plugins must be stored in a `.far` archive file before uploading them to your engine. You can create a `.far` archive of your plugin files using a utility such as `tar`. Here is an example `tar` syntax for creating a plugin archive file:

```
tar --create --verbose --owner=0 --group=0 --exclude-backups --exclude-vcs --one-file-system --format=gnu --file=dlpx-example-plugin.far dlpx-example-plugin/
```

6.7.12.4.5 Uploading plugins to Delphix

Your new Fluentd plugin `.far` file can be uploaded through the API or the GUI in the Fluentd configuration wizard, by clicking the plus icon next to the plugin selection dropdown menu:

Fluentd Configuration ✕

Select a plugin Configuration
splunkHec + 🗑️

protocol _____

hec_port _____

metricsPushFrequency _____

metricsIndex _____

eventsIndex _____

eventsPushFrequency _____

hec_host _____

hec_token _____

Close Save

Click the gray box shown in the next window to locate your plugin .far file or drag it to the box to upload it to your Delphix engine:

6.7.12.4.6 Limitations

The Delphix Fluentd service supports sending logs to Splunk instances by default through use of the built-in splunkHec plugin. Only one additional plugin can be uploaded to a given Delphix engine at a time. If logs need to be sent to another service requiring a new plugin, the existing one needs to be removed from the engine, and a new plugin uploaded for the new data consumer. Removing an existing plugin can be done from the same window for uploading the plugin by selecting your plugin from the “Select a plugin Configuration” drop-down menu and clicking the trash can icon next to it:

SSL Verification does not currently support custom certificates.

These limitations may be relaxed in a future Delphix release.

6.8 Performance analytics management

Delphix offers various performance analytics tools to help users monitor throughput, latency, and other key metrics. Learn more about how to leverage these tools and how to architect your Delphix deployment for optimal performance.

This section covers the following topics:

- [Performance analytics](#) (see page 884)
- [Storage performance configuration options](#) (see page 911)
- [Architecture for performance - hypervisors and host](#) (see page 919)

- [Target host OS and database configuration options \(see page 922\)](#)
- [Block storage cache reports \(see page 932\)](#)

6.8.1 Performance analytics

This section covers the following topics:

- [Performance analytics tool overview \(see page 885\)](#)
- [Working with performance analytics graphs in the graphical user interface \(see page 887\)](#)
- [Performance analytics statistics reference \(see page 890\)](#)
- [Performance analytics tool API reference \(see page 891\)](#)
- [Performance analytics case study: using a single statistic \(see page 899\)](#)
- [Performance analytics case study: using multiple statistics \(see page 903\)](#)

6.8.1.1 Performance analytics tool overview

This topic describes the Performance Analytics tool and illustrates some basic uses of it.

6.8.1.1.1 Introduction

The performance analytics tool allows introspection into how the Delphix Engine is performing. The introspection techniques it provides are tuned to allow an iterative investigation process, helping to narrow down the cause associated with the performance being measured. Performance analytics information can be accessed through the Delphix Management application, as described in [Working with Performance Analytics Graphs in the Graphical User Interface \(see page 887\)](#), as well as the CLI and the web services API, as described in other topics in this section. The default statistics that are being collected on the Delphix Engine include CPU utilization, network utilization, and disk, NFS, and iSCSI IO operations (see [Performance Analytics Statistics Reference \(see page 890\)](#) for details).

The performance tool operates with two central concepts: **statistics** and **statistic slices**.

6.8.1.1.2 Statistics

Each statistic describes some data that can be collected from the Delphix Engine. The first piece of information a statistic provides is its **type**, which you will use as a handle when creating a statistic slice. It also gives the **minimum collection interval**, which puts an upper bound on the frequency of data collection. The actual data a statistic can collect is described through a set of **axes**, each of which describes one "dimension" of that statistic. For example, the statistic associated with Network File System (NFS) operations has a **latency axis**, as well as an **operation type axis** (among many others), which allows users to see NFS latencies split by whether they were reads or writes.

Each axis has some important information embedded in it.

- The **name** of the axis provides a short description of what the axis collects and is used when creating a statistic slice
- A **value** type, which tells you what kind of data will be collected for this axis. The different value types are **integer**, **boolean**, **string**, and **histogram**. The first three are straightforward, but statistic axes with a histogram type can collect a distribution of all the values encountered during each collection interval. This means that instead of seeing an average NFS operation latency every collection interval,

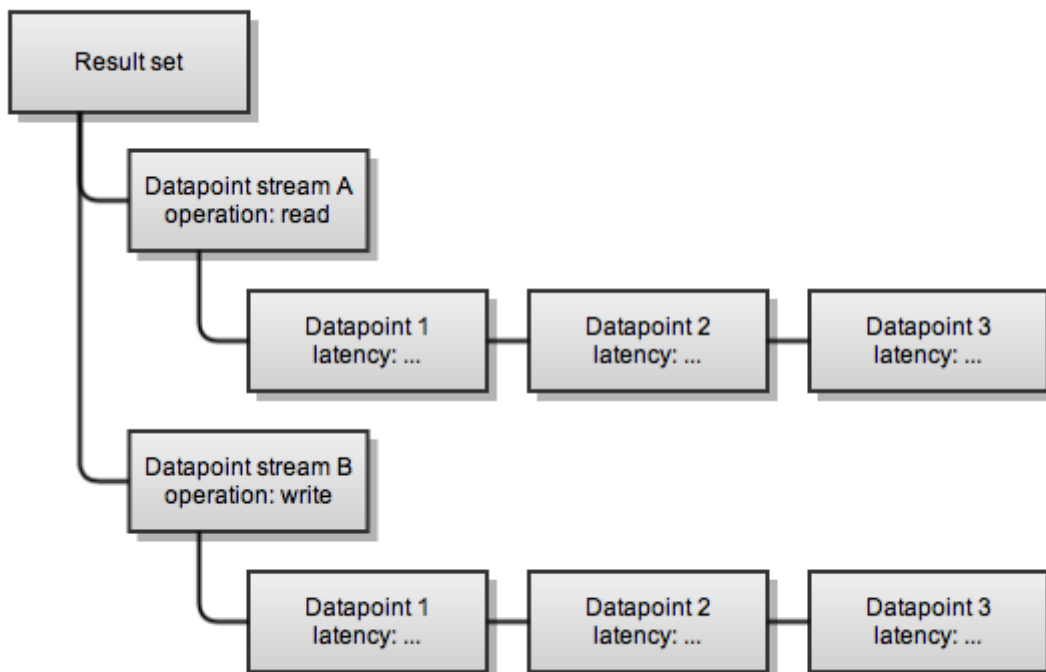

you can see a full distribution of operation latencies during that interval. This allows you to see outliers as well as the average, and observe the effects of caching on the performance of your system more easily.

- A **constraint** type, which is only relevant while creating a statistic slice, and will be described in more detail below

One last bit of information that an axis provides makes the most sense after seeing how data points are queried. In the most basic situation, you would only collect one axis of a statistic, such as the latency axis from the NFS operations statistic. When you ask for data, you would get back a data point for every collection interval in the time range you requested. These data points would be grouped into a single stream.

However, if you had collected the operation type axis as well as the latency axis, you would get two streams of datapoints: one for reading operations, and one for write operations.

Because the operation axis applies to many data points, the data points returned are split into two streams, and the operation axis is stored with the top-level stream instead of with each data point in the streams.

However, the latency axis will be different for each data point in a stream, so it is not an attribute of the stream, but instead an attribute of the datapoint.

6.8.1.1.3 Statistic slices

Statistics describe what data can be collected and are auto-populated by the system, but statistic slices are responsible for actually collecting the data, and you must create them manually when you want to collect some performance data. Each slice is an instantiation of exactly one statistic, and can only gather data that is described by that statistic. "Slices" are so named because each one provides a subset of the information available from the parent statistic it is associated with. A statistic can be thought of as describing the axes of a multidimensional space, whereas you typically will only want to collect a simpler slice of that space due to the large number of axes available.

When you specify a slice, there are several fields that you must supply:

- The statistic type this slice is associated with. This must be the same type as the statistic of which this is an instantiation.
- The collection interval, which must be greater than the minimum collection interval the parent statistic gives
- The axes of the parent statistic this slice will collect

Finally, a slice can place constraints on axes of its parent statistic, allowing you to limit the data you get back. For instance, if you're trying to narrow down the cause of some high NFS latency outliers, it may be useful to filter out any NFS latencies which are shorter than one second. To do this, you would place a constraint on the latency axis of an NFS operation slice that states that the values must be higher than one second. You can constrain any axis in the same fashion, and each axis' description in the parent statistic gives a constraint type that can be applied to it. This allows you to place different types of constraints on the latency axis (which is a number measured in nanoseconds) than the operation type axis (which is an enum that can take the values "read" or "write").

6.8.1.1.4 Persisting analytics data

Data collected by slices is persisted temporarily on the Delphix Engine. Performance data is guaranteed to be available at the finest resolution for six hours, then is compressed to per-minute data and held for seven days, and finally compressed to per-hour data and held for 30 days. If data of a certain resolution will be needed longer than these limits, you should instruct the slice to remember the data permanently until you are done using it. The commands to manage this are listed in the [Performance Analytics Tool API Reference \(see page 891\)](#).

6.8.1.2 Working with performance analytics graphs in the graphical user interface

This topic describes the performance analytics graphs that are available in the Delphix Management application, and the controls for changing the views of those graphs.

6.8.1.2.1 Accessing the performance analytics graphs

1. Log into the Delphix Management application.
2. In the **Resources** menu, select **Performance Analytics**.

- Use the controls described below to view statistics and their related graphs.

6.8.1.2.2 General graph display and controls

Control Name	Control description	Usage
Chart Tabs	Specifies which graphs/charts are displayed.	Chart tabs have a multiple select drop-down which has the same three options checked by default (CPU, Network, Disk IO). Users can show/hide graphs by checking/unchecking drop-down options.
Timescale	Controls the time range of data displayed in the graph. Available values are 1 minute, 1 hour, and 1 day. By default, 1 minute is selected.	Timescale options are presented as a drop-down, select from Minute , Hour , or Day to change the Zoom Level.
Pause/Resume	Pause/Resume icons	All charts display live data so users can pause it by clicking the Pause button in the upper right corner of each graph. Once the chart is paused, the Pause button is replaced by the Resume button so a user can click it to see live data again.
Op. Type	Operation Type (used in Disk IO, NFS and iSCSI charts)	Options are presented as a drop-down.
Shown Data Timeline	Displays timestamps of data points in the graph.	
Available Data Timeline	Displays navigable time ranges for historical data.	

Control Name	Control description	Usage
Timeline Selector	Specifies the start and end time for the currently displayed data. The range displayed is controlled by the Zoom Level .	<p>Drag the Timeline Selector to view statistics for a specific time in the past, or click the scroll bar arrows to view the desired time period. You can also use the slider controls within the Timeline Selector to change the length of time for which data is displayed.</p> <p>When the Timeline Selector is aligned to the right of the timeline, it represents live data that is updated every second. If the Timeline Selector is moved from the right alignment with the timeline, the data displayed is historical and no live updates are displayed. To resume live data updates, move the Timeline Selector back to the right-aligned position representing the current time. The data will be refreshed to the latest data, and live updates will resume every second.</p>
Graph Legend	<p>If more than one set of information is presented on the graph, the Graph Legend displays a description and color for each set and allows a user to toggle that set-off and on.</p> <p>For example, in the network graph there can be multiple network interfaces, and for each network interface the graph displays four statistics (bytes sent, bytes received, packets sent, packets received). When a user toggles off a specific network interface, all four statistics corresponding to that interface are hidden from the screen.</p> <p>The color for lines representing bytes sent and packets sent is the same. Similarly, the color for lines representing bytes received and packets received is the same. This makes it easier to correlate the number of bytes and the number of packets sent/received for a given network interface.</p>	To hide a set of information, click on the set name within the Graph Legend. Data representing that set is removed from the graph, and the set's name is greyed out. To show a set that has been hidden, click on the set name.

6.8.1.2.3 Latency, timeline page, and tooltip graph display and controls

Control Name	Control Description	Usage
Timeline Page Left/Right Button	Scrolls Available Data Timeline by a specified time range depending on the current Zoom Level .	When the Zoom Level is set to Minute , click Timeline Page Left . The Available Data Timeline is changed to show the time period for the previous hour prior.
Graph Value Tooltip	Shows a value, along with the time stamp, for a specific data point.	Mouse over a data point on the graph to view the tooltip.
Latency Range Selector (shown on latency heatmaps only)	Controls the lower and upper limits for displayed latency buckets.	Drag the lower and upper controls to drill down into a specific range of latency buckets. Latency buckets that fall outside of the selected range are summarized, the lower row representing latency buckets that are below the lower limit, and the upper row representing latency buckets that are below the upper limit of the latency range selector. Use Latency Range Selector to view a more detailed distribution of latencies for a specific range.
Latency Outlier Selector (shown on latency heatmaps only)	Hides infrequent latencies (outliers) based on a percentage threshold. Its range is 0%-10%, with a default of 0%. The percentage establishes a threshold below which buckets are considered "outliers" and are hidden from the graph. Each bucket is assigned a percentage based on the ratio of its count vs the maximum count of any bucket in the graph.	Drag the control to the desired percentage threshold.

6.8.1.3 Performance analytics statistics reference

This topic describes the various performance statistics that are available for the Delphix Engine and how they can be used to analyze and improve performance.

The Delphix Engine is shipped with a default set of statistics that are collected on Delphix Engine virtual appliance, as listed below. The statistics are stored for up to 30 days for historical analysis.

Statistic	Description
CPU Utilization	Total CPU utilization for all CPUs. This statistic includes both kernel and user time.
Network Throughput	Measures throughput in bytes and packets, broken down by sent vs. received data and by the network interface. Each network interface shows four graphed lines: bytes sent, bytes received, packets sent, and packets received. To help easily correlate bytes and packets, the same color is used for both bytes and packet values.
Disk IO	Measures a number of IO operations, and the latencies and throughput of the underlying storage layer. The statistic is represented by the graphs - a column chart for IO operations, a heat map for latency distribution, and a line chart for throughput. IO operations are grouped by reads and write. A shaded rectangle on a latency heat map represents an IO operation (read or write) which falls within a particular time range (bucket). The shading of rectangles depends on the number of IO operations that fall within a particular bucket - the higher the count the darker the shading.
NFS	Measures a number of IO operations and the latencies and throughput of the NFS server layer in the Delphix Engine. Its graphical representation is similar to the Disk IO graph. It is useful to diagnose the performance of dSources and VDBs that use NFS mounts (Oracle, PostgreSQL).
iSCSI	Measures the number of IO operations, and the latencies and throughput, of the iSCSI server layer in the Delphix Engine. Its graphical representation is similar to the Disk IO graph. It is useful to diagnose the performance of Microsoft SQL Server dSources and VDBs.

6.8.1.4 Performance analytics tool API reference

This topic describes basic commands and command syntax for using the Performance Analytics tool.

6.8.1.4.1 Statistic types

More detailed information can be found about each statistic type through the command-line interface (CLI) and webservices API, but the following table provides more information about how similar I/O stack statistic types relate to each other.

Statistic type	Description	Axis name	Axis description	Axis value type
NFS_OPS	Provides information about Network File System operations. This is the entry point to the Delphix Engine for all Oracle database file accesses.	op	I/O operation type	STRING
		path	Path of the affected file	STRING
		size	I/O sizes in bytes	HISTOGRAM
		avgLatency	Average I/O latency in nanoseconds	INTEGER
		cached	Whether reads were cached	BOOLEAN
		latency	I/O latencies in nanoseconds	HISTOGRAM
		count	Number of I/O operations	INTEGER
		client	Address of the client	STRING
		throughput	I/O throughput in bytes	INTEGER
		sync	Whether writes were synchronous	BOOLEAN
iSCSI_OPS	Provides information about iSCSI operations. This is the entry point to the Delphix Engine for all SQL Server file accesses.	Same axes as NFS_OPS, except for path, cached, and sync.		

Statistic type	Description	Axis name	Axis description	Axis value type
VFS_OPS	This layer sits immediately below NFS_OPS and iSCSI_OPS. It should give almost exactly the same latencies, assuming no unexpected behavior is occurring.	Same axes as NFS_OPS, except for client.		
DxFS_OPS	This layer sits immediately below VFS_OPS, and the two of them should give almost exactly the same latencies.	Same axes as VFS_OPS.		
DxFS_IO_QUEUE_OPS	This layer sits below DxFS_OPS, but the latencies will differ from that layer because this layer batches together operations to increase throughput.	op	I/O operation type	STRING
		count	Number of I/O operations	INTEGER
		size	I/O sizes in bytes	HISTOGRAM
		avgLatency	Average I/O latency in nanoseconds	INTEGER
		latency	I/O latencies in nanoseconds	HISTOGRAM
		throughput	I/O throughput in bytes	INTEGER
		priority	Priority of the I/O	STRING

Statistic type	Description	Axis name	Axis description	Axis value type
DISK_OPS	This layer sits below DxFs_IO_QUEUE_OPS at the bottom of the I/O stack and measures interactions between the Delphix Engine and disks.	op	I/O operation type	STRING
		count	Number of I/O operations	INTEGER
		size	I/O sizes in bytes	HISTOGRAM
		avgLatency	Average I/O latency in nanoseconds	INTEGER
		latency	I/O latencies in nanoseconds	HISTOGRAM
		throughput	I/O throughput in bytes	INTEGER
		error	Whether the I/O resulted in an error	BOOLEAN
		device	Device the I/O was issued to	STRING
CPU_UTIL	This is unrelated to the layers of the I/O stack. It measures CPU utilization on the Delphix Engine.	idle	Idle time in milliseconds (showAxes command may incorrectly state nanoseconds)	INTEGER
		user	User time in milliseconds (showAxes command may incorrectly state nanoseconds)	INTEGER

Statistic type	Description	Axis name	Axis description	Axis value type
		kernel	Kernel time in milliseconds (showAxes command may incorrectly state nanoseconds)	INTEGER
		dtrace	DTrace time in milliseconds (showAxes command may incorrectly state nanoseconds) Subset of time in kernel	INTEGER
		cpu	Which CPU was utilized	INTEGER
NETWORK_INTERFACE_UTIL	Network interface utilization on the Delphix Engine.	inBytes	Number of bytes received	INTEGER
		inPackets	Number of packets received	INTEGER
		outBytes	Number of bytes transmitted	INTEGER
		outPackets	Number of packets transmitted	INTEGER
		networkInterface	Which network interface was utilized	STRING
TCP_STATS	Statistics for all established TCP connections on the Delphix Engine.	localAddress	Local address for the TCP connection	STRING
		localPort	Local port for the TCP connection	INTEGER

Statistic type	Description	Axis name	Axis description	Axis value type
		remoteAddress	Remote address for the TCP connection	STRING
		remotePort	Remote port for the TCP connection	INTEGER
		inBytes	Data bytes received	INTEGER
		outBytes	Data bytes transmitted	INTEGER
		receiveWindowSize	The size of the local receive window	INTEGER
		sendWindowSize	The size of the peer's receive window	INTEGER
		congestionWindowSize	The size of the local congestion window	INTEGER
		retransmittedBytes	Bytes retransmitted	INTEGER
		inUnorderedBytes	Number of bytes received out of order. This is a subset of the "inBytes" value	INTEGER
		unacknowledgedBytes	Number of bytes sent but unacknowledged	INTEGER

Statistic type	Description	Axis name	Axis description	Axis value type
		roundTripTime	Smoothed average round-trip time in microseconds	INTEGER

6.8.1.4.2 Statistic axis value types

Values are returned when a slice's data is queried. Each axis has a value type, which specifies how the data will be returned.

Value type	Description
INTEGER	The value is returned as an integer. For information about what units the integer is measured in, read the documentation for the related datapoint or datapoint stream type.
BOOLEAN	The value is returned as a boolean.
STRING	The value is returned as a string. This is used for enum values as well, although the set of strings that can be returned is limited.
HISTOGRAM	<p>The value is returned as a log-scale histogram. The histogram has size buckets whose minimum and maximum value get doubled. Histograms are returned as JSON maps, where the keys are the minimum value in a bucket and the values are the height of each bucket.</p> <p>Here is an example histogram. Notice that buckets with a height of zero are not included in the JSON object and that keys and values are represented as strings.</p> <pre>{ "32768": "10", "65536": "102", "262144": "15", "524288": "2" }</pre>

Axis constraints are used to limit the data which a slice can collect. Each axis specifies a constraint type which can be used to limit that axis' values.

Constraint type	Description
<code>BooleanConstraint</code>	A superclass in which constraints on boolean values must extend. Currently, the only subclass is <code>BooleanEqualConstraint</code> , which requires that a boolean axis equal either true or false (depending on user input).
<code>EnumConstraint</code>	A superclass in which constraints on enum values must extend. Currently, the only subclass is <code>EnumEqualConstraint</code> , which requires that an enum axis be equal to a user-specified value.
<code>IntegerConstraint</code>	A superclass in which constraints on integer values must extend. Subclasses include <code>IntegerLessThanConstraint</code> , <code>IntegerGreaterThanConstraint</code> , and <code>IntegerEqualConstraint</code> , which map to the obvious comparators for integers.
<code>NullConstraint</code>	This class signifies that an axis cannot be constrained. This makes the most sense for axes that provide an average value - placing a constraint on an average doesn't make sense because you are not able to include or discard a particular operation based on what its effects would be on the average of all operations.
<code>PathConstraint</code>	A superclass in which constraints on file path values must extend. Currently, the only subclass is <code>PathDescendantConstraint</code> , which requires that a path value must be a descendant of the specified path (it must be contained within it). This only applies to paths on the Delphix Engine itself, and all paths used must be canonical Unix paths starting from the root of the filesystem.
<code>StringConstraint</code>	A superclass in which constraints on string values must extend. Currently, the only subclass is <code>StringEqualsConstraint</code> , which requires that a string value must equal a user-specified string.

6.8.1.4.3 Statistic slice commands

Command	Description and Usage Examples
<code>getData</code>	This is used to fetch data from a statistic slice which has been collecting data for a while. It returns a datapoint set, which is composed of datapoint streams, which contain datapoints. For a full description, see the Performance Analytics Tool Overview (see page 885).

Command	Description and Usage Examples
rememberRange	This is used to ensure that data collected during an ongoing investigation doesn't get deleted unexpectedly. If this is not used, data is only guaranteed to be persisted for 24 hours. If it is used, data will be remembered until a corresponding call to stopRememberingRange is made.
stopRememberingRange	This is used to allow previously-remembered data to be forgotten. The data will be forgotten on the same schedule as brand new data, so you will have at least 24 hours before data which you have stopped remembering is deleted. This undoes the rememberRange operation.
pause	This command pauses the collection of a statistic slice, causing no data to be collected until resume is called.
resume	This command resumes the collection of a statistic slice, undoing a pause operation.

6.8.1.5 Performance analytics case study: using a single statistic

6.8.1.5.1 Overview

The Delphix Engine uses the Network File System (NFS) as the transport for Oracle installations. An increase in the NFS latency could be causing sluggishness in your applications running on top of Virtual Databases. This case study illustrates how this pathology can be root caused using the analytics infrastructure. This performance investigation uses one statistic to debug the issue, and utilizes the many axes of that statistic to filter down the probable cause of the issue. This technique uses an approach of iteratively drilling down by inspecting new axes of a single statistic and filtering the data to only include information about the operations that appear slow. This technique is valuable for determining which use patterns of a resource might be causing the system to be sluggish. If you isolate a performance issue using this approach but aren't sure what is causing it or how to fix it, Delphix Support can provide assistance for your investigation.

The following example inspects the statistic which provides information about NFS I/O operations on the Delphix Engine. This statistic can be collected a maximum of once every second, and the axes it can collect, among others, are:

- **latency**, a histogram of wait times between NFS requests and NFS responses
- **size**, a histogram of the NFS I/O sizes requested

- **op**, whether the NFS requests were reads or writes
- **client**, the network address of the NFS client which was making requests

Roughly the same performance information can be obtained from the iSCSI interface as well.

6.8.1.5.2 Investigation

Because the NFS layer sits above the disk layer, all NFS operations that use the disk synchronously (synchronous writes and uncached reads) will have latencies that are slightly higher than those of their corresponding disk operations. Usually, because disks have very high seek times compared to the time the NFS server spends on CPU, disk operations are responsible for almost all of the latency of these NFS operations. In the graphical representation, you can see this by looking at how the slower cluster of NFS latencies (around 2ms-8ms) have similar latencies to the median of the disk I/O (around 2ms-4ms). Another discrepancy between the two plots is that the number of disk operations is much lower than the corresponding number of NFS operations. This is because the Delphix filesystem batches together write operations to improve performance.

If database performance is not satisfactory and almost all of the NFS operation time is spent waiting for the disks, it suggests that the disk is the slowest piece of the I/O stack. In this case, disk resources (the number of IOPS to the disks, the free space on the disks, and the disk throughput) should be investigated more thoroughly to determine if adding more capacity or a faster disk would improve performance. However, care must be taken when arriving at these conclusions, as a shortage of memory or a recently-rebooted machine can also cause the disk to be used more heavily due to fewer cache hits.

Sometimes, disk operations will not make up all of the latency, which suggests that something between the NFS server and the disk (namely, something in the Delphix Engine) is taking a long time to complete its work. If this is the case, it is valuable to check whether the Delphix Engine is resource-constrained, and the most common areas of constraint internal to the Delphix Engine are CPU and memory. If either of those is too limited, you should investigate whether expanding the resource would improve performance. If no resources appear to be constrained or more investigation is necessary to convince you that adding resources would help the issue, Delphix Support is available to help debug these issues.

While using this technique, you should take care to recognize the limitations that caching places on how performance data can be interpreted. In this example, the Delphix Engine uses a caching layer for the data it stores, so asynchronous NFS writes will not go to disk quickly because they are being queued into larger batches, and cached NFS reads won't use the disk at all. This causes these types of NFS operations to return much more quickly than any disk operations are able to, resulting in a very large number of low-latency NFS operations in the graph above. For this reason, caching typically creates a bimodal distribution in the NFS latency histograms, where the first cluster of latencies is associated with operations that only hit the cache, and the second cluster of latencies is associated with fully or partially uncached operations. In this case, cached NFS operations should not be compared to the disk latencies because they are unrelated. It is possible to use techniques described in the first example to filter out some of the unrelated operations to allow a more accurate mapping between disk and NFS latencies.

1. Begin the performance investigation by examining some high-level statistics such as **latency**.
 - a. Create a slice with statistic type **NFS_OPS**.
 - b. Set the slice to collect the **latency** axis.
 - c. Do not add any constraints.

- d. Set the collection interval. Anything over one second will work, but ten seconds gives good data resolution and will not use a lot of storage to persist the data that is collected. The rest of this example will assume a collection period of ten seconds for all other slices, but any value could be used.

```

/analytics

create
set name=step1
set statisticType=NFS_OPS
set collectionInterval=10
set collectionAxes=latency
commit

```

This will collect a time-series of histograms describing NFS latencies as measured from inside the Delphix Engine, where each histogram shows how many NFS I/O operations fell into each latency bucket during every ten-second interval. After a short period of time, read the data from the statistic slice:

```

select step1
getData
setopt format=json
commit
setopt format=text

```

The `setopt` steps are optional but allow you to see the output better via the CLI. The output looks like this:

```

{
  "type": "DatapointSet",
  "collectionEvents": [],
  "datapointStreams": [{
    "type": "NfsOpsDatapointStream",

```

The data is returned as a set of datapoint streams. Streams hold the fields which are shared by all the datapoints they contain. Later on, in this example, the **opt** and **client** fields will be added to the streams, and multiple streams will be returned. Streams are described in more

detail in [Performance Analytics Tool Overview](#) (see page 885). The `resolution` field indicates the number of seconds that corresponds to each datapoint, which in our case matches the requested `collectionInterval`. The `collectionEvents` field is not used in this example, but lists when the slice was paused and resumed, to distinguish between moments when no data was collected because the slice was paused, and moments when there was no data to collect.

2. If the latency distributions show some slow NFS operations, the next step would be to determine whether the slow operations are reads or writes.
 - a. Specify a new **NFS_OPS** slice to collect this by collecting the **op** and **latency** axes.
 - b. To limit output to the long-running operations, create a constraint on the **latency** axis that prohibits the collection of data on operations with latency less than 100ms.

```
/analytics

create
set name=step2
set statisticType=NFS_OPS
set collectionInterval=10
set collectionAxes=op,latency

edit axisConstraints.0
set axisName=latency
set type=IntegerGreaterThanConstraint
set greaterThan=100000000
back

commit
```

The `greaterThan` field is 100ms converted into nanoseconds.

Reading the data proceeds in the same way as the first step, but there will be two streams of datapoints, one where `op=write`, and one where `op=read`.

info : Because we constrained output to operations with latencies higher than 100ms, none of the latency histograms will all have any buckets for latencies lower than 100ms.

3. After inspecting the two data streams, you might find that almost all slow operations are writes, so it could be valuable to determine which clients are requesting the slow writes, and how large each of the writes is.
 - a. To collect this data, create a new **NFS_OPS** slice which collects the **size** and **client** axes.
 - b. Add constraints ensuring that the **op** axis should be constrained to only collect data for **write** operations, and the **latency** axis should be constrained to filter operations taking less than 100ms.

info : Because the constraint on the `op` axis dictates that it will always have the value `write`, it is not necessary to collect the `op` axis anymore.

```
/analytics
```

```

create
set name=step3
set statisticType=NFS_OPS
set collectionInterval=10
set collectionAxes=size,client

edit axisConstraints.0
set type=IntegerGreaterThanConstraint
set axisName=latency
set greaterThan=100000000
back

edit EnumEqualConstraint
set type=StringEqualConstraint
set axisName=op
set equals=write
back

commit

```

Reading the data proceeds in the same way as the first two steps, but there will be one stream for every NFS client. The dataset collected by this will consist of a set of streams, one corresponding to each NFS client, and each stream will be a time-series of histograms showing write sizes that occurred during each ten-second interval.

Continuing to use this approach will allow you to narrow down the slow writes to a particular NFS client, and you may be able to tune that client in some way to speed it up.

6.8.1.6 Performance analytics case study: using multiple statistics

6.8.1.6.1 Overview

This case study illustrates an investigation involving more than one metric. In typical performance investigations, you will need to peel out multiple layers of the stack in order to observe the component causing the actual performance pathology. This case study specifically examines sluggish application performance caused due to slow IO responses from the disk subsystem. This example will demonstrate a technique of looking at the performance of each layer in the I/O stack to find which layer is responsible for the most latency, then looking for constrained resources that the layer might need to access. This technique is valuable for finding the most-constrained resource in the system, potentially giving actionable information about resources that can be expanded to increase performance.

For the following example, we will inspect latency at two layers: the Network File System (NFS) layer on the Delphix Engine, and the disk layer below it. Both of these layers provide the **latency** axis, which gives a histogram of wait times for the clients of each layer.

6.8.1.6.2 Investigation

The analytics infrastructure enables users to observe the latency of multiple layers of the software stack. This investigation will examine the latency of both layers, and then draw conclusions about the differences between the two.

6.8.1.6.3 Setup

To measure this data, create two slices. When attempting to correlate data between two different statistics, it can be easier to determine causation when collecting data at a relatively high frequency. The fastest that each of these statistics will collect data is once per second, so that is the value used.

1. A slice collecting the **latency** axis for the statistic type **NFS_OPS**.

```
/analytics

create
set name=slice1
set statisticType=NFS_OPS
set collectionInterval=1
set collectionAxes=latency
commit
```

2. A slice collecting the **latency** axis for the statistic type **DISK_OPS**.

```
/analytics

create
set name=slice2
set statisticType=DISK_OPS
set collectionInterval=1
set collectionAxes=latency
commit
```

After a short period of time, read the data from the first statistic slice.

```
select slice2
getData
setopt format=json
commit
setopt format=text
```

The same process works for the second slice. The `setopt` steps allow you to see the output better via the CLI. The output for the first slice might look like this:

```
{
```

```

"type": "DatapointSet",
"collectionEvents": [],
"datapointStreams": [{
  "type": "NfsOpsDatapointStream",

    },
    "timestamp": "2013-05-14T15:51:41.000Z"
  }, ...]
}],
"resolution": 1

```

```
}

```

For the second slice, it might look like this:

```
{
  "type": "DatapointSet",
  "collectionEvents": [],
  "datapointStreams": [{
    "type": "DiskOpsDatapointStream",
    "datapoints": [{
      "type": "IoOpsDatapoint",
      "latency": {
        "262144": "1",
        "524288": "11",
        "1048576": "13",
        "2097152": "34",
        "4194304": "7",
        "8388608": "2",
        "16777216": "3",
        "33554432": "1"
      }
    },
    "timestamp": "2013-05-14T15:51:40.000Z"
  }, {
    "type": "IoOpsDatapoint",
    "latency": {
      "262144": "5",
      "524288": "10",
      "1048576": "14",
      "2097152": "26",
      "4194304": "7",
      "8388608": "4",
      "16777216": "2"
    },
    "timestamp": "2013-05-14T15:51:41.000Z"
  }, ...]
}],
  "resolution": 1
}
```

The data is returned as a set of datapoint streams. Streams hold the fields that would otherwise be shared by all the datapoints they contain, but only one is used in this example because there are no such fields. Streams are discussed in more detail in the [Performance Analytics Tool Overview](#) (see page 885). The `resolution` field indicates how many seconds each datapoint corresponds to, which in our case matches the requested `collectionInterval`. The `collectionEvents` field is not used in this example, but lists when the slice was paused and resumed to distinguish between moments when no data was collected because the slice was paused, and moments when there was no data to collect.

Graphically, these four histograms across two seconds look like this:

6.8.1.6.4 Analysis

Because the NFS layer sits above the disk layer, all NFS operations that use the disk synchronously (synchronous writes and uncached reads) will have latencies that are slightly higher than those of their corresponding disk operations. Usually, because disks have very high seek times compared to the time the NFS server spends on CPU, disk operations are responsible for almost all of the latency of these NFS operations. In the graphical representation, you can see this by looking at how the slower cluster of NFS latencies (around 2ms-8ms) have similar latencies to the median of the disk I/O (around 2ms-4ms). Another discrepancy between the two plots is that the number of disk operations is much lower than the corresponding number of NFS operations. This is because the Delphix filesystem batches together write operations to improve performance.

If database performance is not satisfactory and almost all of the NFS operation time is spent waiting for the disks, it suggests that the disk is the slowest piece of the I/O stack. In this case, disk resources (the number of IOPS to the disks, the free space on the disks, and the disk throughput) should be investigated more thoroughly to determine if adding more capacity or a faster disk would improve performance. However, care must be taken when arriving at these conclusions, as a shortage of memory or a recently-rebooted machine can also cause the disk to be used more heavily due to fewer cache hits.

Sometimes, disk operations will not make up all of the latency, which suggests that something between the NFS server and the disk (namely, something in the Delphix Engine) is taking a long time to complete its work. If this is the case, it is valuable to check whether the Delphix Engine is resource-constrained, and the most common areas of constraint internal to the Delphix Engine are CPU and memory. If either of those is too limited, you should investigate whether expanding the resource would improve performance. If no resources appear to be constrained or more investigation is necessary to convince you that adding resources would help the issue, Delphix Support is available to help debug these issues.

While using this technique, you should take care to recognize the limitations that caching places on how performance data can be interpreted. In this example, the Delphix Engine uses a caching layer for the data it stores, so asynchronous NFS writes will not go to disk quickly because they are being queued into larger batches, and cached NFS reads won't use the disk at all. This causes these types of NFS operations to return much more quickly than any disk operations are able to, resulting in a very large number of low-latency NFS operations in the graph above. For this reason, caching typically creates a bimodal distribution in the NFS latency histograms, where the first cluster of latencies is associated with operations that only hit the cache, and the second cluster of latencies is associated with fully or partially uncached operations. In this case, cached NFS operations should not be compared to the disk latencies because they are unrelated. It is possible to use techniques described in the first example to filter out some of the unrelated operations to allow a more accurate mapping between disk and NFS latencies.

1. Begin the performance investigation by examining some high-level statistics such as **latency**.
 - a. Create a slice with statistic type **NFS_OPS**.
 - b. Set the slice to collect the **latency** axis.
 - c. Do not add any constraints.
 - d. Set the collection interval. Anything over one second will work, but ten seconds gives good data resolution and will not use a lot of storage to persist the data that is collected. The rest of this example will assume a collection period of ten seconds for all other slices, but any value could be used.

```
/analytics  
  
create  
set name=step1  
set statisticType=NFS_OPS  
set collectionInterval=10  
set collectionAxes=latency  
commit
```

This will collect a time series of histograms describing NFS latencies as measured from inside the Delphix Engine, where each histogram shows how many NFS I/O operations fell into each latency bucket during every ten-second interval. After a short period of time, read the data from the statistic slice:

```
select step1
getData
setopt format=json
commit
setopt format=text
```

The `setopt` steps are optional but allow you to see the output better via the CLI. The output looks like this:

```
{
  "type": "DatapointSet",
  "collectionEvents": [],
  "datapointStreams": [{
    "type": "NfsOpsDatapointStream",
    "datapoints": [{
      "type": "IoOpsDatapoint",
      "latency": {
        "32768": "16",
        "65536": "10"
      },
      "timestamp": "2013-05-14T15:51:40.000Z"
    }, ...]
  }],
  "resolution": 10
}
```

The data is returned as a set of datapoint streams. Streams hold the fields which are shared by all the data points they contain. Later on, in this example, the **opt** and **client** fields will be added to the streams, and multiple streams will be returned. Streams are described in more detail in [Performance Analytics Tool Overview \(see page 885\)](#). The `resolution` field indicates the number of seconds that corresponds to each datapoint, which in our case matches the requested `collectionInterval`. The `collectionEvents` field is not used in this example, but lists when the slice was paused and resumed, to distinguish between moments when no data was collected because the slice was paused, and moments when there was no data to collect.

2. If the latency distributions show some slow NFS operations, the next step would be to determine whether the slow operations are reads or write.
 - a. Specify a new **NFS_OPS** slice to collect this by collecting the **op** and **latency** axes.
 - b. To limit output to the long-running operations, create a constraint on the **latency** axis that prohibits the collection of data on operations with latency less than 100ms.

```
/analytics

create
set name=step2
set statisticType=NFS_OPS
```

```

set collectionInterval=10
set collectionAxes=op,latency

edit axisConstraints.0
set axisName=latency
set type=IntegerGreaterThanConstraint
set greaterThan=100000000
back

commit

```

The `greaterThan` field is 100ms converted into nanoseconds.

Reading the data proceeds in the same way as the first step, but there will be two streams of data points, one where `op=write`, and one where `op=read`.

Info : Because we constrained output to operations with latencies higher than 100ms, none of the latency histograms will all have any buckets for latencies lower than 100ms.

3. After inspecting the two data streams, you might find that almost all slow operations are writes, so it could be valuable to determine which clients are requesting the slow writes, and how large each of the writes is.
 - a. To collect this data, create a new **NFS_OPS** slice which collects the **size** and **client** axes.
 - b. Add constraints ensuring that the **op** axis should be constrained to only collect data for **write** operations, and the **latency** axis should be constrained to filter operations taking less than 100ms. **Info**: Because the constraint on the `op` axis dictates that it will always have the value `write`, it is not necessary to collect the `op` axis anymore.

```

/analytics

create
set name=step3
set statisticType=NFS_OPS
set collectionInterval=10
set collectionAxes=size,client

commit

```

Reading the data proceeds in the same way as the first two steps, but there will be one stream for every NFS client. The dataset collected by this will consist of a set of streams, one

corresponding to each NFS client, and each stream will be a time series of histograms showing write sizes that occurred during each ten-second interval.

Continuing to use this approach will allow you to narrow down the slow writes to a particular NFS client, and you may be able to tune that client in some way to speed it up.

6.8.2 Storage performance configuration options

This section covers the following topics:

- [Optimal storage configuration parameters for the Delphix engine \(see page 911\)](#)
- [Storage performance test tool \(fio\) \(see page 912\)](#)
- [Storage performance expectations and troubleshooting \(see page 918\)](#)

6.8.2.1 Optimal storage configuration parameters for the Delphix engine

This topic describes minimum capacity and throughput requirements for storage devices used with the Delphix Engine.

Storage for the Delphix Engine must be able to sustain the aggregated Input/Output Operations Per Second (IOPS) and throughput (MBPS) requirements of all its Virtual Databases. Throughput required for data source synchronization (SnapSync and LogSync) must also be supported.

The Delphix Engine requires storage for:

Item	Description
A copy of each Source Database	The copies are compressed.
Unique Block Changes in VDBs	When changes are made to a VDB, the Delphix Engine stores the changes in new blocks associated with only that VDB. The new blocks are compressed.
Timeflow for dSources and VDBs	The TimeFlow kept for each dSource and VDB comprises snapshots of the database (blocks changed since the previous snapshot) and archive logs. The retention period for this history of changes is determined by policies established for each dSource and VDB. The TimeFlow is compressed.

In addition to the storage for these items, the Delphix Engine requires 30% free space in its storage for the best performance. See [An Overview of Capacity and Performance Information \(see page 762\)](#) and related topics for more details on managing capacity for the Delphix Engine.

Best practices for storage performance include:

- Initial storage is equal to the size of the physical source databases. For high redo rates and/or high DB change rates, allocate an additional 10-20% storage.
- Add storage when storage capacity approaches 30% free
- Use physical LUNS allocated from storage pools or RAID groups that are configured for availability

- Never share physical LUNs between the Delphix Engine and other storage clients.
- Keep all physical LUNs the same size.
- Provision storage using VMDKs or RDMs operating in virtual compatibility mode.
- VMDKs should be **Thick Provisioned, Lazy Zeroed**. The underlying physical LUNs can be thin provisioned.
- Physical LUNs used for RDMs should be thick provisioned.
- Measure or estimate the required IOPS and manage the storage disks to provide this capacity. It is common to use larger numbers of spindles to provide the IOPS required.
- Physical LUNs carved from RAID 1+0 groups or pools with dedicated spindles provide higher IOPS performance than other configurations
- Maximize Delphix Engine vRAM for a larger system cache to service reads

Example

There are two production dSources, totaling 5 TB in size. 5 VDBs will be created for each. The Sum of read and write rates on the production source database is moderate (1000 IOPS), the sum of VDB read rate is moderate (950 IOPS), and the VDB update rate is low (50 IOPS).

- Initial storage equal to 5TB, provisioned as 5 x 1 TB physical LUNs, Thin Provisioned. Allow for expansion of the LUNs to 2TB.
- Provision as 5 x 950 GB Virtual Disks. VMDKs must be Thick Provisioned, Lazy Zeroed. Using 1 TB LUNs allows expansion to 2 TB (ESX 5.1 limit).
- The storage provisioned to the Delphix Engine storage must be able to sustain 1000 IOPs (950 + 50). For this reason, each physical LUN provisioned to the Delphix Engine must be capable of sustaining 200 IOPs. IOPs on the source databases are not relevant to the Delphix Engine.
- 64GB Delphix Engine vRAM for a large system cache

6.8.2.2 Storage performance test tool (fio)

6.8.2.2.1 Overview

This fio-based Storage Performance Tool executes a synthetic workload to evaluate the performance characteristics of the storage assigned to the Delphix Engine. The Storage Performance Tool is a feature that is only available from the command-line

6.8.2.2.2 Prerequisites

Prior to setting up the Delphix Engine, the admin can login to the Delphix CLI using a **sysadmin** account to launch the Storage Performance Tool. Because the test is destructive, it will only run against storage which has not been allocated to Delphix for use by the engine.

6.8.2.2.3 Running the storage test via CLI

1. Login as the sysadmin user to the Delphix Engine CLI.
 - a. If the Delphix Engine has not been setup yet, the **network setup** prompt appears. Discard the command.

```
delphix network setup update *> discard delphix>
```

2. Create a storage test.

```
delphix> storage test
delphix storage test> create
delphix storage test create *>
```

3. Use 'get' to see other optional arguments. Modify the test parameters as needed and **commit** to start the test.

```
delphix storage test create *> get
  type: StorageTestParameters
  devices: (unset)
  duration: 120
  initializeDevices: true
  initializeEntireDevice: false
  testRegion: 128GB
  tests: ALL
delphix storage test create *> commit

delphix storage test 'STORAGE_TEST-1'>

```

6.8.2.3 Storage performance expectations and troubleshooting

6.8.2.3.1 Overview

When you initially set up a Delphix Engine, there is a one-time opportunity (and requirement) to run your storage performance tests on unconfigured storage. Because of the test method we use, we cannot run it again in the same way after the engine is set up. When run from a Windows target host, [DiskSpd](#)²⁶⁸ can help establish a performance baseline that combines the network and storage performance over **iSCSI**. This can be a significant help in determining whether your current or future performance is within normal expectations. Similarly, you can use [fio](#)²⁶⁹ on the *nix side from a target system to establish a performance baseline that combines the network and storage performance over **NFS**.

²⁶⁸ <https://gallery.technet.microsoft.com/DiskSpd-a-robust-storage-6cd2f223>

²⁶⁹ <http://freecode.com/projects/fio>

6.8.2.3.2 Troubleshooting and information gathering questions

These questions are presented roughly in order of priority. The answers to these questions should help narrow down possible causes of poor performance.

- All storage traffic for virtualization Target hosts goes over the network. Have you reviewed [Network Performance Expectations and Troubleshooting](#) (see page 745)?²⁷⁰
- Were all of the [storage best practices](#) (see page 2379) applied?
 - In particular, check the IO Operation limit and round-robin settings.
- Was a baseline ever created for this host using DiskSpd or fio? (How does our current performance compare?)
- Gather storage specs from VM/storage administrator:
 - Vendor, Model (EMC VMAX 40k, HP 3PAR StoreServ 7000)
 - IO latency SLO (e.g. 5ms 99.999%)
 - IOPS/GB SLO (e.g. 0.68 IOPS/GB for EMC Gold-1)
 - Cache type and size (e.g. FAST cache 768GB)
 - Tier, #Pools; if auto – tiering; relocation schedule (e.g. Gold/Silver/Auto/3 pools/etc)
 - Pool detail: (#) drives, RPM, Type (e.g. Pool1: (20) EFD, (30) 15k SAS, Pool 2: (40) 10k SATA)
 - Connection (XXGb Fibre Channel)
 - Dedicated or Shared pool (how many applications/servers)

6.8.2.3.3 Conclusion

If you need further help, please contact Delphix Support or Professional Services to assist in getting the best performance possible from your environment.

6.8.3 Architecture for performance - hypervisors and host

The Delphix Engine is a "virtual appliance": a virtual machine guest running within a hypervisor on a physical host.

There are a few key best practices we need to keep in mind as we consider this architecture.

6.8.3.1 Architecture best practices hypervisor host ESX²⁷¹

6.8.3.1.1 Hypervisor

1. ESXi 6.x²⁷² or 7.0 is recommended. ESXi 5.5 or earlier is no longer supported.

²⁷⁰ <https://delphixdocs.atlassian.net/continuous-data-11-0-0-0/docs/network-performance-expectations-and-troubleshooting>

²⁷¹ <https://delphixdocs.atlassian.net/wiki/pages/resumedraft.action?draftId=5800521>

²⁷² <https://www.vmware.com/files/pdf/techpaper/VMware-PerfBest-Practices-vSphere6-0.pdf>

2. HyperThreading (HT) for Intel®-based servers (no HT on AMD CPUs).
 - a. Disable HT in BIOS, on the ESXi Host, **and** disable [HT Sharing](#)²⁷³ on the Delphix VM for consistency. This is our best practice, disable at all levels.
Any other combination may result in a non-deterministic performance.
 - b. When HT cannot be turned off for both the Host and Delphix VM, it should be turned on at all levels, not run in a "mixed-mode".
 - i. HT disablement at a guest level only can result in non-deterministic performance.
 - ii. A dedicated ESXi host, cluster, or DRA is recommended where consistent VDB performance is paramount.
 - c. VM migration to a new host (e.g. VMware HA or vMotion) can create mismatched HT settings.
3. ESXi overhead (resources required for hypervisor cannot be reserved, they must be left unallocated).
 - a. Memory Overhead - 10% of available RAM must not be allocated to guest VMs.
 - i. *Example: 256GB RAM, allocate 230GB to Delphix VM, leave 26GB for ESX*
 - b. CPU Overhead - At least 2 cores (ideally 4) must not be allocated to guest VMs.
 - i. *Example: If 16 physical cores are available, allocate 12 to the virtual machines, leaving 4 for the hypervisor*
 - ii. Why 4? Certain hypervisor functions require precedence over any virtualized system. If a hypervisor needs more CPU than the amount currently available, it can de-schedule all other virtual processes to ensure adequate CPU resources for the hypervisor. Ensuring the hypervisor will not have to de-schedule any running virtual processes (worlds) by setting aside and not over-subscribing CPUs for virtual functions will leave them available for hypervisor use.
 - c. Even if the Delphix VM is the only VM on a host, the hypervisor is still active and essential; and still needs resources.
4. BIOS Power Management should be set to High Performance where ESXi controls power management.
 - a. It can be impacted by [VMware KB 1018206](#)²⁷⁴ - poor VM application performance caused by power management settings.
 - b. Ensure that all BIOS-managed C-States other than C0 are disabled if power management is hardware controlled.
 - c. Ensure that all ACPI sleep states above S0 are disabled in the BIOS.
 - d. Examples of popular server lines from Cisco, HP, Dell are below. *Specific models will vary, use the appropriate spec sheet.*
 - i. [UCS](#)²⁷⁵: disable the Processor Power States, disable Power Technology, set Energy Performance to "Performance"
 - ii. [HP Proliant](#)²⁷⁶: set HP Power Regulator to HP "Static High Performance" mode

273 <https://stromasys.atlassian.net/wiki/display/KBP/VMware+ESX+-+Disabling+hyper+threading+for+a+specific+virtual+machine>

274 <https://kb.vmware.com/kb/1018206>

275 https://www.cisco.com/c/en/us/products/collateral/servers-unified-computing/ucs-b-series-blade-servers/whitepaper_c11-727827.html#HPC

276 https://h20566.www2.hp.com/hpsc/doc/public/display?calledBy=Search_Result&docId=emr_na-c03031625&docLocale=en_US

- iii. [Dell²⁷⁷](#): set BIOS System Profile to "Performance Optimized" mode
- 5. VMware HA can be enabled; VMware DRS is generally disabled.
- 6. Blade/Rack Server Firmware and ESXi Drivers should be updated to the latest versions.
- 7. For Intel®-based servers with E5-2600 v2 processors.
- 8. Two typical server configurations:
 - a. Blade Farm
 - b. Rack Server
 Hyper-Converged configurations are possible for high performance.

6.8.3.1.2 Virtual machine guest

1. For VM machine settings, see [Virtual Machine Requirements for VMware Platform \(see page 619\)](#).
2. VMWare Guest Specifications:
 - a. Minimum: 8 vCPU x 64 GB
Small: 8 vCPU x 128GB
Medium: 16 vCPU x 256 GB
Large: 24 vCPU x 512 GB
 - b. Reserve 100% of RAM and CPU:
 - i. If the ESX host is dedicated to Delphix, CPU and RAM reservations are advised but not necessary, however, swap space will be required on the hypervisor to compensate for the lack of reserved RAM.
 - c. [Hyperthreading²⁷⁸](#) - See the ESX host section at the top. Disable HT Sharing on VM, disable HT on ESX Host.
3. Assign single-core sockets for vCPUs in all cases. If there is a compelling reason to use multi-core vCPUs, reference the following article from VMware which describes matching virtual multi-core sockets to the hardware ESX is running on.
[VMware Article on CoresPerSocket²⁷⁹](#)
Example: *ESXi Host has 2 socket x 18 core Intel Xeon, Delphix Engine wants 16 vCPU.*
Configure Delphix VM with 2 Virtual Sockets, 8 Cores Per Socket to utilize hardware architecture.
4. Avoid placing other extremely active VMs on the same ESX host.
5. Monitoring - vSphere Threshold Alerts for CPU, Network, Memory, Capacity.
6. To set the number of vCPUs per virtual machine via the vSphere client, please see "[Virtual CPU Configuration](#)" in the Administration guide:
[ESXi 6.0²⁸⁰](#)

 - b. [Exchange on VMware Best Practices](#)²⁸² - VMworld 2013 session
 - c. [ESXTOP Reference](#)²⁸³, [Blog](#)²⁸⁴
7. Ensure that the latest available VMware drivers and firmware versions are installed for HBAs, NICs, and any other hardware components configured on the Delphix virtual machine. This is a critical step that can have a massive impact on the performance and robustness of our solution.

6.8.4 Target host OS and database configuration options

This topic describes configuration options to maximize the performance of a target host in a Delphix Engine deployment. These network-tuning changes should improve performance for any data source

6.8.4.1 OS-specific tuning recommendations

6.8.4.1.1 Solaris

When exclusively using Oracle's Direct NFS Feature (dNFS), it is unnecessary to tune the native NFS client. However, tuning network parameters is still relevant and may improve performance.

6.8.4.1.1.1 Tuning the Kernel NFS client

On systems using Oracle Solaris Zones, the kernel NFS client can only be tuned from the global zone.

On Solaris, by default the maximum I/O size used for NFS read or write requests is 32K. For I/O requests larger than 32K, the I/O is broken down into smaller requests that are serialized. This may result in poor I/O performance. To increase the maximum I/O size:

1. As superuser, add to the `/etc/system` file:

```
* For Delphix: change the maximum NFS block size to 1M
set nfs:nfs3_bsize=0x100000
```

2. Run this command:

²⁸¹ https://support.delphix.com/Delphix_Virtualization_Engine/Platforms/KBA1019_VMWare_and_Delphix_CPU_Utilization_Discrepancy_Explained

²⁸² <https://www.derekseaman.com/2013/08/vmword-2013-virtualize-microsoft-exchange-server.html>

²⁸³ <https://docs.vmware.com/en/VMware-vSphere/7.0/com.vmware.vsphere.monitoring.doc/GUID-D89E8267-C74A-496F-B58E-19672CAB5A53.html>

²⁸⁴ <https://www.yellow-bricks.com/esxtop/>

```
# echo "nfs3_bsize/W 100000" | mdb -kw
```

It is critical that the above command be executed exactly as shown, with quotations and space. Errors in the command may cause a system panic and reboot.

6.8.4.1.1.2 Tuning TCP buffer sizes

On systems using Oracle Solaris Zones, TCP parameters, including buffer sizes, can only be tuned from the global zone or in exclusive-IP non-global zones. Shared-IP non-global zones always inherit TCP parameters from the global zone.

Solaris 10

It is necessary to install a new Service Management Facility (SMF) service that will tune TCP parameters after every boot. These are samples of the files needed to create the service:

File	Installation location
dlpx-tcptune ²⁸⁵	/lib/svc/method/dlpx-tcptune
dlpx-tune.xml ²⁸⁶	/var/svc/manifest/site/dlpx-tune.xml

1. As superuser, download the files and install them in the path listed in the **Installation location** in the table.
2. Run the commands:

```
# chmod 755 /lib/svc/method/dlpx-tcptune
# /usr/sbin/svccfg validate /var/svc/manifest/site/dlpx-tune.xml
# /usr/sbin/svccfg import /var/svc/manifest/site/dlpx-tune.xml
# /usr/sbin/svcadm enable site/tcptune
```

Verify that the SMF service ran after being enabled by running the command:

```
# cat `svccprop -p restarter/logfile tcptune`
```

²⁸⁵ <https://delphix.atlassian.net/wiki/download/attachments/9039020081/dlpx-tcptune?version=1&modificationDate=1368535883352&cacheVersion=1&api=v2>

²⁸⁶ <https://delphix.atlassian.net/wiki/download/attachments/9039020081/dlpx-tune.xml?version=1&modificationDate=1368535896429&cacheVersion=1&api=v2>

You should see output similar to this:

```
[ May 14 20:02:02 Executing start method ("/lib/svc/method/dlpx-tcptune
start"). ]
Tuning TCP Network Parameters
tcp_max_buf adjusted from 1048576 to 16777216
tcp_cwnd_max adjusted from 1048576 to 4194304
tcp_xmit_hiwat adjusted from 49152 to 4194304
tcp_recv_hiwat adjusted from 128000 to 16777216
[ May 14 20:02:02 Method "start" exited with status 0. ]
```

Solaris 11

As superuser

Run the following commands:

```
# ipadm set-prop -p max_buf=16777216 tcp
# ipadm set-prop -p _cwnd_max=4194304 tcp
# ipadm set-prop -p send_buf=4194304 tcp
# ipadm set-prop -p recv_buf=16777216 tcp
```

6.8.4.1.2 Linux/Redhat/CentOs

6.8.4.1.2.1 Tuning the Kernel NFS client

In Linux, the number of simultaneous NFS requests is limited by the Remote Procedure Call (RPC) subsystem. The maximum number of simultaneous requests defaults to 16. Maximize the number of simultaneous requests by changing the kernel tunable `sunrpc.tcp_slot_table_entries` value to 128.

To ensure that the interface does not drop packets because the driver is configured with one receive queue, use the following commands to view the adaptor policy/increase Rx queue length.

```
<LinuxHost> $ ifconfig -a
eth0      Link encap:Ethernet  HWaddr 00:22:BB:CC:DD:22
          inet addr:www.xxx.yyy.zzz  Bcast:www.xxx.yyy.zzz  Mask:255.255.255.0
          inet6 addr: feee::222:bbff:fffc:ddd/64  Scope:Link
          UP BROADCAST RUNNING MULTICAST  MTU:9000  Metric:1
          RX packets:760729910  errors:0  dropped:700  overruns:0  frame:0
```

```
TX packets:309094054 errors:0 dropped:0 overruns:0 carrier:0
collisions:0 txqueuelen:1000
RX bytes:1023150307866 (952.8 GiB) TX bytes:190673864056 (177.5 GiB)
```

RHEL4 through RHEL5.6

1. As superuser, run the following command to change the instantaneous value of simultaneous RPC commands:

```
# sysctl -w sunrpc.tcp_slot_table_entries=128
```

2. Edit the file `/etc/modprobe.d/modprobe.conf.dist` and change the line:

```
install sunrpc /sbin/modprobe --first-time --ignore-install sunrpc &&
{ /bin/mount -t rpc_pipefs sunrpc / var /lib/nfs/rpc_pipefs > /dev/
null 2>&1 || ;;
```

to

```
install sunrpc /sbin/modprobe --first-time --ignore-install sunrpc &&
{ /bin/mount -t rpc_pipefs sunrpc / var /lib/nfs/rpc_pipefs > /dev/
null 2>&1 ; /sbin/sysctl -w sunrpc.tcp_slot_table_entries=128; }
```

Improper changes to the `modprobe.conf.dist` file may disrupt the use of NFS on the system. Check with your system administrator or operating system vendor for assistance. Save a copy of the `modprobe.conf.dist` in a directory other than `/etc/modprobe.d` before starting.

RHEL 5.7 through RHEL 6.2

1. As superuser, run the following command to change the instantaneous value of simultaneous RPC commands:

```
# sysctl -w sunrpc.tcp_slot_table_entries=128
```

2. If it doesn't already exist, create the file `/etc/modprobe.d/rpcinfo` with the following contents:

```
options sunrpc tcp_slot_table_entries=128
```

RHEL 6.3 onwards

Beginning with RHEL 6.3, the number of RPC slots is dynamically managed by the system and does not need to be tuned. Although the `sunrpc.tcp_slot_table_entries` tuneable still exists, it has a default value of 2, instead of 16 as in prior releases. The maximum number of simultaneous requests is determined by the new tuneable, `sunrpc.tcp_max_slot_table_entries` which has a default value of 65535.

6.8.4.1.2.2 Tuning TCP buffer sizes

Packages should install their configuration files in `/usr/lib/(distribution packages)` or `/usr/local/lib/(local installs)`. Files in `/etc/` are reserved for the local administrator, who may use this logic to override the configuration files installed by vendor packages. It is recommended to prefix all filenames with a two-digit number and a dash, to simplify the ordering of the files. The following is an example approach and should be tested beforehand.

```
echo "Target Kernel Parameter Tunings. This is optional but highly recommended."
echo
echo "Tuning TCP Buffer Sizes - Parameters should be as below"
echo
echo "This script takes the recommended vendor approach of creating a file in /usr/
lib/sysctl.d and running \"sysctl -p\""
echo "This script will comment out identical settings in /etc/sysctl.conf, which
would otherwise override the Delphix settings"
echo "Admins can at their discretion set larger values, either in sysctl.conf or /
usr/lib/sysctl.d/60-sysctl.conf"
echo "----"
echo "net.ipv4.tcp_timestamps = 1"
echo "net.ipv4.tcp_sack = 1"
echo "net.ipv4.tcp_window_scaling = 1"
echo "net.ipv4.tcp_rmem = 4096 16777216 16777216"
echo "net.ipv4.tcp_wmem = 4096 4194304 16777216"
cat /dev/null > /usr/lib/sysctl.d/60-sysctl.conf
#Set NOW
NOW=$(date +"%m%d%Y%H%m%s")
echo "net.ipv4.tcp_timestamps = 1" >> /usr/lib/sysctl.d/60-sysctl.conf
echo "net.ipv4.tcp_sack = 1" >> /usr/lib/sysctl.d/60-sysctl.conf
echo "net.ipv4.tcp_window_scaling = 1" >> /usr/lib/sysctl.d/60-sysctl.conf
echo "net.ipv4.tcp_rmem = 4096 16777216 16777216" >> /usr/lib/sysctl.d/60-sysctl.conf
echo "net.ipv4.tcp_wmem = 4096 4194304 16777216" >> /usr/lib/sysctl.d/60-sysctl.conf
echo
echo "Running /sbin/sysctl -p /usr/lib/sysctl.d/60-sysctl.conf"
/sbin/sysctl -p /usr/lib/sysctl.d/60-sysctl.conf
if [ $? -ne 0 ]; then
    echo "Command \"sysctl -p /usr/lib/sysctl.d/60-sysctl.conf\" failed; aborting..."
    exit 1
```

```

fi
# Make a backup and Comment out similar lines in /etc/sysctl.conf if they exist
# sed will search for lines which are NOT comments ( ^[^#]* means starts with
anything other than a "#" ) but contain the parameters either with ." or "/"
notation, and add a Comment.
cp /etc/sysctl.conf /tmp/sysctl.conf.$NOW
sed -i "/^[^#]*net[\./]ipv4[\./]tcp_timestamps/s/^\#Commented out by Delphix /" /etc/
sysctl.conf
sed -i "/^[^#]*net[\./]ipv4[\./]tcp_sack/s/^\#Commented out by Delphix /" /etc/
sysctl.conf
sed -i "/^[^#]*net[\./]ipv4[\./]tcp_window_scaling/s/^\#Commented out by Delphix /" /
etc/sysctl.conf
sed -i "/^[^#]*net[\./]ipv4[\./]tcp_rmem/s/^\#Commented out by Delphix /" /etc/
sysctl.conf
sed -i "/^[^#]*net[\./]ipv4[\./]tcp_wmem/s/^\#Commented out by Delphix /" /etc/
sysctl.conf
echo
echo "Running /sbin/sysctl -p /etc/sysctl.conf"
/sbin/sysctl -p /etc/sysctl.conf
if [ $? -ne 0 ]; then
    echo "Command \"sysctl -p /etc/sysctl.conf\" failed; aborting..."
    echo "We put a copy of the original at /tmp/sysctl.conf.$NOW"
    exit 1
fi

```

6.8.4.1.2.3 NFSv4 only - enabling recover lost locks

RHEL 6.6 onwards

By default, the Redhat NFSv4 client does not attempt to reclaim locks that were lost due to a lease expiration event. This can cause an application to encounter unexpected EIO errors on system calls such as write. The Delphix use case requires that the NFSv4 client attempt to reclaim lost locks that were due to lease expiration. An NFS client module parameter, 'recover_lost_locks', is used to change the default behavior. Use the following command to check if the "recover_lost_locks" option is set to 1:

```
grep recover_lost_locks /etc/modprobe.d/*.conf
```

If the option is currently set to 0, change it to 1. If it is missing, proceed to the next paragraph where instruction is provided on how to add the option.

As superuser, run the following two commands to enable the NFS client to recover the lost locks feature:

```

# cat > /etc/modprobe.d/nfs4-locks.conf <<EOF
options nfs recover_lost_locks=1
EOF

# [ -d "/sys/module/nfs" ] && echo Y > /sys/module/nfs/parameters/recover_lost_locks

```

6.8.4.1.3 IBM AIX®

6.8.4.1.3.1 AIX NFSv4 configuration requirements (7.1 and 7.2)

1. An NFS Domain must be configured.
2. The nfsrgyd service must be running.
3. The NFS server IP address from the Delphix Engine must be mappable to an FQDN.

Configure the nfsv4 domain on the AIX target host

```
bash-3.2# chnfsdom test.com
```

Start the nfsrgyd service and confirm it is active

```
bash-3.2# startsrc -s nfsrgyd

bash-3.2# lssrc -s nfsrgyd
Subsystem      Group      PID        Status
nfsrgyd        nfs        7536760    active
```

Confirm that IP address can be resolved

```
bash-3.2$ host 172.16.105.81
81.105.16.172.in-addr.arpa is dcol1.delphix.com
```

Reference: [IBM AIX: HOW TO SETUP NFSV4 MOUNT IN CLIENT AND SERVER](#)²⁸⁷

6.8.4.1.3.2 Tuning the Kernel NFS Client

On AIX, by default the maximum I/O size used for NFS read or write requests is 64K. When Oracle does I/O larger than 64K, the I/O is broken down into smaller requests that are serialized. This may result in poor I/O performance. IBM can provide an Authorized Program Analysis Report (APAR) that allows the I/O size to be configured to a larger value.

1. Determine the appropriate APAR for the version of AIX you are using:

AIX Version	APAR Name
6.1	IV24594 ²⁸⁸

²⁸⁷ <https://www.ibm.com/support/pages/ibm-aix-how-setup-nfsv4-mount-clinet-and-server>

²⁸⁸ <http://www-01.ibm.com/support/docview.wss?uid=isg1IV24594>

AIX Version	APAR Name
7.1	IV24688 ²⁸⁹

2. Check if the required APAR is already installed by running this command: If the APAR is installed, you will see a message similar to this:

```
# /usr/sbin/instfix -ik IV24594
```

3. If the APAR is not yet installed, you will see a message similar to this:

```
All filesets for IV24594 were found.
```

```
There was no data for IV24594 in the fix database.
```

4. Download and install the APAR, as necessary. To find the APARs, use the main search function at <http://www.ibm.com/us/en/>, specifying the name of the APAR you are looking for from step 1. A system reboot is necessary after installing the APAR.
5. Configure the maximum read and write sizes using the commands below:

```
# nfsd -p -o nfs_max_read_size=524288
# nfsd -p -o nfs_max_write_size=524288
```

6. Confirm the correct settings using the command: You should see an output similar to this:

```
# nfsd -L nfs_max_read_size -L nfs_max_write_size
NAME CUR DEF BOOT MIN MAX UNIT TYPE
DEPENDENCIES
-----
nfs_max_read_size 512K 64K 512K 512 512K Bytes D
-----
nfs_max_write_size 512K 64K 512K 512 512K Bytes D
```

²⁸⁹ <http://www-01.ibm.com/support/docview.wss?uid=isg1IV24688>

6.8.4.1.3.3 Tuning delayed TCP acknowledgements

By default, AIX implements a 200ms delay for TCP acknowledgments. However, it has been found that disabling this behavior can provide significant performance improvements.

To disable delayed ACKs on AIX the following command can be used:

```
# /usr/sbin/no -o tcp_nodelayack=1
```

To make the change permanent use:

```
# /usr/sbin/no -p -o tcp_nodelayack=1
```

6.8.4.1.4 HP-UX

6.8.4.1.4.1 Tuning the Kernel NFS client

On HP-UX, by default the maximum I/O size used for NFS read or write requests is 32K. For I/O requests larger than 32K, the I/O is broken down into smaller requests that are serialized. This may result in poor I/O performance.

1. As superuser, run the following command:

```
# /usr/sbin/kctune nfs3_bsize=1048576
```

2. Confirm the changes have occurred and are persistent by running the following command and checking the output:

```
# grep nfs3 /stand/system  
tunable nfs3_bsize 1048576
```

6.8.4.1.4.2 Tuning TCP buffer sizes

1. As superuser, edit the `/etc/rc.config.d/nddconf` file, adding or replacing the following entries:

```
TRANSPORT_NAME[0]=tcp
NDD_NAME[0]=tcp_recv_hiwater_def
NDD_VALUE[0]=16777216
#
TRANSPORT_NAME[1]=tcp
NDD_NAME[1]=tcp_xmit_hiwater_def
NDD_VALUE[1]=4194304
```

In this example, the array indices are shown as `0` and `1`. In the actual configuration file, each index used must be strictly increasing, with no missing entries. See the comments at the beginning of `/etc/rc.config.d/nddconf` for more information.

1. Run the command:

```
/usr/bin/ndd -c
```

2. Confirm the settings:

```
# ndd -get /dev/tcp tcp_recv_hiwater_def
16777216
# ndd -get /dev/tcp tcp_xmit_hiwater_def
4194304
```

6.8.4.2 OS-specific tuning recommendations for windows

6.8.4.2.1 Receive side scaling

Follow the instructions here to enable RSS: [Enable Receive Side Scaling \(RSS\) on Staging/Target Network Interfaces](#) (see page 2369)

hosted on the target, such as Oracle, SQL Server, Sybase, or vFiles. They should be applied to all Delphix targets.

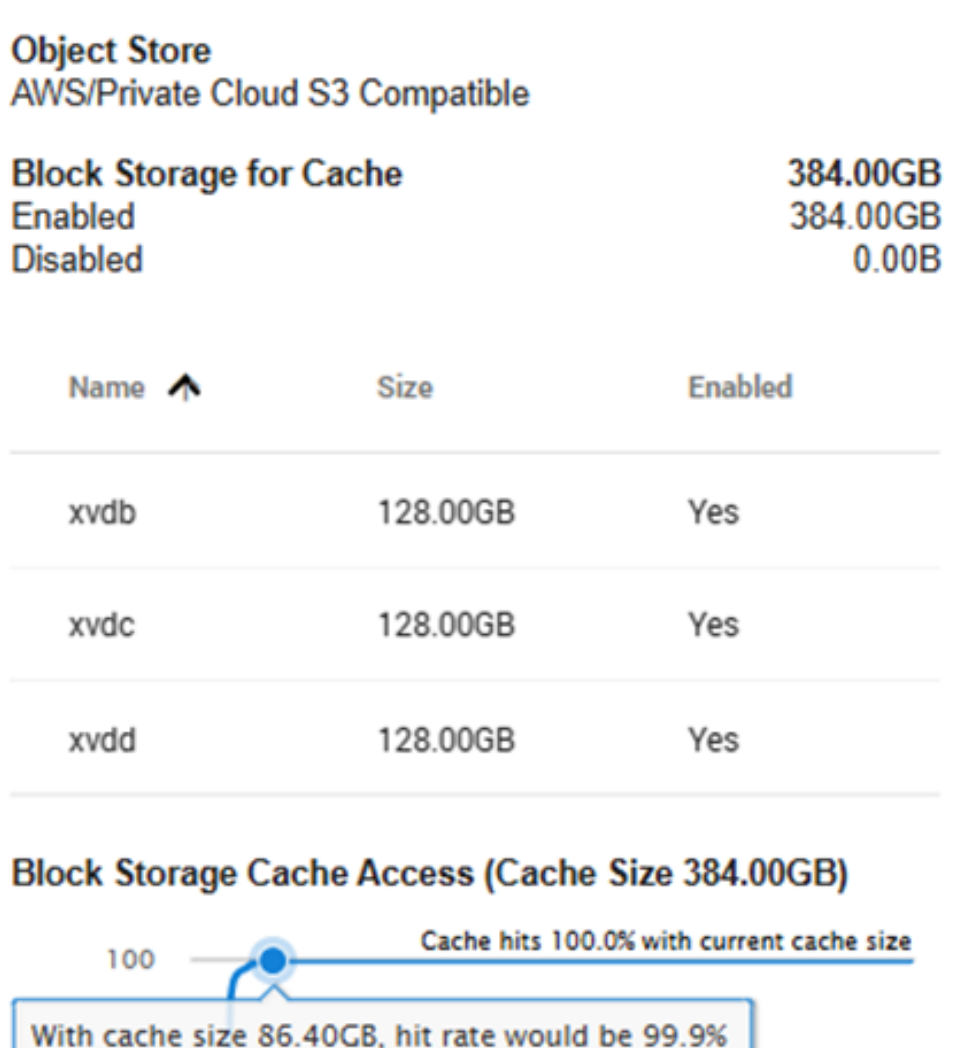

6.8.5 Block storage cache reports

Block storage cache reports, accessed via the Setup dashboard or system CLI, can determine if configured block cache capacity is at the optimal size. IO statistics are collected for up to twice the current size for the block cache. For example, if the total block cache size is 100GB, the Delphix Elastic Data engine collects statistics and displays the predicted performance assuming 200GB of block cache. This information contained in block storage cache reports can help predict if a higher cache hit rate can be achieved with a smaller or larger block cache size.

6.8.5.1 Block storage access graph

In the Setup Dashboard, the block storage cache access graph displayed in the Storage panel can determine if the configured block cache capacity is at the optimal size.

The example graph below illustrates that if the block cache size was reduced from 384GB to 86.40GB, it would not affect performance, but it would, however, lower storage costs.

The block storage cache access graph also provides the following information:

- **Cache data collection start time** - records the exact time when the cache collection was started. The start time is displayed in the user's time zone.
- **Cache data collection end time** - records the exact time the cache stops collecting data. Typically, cache collection ends when the page refreshes. The end time is displayed in the user's time zone.
- **Cache lookups** - records the number of attempts to find data in the cache.

6.8.5.2 Accessing a block cache report from the CLI

The block cache hits report can be accessed via the sysadmin CLI.

Run this command to access a cache report:

```
# storage objectStorage cacheHitsReport *> get
json: (unset)
# storage objectStorage cacheHitsReport *> commit
```

The example hit report below illustrates that if the block cache size was reduced from 360GB to 90GB, it would not affect performance, but it would, however, lower storage costs.

Example block cache hits report

```
Data collection started: Wed, 24 Jul 2024 17:33:34 -0700
Data collection ended: Thu, 25 Jul 2024 11:52:43 -0700 (18h 19m 8s)
Cache Hits: 100.0% in 360GB cache (8047497 lookups with 8047495 hits)
```

```
size : hit% 0 20 40 60 80 100
```

```
-----
45.0GB : 95.5% *****|
90.0GB : 99.9% *****|
135GB : 100.0% *****|
180GB : 100.0% *****|
225GB : 100.0% *****|
270GB : 100.0% *****|
315GB : 100.0% *****|
360GB : 100.0% *****|
```

To clear the block cache hit stats, run this command:

```
# storage objectStorage> clearCacheHits
# storage objectStorage clearCacheHits *> commit
```

6.9 Usage data management

The Delphix User-click Analytics feature is a lightweight method to capture how users interact with Delphix product user interfaces. The goal of capturing this data is to get a better understanding of product usage, engagement, and user behavior, and to use this data to improve Delphix products and customer experience. This feature is enabled by default for customers deploying on or upgrading to this version. User-click Analytics may also be disabled via the UI.

6.9.1 Disabling user-click analytics

This procedure will disable user-click analytics on both the Delphix Engine and Delphix Self-Service.

Procedure to disable user-click analytics via the GUI

Complete the following steps to disable user-click analytics via the GUI.

1. Login to the Delphix Setup application using the sysadmin **username** and **password**.

D E L P H I X
SETUP

Username

Password

Management

2. From the Outbound Connectivity panel, click **Modify**.

Outbound Connectivity ⓘ Modify

Web Proxy
Disabled
⚠ Web proxy not configured

Phone Home
Disabled

User-click Analytics
Disabled

SMTP Server
Disabled
⚠ SMTP not configured - functionality reduced: Not able to send or receive events and notifications.

3. In the **Outbound Connectivity** window, uncheck **Enable Usage Analytics**.

Outbound Connectivity

WEB PROXY
The Web Proxy Server will be used to communicate with Delphix Corp. for support, troubleshooting, upgrades, updates, and patches.

Configure web proxy

PHONE HOME SERVICE
If enabled, this service will automatically send a minimal support bundle once a day to the Delphix support site over HTTPS. This will help with future support and troubleshooting. A connection to the internet, either directly or via web proxy is required.

Enable phone home service

USER-CLICK ANALYTICS
If enabled, this service will automatically send a stream of anonymous, non-personal metadata describing user interaction with the product's user interface. This data will help us to better understand how our products are being used, and to improve our products and services.

Enable Usage Analytics

SMTP
Configure the Delphix Engine's SMTP sending service to enable email notifications. Your sysadmin email will be used for receiving system reports, events, and fault notifications.

Use an existing SMTP server
Enable email notifications for faults and events

⚠ SMTP not configured - functionality reduced: Not able to send or receive events and notifications.

Cancel Save

4. Click **Save**.

6.10 Starting, stopping, and restarting your engine

Several options are available to start, stop, restart, or reset the Delphix engine for maintenance or debugging purposes.

6.10.1 Factory reset

This option returns the Delphix Engine to the "factory default" state. This removes all the data and configurations except for the network configuration and NTP settings. The network configuration and NTP settings are retained in order to make it is easy for a user to start the Delphix Engine otherwise you will need to perform the initial steps to configure the network via the VMware Hypervisor console.

It is recommended to shut down and remove all VDBs before resetting the Delphix Engine. Failure to do so could lead to stale data mounts in target environments. For the same reason, disable all dSources that use validated sync.

Use Factory Reset only when a complete reset and reconfiguration of the Delphix Engine is necessary, as all Delphix Engine objects will be de-allocated.

Complete the following steps to reset the Delphix Engine via GUI:

1. Connect to the Delphix Setup application and log in as a system administrator.
2. From the **Dashboard** panel, click the Actions menu (...) on the top right and select **Factory Reset**.

3. Click **OK**.

6.10.2 Restart

If the Delphix Java process is in a bad state, you may need to restart it to get it operational again.

You can restart the management process safely without shutting down VDBs or disabling dSources because restarting this process has no impact on running VDBs or dSources.

Complete the following steps to restart the Delphix Management Process via GUI:

1. Login to the Delphix Setup application as a system administrator.
2. From the **Dashboard** panel, click the Actions menu (...) on the top right and select **Restart**.

3. Click **OK**.

Complete the following steps to restart the Delphix Management Process via CLI:

1. Log in to the CLI as a system administrator.
2. Go to `system > restart`
3. `delphix system restart *> commit`

6.10.3 Reboot

If the management stack for your Delphix Engine hangs, you will need to perform a reboot.

Before performing a reboot, all your VDBs must be shut down and dSources disabled to maintain data integrity.

Complete the following steps to reboot the Delphix Engine via GUI:

1. Login to the Delphix Setup application as a system administrator.
2. From the **Dashboard** panel, click the Actions menu (...) on the top right and select **Reboot**.

3. Click **OK**.

Complete the following steps to reboot the Delphix Engine via CLI:

1. Log in to the CLI as a system administrator.
2. Go to `system > reboot`
3. `delphix system reboot *> commit`

Reboot vs restart

The only difference between the Restart and Reboot is that the Restart functions without shutting down the VDBs and disabling the dSources.

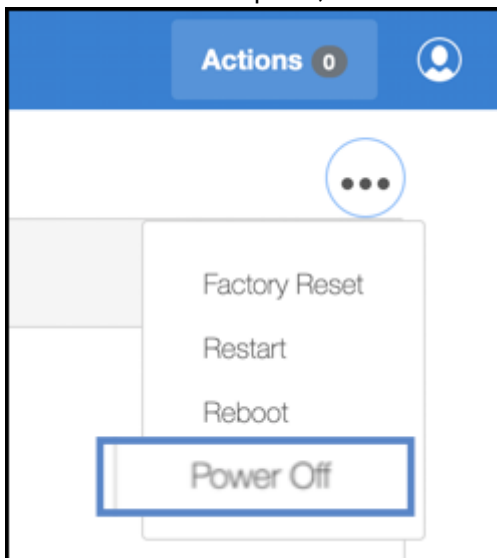

6.10.4 Power off

Occasionally, it is necessary to shut down the Delphix Engine for maintenance purposes. Before performing a shutdown, all your VDBs must be shut down and dSources disabled to maintain data integrity.

Once the Delphix Engine is powered off, you can power it back on through your hypervisor console.

Use the following steps to shut down the Delphix Engine via GUI:

1. Login to the Delphix Setup application as a system administrator.
2. From the **Dashboard** panel, click the Actions menu (...) on the top right and select **Power Off**.

3. Click **OK**.

Use the following steps to shut down the Delphix Engine via CLI:

1. `ssh sysadmin@yourengine`
2. `delphix > system`
3. `delphix system > shutdown`
4. `delphix system shutdown *> commit`

6.11 Introduction to privilege elevation profiles

This topic introduces the concept of Privilege Elevation Profiles, how they are managed, and how they are supported. Privilege Elevation Profiles exist to provide the Delphix Engine with a mechanism for running privileged commands in a secure way to achieve the following:

- Mount and Unmount NFS filesystems
- Create and Remove directories in paths not owned by the Delphix OS user
- Examine the running process list
- Run commands as root

Privilege Elevation Profiles is an advanced CLI topic and are not documented as part of the general Delphix Engine User Guide. Changes to the default sudo-based profile scripts, or the creation of new profiles that do not work as expected, can cause serious problems and render the Delphix Engine unusable. This article is aimed at advanced end-users and Delphix Professional Services consultants.

6.11.1 Support for privilege elevation profiles

Writing and troubleshooting scripts, such as those required for Privilege Elevation Profiles, is out of scope and not covered by Delphix Support.

Privilege Elevation Profiles need to be tailor-made to work with non-standard environments that may use third-party or proprietary privilege elevation mechanisms other than sudo. Customers are strongly encouraged to work with Delphix Professional Services to formulate reliable profile scripts. There is nothing that prevents customers from creating their own profile scripts. However, customers bear full responsibility for supporting and troubleshooting their own profile scripts. Support for profile scripts created by our Professional Services consultants is still supported by Professional Services.

6.11.2 How do privilege elevation profiles work?

Privilege Elevation Profiles exist within a two-tier cascading hierarchy. This means there is one default profile for the entire Delphix Engine that should contain scripts for all the operations that require privilege elevation. Additional profiles may contain a subset of the scripts. When a non-default profile is used, the Delphix Engine uses that profile's scripts where they exist and reverts to the scripts in the default profile if no script for the operation exists. By default, the Delphix Engine ships with simple scripts that pass commands to the standard UNIX **sudo** command.

All Environments added to the Delphix Engine get added with the default Privilege Elevation Profile. The profile can be assigned on a per-host basis. Below shows how a host using a non-standard profile will use scripts in the cascading model.

default profile (sudo)	custom profile (myProfile)	host profile	script used
dlpx_mount	my_mount	myProfile	my_mount
dlpx_umount	my_umount		my_umount
dlpx_rmdir			dlpx_rmdir
dlpx_mkdir			dlpx_mkdir
dlpx_ps			dlpx_ps

default profile (sudo)	custom profile (myProfile)	host profile	script used
dlpx_pfexec			dlpx_pfexec
dlpx_pfexec_as_user			dlpx_pfexec_as_user

7 Upgrade

Version compatibility and support pre-checks

Please refer to [Upgrade matrix \(see page 542\)](#) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

7.1 Upgrade

These topics describe processes for upgrading the Delphix Engine.

- [Upgrading the Delphix Engine: Overview \(see page 942\)](#)
- [Upgrade prerequisites \(see page 944\)](#)
- [Downloading the upgrade image \(see page 946\)](#)
- [Uploading the upgrade image \(see page 947\)](#)
- [Applying the upgrade \(see page 957\)](#)
- [Post upgrade \(see page 960\)](#)

7.2 Upgrading the Delphix Engine: Overview

Upgrading the Delphix Engine is a multi-step process that requires some preparation. The engine upgrade process will affect the availability of the Delphix Engine administrative interface and virtual datasets during the operation based on the type of upgrade chosen. For large configurations and Full/Apply Now upgrades, it can take one to two hours; Delay the Reboot upgrades are typically complete within 15 to 30 minutes. Please refer to [Upgrade Matrix \(see page 542\)](#) and the **version compatibility and support pre-checks** callout below before proceeding with an upgrade.

The following sections explain the steps involved in the upgrade process with links to detailed instructions for proceeding through each of them.

7.2.1 Types of upgrade

There are two types of upgrades, which are characterized by the impact they have on VDBs during the operation:

There is no need to reboot unless instructed to receive a specific fix from Delphix.

Upgrade type	Description
Delay the reboot	The user interface, API, and CLI (Command Line Interface) will only be available to the user performing the upgrade. dSources will stop refreshing from production. Policies execution will be delayed until after the upgrade has been completed. Jobs will be canceled (and resumed after upgrade if supported). Access to VDB data will not be affected by this upgrade and can be used normally.
Apply now	In addition to performing an application upgrade, DelphixOS, the operating system that runs Delphix, will be upgraded and the machine will reboot to the new OS as part of the upgrade process. The Delphix Engine will automatically disable all VDBs and dSources during the upgrade process in order to safely reboot to the new version, and thus you should schedule downtime for your VDB applications.

7.2.2 Outline of the upgrade process

Version compatibility and support pre-checks

Please refer to [Upgrade Matrix \(see page 542\)](#) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

The following is an outline of the steps for upgrading the Delphix Engine:

1. [Upload \(see page 947\)](#) the upgrade image to the Delphix Engine.

2. [Verify](#)²⁹⁰ and [resolve](#) (see page 952) the system requirements and known defects before starting the upgrade.
3. Schedule the appropriate downtime.
4. [Start](#) (see page 957) the upgrade and choose the upgrade type.
5. [Address](#) (see page 957) any runtime failures that happen as part of the upgrade.
6. [Verify](#) (see page 960) that the upgrade was completed successfully.

7.3 Upgrade prerequisites

Version compatibility and support pre-checks

Please refer to [Upgrade matrix](#) (see page 542) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

7.3.1 Scheduling downtime

To determine if an upgrade will require a reboot and VDB downtime refer to [Upgrade matrix](#) (see page 542).

If the OS will not be updated as part of the upgrade, then the upgrade process will have no impact on the availability of VDBs, and you do not need to schedule any downtime for your VDB applications.

If the OS will be updated as part of the upgrade, then you should schedule appropriate downtime for your VDB applications. The Delphix Engine will automatically disable VDBs and dSources during the upgrade. The length of the downtime will be proportional to the number of VDBs.

Long-running jobs including replication and SnapSync will fail during any upgrade.

The upgrade file for the version to which you want to upgrade should be downloaded from the [Delphix download site](#)²⁹¹. From 6.0.2.0 onwards, the upgrade images are packaged with the latest version of upgrade pre-checks. Please use the latest upgrade image from the download site since the checks will be updated on a need-by basis.

Delphix Upgrade images are approximately 5GB in size; it is recommended to have both a fast internet connection to the Delphix download site as well as to the Delphix Engine.

The upgrade image should be downloaded or moved to a location accessible to the computer used for navigating the Delphix Management application.

²⁹⁰ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/4915683/Verifying+the+listener+configuration>

²⁹¹ <https://download.delphix.com/>

Upgrading replication source

Delphix Engines can only perform replication to engines on the same or higher version. Upgrading a replication source without upgrading its replication targets could cause replication between those peers to fail.

7.3.2 Verifying the integrity of the downloaded upgrade image

SHA256 checksums can be used to verify the integrity of files downloaded via download.delphix.com²⁹². The `sha256sum` checksum listed next to each download will help ensure that a file has not changed as a result of a faulty file transfer, a disk error, or non-malicious meddling.

To calculate the checksum of downloaded files and compare them to the checksum listed on the download portal, the following utilities can be used:

- On Windows, `certutil -HashFile <upgrade.tar.gz> SHA256`
- On macOS or Unix servers with Perl installed, `shasum -a 256 <upgrade.tar.gz>`
- On Unix servers with `coreutils` installed, `sha256sum <upgrade.tar.gz>`.

7.3.3 Verifying connectivity to datasets and environments

For Upgrades from versions $> 5.3.6.0$ and $< 6.0.0.0$, your Delphix Engine will automatically quiesce all VDBs and dSources during the upgrade process in order to safely reboot to the new version.

For Upgrades from versions $\geq 6.0.0.0$, based on the [Upgrade matrix \(see page 542\)](#) you can choose to postpone the VDB downtime and update just the running stack and related packages by choosing "Delay the Restart" option. You can update the OS at a later date by completing the upgrade.

At the end of the upgrade process, the Delphix Engine will also update the Delphix platform toolkit on each connected environment.

To perform these tasks, the Delphix Engine must be able to connect to the environments in which datasets exist and must have credentials to connect to datasets or applications. Environments involved must be properly configured to enable script execution.

When an environment, dataset, or application is unreachable or misconfigured, the upgrade may encounter access errors, and may not be able to re-start it after the upgrade has been applied.

If you know that a dataset is unavailable for some reason (e.g. host not reachable on the network, or the hosting server is down), it is recommended that you **disable** it (if necessary utilize **Force Disable**).

The **Impact of Upgrade** section in the **Details** tab contains the list of datasets that have been identified as unreachable, misconfigured or not behaving correctly and are at risk of not functioning after the upgrade.

Review the warnings in this section (if any) and take appropriate actions before applying the upgrade.

²⁹² <http://download.delphix.com/>

Screenshot of warning in the “Impact of Upgrade” section

7.4 Downloading the upgrade image

The upgrade file for the version to which you want to upgrade should be downloaded from the [Delphix download site](#)²⁹³. From 6.0.2.0 onwards, the upgrade images are packaged with the latest version of upgrade pre-checks. Please use the latest upgrade image from the download site since the checks will be updated on a need-by basis.

Delphix Upgrade images are approximately 5GB in size; it is recommended to have both a fast internet connection to the Delphix download site as well as to the Delphix Engine.

The upgrade image should be downloaded or moved to a location accessible to the computer used for navigating the Delphix Management application.

Version compatibility and support pre-checks

Please refer to [Upgrade matrix](#) (see page 542) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

For upgrades from versions > 5.3.6.0 and < 6.0.0.0, you will download a migration image that is specific to the virtualization platform that your Delphix Engine is running on. The platforms for which images are provided include:

- Amazon AWS
- Microsoft Azure
- VMware ESX

For example, an ESX migration image will have a filename like

```
Delphix_6.0.0.0_2019-12-06-09-07_Standard_ESX_Migration.tar.gz.
```

²⁹³ <https://download.delphix.com/>

For upgrades from versions $\geq 6.0.0.0$, you will download an upgrade image that is generic to all the virtualization platforms that your Delphix Engine is running on. The Upgrade image will have a filename like `Delphix_6.0.1.0_2020-03-17-00-39_Standard_Upgrade.tar`.

SHA256 checksums, which can be used to verify the integrity of any downloaded files, are available via download.delphix.com²⁹⁴. Each download link should list a `sha256sum` checksum underneath. Additionally, newer releases may also contain a downloadable SHA256SUMS file, containing the checksums of all files in that directory.

To calculate the checksum of downloaded files, and confirm that they match those in the SHA256SUMS file, the following utilities can be used:

- On Windows, `certutil -HashFile <upgrade.tar.gz> SHA256`
- On macOS or Unix servers with Perl installed, `shasum -a 256 <upgrade.tar.gz>`
- On Unix servers with `coreutils` installed, `sha256sum <upgrade.tar.gz>`.

7.5 Uploading the upgrade image

Version compatibility and support pre-checks

Please refer to [Upgrade matrix \(see page 542\)](#) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

The procedure for uploading an upgrade version to the Delphix Engine is:

1. Login to the **Delphix Setup** application.
2. In the Software Version panel, click View.

²⁹⁴ <http://download.delphix.com>

Dashboard

Software Version ? View

Engine

Data Control Tower Connector

3. Click the **plus** icon to upload a new version.
4. Select the upgrade version you downloaded from the download site.

Upload Upgrade Image ✕

Select upgrade image. Once upload is complete, preparation and verification process will be started.

The new version will be displayed in the Upgrade images list and the progress of the verification will be displayed.

Click to browse
– OR –
Drag and drop a file here

Upload Status

File not selected

The upload begins on the drop or selection of a file (upgrade image) into the Upload Upgrade Image window. You will be able to view the progress in the Upload Status area.

5. In the Upload Complete dialog, click OK. You will see the new version appear on the page.

Once the upgrade image upload is complete, upgrade verification will start automatically

This verification process will notify you of any potential problems that require intervention from either you or Delphix support. The new version of the Delphix Engine cannot be installed before verification has completed. You can track the progress of verification from the **Actions** sidebar. If issues are found during the verification process, they will be listed on the version page. An upgrade will not be possible until the issues are resolved.

For more details, see [Resolving upgrade checks](#) (see page 952)

7.5.1 Upgrade verification

Version compatibility and support pre-checks

Please refer to [Upgrade matrix](#) (see page 542) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

The Delphix Engine provides a feature that allows you to verify an upgrade before applying it. Each new version of the Delphix Engine can introduce new requirements for networking, hypervisor usage, the configuration of Delphix Engine objects and more. Verification can determine if the current Delphix Engine does not meet these requirements. It can also detect if the Delphix Engine is in an unexpected state before an upgrade, in which case the best solution might be to contact support. It is recommended that customers read the [release notes](#) (see page 75) for any version they are upgrading to and look for new Delphix Engine requirements.

As soon as the upgrade image is [uploaded](#) (see page 947), a verification job is started. This verification job will use information stored within the uploaded upgrade image to examine the state of the Delphix Engine and

make a best effort to validate that applying the upgrade image will succeed. It also will notify the user of any potential problems that require either customer or support intervention.

After resolving problems noted by the verification process, verification can be run again. It is expected that customers will continue to fix problems and re-verify until no more problems remain, or until none of the remaining problems are critical.

The verification does a “dry run” of some of the upgrade procedures in order to alert the administrator of potential problems before continuing with the upgrade. It is strongly recommended that you perform this verification a day or two in advance, before your upgrade downtime begins, in order to give yourself time to address any problems flagged by the verification. Perform a re-verify closer to the upgrade, when issues have been resolved.

The procedure for verifying an upgrade is:

1. Login to the **Delphix setup** application.
2. In the **System upgrade management** panel, click **View**.
3. On the left-hand side, select the version to which you will be upgrading. Details on the version will be displayed on the right.
4. In the upper right-hand section of the Details tab, click **Verify upgrade**. Verification will run in the background. You can view the different stages with the progress during the upgrade process in the **Action** sidebar.
5. Click the **Verification results** option to view problems during verification.
6. Click the **Verification steps** option to view verification steps in detail.

7.5.1.1 Understanding the verification page

This section provides details about various components on the **Verification** page.

The screenshot shows the Delphix verification interface. On the left, there's a sidebar with 'Upgrade Images' and a list of versions. The main area displays details for the selected image: 'Upgrade Image - 6.1.0.0-snapshot.20210913234913859+jenkins-ops-devops-...'. Below this, it shows 'Install Date' (Sep 14, 2021 12:34:57 PM), 'OS Version', and 'Minimum OS Version'. A 'Verification' section is active, showing a progress bar and a 'Report' section. The report table has columns for 'Title' and 'Severity'. The table is currently empty, with a 'No Rows To Show' message at the bottom. There are five numbered callouts (1-5) pointing to various UI elements: 1 points to the 'Verification Package Version' dropdown, 2 points to the 'Verification Results' radio button, 3 points to the 'Hide Resolved/Ignored' checkbox, 4 points to the 'Ignore All Warnings' button, and 5 points to the 'Verification Steps' radio button.

1. **Verification package version** displays the version of verification checks that are bundled with an upgrade version.
2. **Verification results** provides result details about the verification outcomes. This option is selected by default. The verification result detail includes upgrade severity, duration, and reason
3. **Hide resolved/ignored** enables hiding of all verification items that are Resolved or Ignored.
4. **Ignore all warnings** allows you to ignore all warning items during the upgrade process.

Title	Severity
<input checked="" type="checkbox"/> Delphix Engine is a replication source - incompatible target version	WARNING
<input type="checkbox"/> Hotfixes not integrated	CRITICAL
<input type="checkbox"/> Hotfix metadata malformed	CRITICAL

WARNING

DESCRIPTION
This Delphix Engine is a replication source for another Delphix Engine named awrepl.dc4.delphix.com. As of the last replication, awrepl.dc4.delphix.com was running version 2019.8.8.1, which would not be replication-compatible with this Delphix Engine after upgrade.

IMPACT
Upgrading this Delphix Engine without upgrading the target Delphix Engine(s) may cause replication to fail. Replication is currently only allowed to a target Delphix Engine that is at most two major versions higher than the source Delphix Engine. Replicating to a lower version is not supported. To ensure that these engines will remain replication-compatible, check that the target Delphix Engine(s) are running at least version 2019.8.8.11 and at most two major versions higher than 2019.8.8.11.

7.5.2 Resolving upgrade checks

7.5.2.1 Overview

When verifying an upgrade, the verification job can sometimes detect particular action items called upgrade checks. These checks are items that the Delphix Engine is not capable of fixing on its own, and require customer and/or Delphix support action. Every upgrade check that appears must be resolved or ignored before the upgrade can proceed, with the exception of INFORMATIONAL checks which require no action by users. Below is a workflow for various severity types and upgrade check action.

Workflow for Severity Types and Upgrade Check Action

7.5.2.2 Upgrade severities checks

Severity	Description
CRITICAL	These checks indicate a potential problem post-upgrade with the Delphix Engine. The Delphix Engine cannot be upgraded while CRITICAL checks are present; it is likely that the engine will fail to upgrade or break catastrophically post-upgrade.

Severity	Description
WARNING	These checks indicate problems that are local to some objects on the Delphix Engine, but the overall engine can continue running. For example, WARNING checks may indicate a problem with the configuration of a particular Windows environment and indicate that if an upgrade occurs, that environment will not function properly.
INFORMATIONAL	These checks provide important information about your upgrade but do not require immediate action.

The following is a list of checks that have been added to the Delphix Engine:

1. **OS tunable settings** (CRITICAL) - Upgrade verification checks that only a certain set of operating system tunables have been adjusted. If tunable settings not on this acceptable list have been changed, please contact Delphix support.
2. **Hotfix** (CRITICAL) - Upgrade verification checks if any hotfixes have been applied to the Delphix Engine, and if any exist that are not resolved in the Upgrade version, this check will generate a Critical result. In this scenario, the Engine may still be upgraded, but we ask that you contact Delphix support to assist in addressing the check.
3. **Snapshot directory visible** (CRITICAL) - This is an internal Delphix Engine problem that Delphix support can resolve for our customers.
4. **Replication** (WARNING) - It indicates that your Delphix Engine has replication set up as either a target or source. Delphix Engines can only perform replication to engines on the same version or higher, so it is recommended to upgrade all Engines in a Replication configuration at the same time, depending on the requirements. For more information on forward-compatible replication, refer to [Replication overview](#) (see page 2399).
5. **Storage available** (WARNING) - Upgrade verification checks that there is sufficient space to perform data operations.
6. **SSL/TLS configuration** (WARNING) - Upgrade verification checks that the security configuration of the engine is up to date and properly configured.

An Upgrade check can result in multiple check results. Check results are essentially a to-do list of action items required before performing an upgrade. For example, the OS Tunables will create one line item in the UI for each present tunable that is not on our acceptable list. There are two actions that can be performed on each check result.

7.5.2.3 Upgrade check actions

Action	Description
resolve	You have taken the action necessary to solve the problem and complete the action item. Marking a result as resolved means that the customer believes the check result indicated will no longer be a problem. The next verification run will check the result again, but if it is fixed will not create any new check results.
ignore	You have no intention of fixing the problem indicated by the check result. Future verification runs will not generate that check result again if it is present. CRITICAL severity checks cannot be ignored.

7.5.2.3.1 Examples of upgrade check actions

7.5.2.3.1.1 Case A: Verification results from critical severity check

Consider a case where Delphix Engine previously had a few hotfixes installed by Delphix Support to resolve an issue.

During the upgrade process, a critical severity message is displayed indicating the hotfixes that was used to resolve issue might be lost or reappear after the upgrade.

Hence new upgrade version is missing the root cause fix for that issue. In this example, the action is either to contact Delphix Support or upgrade to a new version that no longer needs these hotfixes. After taking the necessary action, you must mark resolved for the verification steps to complete for a successful upgrade.

1 It is mandatory to resolve all critical severity errors

7.5.2.3.1.2 Case B: Verification results warning severity check with ignore all warnings

Consider a case where Delphix Engine is configured as a Delphix Replication source for another Delphix Engine.

During the upgrade process, a warning message appears because the target engine is on a version that is incompatible with the source engine version.

Hence replication is interrupted until the target engine is upgraded to a newer version.

In this example, the action steps are either to mark the issue as **Mark resolved** or **Mark ignored** because a replication-compatibility is acceptable with a few limitations (as indicated in below warning message).

Title	Severity
<input checked="" type="checkbox"/> Delphix Engine is a replication source - incompatible target version	⚠ WARNING
<input type="checkbox"/> Hotfixes not integrated	🚨 CRITICAL
<input type="checkbox"/> Hotfix metadata malformed	🚨 CRITICAL

⚠ WARNING

DESCRIPTION
This Delphix Engine is a replication source for another Delphix Engine named awrepl.dc4.delphix.com. As of the last replication, awrepl.dc4.delphix.com was running version 2019.8.8.1, which would not be replication-compatible with this Delphix Engine after upgrade.

IMPACT
Upgrading this Delphix Engine without upgrading the target Delphix Engine(s) may cause replication to fail. Replication is currently only allowed to a target Delphix Engine that is at most two major versions higher than the source Delphix Engine. Replicating to a lower version is not supported. To ensure that these engines will remain replication-compatible, check that the target Delphix Engine(s) are running at least version 2019.8.8.11 and at most two major versions higher than 2019.8.8.11.

7.6 Applying the upgrade

Version compatibility and support pre-checks

Please refer to [Upgrade matrix \(see page 542\)](#) before upgrading to a newer version. Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade. Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

Once you have uploaded an upgrade version, verified the upgrade, optionally reviewed the warnings in the Impact of Upgrade section, scheduled downtime pertaining to the type of upgrade you are performing, you can apply the upgrade.

1. Login to the **Delphix setup** application.
2. In the **Upgrade images** panel, click **View**.
3. On the left-hand side, select the version to which you will be upgrading.
4. Click **Apply upgrade** to initiate the upgrade process.

- a. For upgrades on engines already running 6.0.0.0 and greater, the user can choose the type of upgrade they want to perform.

The upgrade will run in the background. You can view the progress of the upgrade in the Action sidebar. Only the current system admin user can view the progress.

The status of the upgrade will be visible on the screen - if the upgrade is successful, the page will be redirected to the login view.

If an **Apply now** upgrade fails, the appliance will automatically roll back to the version running prior to the upgrade.

The version page will show the new version in an UPLOADED state and the Action sidebar will show that a rollback was performed. If automatic rollback was disabled through the CLI (not advised), you will have to contact support to proceed further, since you may not even be able to log in to the Delphix Engine.

7.6.1 Failure to quiesce a dataset

If Upgrade has failed to quiesce a dataset, it will pause and you will see the banner at the top of the **Upgrade** page as shown below:

While the upgrade is paused, datasets that have been quiesced are unavailable until you either roll back or continue the upgrade.

To review the list of failures, open the **Report** tab:

 Upgrade Image - 6.0.10.1

Cancel Upgrade

Retry Upgrade

Continue Upgrade

 Upgrade is unable to quiesce some datasets and has paused.

Version 6.0.10.1 - Paused on failures

Release Date Oct 29, 2021	Verify Date Not verified
OS Version 6.0.10.1	Minimum OS Version 6.0.4.0

Verification

Report

The datasets listed below were identified as having issues preventing their quiescence, and may not be available after the upgrade is complete.

You can attempt to remedy the issues by:

- Clicking Continue Upgrade (those datasets may not restart after the upgrade)
- Going to the Admin Application in a different browser (e.g. Chrome or IE) or using an incognito window in this browser and resolving issues such as wrong passwords, or stopping the datasets (using Force Disable), then clicking Retry

If you choose to Cancel Upgrade, all changes will be reversed, upgrade will end, and the Engine will be in the state it was in before you started the upgrade.

Filter: none 

Info	Source	Hosts	Failure	Action
	VDBOMSR94FDE4_JYH	ac12201.dcol1.delphix.com	Stress option upg.quiesce....	Disable stress options.
	VDBOMSR94FDE4_JYH	ac12201.dcol1.delphix.com	UPGRADE QUIESCE_SOUR...	Try the job again.

The datasets listed in the report were identified as having issues that prevented them from being quiesced, and may not be available after the upgrade is complete. Review the messages in the report and take the suggested corrective actions.

If you think that the errors may be the result of transient failures, you can click **Retry upgrade** to try again. Otherwise, it is recommended that you manually quiesce datasets that are still running. To do so:

1. Use a different browser or use an incognito window to go to the **Delphix management** application.

Failure to do so might result in losing the current session and you may not be able to return to the Upgrade pause screen.

2. Either resolve issues such as a wrong password or stop the dataset using **Force disable**.
3. In the original browser or window, click **Retry upgrade** to try applying the upgrade again.

If you want to ignore the failures to quiesce datasets and proceed with the upgrade:

1. Click **Continue upgrade**. This will attempt to quiesce all datasets which have not yet been quiesced, but will not pause on failures.

Note : This may result in datasets remaining unavailable after the upgrade is complete and the Delphix Engine restarts, since the underlying storage that backs the datasets will be unreachable during the upgrade. This may cause the databases or applications to failover or transition to a failure state, thus requiring administrator intervention to recover.

2. Review the messages in the report and take the suggested corrective actions.
3. If any of the listed datasets are critical, and you are unable to resolve the configuration errors in the report, you can **Rollback** the upgrade. If you choose **Rollback**, all changes will be reversed, the upgrade will end, and the Delphix Engine will be in the state it was in before you started the upgrade.

7.7 Post upgrade

After the upgrade is done, you will be redirected back to the login page.

Login to **Delphix setup** to make sure that the upgrade succeeded and that the new version is running.

A **post-upgrade cleanup** job is run automatically after the upgrade is done. This job refreshes environments and re-enables sources to bring objects back into a working state. VDB access will not be available at all until the environments have been refreshed and the objects are re-enabled by the job **Perform cleanup tasks following a Delphix engine upgrade**.

7.7.1 Failures

If you used **Continue upgrade** to force the upgrade as is described in [Failure to quiesce a dataset \(see page 957\)](#), the **Report** tab will contain the list of pre-upgrade quiesce failures. Upgrade will make a best effort to restore functionality to these datasets, but it may still hit the same errors that prevented the datasets from being quiesced successfully before the upgrade. You may need to manually bring up these datasets on the target hosts.

8 Security

Given that the Delphix software is meant to interact with some of your organization's most important application data, security is very important. The security section covers everything you need to know about how you can manage the Delphix software securely (user management, etc) as well as how Delphix works to ensure that the software is not susceptible to vulnerabilities. This section outlines standard hardening techniques that you should apply to every Delphix Engine in your environment. The Delphix Engine delivers its functionality through a web-based graphical user interface (GUI), web-based RESTful APIs, and a command-line interface (CLI) accessed over SSH. All three interfaces leverage the same accounts and privileges scheme. Access to the Delphix Operating System (DxOS) is restricted to Delphix Support and Delphix Professional Services and can be controlled through the Support Access Control mechanism, described below. Customer-specific software installations and modifications to the DxOS are not required or supported. Communications to/from connected systems ("sources" and "targets") should be limited to required ports, and encryption should be used wherever possible.

This section covers the following topics:

- [Security principles](#) (see page 961)
- [Product security](#) (see page 962)
- [Replication security](#) (see page 1006)
- [Object security](#) (see page 1006)
- [System configuration](#) (see page 1010)
- [GUI security](#) (see page 1011)
- [Repave Delphix Engine](#) (see page 1012)
- [Masking sensitive data](#) (see page 1038)
- [Audit logs](#) (see page 1038)
- [Support security](#) (see page 1038)
- [Password policies](#) (see page 1039)
- [Additional topics](#) (see page 1041)

8.1 Security principles

The Delphix approach is based on:

Embrace separation of duties: Isolate and compartmentalize capabilities and privileges and never give or concentrate access to a single role.

Apply the principle of least privilege: Users should obtain only those privileges needed to do their jobs and only for as long as they are needed.

Use an open, simple design: Make security mechanisms simple and easy to use, and rely on proven, peer-reviewed solutions.

Use a layered defense: Provide no single point of failure; if one layer fails to catch an error, catch it in another layer.

Use complete mediation and authentication: Control and check every access point every time.

Use fail-safes: Deny access when not explicitly authorized. Prevent faults from causing an opportunity to compromise.

Protect data at rest and data in motion: Utilize common security protocols as well as features of the source database and database software to protect data at all times.

Minimize the attack surface: Present the minimum sockets, services, webpages, and accounts necessary to operate.

Don't rely on obscurity: Be secure even if everything but the key is known.

Audit and monitor everything: Provide a tamper-proof trail of evidence.

Leverage the environment: Design the Delphix Engine to leverage the security features offered by databases, operating systems, storage devices, and networks.

Anticipate external attack vectors: Combat attacks sourced from connected systems.

Enforce strong credentials: Define and enforce password policies.

8.2 Product security

This section covers the following topics:

- [Delphix product security \(see page 962\)](#)
- [Software updates \(see page 963\)](#)
- [Network security \(see page 963\)](#)
- [Password vault support \(see page 965\)](#)
- [Certificate management \(see page 980\)](#)
- [Replication security \(see page 1006\)](#)

8.2.1 Delphix product security

8.2.1.1 Overview

Delphix takes an active approach towards the discovery of vulnerabilities by employing third-party VAPT (vulnerability and penetration testing) Teams on an annual basis, as well as actively reviewing additional tools to assess our products. We also actively monitor bugs and vulnerabilities against the list of open-source software which is integrated into our products.

Delphix investigates all known vulnerabilities, either found by customers or internally, or discovered by the VAPT Teams. During the course of this investigative process, Delphix works with the reporter of the vulnerability to gather the technical information and determine the appropriate remedial action.

Customers can perform their own security scans and audits using their access through application administrative accounts. Because operating system administrative access is not provided with the closed software virtual appliance, scans executed with this privilege level are consistent with the level of access available in the environment.

As needed, we provide compensating controls and mitigations to reduce the impact of security issues more quickly and deliver fixes as part of the standard software release process described above.

8.2.1.2 Software delivery security

We deliver our virtual software appliance and upgrade images to customers on a secure server with access control. Additionally, we provide cryptographic signatures for each image, and customers can use these signatures to ensure the software images have not been tampered with.

8.2.1.3 Ancillary components

The virtual appliance communicates with target servers running virtual databases (VDBs). The software is pushed to target servers to facilitate communication for Oracle and SQL Server databases. (Oracle toolkit and Delphix connector, respectively). This software lives outside of the DDDP product appliance, and new versions of the DDDP product will provide updated versions of this software as well.

8.2.2 Software updates

Keeping Software up to date is an important part of any hardening plan. Delphix software releases are cumulative and include bug fixes, new features, and security improvements. In addition, Delphix releases hotfixes, procedures, and workarounds for critical vulnerabilities.

8.2.2.1 Patch annually

To stay up to date, patch your Delphix Engine at least once per year. If you do not, you might have to upgrade twice to get the latest releases, and your old installed version will not be able to receive vulnerability fixes.

If possible, patch more frequently. Depending on the version you are upgrading from/to, you may be able to avoid or defer the reboot sequence, which defers downtime for your virtual databases (VDBs). This allows you to patch outside of downtime windows.

8.2.2.2 Subscribe to Delphix notifications

Delphix issues email notifications when critical vulnerabilities are discovered. Registered support accounts will automatically receive these notifications. To ensure that you receive these notifications:

- Register at least two Engine Admins with Delphix Support
- Add Delphix Support accounts when Engine Admins leave the company

8.2.3 Network security

Review the official documentation for the full list of required ports, *which depends on your database vendor*. Open only those ports that are required. The following table only lists generic requirements; you will need additional ports to integrate with databases.

 Ports

Open only required ports.

8.2.3.1 General port allocation

The Delphix Engine makes use of the following network ports irrespective of the type of database objects on it:

8.2.3.1.1 General outbound port allocations

Protocol	Port numbers	Use
TCP	21	Passive FTP connections from the Delphix Engine to the Delphix FTP server. Used for sending logs to Delphix Support.
TCP	25	Connection to a local SMTP server for sending email.
TCP/UDP	53	Connections to local DNS servers
UDP	123	Connection to an NTP server
TCP/UDP	389	Standard access to an LDAP server
TCP/UDP	636	Secure access to an LDAP server
TCP	1023	Used to complete the passive FTP connection from the Delphix Engine to Delphix Support. These ports are not used if Delphix uses a proxy server to connect to the Internet.
TCP	8415	A Delphix replication source will connect to the replication target using this destination port

8.2.3.1.2 General inbound port allocations

Protocol	Port numbers	Use
TCP/UDP	22	SSH connections to the Delphix Engine
TCP	80	HTTP connections to the Delphix GUI
TCP	443	HTTPS connections to the Delphix GUI
TCP	8415	A Delphix replication target will accept incoming connections to this port from the replication

8.2.4 Password vault support

8.2.4.1 Overview

More and more organizations use Enterprise Password Vaults (EPV) such as CyberArk and HashiCorp Vault to store securely and centrally manage identities and credentials. Delphix has added CyberArk, HashiCorp and Azure Key Vault support to the Delphix Virtualization Engine as a new authentication option for environments and databases. This minimizes the number of places where credentials need to be stored and, therefore the risk of insecure storage.

The Delphix Engine uses various authentication methods such as username/password, username/ssh key, and Kerberos credentials when connecting to hosts and databases from the Engine. These credentials are stored on the Delphix Engine in an encrypted format and can be retrieved later to perform various operations. Delphix provides an additional authentication method by integrating Virtualization with the most common vault types (CyberArk, HashiCorp, Azure Key Vault). At runtime, Delphix retrieves the credentials (passwords, ssh keys) from the customer's vault servers via API calls and avoids managing customer passwords.

8.2.4.2 Configuring password vaults

In the Setup app, system administrators can manage (add, delete, modify, and validate) vault configurations during and after the initial setup. Each engine can have multiple vaults configured of any type.

The authentication method supported for CyberArk is Certificate-based. Configuring a CyberArk vault requires providing a host address, port number, application ID, and a client certificate (certificate chain and private key).

The authentication methods supported for HashiCorp vaults are Token-based, AppRole-based, and Certificate-based. Configuring a HashiCorp vault requires providing a token ID or a role ID and secret ID or a client certificate along with the host address and port number. For HashiCorp Enterprise vaults, a namespace can also be provided.

The authentication method supported for Azure Key Vault is Client-Secret-based. Configuring an Azure Key Vault requires providing the Azure tenant ID, client ID, and client secret.

8.2.4.3 Using password vaults

The Virtualization engine retrieves credentials at runtime from a vault using a unique identifier that locates a set of credentials in a configured vault. This occurs for any activity that requires Environment access (SnapSync, Validated Sync, LogSync, as well as Environment monitoring). This may result in a significant number of requests, so any existing connection rate limits should be evaluated and adjusted accordingly. For CyberArk, the unique identifier consists of a query string. For HashiCorp Vault, it consists of four parameters: engine, path, and a pair of keys that locate the username and secret (password or SSH key) in the key-value store at that engine and path. For Azure Key Vault, it consists of the Azure Vault Name (also known as the Resource Name within Azure Vault, not to be confused with the vault name that identifies the vault in the engine), username key, and secret key.

To set up an environment or database user to use a vault, use the credential type **VaultCredential** when adding/modifying such users and specify the vault and the unique identifier of the credentials.

8.2.4.4 Roles and privileges for CyberArk and HashiCorp users

Role	Privileges
System Administrator	Can add, modify, delete, and list vault configurations.
Delphix Administrator	Can list existing vault configurations and link environment and database users to vault credentials.

8.2.4.5 Supported environments and databases

All environment users can use vault credentials. For Windows, the initial link via the Delphix Connector does not support vaults, but environment users can be subsequently updated to use vaults.

Vault integration is currently supported for SAP ASE database users, Oracle database users, and MSSQL domain users using 6.0.4 and later.

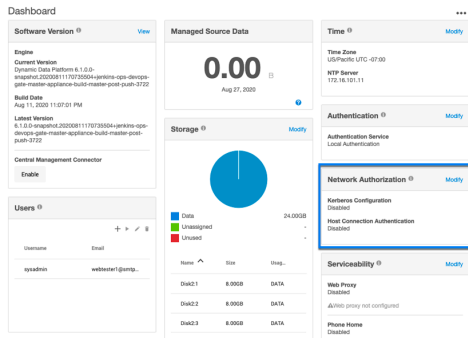

8.2.4.6 Setting up a vault via GUI

Complete setup via the GUI is available for CyberArk as of 6.0.3.0, for HashiCorp as of 6.0.4.0 and for Azure Key Vault as of 10.0.0.0.

1. Connect to the Delphix Engine <http://>
2. Add a CyberArk or HashiCorp CA certificate to the TrustStore as part of the initial configuration. Refer [TrustStore Settings](#)²⁹⁵ for steps to add a CA certificate.

²⁹⁵ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/149499396/23.0.0.0+TrustStore+settings>

- Click on the **Modify** link in the top right of the **Network Authorization** panel.

- On the Network Authorization window, click "+" to add a new vault.
- Enter the following information: Depending upon your requirements, you can set the configurations for CyberArk, HashiCorp, or Azure Key vault.

Field	Possible value and Data Type	Description
Vault Type - CyberArk		
Vault Name	<user-specified> Accepts a string value	Specifies the user-specified vault name
Vault Hostname	mycyberark.myorg.com ²⁹⁶ Accepts a URL string value	Specifies the location of the user's vault server
Port	443 Accepts an integer value	Specifies the port number through which the communication will happen
App ID	MyAppID Accepts a string value	Specifies an application ID registered with and provided by CyberArk
Authentication Certificate	---BEGIN CERTIFICATE--- <certificate> ---END CERTIFICATE--- Accepts a string value	Specifies the authentication certificate provided by CyberArk

²⁹⁶ <http://mycyberark.myorg.com>

Field	Possible value and Data Type	Description
Private Key	<CyberArk-provided> Accepts a string value	Specifies the private key provided by CyberArk for TLS based authentication
Vault-Type - HashiCorp		
Authentication method	Token	
Vault Name	<user-specified> Accepts a string value	Specifies the user-specified vault name
Vault Hostname	12.345.678.90 Accepts a URL string value	Specifies the location of the customer vault server
Port	8100 Accepts an integer value	Specifies the port number through which the communication will happen
Vault Namespace	purple Accepts a string value	Specifies the namespace configuration specific to the user environment that is provided by the HashiCorp Enterprise Platform
Token	s.abcdefghijklmnpqrstuvwxyz z123.waR7a Accepts a string value	Specifies the token specific to the user environment that is provided by the HashiCorp Enterprise Platform
Authentication method	AppRole	
Vault Name	<user-specified> Accepts a string value	Specifies the user-specified vault name
Vault Hostname	12.345.678.90 Accepts a URL string value	Specifies the location of the customer vault server
Port	8100 Accepts an integer value	Specifies the port number through which the communication will happen

Field	Possible value and Data Type	Description
Vault Namespace	purple Accepts a string value	Specifies the namespace configuration specific to the user environment. This feature is provided with the HashiCorp Enterprise Platform
RoleID	abcdefg123-4a56-7890-a2bc-34567def8901 Accepts a string value	Specifies the RoleID specific to the user environment
SecretID	ab1cde0f-123g-4h56-i789-1234jk567890 Accepts a string value	Specifies the SecretID specific to the user environment
Authentication method	Certificate	
Vault Name	<user-specified> Accepts a string value	Specifies the user-specified vault name
Vault Hostname	12.345.678.90 Accepts a URL string value	Specifies the location of the customer vault server
Port	8100 Accepts an integer value	Specifies the port number through which the communication will happen
Vault Namespace	purple Accepts a string value	Specifies the namespace configuration specific to the user environment. This feature is provided with the HashiCorp Enterprise Platform
Authentication Certificate	---BEGIN CERTIFICATE--- <certificate> ---END CERTIFICATE--- Accepts a string value	Specifies the authentication certificate provided by HashiCorp for TLS based authentication
Private Key	abcdefg123-4a56-7890-a2bc-34567def8901 Accepts a string value	Specifies the private key specific to the user environment that is provided by HashiCorp for TLS based authentication

Field	Possible value and Data Type	Description
Role Name (Optional)	purple-admin-role Accepts a string value	Specifies the certificate role name for TLS based authentication

1. Click

Validate to check the configurations before saving the vault details. The below screenshot shows an example of the HashiCorp Vault configuration.

1. Click

Save.

The added configurations can be viewed in the Network Authorization window.

8.2.4.6.1 Editing a vault via the GUI

1. Connect to the Delphix Engine [http:// <Delphix Engine>/login/index.html#serverSetup](http://<Delphix Engine>/login/index.html#serverSetup).
2. Click on the **Modify** link in the top right of the **Network Authorization** panel.
3. In the **Network Authorization** window, select a vault, then the **pencil** icon.
4. Edit your configuration.
5. Select **Edit**.

8.2.4.6.2 Deleting a vault via the GUI

1. Connect to the Delphix Engine `http:// <Delphix Engine>/login/index.html#serverSetup`.
2. Click on the **Modify** link in the top right of the **Network Authorization** panel.
3. In the **Network Authorization** window, select a vault, then select the **trashcan** icon.
4. Select **Yes** to delete the vault.

8.2.4.6.3 Adding a host user for HashiCorp

1. Login to the **Delphix Management Application** and select **Manage > Environments**.
2. Select **Add Environment**.
3. In the **Environment Setting** tab, select **Password Vault** as the Login Type.
4. Select the vault configuration and provide the secret engine name, path, and keys for the username secret and complete your environment configuration.
5. The environment will be created with the primary user using vault credentials.

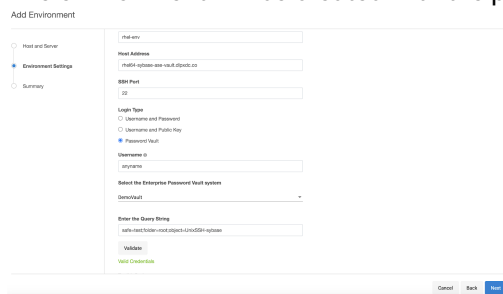

8.2.4.6.4 Adding a database user for HashiCorp

1. Login to the **Delphix Management Application**.
2. Add dSource using database credentials from HashiCorp vault by selecting **Password Vault** as the **Login Type**.

3. Provide the appropriate secret engine name, path, and keys for the username secret and complete configuration.

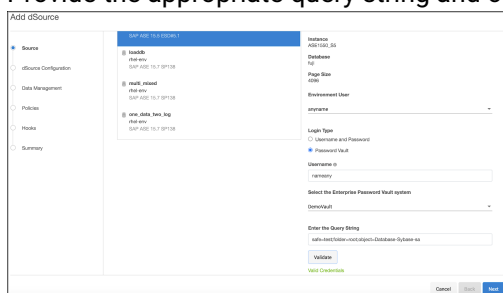

8.2.4.6.5 Adding a host user for CyberArk

1. Login to the **Delphix Management Application** and select **Manage > Environments**.
2. Select **Add Environment**.
3. In the **Environment Setting** tab, select **Password Vault** as the Login Type.
4. Select the vault configuration and provide the username, select the enterprise password vault system, and enter a query string that is a unique identifier pointing to the credentials to be retrieved and complete your environment configuration.
5. The environment will be created with the primary user using vault credentials.

8.2.4.6.6 Adding a database user for CyberArk

1. Login to the **Delphix Management Application**.
2. Add dSource using database credentials from CyberArk vault by selecting **Password Vault** as the **Login Type**.
3. Provide the appropriate query string and complete configuration.

8.2.4.6.7 Setting up a vault via CLI

1. Login as a system administrator and add a CyberArk or HashiCorp CA certificate to the TrustStore as part of the initial configuration.

[Certificate Information](#)

- SSH to <Delphix Engine IP>service passwordVault and enter **create**.

```
ip-10-110-230-197 service passwordVault>create
```

- Add a new vault configuration by entering a name, host, port, applicationId, client certificate, and private key.

```
ip-10-110-230-197 service passwordVault create
Properties
type: CyberArkPasswordVault
  name: DemoVault (*)
  applications: Delphix (*)
  clientCertificate:
```

```

type: PemClientCertificate (*)
clientCertificateChain: (required)
privateKey:(required)
host: services-uscentral.sktyop.com (*)
port: 17993 (*)

```

4. Add a new HashiCorp vault configuration by entering a name, host, port, and other authentication information based on the authentication method (Token/AppRole/Certificate) selected.

HashiCorp - Token Based Authentication

```

ip-10-110-230-197 service passwordVault create
Properties
type: HashiCorpVault (*)
name: HashiCorpDemoVault (*)
authentication:
  type: HashiCorpTokenAuthentication (*)
  token: ***** (*)
host: 10.119.132.40 (*)
port: 8200 (*)

```

HashiCorp - AppRole Based Authentication

```

ip-10-110-230-197 service passwordVault create
Properties
type: HashiCorpVault (*)
name: HashiCorpDemoVault (*)
authentication:
  type: HashiCorpAppRoleAuthentication (*)
  roleId: 20d19a46-6fd9-c78b-b7e3-e43be4c8d5c2 (*)
  secretId: ***** (*)
host: 10.119.132.40 (*)
port: 8200 (*)

```

HashiCorp - Certificate Based Authentication

```

ip-10-110-230-197 service passwordVault create
Properties
type: HashiCorpVault (*)
name: HashiCorpDemoVault (*)
authentication:
  type: HashiCorpCertificateAuthentication (*)
  clientCertificate:
    type: PemClientCertificate (*)
    clientCertificateChain: (required)
    privateKey: (required)
  roleName: (unset)
host: 10.119.132.40 (*)

```

```
port: 8200 (*)
```

8.2.4.6.8 Updating an existing vault configuration

```
ip-10-110-230-197 service passwordVault> select DemoVault
ip-10-110-230-197 service passwordVault 'DemoVault'>update
ip-10-110-230-197 service passwordVault 'DemoVault'update *> set name=TestVault
ip-10-110-230-197 service passwordVault 'DemoVault'update *> commit
ip-10-110-230-197 service passwordVault 'TestVault'>
```

8.2.4.6.9 Deleting an existing vault configuration

```
ip-10-110-230-197 service passwordVault 'TestVault'> delete
ip-10-110-230-197 service passwordVault 'TestVault' delete *> commit
ip-10-110-230-197 service passwordVault>
```

8.2.4.6.10 Adding/Modifying host users

Add an environment with user credentials from CyberArk vault. When adding a host/database user with a vault credential, the name field would be a user identifier and not the actual username. In case this field is empty, a unique identifier is generated with a hash of vault credentials.

```
ip-10-110-230-197 environment create *> set hostEnvironment.name=bbh-env
ip-10-110-230-197 environment create *> set hostParameters.host.address=bbdhcp-vault-
demo.dlpx.co
ip-10-110-230-197 environment create *> set hostParameters.host.toolkitPath="/work"
ip-10-110-230-197 environment create *> set primaryUser.name=oracleUser
ip-10-110-230-197 environment create *> set
primaryUser.credential.type=VaultCredential
ip-10-110-230-197 environment create *> set primaryUser.credential.vault=DemoVault
ip-10-110-230-197 environment create *> set primaryUser.credential.vaultCredentialId="
safe-test;folder=root;object=UnixSSH-sybase"
ip-10-110-230-197 environment create *> commit
`UNIX_HOST_ENVIRONMENT -6
Dispatched job JOB-33
ENVIRONMENT_CREATE_AND_DISCOVER job started for "bbh-env".
ENVIRONMENT_CREATE_AND_DISCOVER job for "bbh-env" completed successfully.
```

8.2.4.6.11 Adding/Modifying database users

Add dSource using database credentials from CyberArk vault.

```

ip-10-110-230-197 database link *> set name=fuji
ip-10-110-230-197 database link *> set group=Untitled
ip-10-110-230-197 database link *> set linkData.config=ASE_SI_CONF-70
ip-10-110-230-197 database link *> set linkData.dbUser=sybaseUser
ip-10-110-230-197 database link *> set linkData.dbCredentials.type=VaultCredential
ip-10-110-230-197 database link *> set linkData.dbCredentials.vault=DemoVault
ip-10-110-230-197 database link *> set linkData.dbCredentials.vaultCredential0d="safe
-test;folder=root;object=Database-Sybase-sa"
ip-10-110-230-197 database link *> set linkData.loadBackupPath='/opt/sybase/dumps"
ip-10-110-230-197 database link *> set linkData.sourceHostUser=HOST_USER-7
ip-10-110-230-197 database link *> set linkData.stagingHostUser=HOST_USER-7
ip-10-110-230-197 database link *> set linkData.stagingRepository=ASE_INSTANCE-6
ip-10-110-230-197 database link *> set
linkData.syncParameters.type=ASENewBackupSyncParameters
ip-10-110-230-197 database link *> commit
`ASE_DB_CONTAINER-1
Dispatched job JOB-39
DB_LINK job started for "Untitled/fuji".
DB_LINK job for "Untitled/fuji" completed successfully.

```

8.2.4.6.12 Update Existing Database Users

Convert an existing database to use vault credentials for the existing database user.

```

ip-10-110-230-197 > sourceconfig
ip-10-110-230-197 sourceconfig > select MyOraDB
ip-10-110-230-197 sourceconfig "MyOraDB" > update
ip-10-110-230-197 sourceconfig "MyOraDB" *> set
credentials.type=CyberarkVaultCredential
ip-10-110-230-197 sourceconfig "MyOraDB" *> set credentials.vault=MyVault
ip-10-110-230-197 sourceconfig "MyOraDB" *> set credentials.queryString="safe-
test;folder=root;object=UnixSSH-delphix_db"
ip-10-110-230-197 sourceconfig "MyOraDB" *> set db_user="Vault-User"
ip-10-110-230-197 sourceconfig "MyOraDB" *> commit

```

The set db_user="Vault-User" is an optional step. If the db_user field is not changed, then it will continue to hold the old value. This value may no longer be correct, or the change to Vault credentials may represent an increase in the customer's security stance, and they may not want their Delphix Admins to know the username.

8.2.4.6.13 Password Vault Cache

If it becomes necessary to reduce the number of vault access requests by the engine, you can enable caching in the vault configuration. To do this, enable the feature flag `PASSWORD_VAULT_CACHE` and set each vault's `cacheEnabled` to `true`, along with the desired `cacheExpiryTimeMinutes` value.

```
ip-10-110-230-197 service passwordVault create *> ls
Properties
  type: AzureVault
  name: (required)
  azureAuthentication:
    type: AzureCertificateAuthentication
    clientCertificate:
      type: KeystoreClientCertificate
      token: (required)
    clientId: (required)
    tenantId: (required)
  cacheEnabled: false
  cacheExpiryTimeMinutes: (unset)
```

```
ip-10-110-230-197 service passwordVault> select DemoVault
ip-10-110-230-197 service passwordVault 'DemoVault'>update
ip-10-110-230-197 service passwordVault 'DemoVault'update *> set cacheEnabled=true
ip-10-110-230-197 service passwordVault 'DemoVault'update *> set
cacheExpiryTimeMinutes=5
ip-10-110-230-197 service passwordVault 'DemoVault'update *> commit
ip-10-110-230-197 service passwordVault 'DemoVault'>
```

8.2.4.7 Setting up Vault via API

The vault API allows users to add, modify, delete, and list vault configurations and retrieving user credentials on a Delphix Engine.

Endpoint - <https://<Delphix Engine IP>/resources/json/delphix/service/passwordVault>

8.2.4.7.1 Sample API Request

```
{
  "type": "CyberArkPasswordVault",
  "name": "DemoVault",
  "host": "services-uscentral.skytap.com",
  "port": 17993,
  "applicationId": "Delphix",
  "clientCertificate": {
```

```

    "type": "PemClientCertificate",
    "privateKey": "-----BEGIN PRIVATE KEY-----<>-----END PRIVATE KEY-----",
    "clientCertificateChain": {
      "type": "PemCertificateChain",
      "chain": [
        {
          "type": "PemCertificate",
          "contents": "-----BEGIN CERTIFICATE-----<>-----END
CERTIFICATE-----"
        }
      ]
    }
  }
}

```

8.2.4.7.2 Deleting an existing vault configuration

```

{
  "type": "CyberArkPasswordVault",
  "name": "DemoVault",
  "host": "services-uscentral.skytap.com",
  "port": 17993,
  "applicationId": "Delphix",
  "clientCertificate": {
    "type": "PemClientCertificate",
    "privateKey": "-----BEGIN PRIVATE KEY-----<>-----END PRIVATE KEY-----",
    "clientCertificateChain": {
      "type": "PemCertificateChain",
      "chain": [
        {
          "type": "PemCertificate",
          "contents": "-----BEGIN CERTIFICATE-----<>-----END
CERTIFICATE-----"
        }
      ]
    }
  }
}

```

8.2.4.7.3 Adding/Modifying host users

Add an environment with user credentials from CyberArk vault. When adding a host/database user with a vault credential, the name field would be a user identifier and not the actual username. In case this field is empty, a unique identifier is generated with a hash of vault credentials.

```

{
  "type": "HostEnvironmentCreateParameters",
  "primaryUser": {

```

```

"type": "EnvironmentUser",
"credential": {
"type": "VaultCredential",
"vault": "CYBERARK_PASSWORD_VAULT-1",
"vaultCredentialId": "safe=test;folder=root;object=UnixSSH-sybase"
}
},
"hostEnvironment": {
"type": "UnixHostEnvironment",
"name": "bbh-env"
},
"hostParameters": {
"type": "UnixHostCreateParameters",
"host": {
"type": "UnixHost",
"address": "bbdhcp-vault-demo.dlpxdc.co",
"toolkitPath": "/work"
}
}
}
}

```

8.2.4.7.4 Adding/Modifying database users

Add dSource using database credentials from CyberArk vault.

The following is a sample API link request for MSSQL Domain User.

```

{
  "type": "LinkParameters",
  "name": "ReportServer",
  "group": "GROUP-1",
  "linkData": {
    "type": "MSSQLLinkData",
    "config": "MSSQL_SINGLE_CONFIG-5",
    "sharedBackupLocations": [],
    "encryptionKey": "",
    "sourceHostUser": "HOST_USER-3",
    "mssqlUser": {
      "password": {

```

```

    "type": "VaultCredential",
    "vault": "CYBERARK_PASSWORD_VAULT-2",
    "vaultCredentialId": "safe=test;folder=root;object=Database-MSSql-addtully"
  },
  "type": "MSSqlDomainUser"
},
"pptRepository": "MSSQL_INSTANCE-4",
"pptHostUser": "HOST_USER-3",
"ingestionStrategy": {
  "validatedSyncMode": "TRANSACTION_LOG",
  "type": "ExternalBackupIngestionStrategy"
},
"sourcingPolicy": {
  "logsyncEnabled": false,
  "type": "SourcingPolicy"
},
"syncParameters": {
  "compressionEnabled": false,
  "backupPolicy": "PRIMARY",
  "type": "MSSqlNewCopyOnlyFullBackupSyncParameters"
}
}
}

```

8.2.5 Certificate management

The Delphix Dynamic Data Platform uses SSL certificates to secure a number of different communications. Delphix provides users with the ability to manage their own certificates for HTTPS, DSP (Delphix Session

Protocol) and stunnel server connections to and from the Delphix Engine. Users are able to see multiple certificates, their attributes, and deployed status, they can also:

- Replace certificates
- Delete certificates
- Create CSRs (certificate signing requests)

8.2.5.1 Configuring network security settings

To enable and modify the extent of security settings for HTTPS and DSP (Delphix Session Protocol), click on the “Settings” button in the top right of the “Network Security” panel. This will open a new wizard where you can modify the settings.

8.2.5.1.1 Configuring settings for HTTPS and DSP.

The following procedure guides you through the process of enabling or modifying security settings for HTTPS and DSP.

1. Connect to the Delphix Engine `http://<Delphix Engine>/login/index.html#serverSetup`
2. Click on the **Settings** link in the top right of the **Network Security** panel. This will open a new wizard where you can modify the settings.

Network Security

[Settings](#)

KeyStore

CUSTOM AUTHORIZATIONS

- Perform Server (target engine) authorization for Replication**
Disabled
- Perform Client (source engine) authorization for Replication**
Disabled
- Perform Server (this engine) authorization for remote connections**
Disabled
- Perform Client (target host) authorization for remote connections**
Disabled
- Perform Server (this engine) authorization for network test remote connections**
Disabled
- Perform Client (target engine or host) authorization for network test remote connections**
Disabled

3. In the **Network Settings** wizard, you can modify the **HTTP mode**, **TLS Version**, and **TLS Cipher Suites** to be used.

Network Security Settings

- Click **Next**.
- By default, self-signed certificates are used for server authentication and username/password login acts as client authorization. You can enable the use of custom certificates and modify the extent of how they are used for the following features:

- [Replication](#) (see page 2398)
- [Remote host connections](#) (see page 984) (SnapSync, Remote hosts for Target or Server environments, and Oracle V2P)
- [Throughput tests](#) (see page 986) using the Network Performance Tool and DSP

Info: For all three features, Server authentication must be enabled for Client authentication to take effect.

Note: Any configuration change requires a stack restart to take effect. Submitting the Network Security Settings in the GUI will automatically trigger a stack restart. All jobs will be stopped, but VDBs will continue to run.

Network Security Settings

- Once the HTTP and DSP configurations have been set as desired, click **Next**.

7. You will be presented with a Summary tab. Clicking **Submit** to accept your changes will trigger a stack restart as this is necessary for the configuration changes to take effect. Note: all jobs will be stopped, but VDBs will continue to run.

8.2.5.1.2 Certificate management and remote connections

8.2.5.1.2.1 Overview

The server is the Delphix engine and the client is the remote host. This can be used for SnapSync, Oracle V2P (Virtual to Physical), and remote host connections. Once either of these options is enabled, the steps for adding certificate must be done for all environments in the engine.

8.2.5.1.2.2 Enabling server authentication

To enable server authentication, follow the below steps:

1. Replace the desired certificate for DSP (Delphix Session Protocol) in the engine KeyStore. For more details, refer to [KeyStore Settings \(see page 1002\)](#)
2. Create a JKS or PKCS#12 keystore on the remote host with the full CA chain of the replaced certificate. Make sure the created keystore has permissions such that it is readable by all environment users configured in Delphix, and enter the keystore details into the host's truststore configuration on the engine. For more details, refer to [Host DSP Configuration \(see page 999\)](#)
3. Select **Perform server (this engine) authorization for remote connections**.

Altering the authentication settings will require DSP keystore and truststore parameters to be configured for all existing environments, if not the refreshing of existing host environments will fail.

8.2.5.1.2.3 Enabling client authentication

1. DSP connector (for both Windows and Unix hosts)

To enable client authentication using DSP connector, first enable server authentication (refer to the above steps), then follow the below steps:

1. Create a JKS or PKCS#12 keystore on the remote host with the desired key pair. Make sure the created keystore has permissions such that it is readable by all environment users configured in Delphix, then enter the keystore details into the host's keystore configuration on the engine. For more details, refer to [Host DSP Configuration \(see page 999\)](#)

2. Add the full CA chain of the remote host's key pair to the TrustStore on the engine. For more details, refer to [TrustStore Settings \(see page 1004\)](#)
3. Select **Perform Client (the target host) authorization for remote connections**.
4. Once the configurations have been set as desired, you will be presented with a summary page. Clicking **Submit** will trigger a stack restart, which is necessary for the configuration changes to take effect. Note: all jobs will be stopped, but VDBs will continue to run.

2. Connector installer connector (specific for Windows hosts)

There are two ways to generate self signed certificates :

- a) By [Installing the Delphix Connector \(see page 2169\)](#), which will by default create certificates.
- b) By using [Self-signed Certificates \(see page 2164\)](#)

To enable client authentication using connector installer, you must perform the below steps for all Windows hosts, which are being added to the Delphix Engine:

1. Execute the below command to generate the PEM file for the Delphix Connector (provided or [self-signed \(see page 2164\)](#))Java KeyStore file. Also, input the store password from the `DelphixConnector.properties` when prompted.

```
keytool -exportcert -alias DelphixConnector-
{UUID_From_DelphixConnector.properties} -keystore "{Installation_Dir}
\connector\DelphixConnector.jks" -rfc -file {Custom_PEM_File_Name}
```

2. Copy the PEM's file content and paste it while adding the certificate into the Delphix Engine.
3. Add the certificate to Delphix engine using the **sysadmin** login and select **Network Security**.
4. Select **Add Certificate** and upload the certificate.
5. Once the certificate is added, enable `validateWindowsConnectorCertificate` from the Delphix engine CLI. This will restart the Delphix engine.

8.2.5.1.3 Certificate management and replication

In Replication, the Server is the Target engine and the Client is the Source engine.

8.2.5.1.3.1 Enabling server authentication

To enable Server Authentication, do the following:

1. Replace the desired certificate for DSP (Delphix Session Protocol) in the Target engine KeyStore. For more details, refer to [KeyStore Settings \(see page 1002\)](#)
2. Add the full CA chain of the replaced certificate from the Target engine to the TrustStore on the Source engine. The CA chain must match on both engines. For more details, refer to [TrustStore Settings \(see page 1004\)](#)

3. Select the option **Perform Server (target engine) authorization for Replication** for both Target and Source engines.

8.2.5.1.3.2 Enabling client authentication

To enable Client Authentication, enable Server Authentication (refer to above steps), then do the following:

1. Replace the desired certificate for DSP in the Source engine KeyStore. For more details, refer to [KeyStore Settings \(see page 1002\)](#)
2. Add the full CA chain of the replaced certificate from the Source engine to the TrustStore on the Target engine. The CA chain must match on both engines. For more details, refer to [TrustStore Settings \(see page 1004\)](#)
3. Select the option Perform Client (source engine) authorization for Replication for both Target and Source engines.
4. Once the configurations have been set as desired, you will be presented with a summary page. Clicking **Submit** will trigger a stack restart as that is necessary for the configuration changes to take effect. Note: all jobs will be stopped, but VDBs will continue to run.

8.2.5.1.4 Certificate management for throughput tests

8.2.5.1.4.1 Enabling server authentication

To enable Server Authentication, do the following:

1. If using the engine to engine tests, follow the steps for [Replication Server Authentication \(see page 985\)](#)
2. If using the engine to host tests, follow the steps for [Remote Connections Server Authentication \(see page 984\)](#)
3. Select the option **Perform Server (this engine) authorization for remote connections.**

8.2.5.1.4.2 Enabling client authentication

To enable Client Authentication, enable Server Authentication (refer to above steps), then do the following:

1. If using the engine to engine tests, follow the steps for [Replication Client Authentication \(see page 985\)](#)
2. If using the engine to host tests, follow the steps for [Remote Connections Client Authentication \(see page 984\)](#)
3. Select the option **Perform Client (target engine or host) authorization for remote connections.**
4. Once the configurations have been set as desired, you will be presented with a summary page. Clicking **Submit** will trigger a stack restart as that is necessary for the configuration changes to take effect. Note: all jobs will be stopped, but VDBs will continue to run.

- [-]** Delphix Engine generates alerts when certificates in the Keystore or truststore are expired or about to expire:
- A warning level alert is generated if certificates are expiring in 60 days.
 - Critical level alerts are generated if certificates expire in 14 days or have already expired.

8.2.5.1.5 Configuring HTTP settings for the Delphix Engine

Use the following steps to configure HTTP settings for the Delphix Continuous Data Engine.

1. Login to the Continuous Data Setup UI as a sysadmin.
2. From the Dashboard, select **Settings** under **Network Security**. This will open a new wizard where you can modify the settings.

Network Security			Settings
KeyStore	TrustStore	Open CSRs	...
D. Name	Issued By	Expires	
CN=Engine ip-10-11...	CN=Engine ip-10-11...	Sep 7, 2025 7:05:10 ...	

3. In the **Network Security Settings** screen, you can modify the **HTTP mode**, **TLS Version**, and **HTTPS Ciphers** to be used.
4. In **HTTP mode**, select one of the following:
 - a. **HTTP Only** – accepts only HTTP connections.
 - b. **HTTPS Only** – accepts only HTTPS connections.
 - c. **HTTP Redirect** – redirect all requests made over HTTP to HTTPS.
 - d. **HTTP and HTTPS** – accepts both HTTP and HTTPS connections.
 - e. **HTTP Redirect with HSTS** – redirect all requests made over HTTP to HTTPS and add the “Strict-Transport-Security” header to all responses.
 - i. HSTS is not required. By default, the Continuous Data Engine is configured to HTTP and HTTPS. This can be left as is.
 - ii. If you set up HSTS and want to revert it, follow the same steps to this point and select your previous option.

Network Security Settings

5. In **TLS Version**, select the required TLS versions.
6. In **HTTPS Ciphers**, select the required option from the drop-down list. Click the check box next to **Select All** to choose all options.
7. Click **Next** and then click **Submit**, allowing your engine to restart for the changes to take effect.
8. When the Continuous Data Engine homepage is loaded after the restart, all the HTTP requests will be redirected to the selected HTTP mode after the first load.

The above steps could fail if:

1. The certificates are not trusted – a “not secure” warning on the search bar of the browser. Certificate setup should be completed before setting up HSTS headers in order for them to be useful. Otherwise, the redirect will still happen over 302 status.
2. Your site is not prepared for HTTPS setup – for example, each of the subdomains accessed should be supporting HTTPS; parts of the application might be inaccessible otherwise.
3. Every first request whenever the cache is cleared would redirect over 302. Any further requests after the first would redirect over 307

8.2.5.1.6 Regenerating self-signed end-entity and CA certificates

In many environments, the replacement of HTTPS and/or DSP may be unnecessary.

DSP certificate is only relevant if Custom Authorizations have been configured in Network Security settings, as discussed in the [Configuring Network Security Settings](#)²⁹⁷ page. If all the options under Custom Authorizations are **Disabled**, this means that the DSP certificate is not being used.

²⁹⁷ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/83199469/19.0.0.0+Configuring+network+security+settings>

HTTPS certificate replacement is only necessary if HTTPS connections are used for web browser access.

The following process will leverage Java `keytool` utility. This is commonly available in most Java JDK installations, including those installed in the Delphix Toolkit for Unix, Linux, and Windows Environments under **<toolkit directory> /*host/java/jdk/bin/**. In the following example, `/work` is the toolkit directory. The subdirectory naming conventions from 5.3.x and 6.0.x are illustrated as:

```
$ find /work -name keytool
/work/Delphix_COMMON_f126df603015_33e2f61712c3_2_host/java/jdk/jre/bin/keytool
/work/Delphix_COMMON_f126df603015_33e2f61712c3_2_host/java/jdk/bin/keytool
/work/Delphix_COMMON_564d56b0_26ad_e6ac_f782_d15213207664_oracle_host/java/jdk/bin/
keytool
/work/Delphix_COMMON_564d56b0_26ad_e6ac_f782_d15213207664_oracle_host/java/jdk/jre/
bin/keytool
```

By the end of this process, a PKCS#12 KeyStore file is generated containing the CA certificate, DSP, stunnel server, HTTPS certificate. This file will be used for upload twice in the System Setup interface.

Other notes:

- The recommended KeyStore password, **changeit**, is used.
- For `<domain>`, replace this string with the Engine FQDN in every command. This is used as the CN (Common Name). For instance, `-dname 'CN=Engine <domain> ca,="" c="">'` would be replaced with `-dname 'CN=Engine example.delphix.com CA, C=US'`.
- The certificate aliases to be used are `tomcat` for HTTPS and `dsp` for DSP.
- The existing Delphix CA certificate in the truststore cannot be removed. Faults related to this certificate should be ignored.

8.2.5.1.6.1 Linux Version

1. Generate a new Delphix CA Certificate.

```
export PASSWORD_ENV='changeit'
keytool -genkeypair -noprompt -alias delphixca -keyalg RSA -keysize 2048
  -validity 397 -ext 1.3.6.1.5.5.7.3.1 -ext bc=ca:true -ext ku=kCS,cRLS -sigalg
SHA256withRSA -storepass:env PASSWORD_ENV -storetype pkcs12 -startdate -10000M
-dname 'CN=Engine <domain> CA, C=US' -keypass:env PASSWORD_ENV -storetype
pkcs12 -keystore keystore
```

2. Generate the HTTPS/TLS certificate

```
keytool -genkeypair -alias tomcat -keyalg RSA -keysize 2048 -validity 397 -ext
1.3.6.1.5.5.7.3.1 -ext san=dns:<domain> -ext bc=ca:false -sigalg SHA256withRSA
-storetype pkcs12 -storepass:env PASSWORD_ENV -startdate -10080M -dname
'CN=<domain>, C=US' -keypass:env PASSWORD_ENV -keystore keystore
```

3. Generate the DSP certificate

```
keytool -genkeypair -alias dsp -keyalg RSA -keysize 2048 -validity 397 -ext 1.3.6.1.5.5.7.3.1 -ext san=dns:<domain> -ext bc=ca:false -sigalg SHA256withRSA -storetype pkcs12 -storepass:env PASSWORD_ENV -startdate -10080M -dname 'CN=<domain>, C=US' -keypass:env PASSWORD_ENV -keystore keystore
```

4. Generate the STUNNEL-SERVER certificate

```
keytool -genkeypair -alias stunnel-server -keyalg RSA -keysize 2048 -validity 397 -ext 1.3.6.1.5.5.7.3.1 -ext san=dns:<domain> -ext bc=ca:false -sigalg SHA256withRSA -storetype pkcs12 -storepass:env PASSWORD_ENV -startdate -10080M -dname 'CN=<domain>, C=US' -keypass:env PASSWORD_ENV -keystore keystore
```

5. Sign the HTTP/TLS certificate

```
keytool -certreq -alias tomcat -keyalg RSA -sigalg SHA256withRSA -storetype pkcs12 -keypass:env PASSWORD_ENV -storepass:env PASSWORD_ENV -keystore keystore -file tomcat.csr
keytool -gencert -alias delphixca -ext 'san=dns:<domain>' -validity 397 -sigalg SHA256withRSA -storetype pkcs12 -storepass:env PASSWORD_ENV -keystore keystore -startdate -10080M -infile tomcat.csr -outfile tomcat.p12
keytool -importcert -alias tomcat -storetype pkcs12 -storepass:env PASSWORD_ENV -keystore keystore -file tomcat.p12
```

6. Sign the DSP Certificate

```
keytool -certreq -alias dsp -keyalg RSA -sigalg SHA256withRSA -storetype pkcs12 -keypass:env PASSWORD_ENV -storepass:env PASSWORD_ENV -keystore keystore -file dsp.csr
keytool -gencert -alias delphixca -ext 'san=dns:<domain>' -validity 397 -sigalg SHA256withRSA -storetype pkcs12 -storepass:env PASSWORD_ENV -keystore keystore -startdate -10080M -infile dsp.csr -outfile dsp.p12
keytool -importcert -alias dsp -storetype pkcs12 -storepass:env PASSWORD_ENV -keystore keystore -file dsp.p12
```

8.2.5.1.6.2 Windows version

1. Generate a new Delphix CA Certificate.

```
$ENV:PASSWORD_ENV='changeit'
.\keytool -genkeypair -noprompt -alias delphixca -keyalg RSA -keysize 2048 -validity 397 -ext 1.3.6.1.5.5.7.3.1 -ext bc=ca:true -ext ku=kCS,cRLS -sigalg SHA256withRSA -storepass:env PASSWORD_ENV -storetype pkcs12 -startdate -10000M
```

```
-dname 'CN=Engine <domain> CA, C=US' -keypass:env PASSWORD_ENV -storetype
pkcs12 -keystore keystore
```

2. Generate the HTTPS/TLS certificate

```
.\keytool -genkeypair -alias tomcat -keyalg RSA -keysize 2048 -validity 397
-ext 1.3.6.1.5.5.7.3.1 -ext san=dns:<domain> -ext bc=ca:false -sigalg
SHA256withRSA -storetype pkcs12 -storepass:env PASSWORD_ENV -startdate -10080M
-dname 'CN=<domain>, C=US' -keypass:env PASSWORD_ENV -keystore keystore
```

3. Generate the DSP certificate

```
.\keytool -genkeypair -alias dsp -keyalg RSA -keysize 2048 -validity 397 -ext
1.3.6.1.5.5.7.3.1 -ext san=dns:<domain> -ext bc=ca:false -sigalg SHA256withRSA
-storetype pkcs12 -storepass:env PASSWORD_ENV -startdate -10080M -dname
'CN=<domain>, C=US' -keypass:env PASSWORD_ENV -keystore keystore
```

4. Sign the HTTP/TLS certificate

```
.\keytool -certreq -alias tomcat -keyalg RSA -sigalg SHA256withRSA -storetype
pkcs12 -keypass:env PASSWORD_ENV -storepass:env PASSWORD_ENV -keystore keystore
-file tomcat.csr
.\keytool -gencert -alias delphixca -ext 'san=dns:<domain>' -validity 397
-sigalg SHA256withRSA -storetype pkcs12 -storepass:env PASSWORD_ENV -keystore
keystore -startdate -10080M -infile tomcat.csr -outfile tomcat.p12
.\keytool -importcert -alias tomcat -storetype pkcs12 -storepass:env
PASSWORD_ENV -keystore keystore -file tomcat.p12
```

5. Sign the DSP Certificate

```
.\keytool -certreq -alias dsp -keyalg RSA -sigalg SHA256withRSA -storetype
pkcs12 -keypass:env PASSWORD_ENV -storepass:env PASSWORD_ENV -keystore keystore
-file dsp.csr
.\keytool -gencert -alias delphixca -ext 'san=dns:<domain>' -validity 397
-sigalg SHA256withRSA -storetype pkcs12 -storepass:env PASSWORD_ENV -keystore
keystore -startdate -10080M -infile dsp.csr -outfile dsp.p12
.\keytool -importcert -alias dsp -storetype pkcs12 -storepass:env PASSWORD_ENV
-keystore keystore -file dsp.p12
```

At this point, the certificates can be installed by following the Customer Provided Key Pair method described in the [User provided key pair configuration](#)²⁹⁸ page.

The same KeyStore generated will be uploaded twice, once using alias 'dsp' and once using alias 'tomcat', to replace DSP and HTTPS certificates, respectively.

²⁹⁸ <https://cd.delphix.com/docs/latest/customer-provided-key-pair-configuration>

If this error occurs, **Failed to read file with error "Invalid KeyStore format"**, ensure the **Upload certificate from a PKCS#12 KeyStore** radio button is selected.

8.2.5.1.6.3 Windows keytool distinctions

- Given the Delphix Connector installation directory **C:\Program Files\Delphix\DelphixConnector**, the keytool.exe executable can be found at **C:\Program Files\Delphix\DelphixConnector\jre\bin\keytool.exe**.
- PowerShell set environment variable with: `$ENV:PASSWORD_ENV='changeit'`
- Similar to the comment above with path assumption, on Windows, change ./keytool to .\keytool.exe if located in the jre\bin subdirectory.

8.2.5.2 Configuring network settings

This topic provides instructions on replacing the HTTPS (HTTP Secure) certificate, the DSP (Delphix Session Protocol) certificate, and the stunnel-server certificate used by the Delphix Continuous Data Engine. The KeyStore tab within the Network Security panel displays the keys that the Delphix Continuous Data Engine uses for its identity in HTTPS, DSP, and stunnel-server communication. For a selected service, the tab displays the complete certificate chain, starting with the end-entity certificate and ending with the root CA.

There are two methods of replacing a certificate. The key difference between the two is whether Delphix or the user is providing the key pair (public and private key).

For more information on how to configure these see:

- [Delphix provided key pair configuration \(see page 995\)](#)
- [User-provided key pair configuration \(see page 993\)](#)

8.2.5.2.1 Customer provided key pair configuration

This section describes the steps to take if you are replacing the HTTPS or DSP (Delphix Session Protocol) or stunnel-server with your own key pair and certificate. To start, you need to add the key pair and full certificate chain as an entry in a file in JKS or PKCS #12 format.

[-] If replacing the key pair for the DSP application, note that when the DSP Server or Client authenticates each incoming DSP connection (if enabled), it will validate that each certificate of the incoming connection's identity chain has a "Valid From (or Not Before)" date that is after its own time.

Thus, if your Delphix Engine or host environments are running off of an incorrect (slow) time configuration, then your DSP connections will not work until the offending engine or host's time advances past all incoming certificate's "Valid From (or Not Before)" time.

If correcting the Delphix Engine's or host environment's time configuration may cause issues, then you can workaround this issue by creating and using a certificate with a "Valid From (or Not Before)" date which is before your slowest Engine or host.

1. From the **Network Security** panel, select the **Actions (...)** menu, and select **Replace Certificate**.

2. In the **Replace Certificate** window, select **Upload certificate as files**.

Replace Certificate
✕

Upload Certificate

Summary

Upload Certificate

This will replace the HTTPS CN=js532.dcenter.delphix.com, C=US certificate on this Delphix Engine.

Note: only the X.509 standard, and JKS or PKCS#12 file formats are supported. Upon certificate replacement, the management stack will need to be restarted before the new certificate will be used.

You can either upload a keystore file containing the full trust chain, or you can paste the equivalent PEM file contents.

Upload certificate from a JKS keystore

Upload certificate from a PKCS#12 keystore

PEM file contents

Select the file to upload. Upload a single keystore file containing the chain of trust.

Certificate Alias

Keystore Passcode

Key Pair Passcode (if different from Keystore Passcode)

- a. The **Certificate Alias** field is where the key pair and certificate is saved in your JKS or PKCS #12 store.
 - b. The **Keystore Passcode** field is the keystore's password.
 - c. The **Key Pair Passcode** field is the password for the given alias' key. If not set, it uses the keystore's password.
3. Click **Next** to view a summary. Then click **Submit**.

8.2.5.2.2 Delphix provided key pair configuration

8.2.5.2.2.1 Creating CSR

Perform the following steps to provide an HTTPS or DSP (Delphix Session Protocol) or stunnel-server certificate chain for a key pair created by the Delphix Continuous Data Engine.

1. Connect to the Delphix Engine HTTP://< your engine>/login/index/html#serverSetup.
2. From the **Network Security** panel, select the **Actions (...)** menu, and select **Create CSR**.

3. In the **Create CSR window** provide options for your CSR (certificate signing request). Fill up the following fields:

- a. The **Common Name (CN)** is required. If the CN is a valid hostname, then the **Subject Alternative Name (SAN)** can be left blank, otherwise a SAN should be provided. When the CN is a wildcard Common Name (e.g. *.abc.com), the SAN must be populated with every possible domain name covered by the certificate as a comma delimited list. A valid SAN is required for most browsers to accept the certificate.

Create CSR ✕

Complete the following form and click "Create". A key pair and the CSR will be generated.
Once created, it can be accessed via the CLI.

Service

HTTPS

DSP

STUNNEL SERVER

Distinguished Name

Complete form fields

Create a composite Distinguished Name

Common Name
d5250.dc4.abc.com

Subject Alternative Names

Organizational Unit
abc corp

Organization
CUPERTINO

- b. Select the service you want to create a CSR for (HTTPS or DSP).
- c. Select how to enter the distinguished name (using the provided fields, or as a composite string).

4. The Validate button will verify that your provided distinguished name follows a legal format.

Create CSR ✕

Complete the following form and click "Create". A key pair and the CSR will be generated.
Once created, it can be accessed via the CLI.

Service

HTTPS

DSP

STUNNEL SERVER

Complete form fields

Create a composite Distinguished Name

Composite Distinguished Name

test

Validate

Show advanced

Cancel **Create**

5. [Optional] Select the **Show advanced link** to provide extra options.
- a. **Force Replace:** By default, this is false and means Delphix will not replace the active key pair and certificate with the newly generated key pair and self-signed certificate. If you want to replace the active key pair right away before the signed certificate has been created this can be set to true.
 - b. **Keypair Algorithm:** Choose whether the created keypair will use the RSA or ECDSA algorithm. Once an algorithm has been chosen the user can customize the key size and the signature algorithm used.
 - i. **Key size:** The valid sizes for RSA are between 2048 and 4096 inclusive. The valid sizes for ECDSA are between 256 and 571 inclusive.
 - ii. **Signature algorithm:** The available signature algorithms for RSA are "SHA256withRSA", "SHA384withRSA", "SHA512withRSA". The available signature algorithms for ECDSA are "SHA256withECDSA", "SHA384withECDSA", "SHA512withECDSA".
6. Click **Create**. Once submitted, the CSR is created, and will show up in the **Open CSRs** tab. You can select the CSR and click on View PEM to obtain the CSR in a PEM format.

- If creating a CSR for the DSP application, note that when the DSP Server or Client authenticates each incoming DSP connection (if enabled), it will validate that each certificate of the incoming connection's identity chain has a "Valid From (or Not Before)" date that is after its own time.

Thus, if your Delphix Engine or host environments are running off of an incorrect (slow) time configuration, then your DSP connections will not work until the offending engine or host's time advances past all incoming certificate's "Valid From (or Not Before)" time.

If correcting the Delphix Engine's or host environment's time configuration may cause issues, then you can workaround this issue by signing the CSR with a "Valid From (or Not Before)" date which is before your slowest Engine or host.

8.2.5.2.2.2 Replacing a certificate

After the CSR has been signed and turned into an X.509 Certificate, you can replace the certificate using the Replace Certificate option.

- From the **Network Security** panel select the **Actions (...)** menu and select **Replace Certificate**.

The screenshot shows the 'Network Security' panel with a 'Settings' link in the top right. Below the title bar are three tabs: 'KeyStore', 'TrustStore', and 'Open CSRs'. The 'KeyStore' tab is active. A table lists certificates with columns for 'Service', 'Issued By', and 'Expires'. A three-dot menu is open over the table, showing 'Replace Certificate' and 'Create CSR' options.

Service	Issued By	Expires
HTTPS	CN=Engine ip-10-110-2...	Dec 1, 2024 6:0...
DSP	CN=Engine ip-10-110-2...	Dec 1, 2024 6:01:03 AM...
STUNNEL SERVER	CN=ip-10-110-207-104...	Dec 1, 2024 6:01:05 AM...

- In the Replace Certificate window, select PEM file contents. You can then paste the PEM response in the text box.

The PEM contents must contain a list of the entire trust chain from the newly generated end-entity certificate to the root CA. You can do this by just pasting each certificate back to back in the text box as long as they are separated by the begin and end cert tags. The order that the PEM certificates are added to the list does not matter

3. Click **Next**.

4. The **Summary** tab describes your selections. Click **Submit**.

8.2.5.2.3 Host DSP configuration

In Delphix Engine to remote host DSP (Delphix Session Protocol) communication, the Server is the engine and the Client is the host. The Add Environment wizard allows you to tell the Delphix Engine how the KeyStores and TrustStores have been set up on the remote hosts.

When the Server or Client authenticates each incoming DSP connection (if enabled), it will validate that each certificate of the incoming connection's identity chain has a "Valid From (or Not Before)" date that is after its own time.

Thus, if your Delphix Engine or host environments are running off of an incorrect (slow) time configuration, then your DSP connections will not work until the offending engine or host's time advances past all incoming certificate's "Valid From (or Not Before)" time.

If correcting the Delphix Engine's or host environment's time configuration may cause issues, then you can workaround this issue by creating and using certificates with a "Valid From (or Not Before)" date which is before your slowest Engine or host.

8.2.5.2.3.1 Adding a new single instance environment after DSP configuration changes

- If server authentication for remote host communication or engine to host throughput tests is desired, make sure the appropriate config is set. For more details refer to [Configuring Network Security Settings \(see page 981\)](#). You will need to create a JKS or PKCS#12 keystore on the remote host with the full CA chain of the DSP key in the keystore. By default, the key will just be signed by the Delphix CA, but you can replace the DSP key if you wish. Refer to [KeyStore Settings \(see page 1002\)](#) for more details.
- If client authentication for remote host communication or engine to host throughput tests is also desired, make sure the appropriate config is set. For more details refer to [Configuring Network Security Settings \(see page 981\)](#). You will need to create another JKS or PKCS#12 keystore on the remote host with the desired key pair. Make sure the created keystore has permissions such that it is readable by all environment users. Then, add the full CA chain of the remote host's key pair to the TrustStore on the engine. For more details, refer to [TrustStore Settings \(see page 1004\)](#)

Once the appropriate toggles are enabled, and the remote host is all set up, you can now add the environment as shown below. If only server authentication was desired, only the TrustStore fields need to be filled in. If client authentication was also desired, then the KeyStore fields will also need to be filled in

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click the **Actions (...)** menu next to Environments and select **Add Environment**.
5. In the **Host and Server** tab, select **Unix/Linux**.
6. Select **Standalone Host** or **Oracle Cluster**, depending on the type of environment you are adding.
7. Click **Next**.
8. In the Environment Settings tab enter your DSP configurations.
9. Select **Submit**.

8.2.5.2.3.2 Modifying an existing single instance environment after DSP configuration changes

1. If an environment already exists after enabling server/client DSP authentication, you will need to modify its attributes for host communication to continue working. As detailed in the above section [Adding a new single instance environment after DSP configuration changes \(see page 999\)](#), you will need to set up the appropriate stores on the remote host.
2. Once this is done, the **Details** page of your environment will show the existing DSP attributes.
3. Click the **pencil** icon in the top right corner to edit the DSP KeyStore and TrustStore fields accordingly.

4. Edit the DSP fields as required.

5. Once you are done select the checkmark.

Attributes

Host Address	<input type="text" value="bbdhcp-AHCI-58503.dcenter.delphix.com"/>
NFS Addresses	<input type="text" value="Separate IP Addresses/Hostnames with a comma"/>
SSH Port	<input type="text" value="22"/>
DSP KeyStore Path ⓘ	<input type="text" value="/work/my_keystore"/>
DSP KeyStore Password ⓘ	<input type="password" value="....."/>
DSP KeyStore Alias ⓘ	<input type="text" value="dsp"/>
DSP TrustStore Path ⓘ	<input type="text" value="/work/my_truststore"/>
DSP TrustStore Password ⓘ	<input type="password" value="....."/>

This will need to be done for all existing environments after DSP server/client authentication is enabled otherwise many host communication features will not work.

8.2.5.2.3.3 Adding a new Unix/Linux cluster environment after DSP configuration changes

Adding a new cluster environment is similar to adding a single instance environment, see [Adding a new single instance environment after DSP configuration changes \(see page 999\)](#). The steps for setting up the TrustStore and/or KeyStore will need to be done on ALL nodes of the cluster. For a new cluster, each node

must also be set up to have the exact same path, password, an alias, because the Delphix Engine will use the same configuration for every auto discovered node. If desired, the path, password, and alias configuration can be changed for each node, but only AFTER the cluster has been added. See [\(see page 0\) Modifying an existing Unix/Linux cluster environment after DSP configuration changes \(see page 999\)](#) for more details.

8.2.5.2.3.4 Modifying an existing Unix/Linux cluster environment after DSP configuration changes

Similar to single instance environments, an existing cluster can be modified if DSP server/client authentication is enabled. In the cluster environment's Details page, each node can be selected and modified individually. You can also use this to change the path, password, and/or alias to be different across nodes for a cluster that was just added.

8.2.5.2.3.5 DSP for windows clusters

 This will need to be done for all existing environments after DSP server/client authentication is enabled otherwise many host communication features will not work.

Before adding a Windows cluster, each node must have already been added as a single instance. See [Adding a new single instance environment after DSP configuration changes \(see page 0\)](#) if adding a new Windows cluster. If modifying a Windows cluster after a DSP configuration change, you can modify each Windows node on its environment details page See [Modifying an existing single instance \(see page 0\)](#) for more details, or just use the cluster environment details which will allow you to select which node to modify. See [Modifying an existing Unix/Linux cluster environment after DSP configuration changes \(see page 0\)](#).

8.2.5.3 KeyStore settings

The KeyStore tab in the Network Security panel displays the public key certificates that the Delphix Continuous Data Engine uses for its identity in HTTPS, DSP (Delphix Session Protocol), and stunnel-server communication. For a selected service, the tab displays the complete certificate chain starting from the end-entity certificate and ending with the root CA.

There are two methods of replacing a certificate. The key difference between the two is whether Delphix or the user is providing the key pair (public and private key). For more information see [Configuring Network Settings](#) (see page 992).

- =
 Delphix Engine generates alerts when certificates in the Keystore or truststore are expired or about to expire:
 - A warning level alert is generated if certificates are expiring in 60 days.
 - Critical level alerts are generated if certificates expire in 14 days or have already expired.

8.2.5.4 TrustStore settings

The TrustStore tab in the Network Security panel displays all the CA certificates that the Delphix Engine trusts. Click on the Actions (...) menu in the top right to reveal the options for editing the TrustStore contents:

- =
 Delphix Engine generates alerts when certificates in the Keystore or truststore are expired or about to expire:
 - A warning level alert is generated if certificates are expiring in 60 days.
 - Critical level alerts are generated if certificates expire in 14 days or have already expired.

- =
 The truststore is used for a variety of connections from the engine to external hosts, such as secure SMTP, and HTTPS proxy connections.

8.2.5.4.1 Adding a certificate

1. From the Actions menu select Add Certificate.
2. In the Add Certificate wizard paste the PEM contents of the CA certificate you want to add. The PEM contents must have the appropriate header and footer included.

Add Certificate
✕

Upload Certificate

Summary

Upload Certificate

Upload a certificate by pasting the PEM file contents. Only the X.509 standard is supported.

Paste PEM file contents

5. Click **Submit**.

8.2.5.4.2 Deleting a certificate

Use this option to delete the selected CA certificate.

Deleting any certificate that breaks an existing chain of trust is not allowed.

1. From the Actions menu select **Delete Certificate**.
2. The default Delphix CA cannot be deleted. Note that deleting any certificate that breaks an existing chain of trust is also not allowed.
3. In the Confirmation dialog select **Delete**.

Unlike the network security settings, any changes to the TrustStore will not require a stack restart.

8.3 Replication security

8.3.1 Choose encrypt and compress when replicating

Delphix provides encryption capabilities when replicating data from one Delphix Engine to another.

Upon selecting the **Encrypted** option under **Traffic Options** the Delphix Engine intelligently compresses before encrypting data. This ordering leads to lower CPU utilization and higher throughput compared to using encryption alone, with the same level of protection. See [Configuring Replication \(see page 2412\)](#) for details. The flag can be set at any time. Once set, it results in sending subsequent replication traffic streams as encrypted.

Train your Delphix Administrators to choose both options.

8.4 Object security

This section covers the following topics:

- [User management \(see page 1007\)](#)

- [Source database security \(see page 1008\)](#)
- [Source and target host security \(see page 1009\)](#)

8.4.1 User management

8.4.1.1 Secure user management

Secure user management is best achieved by integration with your centralized authentication service. Once the integration is complete, create LDAP authenticated named users to facilitate separation of duties, least privileges, and auditing. Disable the out-of-the-box generic ADMIN and SYSADMIN accounts.

8.4.1.2 Use LDAP for authentication

As described under System Configuration above, enable LDAP authentication to leverage your enterprise authentication service and enable SSL/TLS to secure LDAP connections.

8.4.1.3 Create named users

Do not create generic functional accounts such as “QA,” “DEV,” or “TEST.” Such accounts will not leave a proper audit trail and violate the separation of duties principle. Instead, create LDAP authenticated named users.

8.4.1.4 Assign least privileges

Restrict the **admin** and **sysadmin** roles to 1-2 trusted named users each. These roles are highly privileged and must be carefully managed. These roles typically map to a **DBA** and **System Administrator** respectively.

For subordinate users who need to refresh VDBs, assign “Data Operator” privilege on the VDB and “Reader” privilege on the dSource.

For subordinate users who need to provision new VDBs from dSources, assign “Provisioner” privilege on the dSource and “Provisioner” privilege on the Group to which they will assign the VDB.

8.4.1.5 Consider Delphix self-service functionality

The Delphix Self-Service functionality is targeted towards developer and tester self-service, and it contains a more sophisticated privilege model. With this functionality, Delphix Self-Service users do not have access to the Administrator GUI.

Administrators can define multiple data sources as a complete template. They also allocate server resources as a “data container.” The end-user has the ability to update data from the source, from peers using the same source, and from prior images of the source that they have created.

8.4.1.6 Disable ADMIN and SYSADMIN

Once you have established named Delphix Administrators and Systems Administrators, disable the out-of-the-box `sysadmin` and `admin` accounts. You can disable accounts through the CLI.

 When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling delphix_admin.

8.4.2 Source database security

8.4.2.1 Choose minimum privileges for Delphix DB user

The Delphix Engine requires a DB user (**delphix_db**) on your source databases. This account is necessary to detect the state of the source and stay in sync. Do not give unnecessary privileges to this user. Leverage the script provided by Delphix in the hostchecker bundle to create a user with the minimum required privileges. The DB user (e.g., **delphix_db**, which is the example used on this page) account can have the same or different user name on each of your source databases.

8.4.2.2 Protect the Delphix DB user password

Because the **delphix_db** user has access to sensitive data dictionary information, take steps to protect access to this account.

8.4.2.3 Use database encryption functionality to encrypt sensitive data at rest

Database vendors provide tools to encrypt data at rest. This encrypts data on disk in order to provide protection at rest. Use the database encryption on your source databases to encrypt sensitive or all data. Delphix integrates seamlessly with database encryption to provide protection at rest.

8.4.2.4 Choose encrypt and compress when linking

Delphix provides encryption capabilities when linking against your source databases. Encrypting while linking can lead to higher CPU utilization and higher throughput. This overhead can be reduced by selecting both the Compress and Encrypt options, in order to compress the data before it is encrypted. Train your Delphix Administrators to choose both options.

8.4.3 Source and target host security

8.4.3.1 Oracle on UNIX

Delphix support for Oracle on UNIX requires an OS account (**delphix_os**) on source database servers and on target servers that will host virtual databases or files. The Delphix Engine uses SSH to send commands to this user, which performs operations on the host. Some of these commands require elevated privileges.

= There is no actual requirement that the account be named **delphix_os** on both sources and targets. You can name the account anything you want; you can also use separate accounts on every source and target.

- **Restrict su - delphix_os to named Delphix admins and system administrators**

Other users of the system do not need access to the delphix_os user. Your Delphix Admins and System Administrators should retain su ability to facilitate troubleshooting.

- **Use SSH Key exchange to allow the Delphix engine to communicate with targets**

Implement public/private key exchange instead of username/password. This allows you to keep the password of **delphix_os** completely secret.

- **Put delphix_os on password rotation** Rotate the delphix_os password in accordance with your enterprise security policy for application software accounts. You should either:
 - implement SSH Key exchange prior to placing delphix_os on password rotation, or
 - script CLI commands to update the password inside the engine as part of the rotation process.

Delphix Professional Services can assist you in integrating Delphix with your enterprise password rotation system.

- **Restrict elevated privilege commands to the lowest level needed** The Delphix Engine uses elevated privileges to provide core features as well as optional features. The Delphix docs describe in detail which privileges are absolutely necessary, as well as techniques for further restricting the commands that can be used. The Delphix Engine ships with support for “sudo” as the privilege elevation system, but also allows for integration with third-party and custom centralized privilege management systems.

8.4.3.2 Windows

Delphix support for SQL Server requires two OS accounts for Windows:

- **delphix_src** – used on the source database server
- **delphix_trgt** – used on the servers which host Virtual Databases Both are required for the Validated Sync target

- There is no actual requirement that the account is named **delphix_src/delphix_trgt**. You can name the account anything you want; you can also use separate accounts on every source and target. Finally, you can create a single account for use everywhere, but this is not recommended since it violates the separation of duties.

8.4.3.2.1 Restrict privileged commands to the lowest level needed

The Delphix user or domain account should have exactly the privileges required in the Delphix documentation. Do not grant additional privileges.

8.4.3.2.2 Put delphix_src and delphix_trgt on password rotation

Change the user or domain account password at regular intervals or in accordance with security policies for application software accounts. Use CLI scripts to quickly modify the password across the Delphix ecosystem. Delphix Professional Services can assist you in scripting and integrating Delphix with your enterprise password rotation system.

8.4.3.2.3 Use minimum privileges on your SMB share

Consult <http://technet.microsoft.com/en-us/library/cc754178.aspx> to understand how shared folder privileges work. Use the minimum privileges.

8.4.3.2.4 Use windows authentication for SQL server

SQL Server allows authentication via Windows or Mixed mode. Mixed mode allows authentication via Windows or SQL Server.

Windows authentication is more secure; it uses Kerberos security protocol, provides password policy enforcement with regard to complexity validation for strong passwords, provides support for account lockout, and supports password expiration. <http://msdn.microsoft.com/en-us/library/ms144284.aspx>

8.5 System configuration

There are a number of configuration options available in the System Administration area that help you to secure the Delphix Engine. You can configure these during installation through the setup wizard, or later by accessing the Delphix Setup screens.

8.5.1 Maintain system time with NTP

Establish at least one, but preferably three, corporate NTP servers and sync your Delphix Engine to them. This ensures that audit and error messages display the correct time.

When configuring Delphix Engine on VMware, be sure to configure the NTP client on the ESX host to use the same servers that you enter here. On a vSphere client, the NTP client is set in the **Security Profile** section of the configuration process.

8.5.2 Enable phone home

Phone Home service will send critical information about the Delphix Engine to Delphix Support using HTTPS, on a periodic basis. The use of a Web Proxy Server is fully supported. Phone Home data allows Delphix Support to proactively detect Delphix Engines affected by critical vulnerabilities.

8.5.3 Register your Delphix engine

Registration is fast and easy, and you can do it with or without Internet connectivity from the Delphix Engine. Failing to register the Delphix Engine will impact its supportability and security in future versions.

8.5.4 Enable LDAP for authentication

The LDAP protocol is used by enterprise authentication services. Enabling LDAP authentication allows your Delphix Engine to leverage the password control features of these products, such as expiration, lockout, and complexity.

Import your LDAP server certificate into your Delphix Engine, and enable SSL/TLS.

8.5.5 Enable SMTP and/or SNMP monitoring

When the Delphix Engine encounters errors, it issues **alerts**. Configure SMTP and/or SNMP to forward **alerts** to your central monitoring system.

8.6 GUI security

8.6.1 Overview

The sections in this article cover securing the Delphix GUI, which is similar to securing other web consoles. Some of these solutions include reducing the session timeout threshold, creating a signed certificate, and disabling HTTP access.

8.6.2 Reduce inactive session timeout to 15 minutes

This means that a user will be booted from the session after 15 minutes of inactivity. This is done with a CLI command on a per-user basis by modifying the `sessionTimeout` property of the **User** object, as shown below. The default inactive timeout happens after 30 minutes.

```
myhost.delphix.com> cd user
```

```
myhost.delphix.com user> select delphix_admin
myhost.delphix.com user 'delphix_admin'> update
myhost.delphix.com user 'delphix_admin' update *> set sessionTimeout=15
myhost.delphix.com user 'delphix_admin' update *> commit
```

8.6.3 Use a URL from your domain and create a signed certificate

Do not use IP Addresses to access the Delphix Engine. Create a hostname and DNS entry, such as “delphix1.mycompany.com”. Delphix Support can assist in converting the engine from a self-signed certificate to a signed certificate that maps to your domain name. Please file a Support ticket to proceed.

8.6.4 Disable HTTP access

Disabling HTTP or configuring HTTP to redirect connections to HTTPS is recommended to protect in-flight user credentials and connections with the engine. This can be done via the [command line](#)²⁹⁹ or through the [GUI](#) (see page 987).

8.7 Repave Delphix Engine

8.7.1 Overview

Delphix continues developing solutions to mitigate potential risks as new security vulnerabilities rise. Repave is a solution applied to a Delphix Engine to eliminate any potentially compromising complications. Repave transfers datasets and required metadata to a fresh, new target engine without carrying over any compromised binaries. The target engine will function identically to the source engine.

This section discusses two repave methods:

- [Block Storage Engines](#) (see page 1012)
- [Elastic Data Engines \(Engines backed by object storage\)](#) (see page 1021)

8.7.2 Block storage engines

8.7.2.1 Prerequisites

- Repave is supported on Continuous Data (virtualization) engine with block storage as of version 13.0.0.0 and Continuous Compliance (masking) engine with block storage as of version 16.0.0.0.
- The target engine shall be in the same version as the source engine.

²⁹⁹ <https://delphixdocs.atlassian.net/continuous-data-11-0-0-0/docs/cli-cookbook-changing-http-and-https-web-connections-1>

8.7.2.2 How to Repave a Delphix Engine

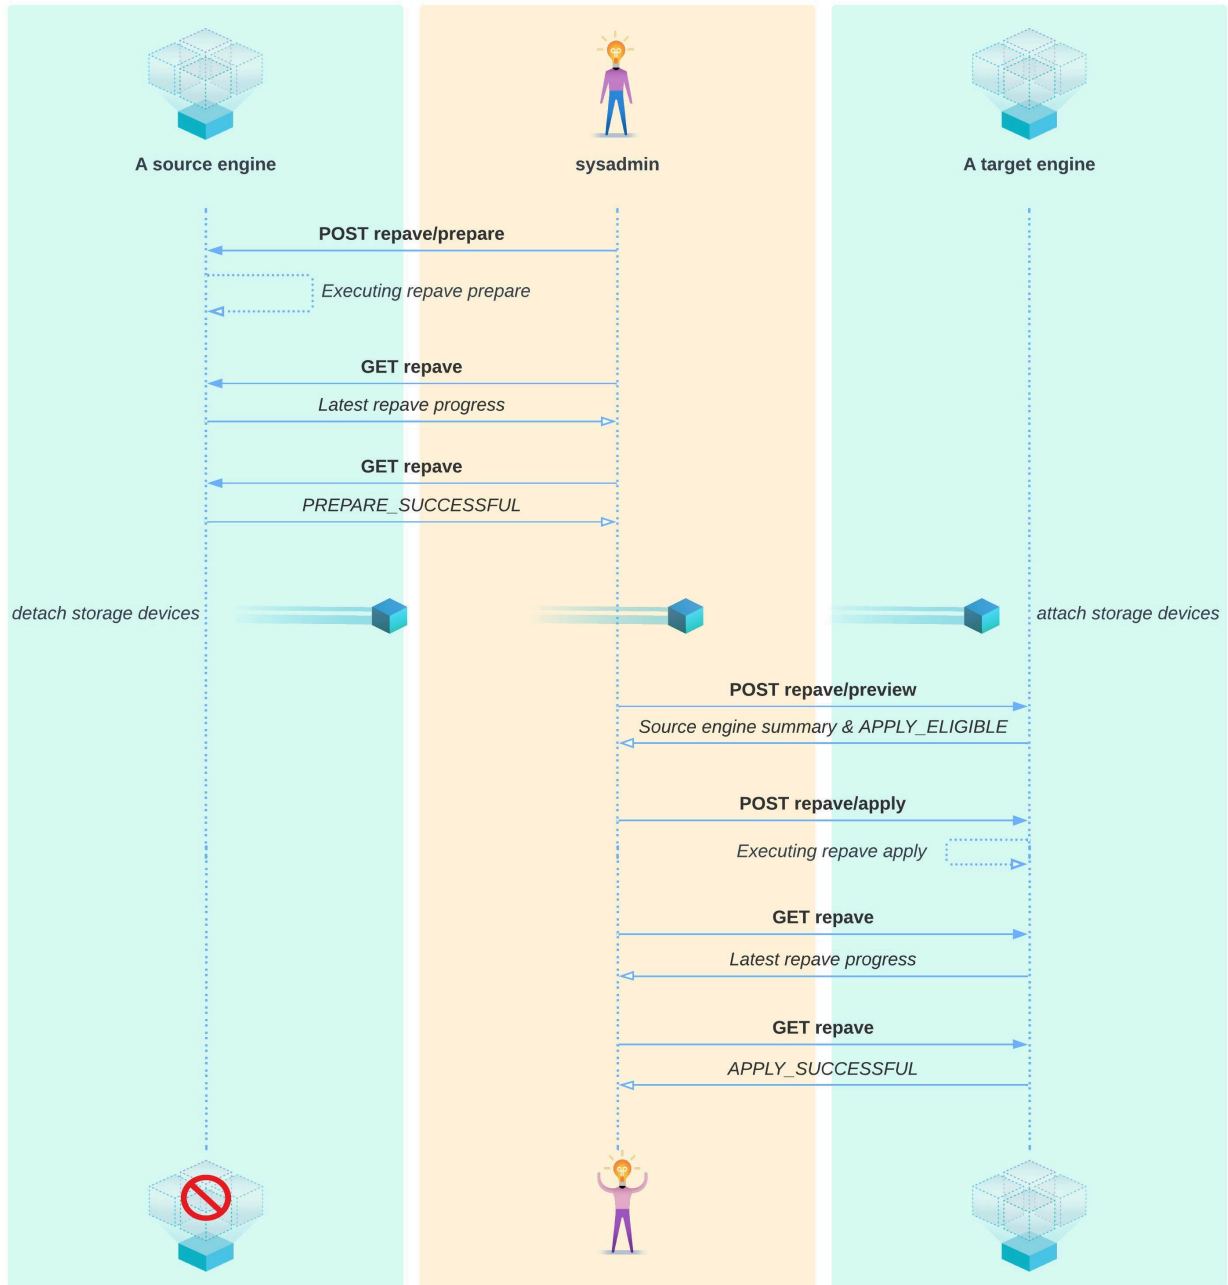

1. A sysadmin initiates **repave/prepare** on the source engine. All Delphix datasets are disabled and the Delphix management service is shut down.
2. A sysadmin detaches storage devices from the Delphix engine and attaches them to a new Delphix engine. This can be done through cloud APIs or manual operation.
3. A sysadmin calls **repave/apply** on the new engine. All previously disabled data sources are enabled again.

8.7.2.3 Repave API calls

- `POST repave/prepare` initiates the repave preparation on the source engine
- `POST repave/apply` starts the process of applying repave on the target engine.
- `GET repave` returns the repave state, configurable metadata, and engine summary of the current engine.
- `POST repave/preview` provides a preview of the configurable metadata and engine summary of the source engine, as well as determines its eligibility for applying repave on the target engine.

The representation below is a general API workflow of repave.

You might need to call APIs `Establish Session`, `Login` before calling repave APIs.

8.7.2.3.1 Tips and usage guidelines

- `repave/prepare` and `repave/apply` returns a job id. However, when the Delphix management service is down, the job API will not work. The other way to check the repave status is by calling `GET repave`.
- All running sources on the engine will be disabled by repave. However, if an environment was disabled before repave, repave might fail to enable the corresponding dSources and vDBs back. Manually enabling the environment and then enabling the dSources and vDBs should resolve the problem.
- If an engine gets stuck in an ongoing repave state for a very long time (like a few hours), restarting the Delphix management stack can forcibly reset repave to a failed state so users are able to try again.
- If the source engine has a hot fix installed, the target engine shall have the same hotfix installed as well before applying repave.

8.7.2.4 POST calls

8.7.2.4.1 Establish session

`http://{{delphix_engine_url}}/resources/json/delphix/session`

Establish an API session with Delphix, which is **required** before calling repave APIs.

```
{
  "type": "APISession",
  "version": {
    "type": "APIVersion",
    "major": {{api_version_major}},
    "minor": {{api_version_minor}},
    "micro": {{api_version_micro}}
  }
}
```

8.7.2.4.2 Login

`http://{{delphix_engine_url}}/resources/json/delphix/login`

Login as `sysadmin`, which is **required** before calling repave APIs.

```
{
  "type": "LoginRequest",
  "username": "{{sysadmin_user}}",
  "password": "{{sysadmin_pwd}}"
}
```

}

8.7.2.4.3 Repave prepare

`http://{{delphix_engine_url}}/resources/json/delphix/repave/prepare`

8.7.2.4.3.1 Introduction

Delphix sysadmin calls **repave/prepare** to start preparing for repave on the source engine compromised.

- All the sources will be disabled.
- All datasets and required metadata will be transferred to domain storage devices.
- The Delphix management service will be shut down.

8.7.2.4.3.2 Request parameters

- `ignoreDisableSourcesFailures`
If `true`, a failure to disable sources will not block the repave. The default is `false`, if not provided.
- `enableSourcesOnFailure`
If `true`, when repave fails, data source disabled by repave will be enabled again. The default is `false`, if not provided.

8.7.2.4.3.3 Response

A job id and action id will be returned if the API is called successfully.

Please make sure repave state is `PREPARE_SUCCESSFUL` before detaching domain0 storage devices.

8.7.2.4.3.4 Technical details

The Delphix engine will go through four main steps during this phase:

- **Quiesce engine**
All domain users will be forcibly kicked out. All automatic replication will be turned off. All running jobs will be cancelled or suspended. All policies will be paused. All sources will be disabled. A Repave state `PREPARE_QUIESCE_ENGINE_FAILED` indicates that the engine is failed to quiesce the engine.
- **Clean up environments**
Windows environments will be cleaned up, this step is mainly to clean up the iSCSI setting of

environment hosts. Any failure will be ignored since this step does not block repave, but users might see legacy iSCSI settings on their Windows environment hosts.

- **Extract metadata**

Metadata that presents the identity of the current engine will be extracted and stored in domain0. A Repave state `PREPARE_EXTRACT_METADATA_FAILED` indicates that the engine has failed to extract metadata.

- **Export Domain0**

Services like Delphix management stack and Postgres will be stopped before exporting the domain0 pool. The repave state `PREPARE_EXPORT_DOMAIN0_FAILED` indicates that the current engine has failed to stop services or export the domain0 pool.

```
{
  "type": "RepavePrepareParameters",
  "ignoreDisableSourcesFailures": false,
  "enableSourcesOnFailure": false
}
```

8.7.2.4.4 Repave apply

`http://{{delphix_engine_url}}/resources/json/delphix/repave/apply`

8.7.2.4.4.1 Introduction

Delphix sysadmin calls **repave/apply** on the new engine. The Delphix management service will be restarted and all previously disabled data sources will be enabled again.

- Before calling this API, make sure all domain0 pool storage devices have been attached to the target engine correctly.

8.7.2.4.4.2 Request parameters

One type of parameter is supported for version 13.0.

- `BlockStorageRepaveApplyParameters` is for Delphix Continuous Data engines with block storage.

8.7.2.4.4.3 Response

A job id and action id will be returned if the API is called successfully.

8.7.2.4.4 Technical Details

The engine will go through six main steps during the this phase. `APPLY_SUCCESSFUL` indicates the engine has applied repave successfully. You can always call `repave/apply` again if there is any failure during repaving.

- **Import Domain0**

The domain0 pool from the source engine will be imported to the target engine.

`APPLY_IMPORT_DOMAIN0_FAILED` indicates the repave apply failed to import domain0. Delphix management stack will be stopped after this step.

- **Check eligibility**

Check if the target engine is eligible to apply repave. If the target engine version is different from the source engine, or any required hotfix is not installed, or not enough space is in rpool storage, checking eligibility will fail.

- **Setup engine metadata**

Repave will shut down the Delphix management stack and call a backend task to set up engine metadata (MetaData Service) in this step, the engine metadata was originally from the source engine. It will also `rsync /var/delphix`, snapshot-based metadata and system tunable from domain0 to rpool. `APPLY_SETUP_MDS_FAILED` indicates repave fails in setting up engine metadata. The Delphix management stack will be restarted after this step.

- **Generate metadata**

The configurable metadata stored in domain0 will be generated on the target engine so the target engine will behave identically as the source engine. `APPLY_GENERATE_METADATA_FAILED` indicates repave fails to generate metadata.

- **Refresh environments**

All environments will be refreshed in parallel during this step. New iSCSI settings will be set up again on Windows environment hosts. `APPLY_REFRESH_ENV_FAILED` indicates repave fails to refresh environments.

- **Unquiesce engine**

In this step, all sources disabled by repave will be enabled again, all scheduled replication jobs will be resumed and policy execution will be resumed. `APPLY_UNQUIESCE_ENGINE_FAILED` indicates repave fails to unquiesce engine.

```
{
  "type": "BlockStorageRepaveApplyParameters"
}
```

8.7.2.4.5 Repave status

`http://{{delphix_engine_url}}/resources/json/delphix/repave`

8.7.2.4.5.1 Introduction

`GET /repave` will show:

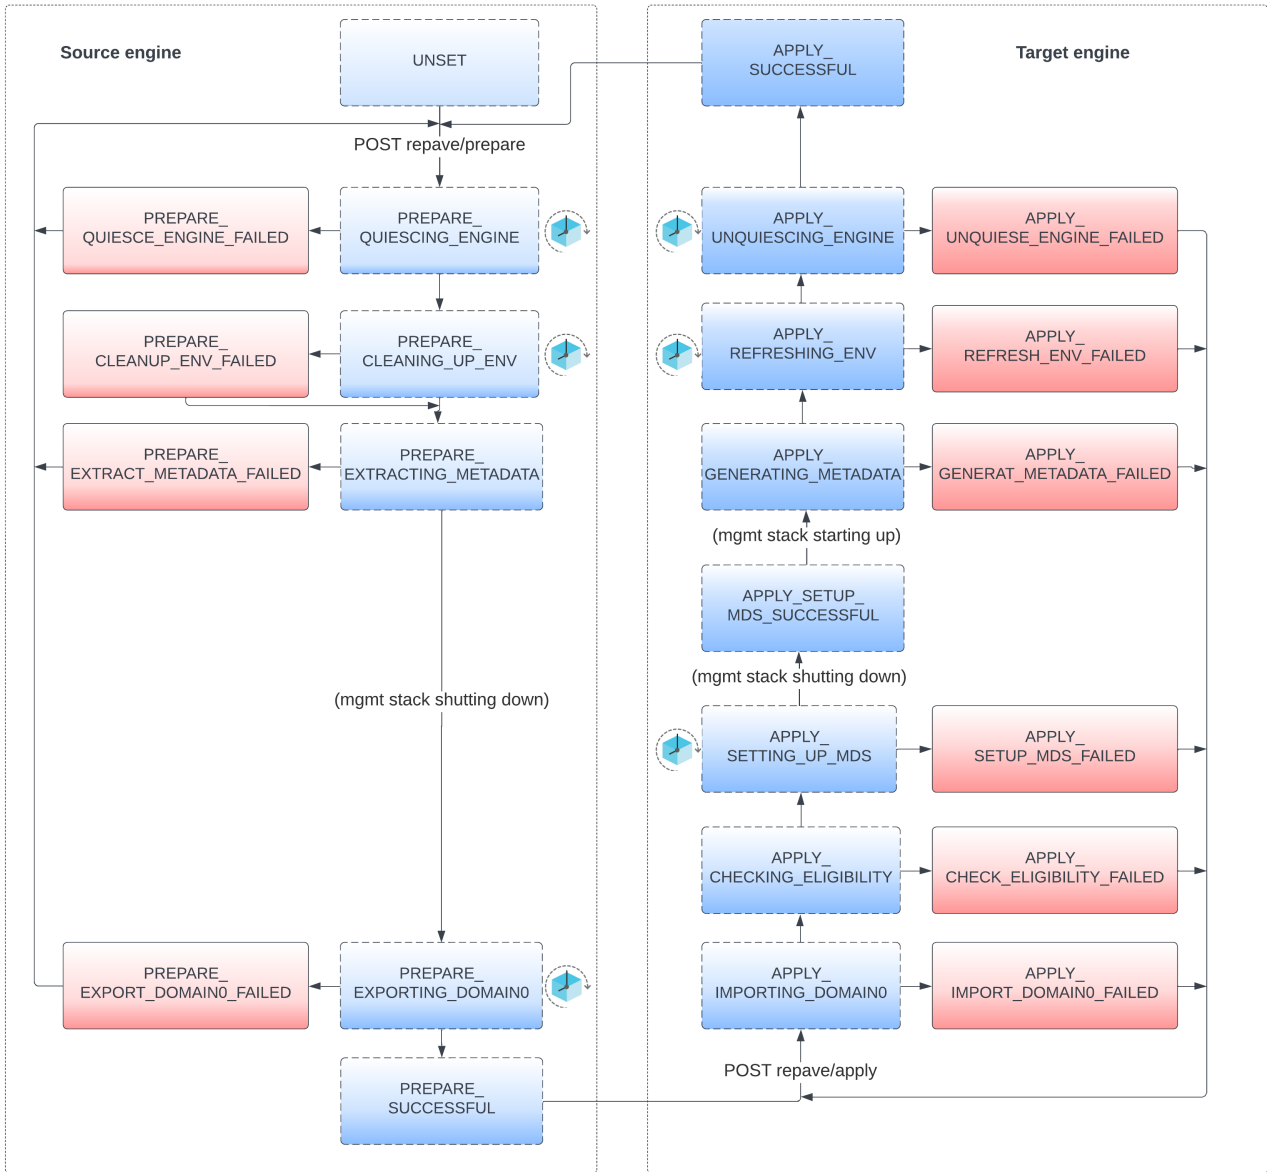

- Latest state of Repave.
- Summary of the current engine.
- Metadata of the current engine that will be migrated to the target engine.

8.7.2.4.5.2 Tips

- Always use `GET /repave` to check repave progress.
- When the Delphix management service is restarting, `GET /repave` might not respond, wait for a few minutes and try again.
- Use the repave state transition diagram below for reference.

Repave State Transition Diagram

Simon Lin | July 15, 2023

8.7.2.4.6 Repave preview

http://{{delphix_engine_url}}/resources/json/delphix/repave/preview

8.7.2.4.6.1 Introduction

- `repave/preview` is for users to preview the summary and metadata of a source engine.
- The `APPLY_ELIGIBLE` state indicates the current engine is eligible to apply repave.

- The `APPLY_CHECK_ELIGIBILITY_FAILED` state indicates the current engine is not eligible to apply repave, the actual reason can be found from `stateDetail`.

8.7.2.4.6.2 Request parameters

One type of parameter is supported for version 13.0.

- `BlockStorageRepavePreviewParameters` is for engines with block storage.

8.7.2.4.6.3 Response

The engine summary and metadata of the source engine.

8.7.2.4.6.4 Technical details

- The engine summary and metadata of the source engine is stored in the domain0 rpool. `repave/preview` will try to import domain0 pool before previewing them, then domain0 pool will be exported again.

```
{  
  "type": "BlockStorageRepavePreviewParameters"  
}
```

8.7.3 Elastic Data engines (engines backed by object storage)

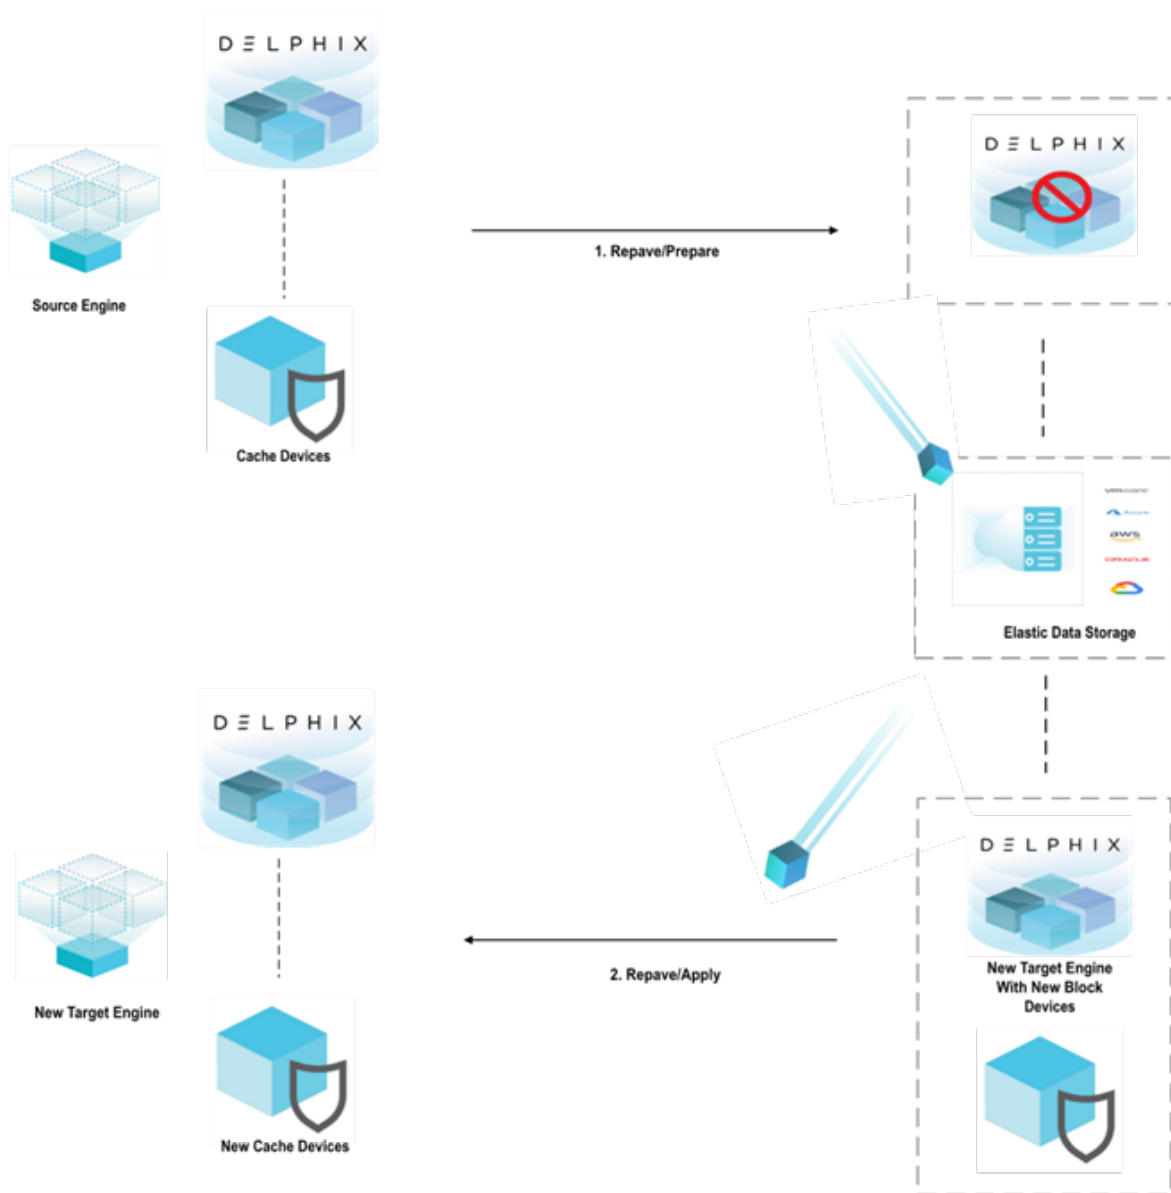

8.7.3.1 Prerequisites

- Repave on elastic data engines is supported as of version 27.0.
- The target engine must be in the same version as the source engine.

8.7.3.2 How to repave a Delphix Elastic Data Engine

Repave with New Cache Devices

1. A sysadmin initiates **repave/prepare** on the source engine. All Delphix datasets are disabled and the Delphix management service is shut down.
2. The new target engine will connect to the same object storage data container during the repave apply process, with object parameters provided by the sysadmin in the repave apply payload.
3. To get an immediate and consistent performance on the new engine, the sysadmin can detach the block storage devices for cache from the Delphix engine and attach them to a new Delphix engine. This can be done through cloud APIs or manual operation. Another option is to use new/different block storage devices for cache with the caveat that the previously cached data from the source engine will be lost.

4. A sysadmin calls **repave/apply** on the new engine. All previously disabled data sources are enabled again.

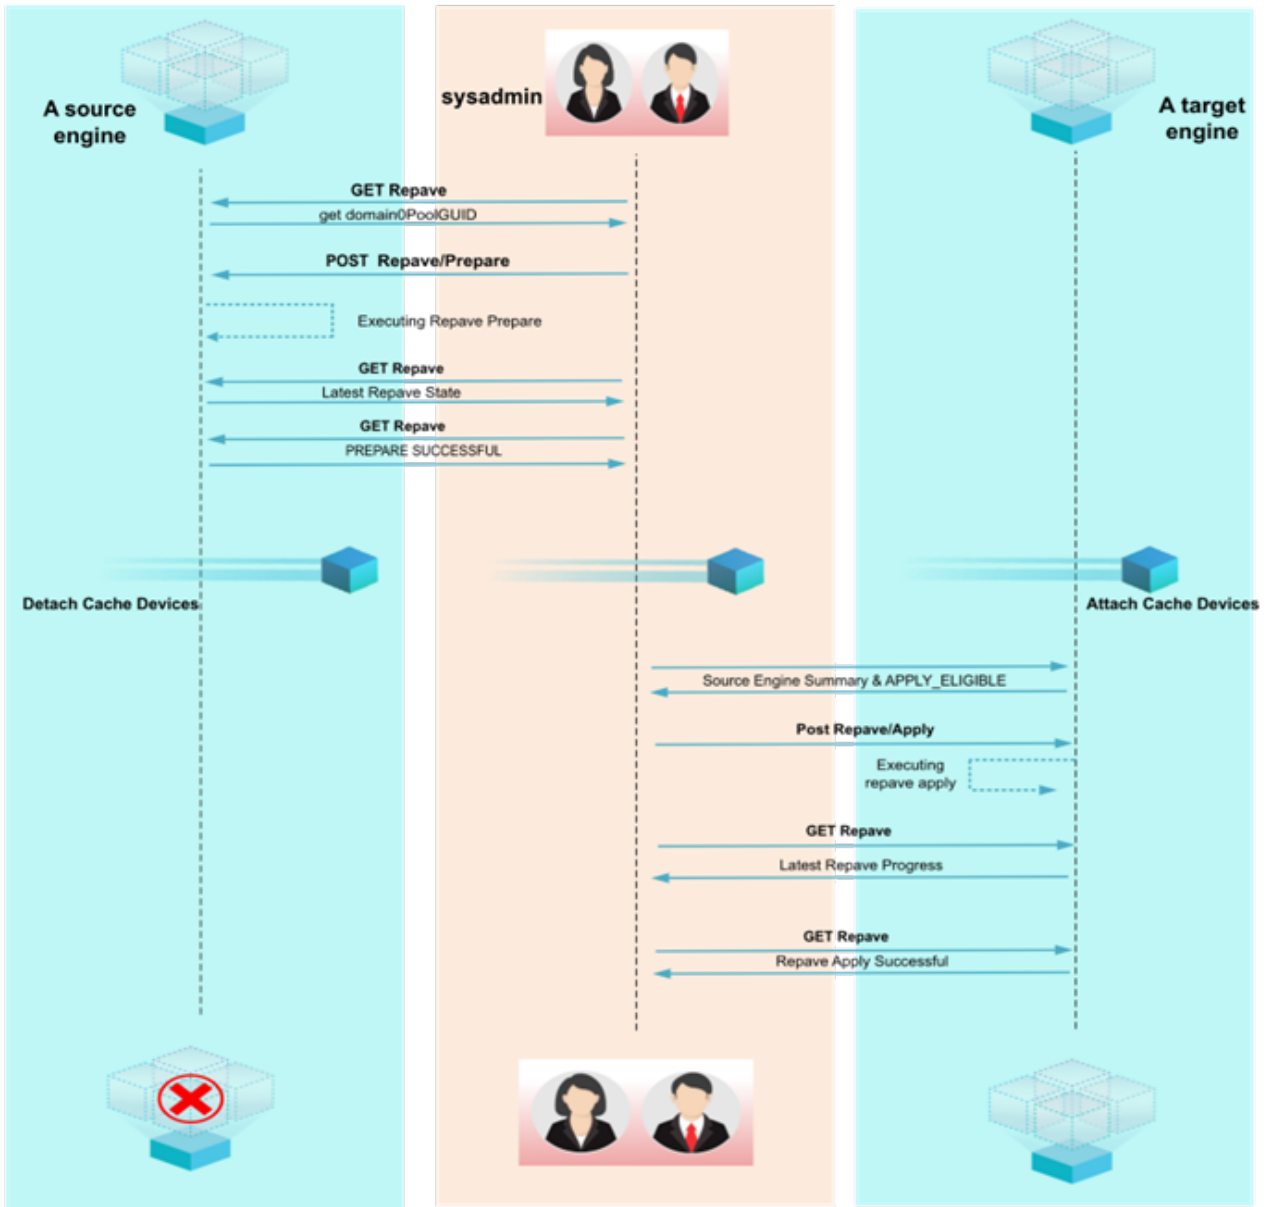

8.7.3.3 Repave API calls

- GET `repave` on the source engine obtains the `domain0PoolGUID` value for the next step.
- POST `repave/prepare` initiates the repave preparation on the source engine.
- POST `repave/preview` (optional) on the target engine provides a preview of the configurable metadata and engine summary of the source engine and determines its eligibility for applying repave on the target engine.
- POST `repave/apply` on the target engine starts the process of applying repave from the source engine to the target engine.
- GET `repave` returns the repave state, configurable metadata, and engine summary of the target engine.

 The API calls to repave can also be executed with the command line interface (CLI). The equivalent CLI command(s) are listed with the REST API command. It is recommended CLI commands are used to execute the repave process.

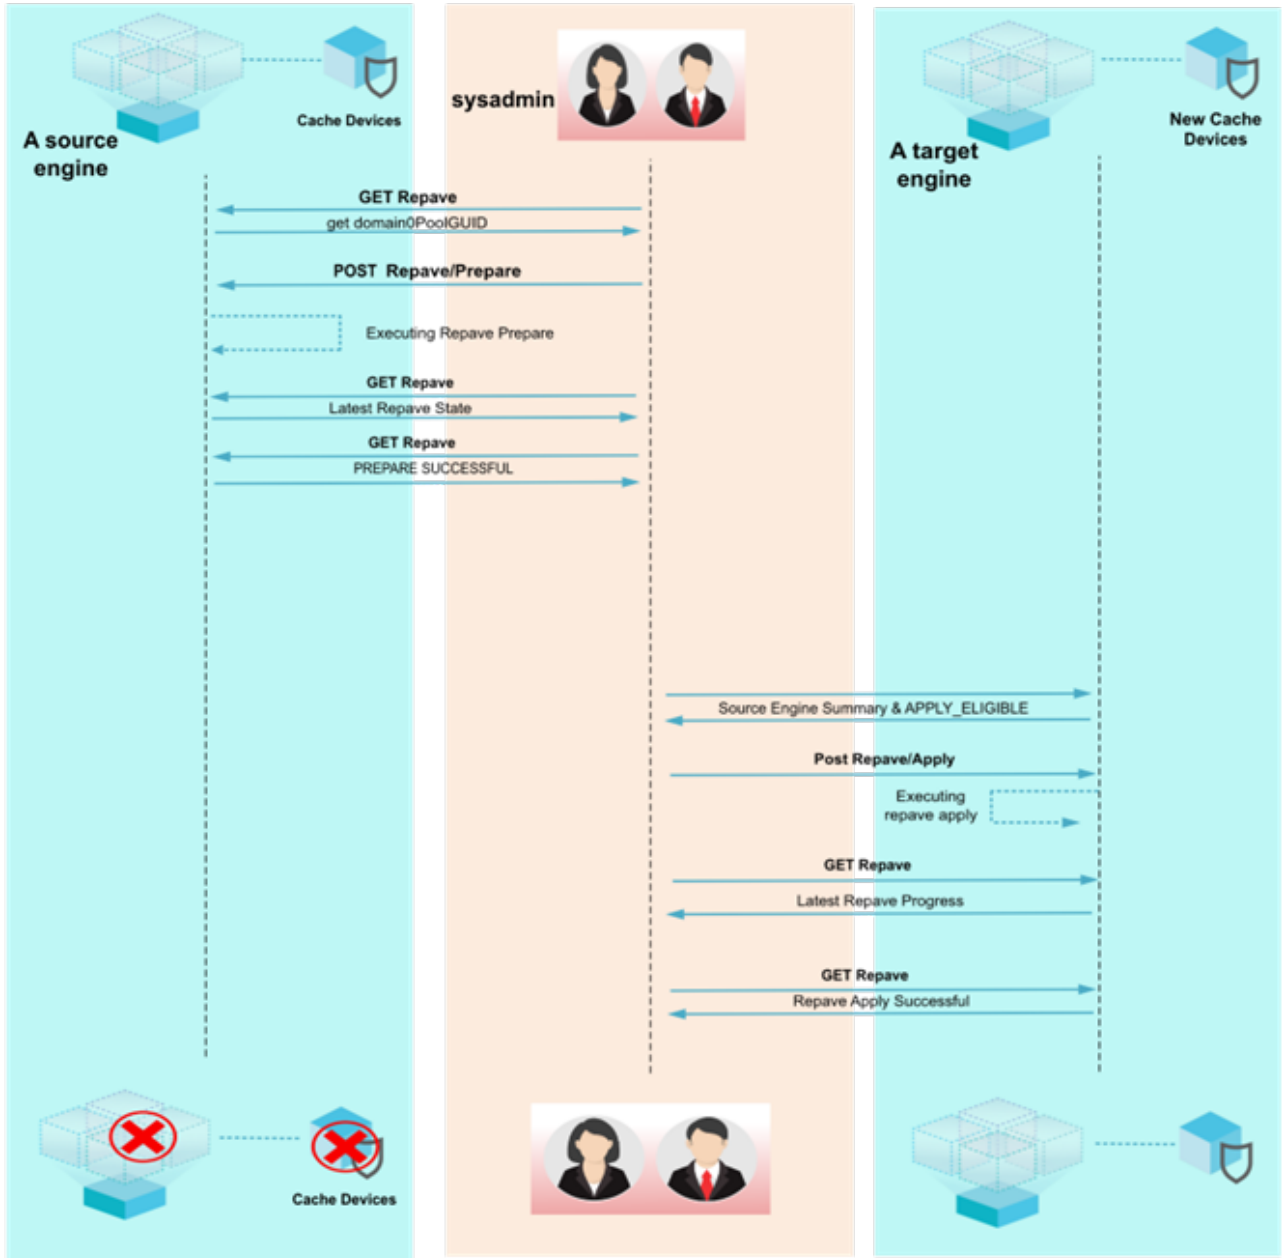

This image illustrates a repave workflow using old cache devices:

Repave with Old Cache Devices

This image illustrates a repave workflow using new cache devices:

Repave with New Cache Devices

8.7.3.4 REST API POST calls to execute the repave process

8.7.3.4.1 Establish a session

8.7.3.4.2 `http://{{delphix_engine_url}}/resources/json/delphix/session`

Establish an API session with Delphix, which is **required** before calling repave APIs.

```
{
  "type": "APISession",
  "version": {
    "type": "APIVersion",
    "major": {{api_version_major}},
    "minor": {{api_version_minor}},
    "micro": {{api_version_micro}}
  }
}
```

 You do not need to establish a session using the CLI.

8.7.3.4.3 Login

`http://{{delphix_engine_url}}/resources/json/delphix/login`

Log in as `sysadmin`, which is **required** before calling repave APIs.

```
{
  "type": "LoginRequest",
  "username": "{{sysadmin_user}}",
  "password": "{{sysadmin_pwd}}"
}
```

The CLI command for login requires logging into the Delphix engine host using the sysadmin user:

```
ssh sysadmin@<delphix_engine_hostname>
```

8.7.3.4.4 Get the pool GUID from the repave GET API

Before initiating the repave prepare process on the source engine, the sysadmin needs to know the domain0PoolGUID value on the source engine that will be used during the repave apply phase.

The sysadmin can get the domain0PoolGUID value by executing the repave GET API call on the source engine, which is shown in the [repave status](#)³⁰⁰ section.

8.7.3.4.5 Prepare block storage devices used for cache

There are two options when configuring the block storage devices for cache:

- use the existing, original (old) cache devices from the source engine, or
- use new cache devices.

If planning on using the existing (old) cache devices from the source engine, make sure to note from the hypervisor layer which block devices will need to be moved to the target engine before the apply phase.

If planning on using new cache devices, the device names can be viewed on the target engine using the CLI command `storage device ls`. This list of device names is needed for the parameter `RepaveCacheDevicesNew` during the repave apply command. repave apply command.

8.7.3.4.6 Repave prepare

`http://{{delphix_engine_url}}/resources/json/delphix/repave/prepare`

CLI commands:

```
repave/prepare
commit
```

Introduction

Delphix sysadmin calls **repave/prepare** to start preparing for repave on the source engine. During the **repave/prepare** phase:

- All the sources will be disabled.
- All datasets and required metadata will be transferred to cloud storage.
- The Delphix management service will be shut down.

Request parameters

`ignoreDisableSourcesFailures`

If true, a failure to disable sources will not block the repave. The default value is false, if not provided.

`enableSourcesOnFailure`

If true, when repave fails, data source disabled by repave will be enabled again. The default value is false, if not provided.

³⁰⁰ [https://cd.delphix.com/docs/latest/elastic-data-engines-engines-backed-by-object-storage#id-\(27.0.0.0\)ElasticDataengines\(enginesbackedbyobjectstorage\)-Repavestatus](https://cd.delphix.com/docs/latest/elastic-data-engines-engines-backed-by-object-storage#id-(27.0.0.0)ElasticDataengines(enginesbackedbyobjectstorage)-Repavestatus)

Response

If successful, the API will return a job ID and an action ID.

- Before starting the repave apply operation on the new target engine, verify the repave state is `PREPARE_SUCCESSFUL` on the source engine.

To check the repave state with the CLI:

```
repave
  get
==> state: PREPARE_SUCCESSFUL
```

8.7.3.4.7 Repave status

`http://{{delphix_engine_url}}/resources/json/delphix/repave`

CLI command:

```
repave/get
```

`GET /repave` will show:

- Current state of the repave process.
- Summary of the current engine.
- Metadata of the current engine that will be migrated to the target engine.

8.7.3.4.7.1 Tips

- Always use `GET /repave` before initiating repave prepare to see the engine summary and engine metadata. Copy the output to a saved text file for use later.
- Always use `GET /repave` to check the repave progress.
- When the Delphix management service is restarting, `GET /repave` might not respond, wait for a few minutes and try again.

8.7.3.4.8 Repave preview

`http://{{delphix_engine_url}}/resources/json/delphix/repave/preview`

8.7.3.4.8.1 Introduction

- Repave/preview (optional) is for users to preview from the target engine, the summary and metadata of a source engine that will be applied to the target engine.
- The `APPLY_ELIGIBLE` state indicates the target engine is eligible to apply repave.
- The `APPLY_CHECK_ELIGIBILITY_FAILED` state indicates the current engine is not eligible to apply repave, the actual reason can be found from the `stateDetail` attribute.
- Before calling this API ensure you have the `domain0PoolGUID` from the source engine and other object storage profile information and credentials used for the source engine.

8.7.3.4.8.2 Request parameters

Each cloud platform requires different parameters.

AWS S3 parameters

- type: `S3ObjectStoreRepavePreviewParameters`
- accessCredentials : defined in repave apply section here: [access \(see page 1021\)](#)
- bucket: S3 bucket name which is used on the source engine
- domain0PoolGUID: the domain0 pool GUID, which has been noted from the engine summary before initiating repave prepare
- endpoint: S3 endpoint/portal address.
- region: S3 bucket Region

Blob parameters

- type: `BlobObjectStoreRepavePreviewParameters`
- accessCredentials: defined in repave apply section here: [blob access](#)³⁰¹
- container: blob container name which is used on the source engine.
- domain0PoolGUID: the domain0 pool GUID, which has been noted from the engine summary before initiating repave prepare.
- endpoint: blob endpoint address

³⁰¹ [https://cd.delphix.com/docs/latest/elastic-data-engines-engines-backed-by-object-storage#id-\(27.0.0.0\)ElasticDataengines\(enginesbackedbyobjectstorage\)-Requestparameters.1](https://cd.delphix.com/docs/latest/elastic-data-engines-engines-backed-by-object-storage#id-(27.0.0.0)ElasticDataengines(enginesbackedbyobjectstorage)-Requestparameters.1)

GCP parameters

- type: `GcpObjectStoreRepavePreviewParameters`
- bucket: GCP bucket name which is used on the source engine
- domain0PoolGUID: the domain0 pool GUID, which has been noted from the engine summary before initiating repave prepare

OCI parameters

- type: `OciObjectStoreRepavePreviewParameters`
- bucket: OCI bucket name which is used on the source engine
- domain0PoolGUID: the domain0 pool GUID, which has been noted from the engine summary before initiating repave prepare

8.7.3.4.8.3 Response

The engine summary and metadata of the source engine.

CLI example commands on the target engine for repave/preview using an AWS instance profile

```
> repave/preview
repave preview *> set type=S3ObjectStoreRepavePreviewParameters
repave preview *> set accessCredentials.type=S3ObjectStoreAccessInstanceProfile
repave preview *> set bucket=repave-elastic-source-27-0
repave preview *> set domain0PoolGUID=10998343740256899999
repave preview *> set endpoint=https://s3-us-west-2.amazonaws.com
repave preview *> set region=us-west-2
repave preview *> commit
```

Output:

```
state: APPLY_ELIGIBLE
stateDetail: The engine is eligible to apply repave.
```

For AWS access key credentials, the CLI commands are below. Replace the `accessCredentials.type` value with the first command and add the second and third commands.

- `repave preview *> set accessCredentials.type=S3ObjectStoreAccessKey`

- repave preview *> set accessCredentials.accessId=*****
- repave preview *> set accessCredentials.accessKey=*****

8.7.3.4.9 Repave apply

8.7.3.4.10 `http://{{delphix_engine_url}}/resources/json/delphix/repave/
apply`

8.7.3.4.10.1 Introduction

- Delphix sysadmin calls **repave/apply** on the new engine. The Delphix management service will be restarted, and all previously disabled data sources will be enabled again.
- Before calling this API:
 - Verify old cache devices are attached to the new target engine if you want to use the same cache devices. You must detach the original (old) devices from the source engine and attach them to the target engine.
 - If you don't want to use the old cache devices, make sure new block devices are connected to the target engine to use as cache.
 - Make sure you have domain0PoolGUID from the source engine and other object storage profile information and credentials from the source engine.

8.7.3.4.10.2 Request parameters

Each cloud will have a different parameter required to perform repave apply.

AWS S3/ S3 Compatible Parameters

- type: `S3ObjectStoreRepaveApplyParameters`
- `accessCredentials` : Bucket credential type

In case you have accessKey and accessID for S3 bucket:

- type: `S3ObjectStoreAccessKey`
- accessId : S3 Bucket access ID
- accessKey: S3 Bucket access Key

In case of Instance Profile:

- type: `S3ObjectStoreAccessInstanceProfile`

- bucket: S3 bucket name which was used on the source engine
- cacheDevices: Possible two types whether you are using old cache devices or new cache devices.
 - New Cache:
 - type: `RepaveCacheDevicesNew`
 - devices: list of new storage devices to use as object store cache.
 - Old Cache:
 - type: `RepaveCacheDevicesOld`
 - NOTE: no need to add devices here.
- domain0PoolGUID: the domain0 pool GUID, which has been noted from the engine summary before initiating repave prepare
- endpoint: S3 endpoint/portal address.
- region: S3 bucket Region

Blob Parameters

- type: `BlobObjectStoreRepaveApplyParameters`
- accessCredentials: Blob access credential type
- In case of Managed Identity:
 - type: `BlobObjectStoreAccessManagedIdentities`
 - In case of Access based:
 - type: `BlobObjectStoreAccessKey`
 - azureAccount: Azure account for the object store.
 - azureKey: Account Key
- cacheDevices: Possible two types whether you are using old cache devices or new cache devices.
 - New Cache:
 - type: `RepaveCacheDevicesNew`
 - devices: List of new storage devices to use as object store cache.
 - Old Cache:
 - type: `RepaveCacheDevicesOld`
 - NOTE: no need to add devices here.
- container: blob container name which was used on the source engine.
- domain0PoolGUID: the domain0 pool GUID, which has been noted from the engine summary before initiating repave prepare
- endpoint: blob endpoint address

GCP Parameters

- type: `GcpObjectStoreRepaveApplyParameters`
- bucket: GCP bucket name which is used on the source engine
- cacheDevices: Possible two types whether you are using old cache devices or new cache devices.
 - New Cache:
 - type: `RepaveCacheDevicesNew`
 - devices: List of new storage devices to use as object store cache.
 - Old Cache:
 - type: `RepaveCacheDevicesOld`
 - NOTE: no need to add devices here.
- domain0PoolGUID: the domain0 pool GUID, which has been noted from the engine summary before initiating repave prepare

OCI Parameters

- type: `OciObjectStoreRepaveApplyParameters`
- Bucket: Oci bucket name which is used on the source engine
- cacheDevices: Possible two types whether you are using old cache devices or new cache devices.
 - New Cache:
 - type: `RepaveCacheDevicesNew`
 - devices: List of new storage devices to use as object store cache.
 - Old Cache:
 - type: `RepaveCacheDevicesOld`
 - NOTE: no need to add devices here.
- domain0PoolGUID: the domain0 pool GUID, which has been noted from the engine summary before initiating repave prepare

8.7.3.4.10.3 Response

A job id and action id will be returned if the API is called successfully.

The Delphix management stack will restart when repave apply is executed. Wait until the management stack restarts and then log into the target engine.

CLI example commands for repave/apply using OLD cache devices

The following is an example of CLI commands needed to execute repave apply for an AWS instance profile with old cache devices from the source engine now attached to the target engine:

```
> repave/apply
repave apply *> set type=S3ObjectStoreRepaveApplyParameters
repave apply *> set accessCredentials.type=S3ObjectStoreAccessInstanceProfile
repave apply *> set bucket=repave-elastic-source-27-0
repave apply *> set cacheDevices.type=RepaveCacheDevicesOld
repave apply *> set domain0PoolGUID=10998343740256853264
repave apply *> set endpoint=https://s3-us-west-2.amazonaws.com
repave apply *> set region=us-west-2
repave apply *> commit
```

Output:

REPAVE_APPLY: A job has been dispatched to apply repave on the engine. Management stack might restart to finalize repave, it will take a few minutes, please wait patiently.

Dispatched job JOB-1

REPAVE_APPLY_INITIATE job started.

Invalid response returned from server. The management service may be unavailable, please wait and **try** again. If the problem persists, please contact Delphix support.

The Delphix management stack will restart when repave apply is executed via the CLI. Wait until the management stack restarts and then log back into the engine using the CLI and execute repave/get to verify the APPLY_SUCCESSFUL state, which indicates that the repave apply operation was successful.

```
> repave/get
```

Output:

state: APPLY_SUCCESSFUL

stateDetail: Congrats! The engine has applied repave successfully.

For AWS access key credentials, the CLI commands are below. Replace the accessCredentials.type value with the first command and add the second and third commands.

- repave apply *> set accessCredentials.type=S3ObjectStoreAccessKey
- repave apply *> set accessCredentials.accessId=*****

- `repave apply *> set accessCredentials.accessKey=*****`

CLI example commands for repave/apply using NEW cache devices

The following is an example of CLI commands needed to execute repave apply for an AWS instance profile with new cache devices on the target engine:

```
> repave/apply
repave apply *> set type=S3objectStoreRepaveApplyParameters
repave apply *> set accessCredentials.type=S3objectStoreAccessInstanceProfile
repave apply *> set bucket=repave-elastic-source-27-0
repave apply *> set cacheDevices.type=RepaveCacheDevicesNew
repave apply *> set cacheDevices.devices=xvdb
repave apply *> set domain0PoolGUID=12424137104599998999
repave apply *> set endpoint=https://s3.us-west-2.amazonaws.com
repave apply *> set region=us-west-2
repave apply *> commit
```

Output:

```
REPAVE_APPLY: A job has been dispatched to apply repave on the engine. Management
stack might restart to finalize repave, it will take a few minutes, please wait
patiently.
```

```
Dispatched job JOB-1
```

```
REPAVE_APPLY_INITIATE job started.
```

```
Invalid response returned from server. The management service may be unavailable,
please wait and try again. If the problem persists, please contact Delphix support.
```

NOTE: the Delphix management stack will restart when repave apply is executed via the CLI. Wait until the management stack restarts and then log back into the engine using the CLI and execute repave/get to verify the APPLY_SUCCESSFUL state, which indicates that the repave apply operation was successful.

```
> repave/get
```

Output:

```
state: APPLY_SUCCESSFUL
```

```
stateDetail: Congrats! The engine has applied repave successfully.
```

For AWS access key credentials, the CLI commands are below. Replace the `accessCredentials.type` value with the first command and add the second and third commands.

- `repave apply *> set accessCredentials.type=S3ObjectStoreAccessKey`
- `repave apply *> set accessCredentials.accessId=*****`
- `repave apply *> set accessCredentials.accessKey=*****`

8.8 Masking sensitive data

Encryption does not protect data that is accessed through applications and database clients, the most likely attack vector. Masking sensitive data before it gets to non-production systems is a critical tool in the security arsenal.

Delphix provides an add-on masking product for simple cost-effective integration. It is also possible to integrate Delphix with any masking technology.

There are many topologies to consider, and the complete explanation of their pros and cons is outside the scope of this document. Delphix Professional Services can assist you in analyzing various masking solutions.

8.9 Audit logs

8.9.1 Review audit logs monthly

Conduct a monthly review of audit logs on your Delphix Engine. Pay particular attention to provisioning operations of unmasked databases, which creates new copies of your production data. See [Accessing Audit Logs \(see page 819\)](#) for instructions.

8.9.2 Forward audit logs to central server via syslog

Forward audit logs to a central audit server using syslog techniques. Delphix Professional Services can assist you with scripts that facilitate this. See also [Setting Syslog Preferences \(see page 825\)](#) for configuration instructions.

8.10 Support security

At least every six months, regenerate the registration code and re-register the engine. See [Regenerating the Delphix engine registration code \(see page 686\)](#) for instructions and the reasons why this is important for security.

8.10.1 Delphix operating system (DxOS)

Delphix Support accesses the DxOS for deep diagnostics and troubleshooting. Access to the Delphix Engine requires access to your network. Typically this is granted via shared troubleshooting sessions over Webex, with full transparency.

If desired, you can enable additional control so that access can only take place when you provide a token.

If you disable Support Access, do not have the token, and you are unable to login as a system administrator, it can become impossible for Delphix Support to login to repair your system. Example: the management stack crashes, the login system becomes unavailable, and you have disabled Support Access and do not have the token. For this reason, Delphix strongly recommends leaving Support Access enabled at all times. If you wish to disable access, generate a unique token once a month and place it in a secure location separate from the Delphix Engine.

8.10.1.1 Disable support access (optional)

Support Access Control is managed as a system administrator in the Server Setup area.

- When set to DISABLED, it is impossible for Delphix Support to login to the DxOS.
- When set to ENABLED (the default), Delphix Support can login to the DxOS.
- When set to ENABLED and calendar time is set and a token generated, Delphix Support can only login with the token during that timeframe, which you provide. Generate the token once/month for an entire month and store it in a secure location separate from your Delphix Engine. When requested, provide the token through a secure means: in your support ticket, via email or SMS to a trusted entity, etc.

8.11 Password policies

8.11.1 Getting started

The password policy feature allows users to create their own custom password policies and enforce the password policy on non-LDAP Delphix Engine users.

8.11.2 Understanding password policies

A password policy is a named password policy that can be assigned to a user. It is a set of requirements that passwords must satisfy.

- minLength - A password must be longer than this length.
- reuseDisallowLimit - The user should not reuse old passwords. This tells the number of last used passwords disallowed to be reused as the new passwords.
- uppercaseLetter - A password must have at least one capital letter.
- lowercaseLetter - A password must have at least one lower case letter.
- digit - A password must have at least one digit.
- symbol - A password must have at least one symbol.

- `disallowUsernameAsPassword` - A password should not be the same as the user name.

Password policy requirements

When you set a password, it must differ from the most recent password and contain:

- at least 5 characters
- at least one uppercase letter
- at least one lowercase letter
- at least one numeric digit
- at least one symbol such as #, \$, !
- do not use username or reverse username

This policy applies to non-LDAP Delphix Engine users. This includes the default users, **delphix_admin** and **sysadmin**. The password policy does not apply to LDAP users.

8.11.3 Default password policy

By default, the Delphix Engine enforces the password policy named **NONE**, which enforces the least possible constraint.

Passwords must contain at least one character.

8.11.4 Changing the password policy

To change the current password policy from the default policy **NONE**, create a custom password policy and select it instead of **NONE**.

8.11.4.1 Who can change password policy for whom

- Domain administrators can change the current password policy for all domain users.
- System users can change the current password policy for all system users.
- Domain regular users (non-administrators) users can only view the password policy.

8.11.5 What operations can be done by administrators

- Create custom password policies
- Update custom password policies
- Delete custom password policies
- Change the current password policy to any of the available password policies
- View available password policies
- View current password policy requirements

8.11.6 Password policy parameters

When you create a password policy, you can set the following parameters:

- Unique name for the password policy

- Minimum length of the password
- Whether password must differ from the last password
- Whether password must not contain the username or reverse user name
- Whether password must contain at least one uppercase letter
- Whether password must contain at least one lowercase letter
- Whether password must contain at least one numeric digit
- Whether password must contain at least one symbol such as #, \$, !

8.11.7 Restrictions

- Restrictions for default password policy's modification (named **NONE**):
 - not allowed to delete the default password policy from available list of password policies.
 - not allowed to update any parameters of the default password policy.
- Cannot delete the password policy which is set as current password policy.

8.12 Additional topics

The Delphix Engine provides robust, enterprise-quality security controls. Performing the steps listed in this document will allow you to easily bring your Delphix Engines into compliance with your organization's security policies.

8.12.1 Perform a yearly audit

At least once annually, audit one or more Delphix Engines to ensure compliance with your security policies.

8.12.2 Port scan

Delphix fully supports network security scans, using a tool of your choosing.

8.12.3 Security testing

Many companies require security testing of applications in their environment using a Port Scanner or other Security Penetration Test tools. Delphix supports the use of these security tools with the application credentials available for the engine (e.g., `delphix_admin`). The Delphix Engine is a closed appliance, and OS credentials on the appliance are not provided for these tests.

8.12.4 Security banner

You can configure a custom security banner that will be displayed to all the users prior to login.

1. Login to the CLI using the `sysadmin` **username** and **password**.

```
ssh sysadmin@yourdelphixengine
```

2. Set the configuration and commit the changes.

```
delphix > service security  
delphix service security > update  
delphix service security update * > set banner="Your Message Here"  
delphix service security update * > commit
```

The string set in the banner is in plain text only. You can also generate banners with multiple lines, however, this can only be done using the "securityConfig" API. Refer to the [Delphix KB article](#)³⁰² for additional information.

8.12.5 Virtual database security

The Delphix Engine provides advanced storage capabilities and automation to allow rapid provisioning of virtual databases (VDBs), which use only a fraction of the physical storage used by full database copies. Nonetheless, a VDB is equivalent to a physical database **and must be properly secured like any other database**.

By far the most dangerous attack vectors in the Delphix ecosystem are the same ones that existed pre-Delphix: unauthorized access to your non-production systems containing sensitive production data. **You must perform all the same actions to harden virtual databases as you would to harden physical clones.**

For information on securing your virtual databases, consult vendor-specific material and security guides.

³⁰² [https://support.delphix.com/Delphix_Virtualization_Engine/Sysadmin/Setting_up_a_Custom_Security_Banner_\(KBA6215\)](https://support.delphix.com/Delphix_Virtualization_Engine/Sysadmin/Setting_up_a_Custom_Security_Banner_(KBA6215))

9 Datasets

A major factor of using Delphix (and where Delphix thrives) is integrating with various data sources, enabling the many facets available for getting the most out of your data.

Find a variety of topics to help understand the usage and architecture of data with Delphix in the **Getting started** section. This encompasses topics such as adding environments, creating their users, and using Delphix objects such as virtual databases (VDBs).

In addition, Delphix provides a vast offering of features specific to certain databases, covering a large range of potential data needs. To find detailed overviews, requirements, and workflows particular to specific data sources, select a section below that corresponds with the desired platform.

- [Getting started with datasets](#) (see page 1043)
- [Cassandra data sources](#) (see page 1111)
- [CockroachDB data sources](#) (see page 1148)
- [Couchbase data sources](#) (see page 1193)
- [IBM Db2 data sources](#) (see page 1230)
- [MongoDB data sources](#) (see page 1311)
- [MySQL data sources](#) (see page 1365)
- [Oracle data sources](#) (see page 1419)
- [Oracle E-Business Suite \(EBS\) environments and data sources](#) (see page 1715)
- [PostgreSQL](#) (see page 1831)
- [SAP ASE data sources](#) (see page 1916)
- [SAP HANA data sources](#) (see page 2024)
- [SQL Server data sources](#) (see page 2072)
- [Unstructured files and app data](#) (see page 2269)
- [Yugabyte data sources](#) (see page 2315)

9.1 Getting started with datasets

This section provides an overview of how to implement your datasets into the Delphix Ecosystem hub. It covers the general data architecture in Delphix, management practices for environments, dSources, and VDBs specific to your datasets, getting the most out of hook operations, setting secure policies, and basic dataset troubleshooting. Select a topic below to get started.

- [Datasets overview](#) (see page 1044)
- [Dataset support](#) (see page 1044)
- [General architecture](#) (see page 1046)
- [Environment management](#) (see page 1050)
- [dSource management](#) (see page 1074)
- [Virtual database \(VDB\) management](#) (see page 1080)
- [Hook operations](#) (see page 1093)
- [Shell operations](#) (see page 1101)
- [Other operations](#) (see page 1102)
- [Policies](#) (see page 1105)

- [Basic troubleshooting](#) (see page 1110)

9.1.1 Datasets overview

This section outlines everything required to prepare and provision datasets (VDBs, files, etc) once you have successfully deployed the Delphix Continuous Data Engine. This includes setting up environments, dSources, and virtual databases (VDB). Before beginning, read through this section to better understand the overall ingestion strategy and the requirements to perform it.

- The [General architecture](#) (see page 1046) describes the layout of various components outside of Delphix, such as the source databases, environments, and other Continuous Data Engines. Determining how you get data into the Continuous Data Engine will determine where you should place certain environments and how many are required. Based on the ingestion configuration, an equivalent environment called the **target environment** is required to provision to.
- Learn how to create and manage environments in the [Environment management](#) (see page 1050) section. The section also touches on various technical requirements and how to ensure a reliable connection between your environments (or hosts) and the Continuous Data Engine. Once connected, the Continuous Data Engine will perform scans to affirm that dataset binaries and installation is available.
- Next, the formal ingestion phase begins with the creation of [dSources](#) (see page 1074). dSources are a central component in how Delphix's data virtualization is able to produce ephemeral copies. Once represented within the Continuous Data Engine, its state is then managed through Timeflow, Snapshots, and provisioning new database copies.
- The provisioning phase concludes with the creation of [virtual databases \(VDBs\)](#) (see page 1080). Once created, they can be easily distributed to your application teams without worry of overhead or broken infrastructure. Similar to a dSource, users can snapshot the VDB's state or provision new VDB's. If they get into a broken state or need to view an earlier point in time, the refresh capability can easily rollback time.
- The [Hook operations](#) (see page 1093) and [Policies](#) (see page 1105) sections provide functions that can be applied to all datasets and sources. Hooks and Policies help manage and optimize the interaction with datasets.
 - Hooks are scripts or sets of commands executed at specific events or stages of a dataset's lifecycle, to ensure custom processes are integrated seamlessly.
 - Policies define the rules and behaviors that govern the handling and maintenance of datasets within the Continuous Data Engine.

Due to differences between data source connectors, it is recommended to supplement each of these sections with connector-specific requirements. Further details can be found within each data source's documentation.

9.1.2 Dataset support

The data source connectors that Delphix Continuous Data can ingest and provision are divided into four categories. Categories differ by their support and development teams.

Category	Description
Standard Connector	Fully supported by Delphix Support. Entitled via Delphix Continuous Data.
Select Connector	Fully supported by Delphix Support. Entitled via the purchase of an add-on.
Premium Connector	Not supported by Delphix Support. Supported by a third party. Entitled via the purchase of an add-on.
Custom Connector	Not supported by Delphix Support. Supported by its open-source community or Delphix Services.

Users of Standard and Select Connectors can submit support tickets through the [Delphix Support Portal](https://support.delphix.com/)³⁰³. Users of Premium Connectors can receive support through the third party that provided them with the connector. Users of Custom Connectors can receive support through the connector's open-source community or contact their Delphix Account Team for guidance.

The list below describes the category each Delphix-supported connector falls under. Reference this list to identify if Delphix Support supports a data source connector. Documentation for Standard and Select Connectors can be found within this documentation portal.

Connector Name	Category
Apache Cassandra	Select Connector
CockroachDB	Select Connector
Couchbase Server	Select Connector
IBM Db2 (for LUW)	Standard Connector
IBM Db2 (for z/OS)	Premium Connector (PopUp Mainframe)
Microsoft SQL Server	Standard Connector
Microsoft SQL Server Backup Ingestion	Select Connector

³⁰³ <https://support.delphix.com/>

MongoDB	Select Connector
MySQL	Select Connector
Oracle	Standard Connector
Oracle Backup Ingestion (OBI)	Select Connector
Oracle E-Business Suite (EBS)	Standard Connector
PostgreSQL	Standard Connector
SAP Adaptive Server Enterprise (ASE)	Standard Connector
SAP HANA	Standard Connector
SAP IQ	Select Connector
Unstructured Files (vFiles)	Standard Connector
YugabyteDB	Select Connector

9.1.2.1 Limitations

Delphix Continuous Data Engine and supported connectors should not be considered a replacement for the backup and recovery of your source instances and databases. The Delphix Continuous Data solution is intended to create non-production test database copies. Review our [Delphix Continuous Vault \(see page 2381\)](#) product if a strong disaster recovery methodology is required.

9.1.3 General architecture

9.1.3.1 Ingestion overview

Delphix Continuous Data Engine automatically delivers copies of data to developers and testers to enable high-quality, on-time application development while mitigating infrastructure costs.

These virtual data copies are full read-write capable database instances that use a small fraction of the storage resources that a normal database copy would require. This helps promote a seamless flow of updates and changes to your data in real-time.

In order to create virtual data copies, Delphix Continuous Data Engine must ingest a copy of the source database into persistent storage on the engine, to later be provisioned as one or more copies.

After a copy is ingested, an imperative step is to preserve its current state by taking a snapshot. Subsequently, generating a VDB by provisioning it from the ingested copy establishes a replica of the source database. This VDB can be further enhanced by allowing snapshots or bookmarks, facilitating the capture of its current state for future reference.

Implementing functionality to rewind the VDB to a previous state is crucial. This action allows you to navigate and revert to specific points in the VDB's history. A dSource must consistently reflect the most recent changes from the source database. To do so, you must enable the refreshing of the dSource, maintaining synchronization with the source data.

Furthermore, for a VDB to stay current, it can be refreshed by updating it with the latest changes from a new snapshot of the dSource. Lastly, perform cloning of a VDB to create a child VDB.

Ingestion is the important process by which a consistent, ready-to-run copy of the data is prepared and captured, and persisted as a Delphix snapshot in Delphix storage, so that it can be provisioned to virtual copies as Delphix vDB(s). Before beginning, it's important to understand the recommended ways to ingest.

There are two architectural models by which Delphix performs ingestion:

9.1.3.1.1 Direct ingestion

Direct ingestion is an approach where the Delphix Continuous Data Engine is able to extract (directly from the true production source) the necessary information to reconstruct the source database and persist it into storage on the Delphix Continuous Data Engine. This direct methodology requires no intermediate host nor instance of the source database. The Delphix connector must interact directly with the true production source system to request the data to be persisted. There is no activity whatsoever on an intermediate staging host; instead the blocks are directly written to storage on the Delphix Continuous Data Engine.

The two primary examples of Direct ingestion are:

1. Unstructured files ingestion (does not require a connector).
2. Oracle database ingestion via direct integration with Oracle RMAN (Recovery MANager) utility.

For unstructured files ingestion, the Delphix Continuous Data Engine will connect directly to the true production source of the files and RSYNC them onto a filesystem in Delphix Storage.

Oracle database ingestion via RMAN integration is where the Oracle RMAN utility is able to ship the entire storage block map to Delphix when Delphix requests it, then later just the changed blocks since the previous ingestion (an incremental roll forward capability).

9.1.3.1.2 Staged ingestion

Staged ingestion dictates and expects reconstruction of the source database on an intermediate host (separate from the true source system) or instance of the source database. The intermediate platform is called Staging, and the persistent storage which backs the staging database is provided over the network by the Delphix Continuous Data Engine.

The majority of Delphix Continuous Data Connectors perform Staged ingestion.

Two common examples of Staged ingestion are:

1. Backups and logs.

2. Various forms of replication (physical or logical).

Backup and log ingestion is where database backups and transaction logs from a true production source database are recovered and rolled-forward on a staging host, where the persistent storage is provided by the Delphix Continuous Data Engine. The activity is completely independent and isolated from the true source database and system. This example of Staged ingestion requires zero communication between the Delphix solution, and the true production system, as long as the needed backups and logs are made accessible to the staging host.

Replication ingestion is where the staging host is configured as a replica to true production. Each DBMS system has its own specific facility and methodology for implementing replication. Typically some sort of direct communication is required to exist between the staging host and the true production source host.

9.1.3.2 Staging Pull vs. Staging Push

As described above, Staged ingestion involves an intermediate environment that mounts Delphix storage over the network for persistent storage (rather than locally-attached, physical storage) upon which the source database is reconstructed or prepared.

There are two forms of Staged ingestion:

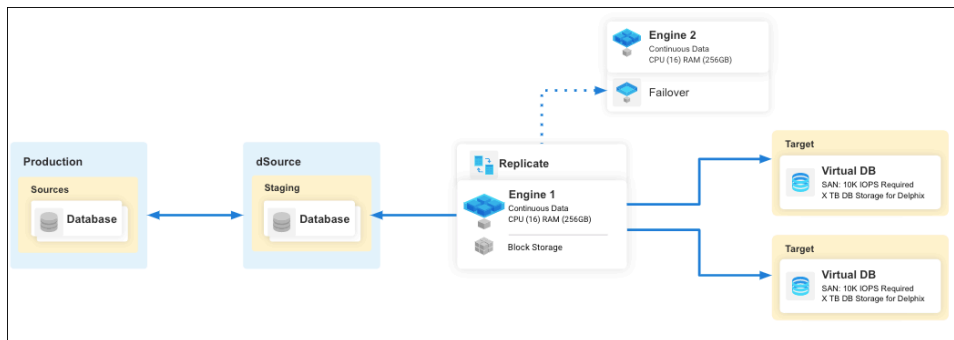

1. Staging Pull
2. Staging Push

The distinction between the two hinges on whether or not Delphix Continuous Data performs the steps to prepare the data contents in the staging dataset.

- **Staging Pull:** Delphix Continuous Data performs the preparation and reconstruction (e.g. database restore/roll forward or replication configuration).
 - The process is entirely under the control of Delphix and cannot be modified nor substantially customized by the user. The benefit is that the heavy lifting to prepare the data on the staging host is automated and entirely taken care of by Delphix, simplifying the operational steps for the user. The downside is that the process is hard-coded and cannot be customized or modified, nor integrated with other third-party applications (like various Enterprise Backup

solutions). This approach typically results in a logically identical copy of the pristine production data.

- **Staging Push:** The user, outside of Delphix Continuous Data, performs the steps of data preparation and reconstruction.
 - The user can tailor and customize the process, integrate with third-party tools, and is free to create the data contents however they wish. This approach is wide-open and can be performed however the user prefers, as long as the outcome results in a valid dataset (as determined by the corresponding DBMS) at the time that a dSource snapshot is taken in Delphix Continuous Data.
 - This approach is infinitely more flexible, in exchange for increased responsibilities placed upon the user. This approach can produce logically identical contents of the pristine source data, but also offers flexibility to filter, modify, or reorganize the data so that it is not logically identical to the original source.

9.1.3.3 Provisioning

After the data source has been successfully ingested into Delphix Continuous Data Engine and represented internally as a dSource, it can be provisioned as a virtual database (VDB). VDBs are deployed onto a target environment and leverage the binaries and resources that are made available.

Once the VDB is running, a wide array of functionality is made available to it, such as refreshing it back to the latest dSource's snapshot, snapshotting a new branch of the dataset, or sharing it with team members. Then, when no longer needed, the virtual database can be destroyed and resources are instantly reclaimed in the target environment. Delphix Continuous Data Engine's virtualization capabilities drastically lower the effort required to manage datasets.

In advanced scenarios, virtual database management might be required to offload target environments or share datasets with other engines. For example, the migrate capability allows administrators to move the VDB from one target environment to another. This is particularly helpful if a target environment is overloaded or the end user is in a different region or zone.

Similarly, a virtual database can be copied to other engines through the process of Replication. In this scenario, the replica is a read-only virtual database in which other virtual databases can be provisioned from where the dSource is not directly available. This is valuable when combined with Delphix's Continuous Compliance's masking and production and non-production zones. In these scenarios, a masked virtual database is provisioned in production and then replicated over to the non-production zone to eliminate data leak risk. It is also broadly helpful to organize engines and limit access to certain datasets.

9.1.4 Environment management

9.1.4.1 Overview

In Delphix Continuous Data's architecture model, an environment is a single instance host or cluster of hosts that run database software. For example, a Linux system running PostgreSQL. Environments can either be a source (where data comes from), staging (where data is prepared/masked), or target (where data is delivered and used by developers and testers). To identify which environments are needed and how many, you must understand the general architecture documentation and the connector's supported ingestion models.

Each environment has its own properties and information depending on its source, staging, and target environment type and the dataset it will support. In this section, you can learn general the requirements to configure an environment, how to add them to Delphix Continuous Data, and discover the environment dataset's binaries. If there is a configuration specific to certain connectors, it will be called out.

9.1.4.2 Environment configuration requirements

The following list outlines the requirements of an environment, such as name, host address, network requirements, or Delphix Toolkit path, to ensure a valid connection with Delphix Continuous Data. During the environment creation process, we recommend using this list as a guide along with the data source connector's specific environment requirements. These environments must be created before any configuration is performed within Delphix Continuous Data. Follow the other Environment Management sections for additional information on each of these requirements. In addition, please take note of the Operating System specific environment differences.

Requirement	Description
Environment Name	A unique, custom label to identify the environment within Delphix Continuous Data. This should be a user-friendly label to uniquely identify the environment.
Host Address	The fully qualified domain name (FQDN) or IP address for the environment.

<p>Network Requirements</p>	<p>Communication between Delphix Continuous Data and environments occurs through various TCP and UDP which requires various ports to be open and available. Ports must be made available on the engine and the environment.</p> <p>Connector Specific: Many connectors require additional Ports to be opened to communicate with the database. Please consult your data source's connector for additional networking information.</p> <p>Unix/Linux: Configuration requires specification of the Secure Shell Protocol (SSH) port. By default, Delphix Continuous Data Engine will use port 22.</p> <p>Windows: Configuration requires the installation of the Delphix Connector on the target environment which is made available to the source or staging environments. Consult the Delphix Connector documentation (LINK) for more information.</p>
<p>Environment User(s)</p>	<p>The operating system (OS) user(s) for the environment. These are the users who have permission to ssh into an environment (Unix-based environments) or access the environment through the Delphix Connector (Windows-based environments). Multiple authentication methods are supported, such as Username/Password, Public Key, and Password Vault.</p> <p>Privilege elevation can also be configured in this phase.</p>
<p>Delphix Toolkit path (link to section in requirements area)</p>	<p>Unix/Linux: Location to install the Delphix Toolkit on the environment. <Link to glossary></p> <p>Windows: This will be specified during the installation of the Delphix Connector.</p>
<p>Java Development Kit (Optional)</p>	<p>Each environment requires a JDK to communicate with Delphix Continuous Data. By default, the engine will provide the Eclipse Adoptium Java via the Delphix Toolkit. If the user would prefer to bring their own Java, follow these directions for details. (link)</p>

Network File System (NFS) Addresses (Optional)	<p>Unix/Linux: A list of authorized IP addresses that can mount a Delphix file system persisted by Delphix Storage. Additional IP addresses of the host.</p> <p>By default, Delphix Continuous Data Engine will automatically use the Host Address parameter above for NFS requests</p> <p>Windows: N/A</p>
Delphix session protocol (DSP) Configuration (Optional)	<p>If an environment already exists after enabling server/client DSP authentication, you will need to modify its attributes for environment communication to continue working, you will need to set up the appropriate stores on the remote environment.</p>
Cluster (Optional)	<p>Environments can be defined as part of a cluster. During this phase, the user will define one node of that overall cluster. Some of the above properties change slightly. Consult the data source's documentation for additional information.</p>

9.1.4.3 Adding and discovering an environment

9.1.4.3.1 Adding an environment

Once the environments have been created and the network connectivity requirements are configured, they can be added to Delphix Continuous Data. Source or staging environments will contain the datasets made available for ingestion or provisioning. Target environments will provide the database binaries and hardware to perform the virtualization actions. Before proceeding we recommend installing the necessary dataset binaries on the environments.

To add an environment, navigate to the **Manage > Environments** tab and follow the steps of the configuration wizard. Additional information can be found in the [Adding an environment \(link\)](#). Once added, Delphix Continuous Data will maintain a connection to the environment and begin the discovery process.

9.1.4.3.2 Discovering an environment

Each environment added to Delphix Continuous Data is composed of two primary components: Installations (Dataset Homes) and Databases (Instances or Repositories). Installations contain the dataset's binaries which maintain the specific Databases and datasets you plan to ingest. Each Database then maps to a single dSource which is a primary object in Delphix Continuous Data's ingestion model. Delphix Continuous Data must keep track of all of these objects to perform ingestion and provisioning.

Once environments are added, the [Discovering an Environment\(link\)](#) process will automatically scan the source, staging, and target environment for available installations, databases, and files. Note: Target environments should only contain binaries as their purpose is to provision virtual databases, but not source datasets. In test scenarios and with proper organization, the same environment can be used as both a staging and target environment.

However, not all data source connectors fully support automated discovery. Adding a dataset home or Adding a database documentation describes how to manually add these objects. These processes are also useful if automated discovery misses a Dataset Home or Database. Consult the data source connector's documentation to understand which discovery mechanism each connector supports.

Once the Installations and Databases have been successfully discovered, you can continue to the dSource management phase. Follow the Environment operations section to learn more about the specific steps for each major action.

9.1.4.4 Network requirements

9.1.4.4.1 Overview

This topic covers the general network and connectivity requirements for connecting the Delphix Continuous Data Engine to the source, staging, and target environments. Ensure all ports are open and available before adding an environment to the engine.

9.1.4.4.2 Delphix Continuous Data Engine Connectivity

During the installation of the Delphix Continuous Data Engine, our documentation provided various ports that must be opened. Consult the Deployment section's [Network connectivity requirements](https://cd.delphix.com/docs/latest/network-connectivity-requirements)³⁰⁴ and Deployment for additional engine-specific information.

9.1.4.4.2.1 NFS mounts on environments

Delphix Continuous Data Engine shares its storage space with the staging and target environments using NFS mounts.

Protocol	Port number	Use
TCP/UDP	111	Remote Procedure Call (RPC) port mapper used for NFSv3 mounts.
TCP	1110	Network Status Monitor (NSM) client from target environment to Delphix Continuous Data.
TCP	2049	Network File System (NFS) client from target environment to Delphix Continuous Data. (NFSv3 and NFSv4).
TCP	8341	Sending LogSync data from source to Delphix Continuous Data (for LogSync).

³⁰⁴ <https://cd.delphix.com/docs/latest/network-connectivity-requirements>

TCP	8415	SnapSync control and data from source to the Delphix Continuous Data. V2P control and data from the target environment to the Delphix Continuous Data.
TCP	54043	Client mount daemon (NFSv3 only).
TCP	54044	Lock state notification service (NFSv3 only).
TCP	54045	Network Lock Manager (NLM) client from target environment to the Delphix Continuous Data (NFSv3 only).
UDP	33434 - 33464	Traceroute from the target database server to the Delphix Continuous Data (optional).

9.1.4.4.3 General environment connectivity

Environments share a common set of ports that must be opened to establish communication with the Delphix Continuous Data engine.

9.1.4.4.3.1 Data source connector connectivity

Many connectors have their own set of connection requirements to consider due to database differences. We recommend navigating to the connector's specific documentation on environment creation to identify other network requirements.

Due to these differences, many connectors support a HostChecker (sometimes called HealthChecker) utility to ensure the validity of the newly created environment. Consult the connector's documentation for more information.

9.1.4.4.3.2 Secure Socket Shell (SSH) connectivity

The Delphix Continuous Data Engine connects to Linux and Unix environments using Secure Shell Protocol (SSH). This connection is long-running, performed through the `sshd` (OpenSSH Daemon) program.

Allow the following inbound port for SSH connection to each environment.

Protocol	Port numbers	Use
TCP	22	SSH connections to the source, staging, and target database environments.

9.1.4.4.3 Delphix connector connectivity

Windows environments require the Delphix Connector to communicate with the Delphix Continuous Data Engine. The Delphix Connector is installed on all target environments. Source and staging environments will use the target environment's connector for communication. Refer to the Delphix Connector documentation for additional information.

9.1.4.5 Environment users

9.1.4.5.1 Overview

Not to be confused with Delphix Continuous Data Engine administrator (admin) users and system administrator (sysadmin) users, environment users must be created for each environment to perform actions on each environment. These users are configured for each data platform to interface with the database instance on the host.

1. Login to the Delphix Management application using Admin credentials.
2. Click **Manage**.
3. Select **Environments**.
4. Click on the existing environment name you want to modify and open the environment information screen.
5. In the **Details** tab, click the **Plus** icon located next to Environment users.
6. There are four ways that can be used for the Delphix Continuous Data Engine to login into the environment.
 - a. Enter the Username and Password for the OS user in that environment and click **Validate**.
 - b. If you want to use a [public key](#)³⁰⁵ for logging into your environment:
 - i. Select 'Username and Public Key' for the Login Type.
 - ii. Copy the public key that is displayed, and append it to the end of `~/ .ssh/ authorized_keys` file of the new user being added. If this directory or file does not exist, you will need to create it.
 - iii. Run `chmod 600 authorized_keys` to enable only the file owner with read and write privileges.
 - iv. Run `chmod 755 ~` to make your home directory writable only by your user and no other user may write to it.
 - v. The public key needs to be added only once per user and per environment.
 - c. Specify a Custom Key Pair
 - d. Specify a Password Vault. Consult the [Password Vault Support documentation](#)³⁰⁶ for more information.
7. Click the **Add** icon to save the new user.

³⁰⁵ <https://cd.delphix.com/docs/13.0.0.0/cli-cookbook-configuring-ssh-host-verification-for>

³⁰⁶ <https://cd.delphix.com/docs/latest/password-vault-support>

8. To change the primary user for this environment, select the environment. Then click the **'star'** icon next to **Environment Users**. Only the primary user will be used for environment discovery.
9. To delete a user, click the **Trash** icon next to their username.

9.1.4.5.2 Privilege elevation profiles

Privilege elevation profiles exist to provide the Delphix Continuous Data Engine with a mechanism for running privileged commands in a secure way to achieve the following:

- Mount and unmount Network File System (NFS) file systems
- Create and remove directories in paths not owned by the Delphix Continuous Data Engine OS user
- Examine the running process list
- Run commands as root

9.1.4.5.2.1 How privilege elevation profiles work

Privilege Elevation Profiles need to be tailor-made to work with non-standard environments that may use third-party or proprietary privilege elevation mechanisms other than sudo. You are strongly encouraged to work with Delphix Professional Services to formulate reliable profile scripts.

Privilege Elevation Profiles exist within a two-tier cascading hierarchy. This means there is one default profile for the entire Delphix Continuous Data Engine that should contain scripts for all the operations that require privilege elevation. Additional profiles may contain a subset of the scripts. When a non-default profile is used, the Delphix Continuous Data Engine uses that profile's scripts where they exist and reverts to the scripts in the default profile if no script for the operation exists. By default, the Delphix Continuous Data Engine ships with simple scripts that pass commands to the standard UNIX sudo command.

All environments added to the Delphix Continuous Data Engine get added with the default Privilege Elevation Profile. The profile can be assigned on a per-environment basis. Below description shows how an environment which is using a non-standard profile, will use scripts in the cascading model.

In order to create a privilege elevation profile, you must create both a profile and a profileScript. Scripts exist for particular operations, which include:

- dlp_x_mount
- dlp_x_umount
- dlp_x_rmdir
- dlp_x_mkdir
- dlp_x_ps
- dlp_x_pfexec
- dlp_x_pfexec_as_user

There are three parameters to consider while creating a new profile:

1. name:
2. contents:
3. Profile:

9.1.4.5.2.2 Support for privilege elevation profiles

Writing and troubleshooting scripts, such as those required for Privilege Elevation Profiles, is out of scope and not covered by Delphix Support.

9.1.4.6 Delphix toolkit

9.1.4.6.1 Overview

The Delphix Toolkit is a group of files that allows communication between Delphix Continuous Data Engine and remote environments. Delphix Toolkit includes:

- Database and Host scripts
- Delphix Session Protocol (DSP) binaries
- Delphix HostChecker
- Java Development Kit (JDK)

The Delphix Toolkit is automatically installed on the environments at the specified toolkit path whenever an environment is added or refreshed.

9.1.4.6.2 Toolkit size and predicted growth

Delphix Toolkit's size depends on two factors:

1. The number of Delphix client applications running on the environment
2. The number of Virtual database(VDBs) on the environment (if any)

Currently, there are three Delphix client-side applications including the SnapSync, Delphix Connector, and Virtual to Physical (V2P) client. Each of the clients that run from the client-side toolkit generates their own logs - info, trace, debug, error. Each level of logging is restricted to a maximum of 10 log files and these log files are capped at 10 MB each.

Therefore the maximum space occupied by the toolkit directory on the Source server is its initial size of 400 MB + 1200 MB = 1.6 GB.

However, on the target server, the maximum toolkit size is initial size 400 MB + 800 MB + (Number of VDBs * 1MB)

9.1.4.7 Java Development Kit (JDK)

9.1.4.7.1 Overview

The Java Development Kit (JDK) is required on each environment to run the Delphix Toolkit. The JDK is provided by default with the Delphix Connector. Delphix Continuous Data Engine uses Eclipse Adoptium (formerly known as AdoptOpenJDK) by default.

Users can provide their own Java when adding an environment and in the environment configuration page. This includes Oracle JDKs, Adoptium Temurin JDKs, and JDKs specific to HP UX and AIX hosts. If you want to use a more recent version than the one that comes with Delphix Continuous Data Engine, you can do so when adding an environment to a given Delphix Continuous Data Engine.

Note that the JDK is provided per node or host, not per cluster or environment. Initially, when creating a cluster all hosts must have Java at the same absolute path. However, once the cluster has been discovered in Delphix Continuous Data Engine each host's path can be adjusted. Supported JDKs include Adoptium Temurin OpenJDK, AIX, HPUX, and Oracle. If you have a Java license with Oracle then you can follow the instructions in this section.

- All Delphix environment users on that environment require read and execute permissions on the provided JDK, its subfolders, and files.
- Delphix only supports using custom JDKs for Oracle, Adoptium Temurin, AIX, and HPUX. All other JDKs are not supported.

9.1.4.7.2 Adding a JDK

By default, Delphix Continuous Data Engine comes with Adoptium's OpenJDK. To modify the JDK, follow the below steps:

1. Log in to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click the **Actions (...)** menu next to **Environments and** select **Add environment**.
5. In the **Environment settings** tab, select the **Provide my own JDK** checkbox, and click **Next**.
This action will remove the previous built-in JDK and will initiate an Environment refresh operation after the path is changed.

Select Reset to Default to reset your JDK to the OpenJDK default.

6. In the **Java development kit** tab, the currently selected JDK kit will be shown (default is OpenJDK). Provide an absolute path to the JDK root and click **Next**.
7. Verify the configured JDK and environment settings and click **Submit**.

9.1.4.7.3 Updating a JDK path

For existing environments, you can add or update JDK paths by following the steps below:

1. Log in to the **Delphix management** application.
2. Select **Manage > Environments**.
3. Click on the name of an environment to view its basic information.
4. In the Details tab next to the **Java development kit**, click the **Pencil** icon.
5. In the **Java development kit dialog**, provide an absolute path to the JDK root and click **Next**.

Do not place the JDK inside the Delphix Toolkit.

6. Click the **Check** icon to save your changes.

9.1.4.7.4 Finding a JDK

Custom JDKs need to be present on an environment which is being added to Delphix Continuous Data Engine and can be sourced directly from the supported vendors. These JDKs must be of Java major version 8 and come from one of the following:

- Oracle
- Adoptium Temurin OpenJDK
- HP-UX Java
- IBM Java for AIX

9.1.4.7.5 Supported operating systems

This feature is supported with use for Linux, Solaris, and Windows environments, as described in the support matrix. AIX and HP-UX provide us with a specific Java version to run on those hosts.

Only Java versions equal to or greater than U281 and equal to or lesser than U402 are tested and certified by Delphix based on below matrix.

	RHEL	SLES	Solaris	AIX	HP-UX	Windows
Oracle Java 8 u281	Supported	Supported	Supported	N/A	N/A	Supported
Oracle Java 8 u333	Supported	Supported	Supported	N/A	N/A	Supported

	RHEL	SLES	Solaris	AIX	HP-UX	Windows
Oracle Java 8 u351*	Supported	Supported	Supported	N/A	N/A	Supported
Oracle Java 8 u381**	Supported	Supported	Supported	N/A	N/A	Supported
Oracle Java 8 u401***	Supported	Supported	Supported	N/A	N/A	Supported
AdoptOpenJDK 8 u382-b05	Supported	Supported	Supported	N/A	N/A	Supported
AdoptOpenJDK 8 u402-b06	Supported	Supported	Supported	N/A	N/A	Supported
AdoptOpenJDK 8 u422-b05	Supported	Supported	Supported	N/A	N/A	Supported
AIX Java 8.0.0.830	N/A	N/A	N/A	Supported	N/A	N/A
HPUX Java 8.0.28	N/A	N/A	N/A	N/A	Supported	N/A

- * With Continuous Data Engine version 8.0.0.0 and above.
- ** With Continuous Data Engine version 15.0.0.0 and above.
- *** With Continuous Data Engine version 22.0.0.0 and above.

9.1.4.7.6 Delphix toolkit native Java support matrix

The below matrix describes the supported versions of Java we package with the Delphix toolkit for each operating system. This is the default option if you do not use the feature to provide your own Java for each host.

	RHEL	SLES	Solaris x64	Solaris sparc9	AIX	HP-UX	Windows
AdoptOpenJDK 8 u422-b05	Supported	Supported	Supported	Supported	N/A	N/A	Supported

IBM Java 8.0.830	N/A	N/A	N/A	N/A	Supported	N/A	N/A
HP Java 8.0.28	N/A	N/A	N/A	N/A	N/A	Supported	N/A

9.1.4.7.7 Java support policy

Delphix Continuous Data Engine is committed to testing and certifying the JDK versions that are included with the product, along with specific versions provided by Oracle. While using custom JDKs from Adoptium Temurin, AIX, and HPUX is generally supported, there is no certification process beyond those detailed in the native Java support matrix above Providing Your Own Oracle Java.

9.1.4.8 Data communication encryption

The Delphix Continuous Data Engine facilitates data communication with VDB target environments and staging environments via NFS for Linux environments and iSCSI for Windows environments. The system provides the flexibility to encrypt these communications as needed.

9.1.4.8.1 Feature limitations

- NFS Encryption limitations (For Linux environments):
 - NFS encryption is not compatible with Oracle dNFS.
 - NFS encryption is not compatible with NFSv3.
- iSCSI Encryption limitations (For Windows environments):
 - Windows clusters are not yet supported.
 - Windows standalone sources are not supported, as they use a connector environment (target environment) for iSCSI transactions and storage. Therefore, encryption of the source can be achieved by enabling encryption in the connector environment.

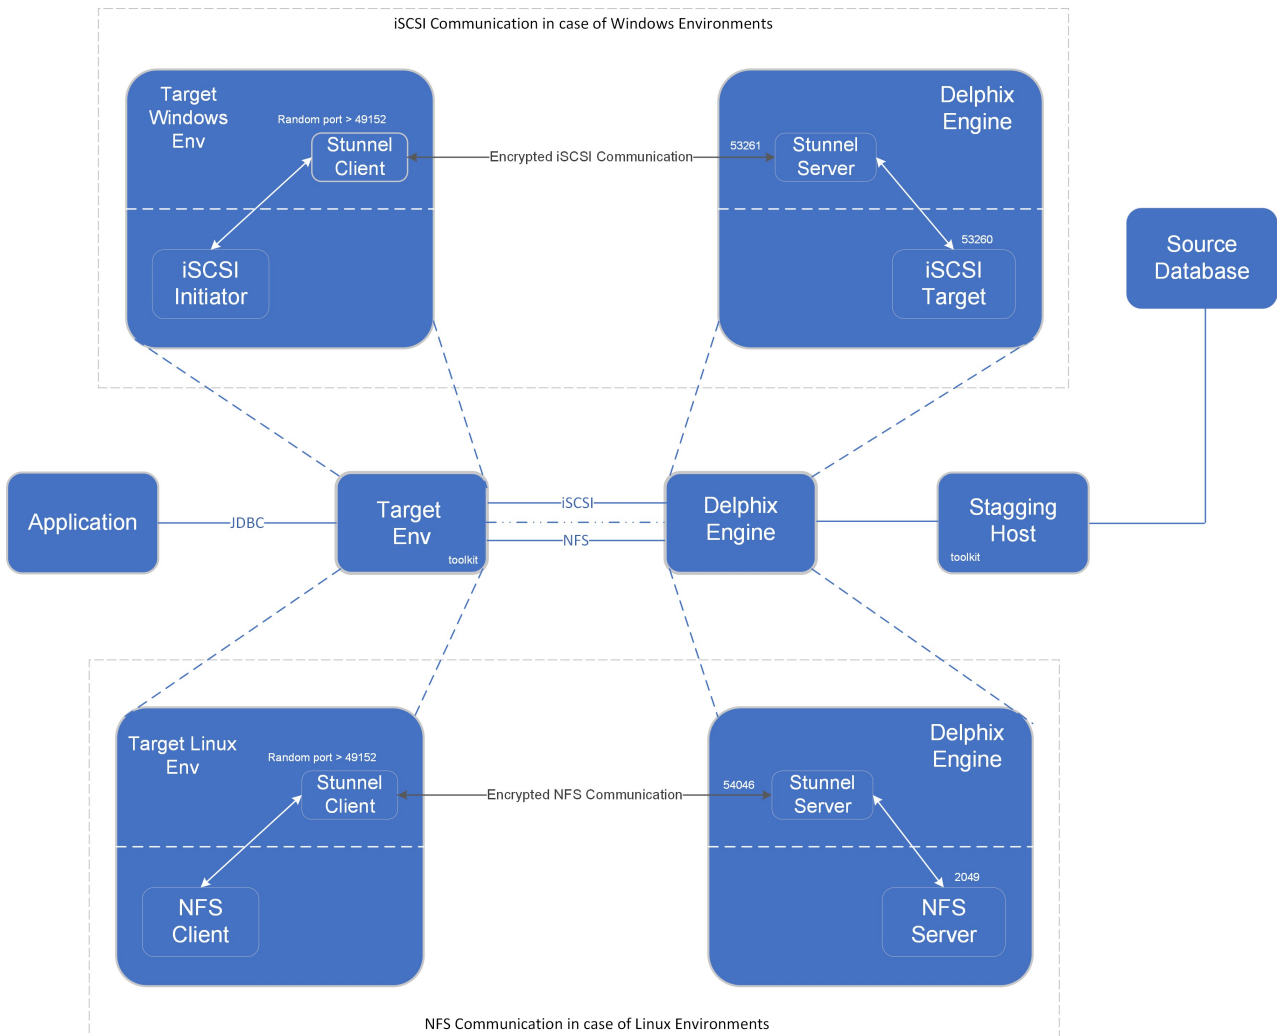

9.1.4.8.2 Prerequisites

- The following operating systems are supported:
 - CentOS 7 and later
 - RHEL 7 and later
 - SUSE 12 and 15
 - All Delphix-supported Windows OSes. For more information, refer [MySQL support matrix \(see page 1367\)](#).
- The designated network port for the specified feature in the Delphix Continuous Data Engine is 54046 for NFS and 53261 for iSCSI. The connection to these ports is initiated from the host to the Delphix Continuous Data Engine, constituting an ingress connection from the perspective of the Delphix

Continuous Data Engine. For network connectivity requirements about inbound to the Delphix Engine port allocation, refer to the network connectivity requirements below.

TCP	54046	Provides connections from source and target environments to the engine when encryption is enabled for a Linux environment .
TCP	53261	Provides connection from a staging or target environment to the engine when encryption is enabled for the Windows environment .

9.1.4.8.3 Feature design

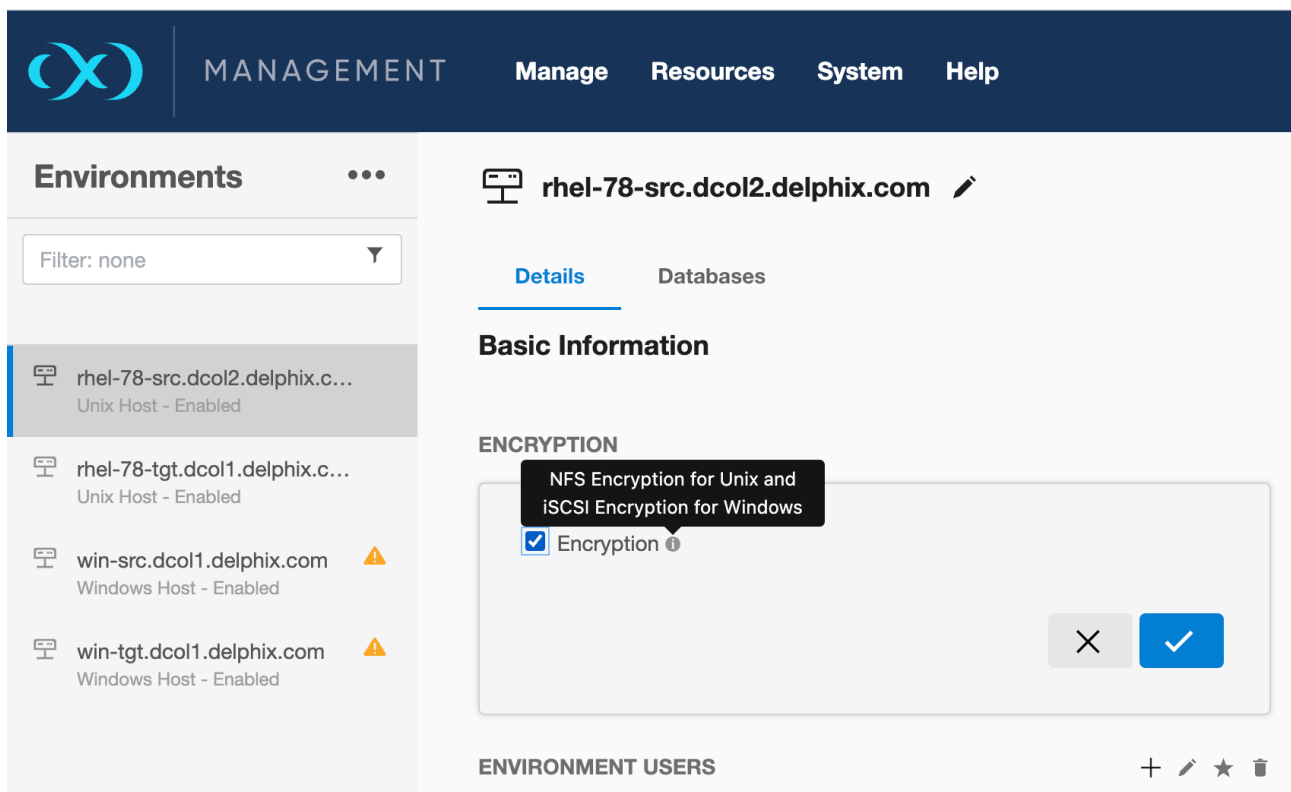

Encryption can be applied to secure data transfer between the Delphix Continuous Data Engine and the target VDB or staging source environment via NFS/iSCSI. This feature allows you the flexibility to enable or disable data communication (i.e. NFS/iSCSI communication) encryption on a per-environment basis.

Stunnel is used for this purpose. Stunnel is a utility that provides TLS tunneling capabilities in user space. The implementation involves configuring two Stunnel services to establish a secure TLS connection: one acting as a server and the other as a client. The client is configured to listen on a local port, enabling secure tunneling of any connections made to that port to the remote peer Stunnel application running on the server.

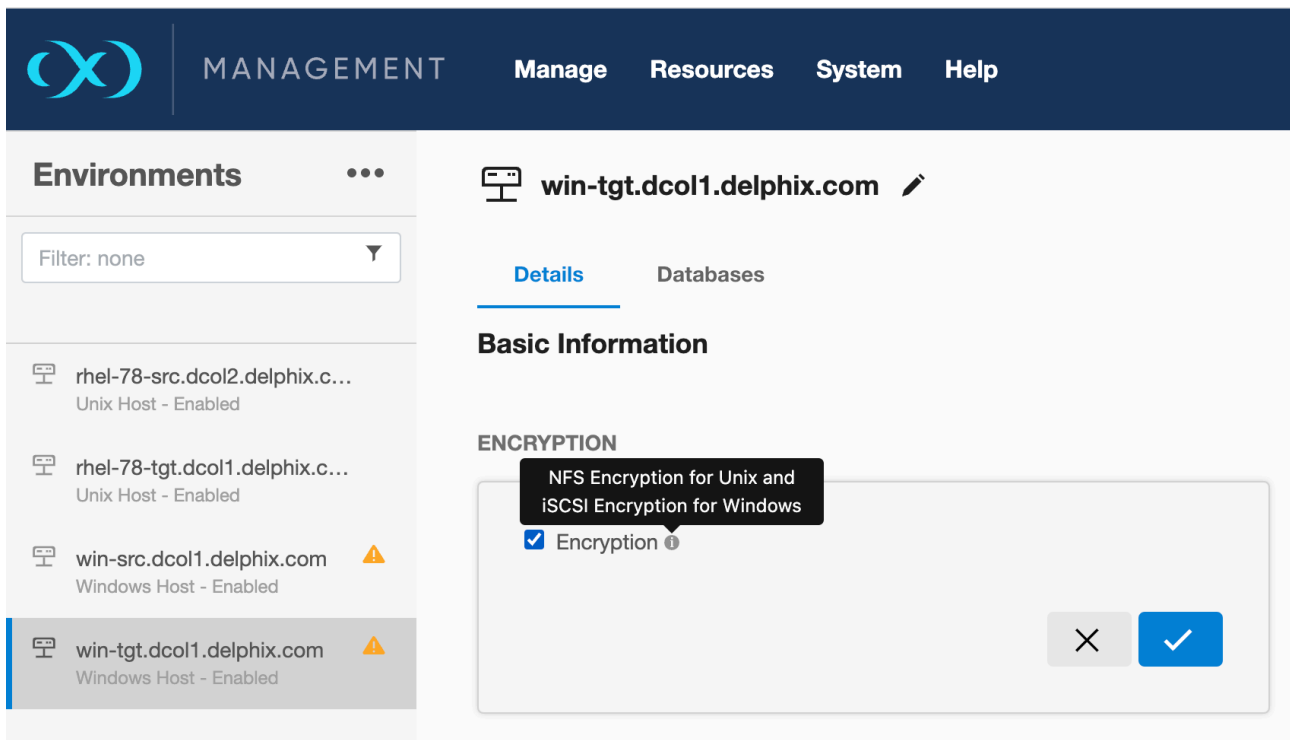

9.1.4.8.4 Implementation

The Encryption parameter can be activated for the specific environment either through the environment page or using the command-line interface (CLI). For more information about using the CLI, refer to the [CLI](#)³⁰⁷ guide.

2 Image 2. Linux Environment Page

307 <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/71074700/18.0.0.0+Command+line+interface+guide>

3 Image 3. Windows Environment Page

Before activating encryption, it's essential to confirm that all datasets linked to the environment are disabled.

Once environment encryption is enabled, you must enable all the relevant datasets. To verify whether a dataset is encrypted, you can check its environment's encryption status. All sources within an environment can either be encrypted or unencrypted, without any other state. For Linux environments, the encryption status of datasets can also be viewed in the status tab. To disable or enable all the associated datasets, APIs are available at the environment level. For specific API details and changes, refer to [API Changes in Delphix 17.0.0.0](#) (see page 447).

9.1.4.8.5 Stunnel for encryption (deployment and configuration)

Stunnel is employed for Data Encryption, as illustrated in the image for feature design above. The Stunnel executable and required resources are deployed to the host via the toolkit. A new working directory is created on the host and Stunnel functions from that location. A randomly generated port is employed to configure Stunnel on the host. Upon disabling this feature, the Stunnel process is terminated, and the working directory is removed from the host.

In cases where a host is connected to more than one Delphix Continuous Data Engine with encryption enabled, it is possible to observe multiple Stunnel working directories and stunnel process on the host.

In the case of the Oracle cluster, the stunnel toolkit is set up, and the stunnel process is initiated on all active nodes when enabling this feature. Upon disabling the feature, the stunnel process is terminated, and the stunnel toolkit is uninstalled from all active nodes in the cluster.

Furthermore, when creating or enabling a node with this feature turned on for the cluster, the stunnel toolkit is configured, and the stunnel process is initiated on that specific node. If the feature is later turned off or the node is removed, the stunnel process is stopped, and the stunnel toolkit is removed from that individual node.

As Windows cluster is not supported, the encryption enabling feature is not available for cluster environments. Attempting to enable encryption on any cluster node environment that is part of a cluster will result in an error. Additionally, if encryption is enabled on an environment, adding that environment to a cluster as a node will fail.

9.1.4.8.6 Certificate usage for Stunnel communication

On the setup page, a new certificate for the stunnel-server has been seamlessly integrated and this integration is fully automated, eliminating the need for any user intervention. The process for replacing this certificate is similar to the process of replacing another certificate on the setup page. For more details, refer to [Customer provided key pair configuration](#)³⁰⁸.

Upon enabling encryption for an environment, the stunnel working directory is established. Essential files are then transferred from the common toolkit directory to this newly created directory. Additionally, a required certificate is generated with a 730-day expiration period in real-time and is subsequently transferred to the host. This process facilitates the establishment of stunnel communication.

Changing a CA certificate chain along with a stunnel certificate update can result in downtime if the subject and issuer credentials are the same as the old CA certificate. The duration of the downtime is proportional to the number of encrypted environments. During this downtime, functions that involve mounting such as snapshot creation, VDB enable/disable, and VDB refresh, will not work due to the stunnel certificate replacement.

When you refresh the environment with encryption enabled, a new certificate is generated and uploaded to the host. This process effectively extends the expiry, ensuring continued secure communication.

9.1.4.8.7 Configuring ciphersuites

The default ciphersuite used for stunnel communication is `TLS_CHACHA20_POLY1305_SHA256`. If needed, you can change it to one of the following options: `" TLS_AES_256_GCM_SHA384 "`, `" TLS_AES_128_GCM_SHA256 "`, `" TLS_AES_128_CCM_8_SHA256 "`, or `" TLS_AES_128_CCM_SHA256 "` using the provided API.

Details	Path	Visibility	Availability
Env Encryption Ciphersuite	<code>GET /service/security/ env_encryption</code>	System	CLI
Env Encryption Ciphersuite	<code>POST /service/security/ env_encryption</code>	System	CLI

The endpoint `/service/nfs/encryption` is unavailable from version 22.0.0.0 onwards.

³⁰⁸ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/71075999/18.0.0.0+Customer+provided+key+pair+configuration>

When altering the ciphersuite used for Encryption, any changes to the ciphersuite automatically trigger adjustments in the transport layer. This process eliminates the need for additional modifications or manual service restarts.

9.1.4.8.8 Diagnostic data

The environment monitoring system is implemented to assess the operational status of active stunnel connections and trigger the necessary alerts and fault notifications in case of any identified issues. However, assuming all configurations are in order, it can also restart the stunnel process if it unexpectedly stops.

Additionally, for diagnostic purposes, it should be noted that:

- NFS encrypted mounts will be associated with the loopback IP address (127.0.0.1), while non-encrypted mounts will use the Delphix Continuous Data Engine's IP.
- iSCSI encrypted connections will be connected with the loopback IP address (127.0.0.1), while non-encrypted iSCSI connections will use the Delphix Continuous Data Engine's IP.

9.1.4.8.9 API Usage

The following APIs are integrated for broad applicability, proving particularly advantageous when setting up NFS/iSCSI encryption in an environment.

Details	Path	Visibility	Availability
Enable all datasets for an environment	POST /environment/<environment>/enableAllSources	Admin	CLI
Disable all datasets for an environment	POST /environment/<environment>/disableAllSources	Admin	CLI

9.1.4.9 Environment operations

9.1.4.9.1 Adding an environment

Follow the steps below to add source, staging and target environments.

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click on the **Plus** icon next to **Environments**.

5. In the **Add environment** dialog, select **Unix/Linux**.
6. Select **Standalone host** or **Oracle cluster**, depending on the type of environment you are adding.
7. For a standalone environment enter the **Host IP** address.
8. For clustered environments, enter the **Node address** and **Cluster home**.
9. Enter an optional **Name** for the environment.
10. Enter the **SSH** port. The default value is **22**.
11. Enter a **Username** for the environment.
12. Select a Login Type:
 - Username and Password - enter the OS username and password, or
 - Username and Public Key - enter the OS username, and select Password Vault from an existing Enterprise Password Vault

Info : For using Public Key Authentication
If you want to use public-key encryption for logging into your Unix-based environment:

 - a. Select **Public key** for the **Login type**.
 - b. Click **View public key**.
 - c. Copy the public key that is displayed, and append it to the end of your `~/.ssh/authorized_keys` file. If this file does not exist, you will need to create it.
 - i. Run `chmod 600 ~/.ssh/authorized_keys` to allow only the file's owner to read and write to it (make sure the file is owned by the user).
 - ii. Run `chmod 755 ~` to restrict access to the user's home directory so no other user may write to it.
 - iii. Run `chmod 700 ~/.ssh` so that others cannot write to it. The `~/.ssh` directory cannot be writable by group or other users. Otherwise, authentication will fail.
13. The public key needs to be added only once per user and per environment.
14. For **Password login**, click **Verify credentials** to test the username and password.
15. Enter a **Toolkit path**. The toolkit directory stores scripts used for Delphix Continuous Data Engine operations, and should have a persistent working directory rather than a temporary one. The toolkit directory will have a separate subdirectory for each database instance. The toolkit path must have 0770 permissions and at least 345MB of free space.
16. Click **Submit**.

9.1.4.9.2 Refreshing an environment

After you make changes to an environment that you have already set up in the Delphix Management application, such as installing a new database home, creating a new database, or adding a new listener, the environment may need to be refreshed to reflect these changes.

During environment discovery and environment refreshes, Delphix Continuous Data Engine pushes a new copy of the toolkit to each staging and target environment and replaces the old toolkit with the newer one. The toolkit includes:

- A Java Runtime Environment (JRE)
- Delphix jar files

- The HostChecker utility
- Scripts for managing the environment and/or VDBs
- Delphix Connector log files

When you refresh the environment, it will push the toolkit back to the directory identified as the **Toolkit Path** for the given environment. Once this completes, the dSource can be brought back online.

Delphix Continuous Data Engine then executes some of these scripts to discover information about the objects in your environment (where the databases are installed, the database names, information required to connect to these databases, etc.). In some environments (Windows in particular), the scripts are customized to fit your environment.

An environment refresh or discovery operation does not alter the source configuration of manually added databases. If you have added the databases manually, then Delphix Continuous Data Engine does not update its source configuration upon discovering a change.

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. In the Environments panel, click the name of the environment you want to refresh.
5. Select the **Refresh** icon.
6. In the Refresh confirmation dialog select **Refresh**.

9.1.4.9.3 Adding a dataset

While adding an environment to the Delphix Continuous Data Engine, all database installation homes on it are automatically discovered. However, if a database installation home is not automatically discovered, you can add it manually to the environment. This feature may vary for different connectors, for workflow related information, refer to the connector specific documentation.

Below is an example of how to add a dataset home for Oracle.

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Select an Environment.
5. Click the **Databases** tab.
6. Click the **Add dataset home** button.
7. Enter the **Installation home**.
8. Enter the **Version** of the Installation Home.
9. Enter the **Oracle base** of the Installation Home.

10. Enter the **Bits** of the Oracle Home.
11. When finished, click **Add**.

9.1.4.9.4 Adding a database

An environment contains installations, that are database installations in the environment. Each environment may have any number of installations associated with it.

A database object defines the configuration of the dSource, sometimes called a Source Config or Instance, and is required to create a dSource. You can create any number of database objects using an installation, which represents known database instances. Databases only need to be identified on source or staging environments, not target environments.

For Oracle, SQL Server, and some other connectors, known databases are automatically added during discovery. However, not all support automatic database discovery, such as PostgreSQL, or databases can be missed by the discovery feature. In these scenarios, you must create the database manually.

Follow the steps below to create a database, or Source Config, on a source or staging environment:

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Select one of the configured source or staging environments.
5. Select the **Databases** tab.
6. Select one of the **Dataset Home** installations, in some connectors there will be no installation but a placeholder for installation.
7. Select the **Add Database** plus (+) button to specify the database configuration. Input fields for database installation may vary connector to connector. To know about the exact input fields you can refer to the connector specific documentation.

9.1.4.9.5 Adding a database using the CLI

The equivalent of adding a database in the CLI is creating a new `sourceconfig` object. Follow the directions below on how to do so.

Login to Delphix Continuous Data Engine as an admin user:

```
ssh admin@<CONTINUOUS-DATA-FQDN-or-IP>
```

Execute the commands below:

```
sourceconfig
create
set type=<AppDataStagedSourceConfig>
set databaseName=<dbname>
set repository="<repository name>"
```

```
set parameters="{\"name\": \"<source config name>\"}"
commit
```

9.1.4.9.6 Enabling data communication encryption

To enable data communication encryption, select the **Encryption** checkbox in the **Encryption** section. For more information, refer to the [Data Communication Encryption](#) (see page 1062).

9.1.4.9.7 Deleting an environment

Deleting an environment in Delphix Continuous Data will remove all data and configurations related to that environment. This action only affects the environment metadata stored in Delphix Continuous Data. It will not affect your database installations on the hosts or clusters that the environment is referencing.

Before deleting an environment, you must first delete all dependencies, such as dSources and virtual databases (VDBs)

1. Login to the **Delphix Management** application.
2. Select **Environments**.
3. In the Environments panel, select the environment you want to delete.
4. Click the Actions (...) menu, and select **Delete**.
5. In the Delete Environment confirmation dialog click **Delete**.

9.1.4.10 Validating host environments with HostChecker

9.1.4.10.1 Overview

Delphix Continuous Data Engine has developed a host checker for connectors utility that contains standardized checks for source, staging, and target hosts. These checks generally fall into two buckets:

- OS and Host permissions/access
- DB-specific functionality

Currently, the host checker utility is implemented for two types of data sources:

1. IBM DB2
2. Oracle EBS

OS and host permissions/access can (and should) be performed before adding the environment to Delphix Continuous Data Engine to ensure smooth deployment and virtualization workflows.

9.1.4.10.2 Procedure

1. Download the HostChecker tarball for the engine from <https://download.delphix.com/> located in the **Delphix Product Releases > Continuous Data Connectors > Utilities > Host Checker Tool** directory.

2. Extract the HostChecker files from the HostChecker tarball.

```
[ d\lpxqa@stagehost:~ ]$ tar -xvf hostchecker-for-connectors-1.1.0.tar
```

3. Grant execution permissions and run the shell script `main.sh` to initiate the Host checker utility.

```
[ d\lpxqa@stagehost:~/hostchecker-for-connectors-1.1.0 ]$ chmod +x main.sh
[ d\lpxqa@stagehost:~/hostchecker-for-connectors-1.1.0 ]$ ./main.sh
```

Do not run the HostChecker as root. This will cause misleading or incorrect results from many of the checks.

4. Since Host checker is designed to run on different types of databases such as IBM Db2 and Oracle EBS, the user needs to select the type of dataset before starting the host checker.

```
[ d\lpxqa@stagehost:~/hostchecker-for-connectors-1.1.0 ]$ ./main.sh
=====
                                     Delphix  Host Checker  Utility
=====
Please select the type of dataset you want to run the host checker on:

1. DB2
2. Oracle EBS
Enter your choice (Default: 1): 1

Dataset type selected: DB2

-----
Starting host checker for DB2
-----
```

5. The utility prints the output of the various checks that it performs and also logs the details in a specific log directory under the utility's root directory. For example, IBM Db2 dataset environment logs are written under the `DB2-hostchecker-logs` directory.
6. When the script is running, the discovered issues or conflicts (text colored red) are always accompanied by the corresponding documentation URL for the customers to verify and fix the issues

raised by the utility. However, if there are no accompanied documentation URLs, please forward them to Delphix Support along with the logs.

7. Repeat steps 3-7 until all the checks return no errors or warnings.

On successful completion, the scanned host should be added to Delphix Continuous Data and be used as a staging or target environment for your ingesting or provisioning data set.

9.1.4.11 Manually recovering a database after V2P

This page describes how to manually recover a database after the V2P process.

For the Oracle database, while running V2P, Delphix copies the datafiles and other required files on the physical storage. After that it performs the database recovery, followed by some post recovery steps and openDatabase.

- While running V2P from CLI, you can set `recoverDatabase=false` and `openDatabase=false`.
- While running V2P from UI, you can select not to openDatabase.
- If `recoverDatabase=false` is set, run both `recover-vdb.sh` and `open-vdb.sh`.
- If the V2P was performed with `recoverDatabase=true` and `openDatabase=false`, only run `open-vdb.sh`.

9.1.4.11.1 Procedure

1. In the V2P target environment, navigate to the scripts directory for the exported database instance. You can find the scripts in a sub-directory named for that specific database instance. For Oracle databases, the path is `<target_directory>/<db_unique_name>/script/<instance name>`. For SQL Server databases, the path is `<target_directory>\<db_name>\scripts`.
2. For **Oracle** databases, locate the `recover-vdb.sh` and `open-vdb.sh` scripts, then run the required script(s) as described above (as `sh ./recover-vdb.sh` and `sh ./open-vdb.sh`). For **SQL server** databases, locate the script `Provision.ps1` and run it.
3. For **Oracle** databases, add the recovered database to `/etc/oratab` and **Refresh** the target environment for it to discover the recovered database. For **SQL server** databases, when the script completes, **Refresh** the target environment for it to discover the recovered database.

9.1.5 dSource management

9.1.5.1 Overview

dSource is the copy of a source database's persistent data layer that Delphix Continuous Data uses to create and update virtual databases (VDBs). Based on the ingestion model and data source type, the dSource could be exposed through a mount point and interacts with a Staging Database Instance, Database, or Files. Consult the data source connector documentation for specific details.

9.1.5.2 Linking dSources

Once you have discovered your data source environments, you will see a list of data sources on that host. The first step to sync data is to link a dSource from the host.

Linking a dSource will ingest data from the source and create a dSource object on the Delphix Continuous Data engine. As mentioned, the dSource is an object used to create and update virtual copies of your database. As a virtualized representation of your source data, it cannot be managed, manipulated, or examined by database tools.

Once a dSource has been linked, you can begin to perform dSource operations on it, such as enable, detach, delete, and more.

9.1.5.3 The dSource timeflow

Both dSources and VDBs have timeflows, which describes the timeline of data of a virtual database or dSource. Virtual databases can be provisioned from any snapshot in a Timeflow. In the UI, a Timeflow is represented vertically with a series of individual snapshots as rows.

9.1.5.4 The dSource snapshot

Snapshots of dSources preserve specific points in time for use later during the virtual database provisioning workflow. Taking a snapshot will create a new snapshot entry in the dSource's Timeflow.

9.1.5.5 dSource operations

9.1.5.5.1 Overview

In order to use dSource snapshots, you must create a virtual database (VDB), an independent, writable copy of a dSource snapshot.

When integrating an environment into the Continuous Data Engine, the system automatically locates and identifies any data sources within the host, listing them as dSources under the Databases tab specific for each environment. This section outlines the management of dSources and the synchronization of data from your sources, involving operations and concepts such as:

- **Link/Sync:** Establishing a connection with a data source.

- **Timeflows:** Describes the timeline of data of a virtual database or dSource.
- **Snapshots:** Captured states of a dSource at specific moments.
- **SnapSync and LogSync:** Processes to capture and synchronize data changes.
- **Enable/Disable:** Activating or deactivating a dSource.
- **Detach/Reattach:** Temporarily disconnecting and then reconnecting a dSource.
- **Delete:** Removing a dSource.
- **Upgrade:** Updating a dSource to a new version.

9.1.5.5.2 Adding an environment configuration

In the Delphix Continuous Data Engine, environments are composed of repositories, which correspond with your respective database management software (DBMS) installations. An environment can be linked with an unlimited number of these repositories.

To establish a dSource, you must define its configuration with a source environment configuration. Repositories serve as a foundation for creating this kind of object, each of which corresponds to a recognized database instance within the system.

For connectors, it is necessary to set up the environment configuration manually.

9.1.5.5.2.1 Steps to create an environment configuration in the staging environment

1. Access the Delphix Management application by logging in.
2. Navigate to the **Manage** section.
3. Go to **Environments** and select the appropriate repository.
4. Click the plus (+) icon to initiate a new configuration.
5. In the **Add database** area, fill in the necessary details.
6. Provide a name for your dSource in the **Name** field.

9.1.5.5.2.2 Setting up an environment configuration using the Command Line Interface (CLI)

To configure SourceConfig via CLI, follow these instructions:

1. Securely log into your Delphix Continuous Data Engine using the admin account with SSH:

```
ssh admin@<CONTINUOUS-DATA-FQDN-or-IP>
```

2. Execute the following commands:

```
sourceconfig
create
set type=<AppDataStagedSourceConfig>
set databaseName=<dbname>
set repository="<repository name>"
```

```
set parameters="{\"name\": \"<source config name>\"}"  
commit
```

This process will create a SourceConfig for your dSource using the specified repository details.

9.1.5.5.3 Disabling a dSource

To ensure certain operations can be carried out, a dSource may need to be disabled. Disabling halts communication between the Delphix Continuous Data Engine and the source database without removing the underlying configuration.

9.1.5.5.3.1 Steps to disable a dSource

1. Log in to the Delphix Management application.
2. Select the dSource you wish to disable.
3. In the upper right-hand corner, click the Actions menu (...) and choose **Disable**.
4. In the confirmation dialog, click **Disable** again.

Disabling is a prerequisite for operations such as:

- Database migration
- dSource metadata upgrading post-data source upgrade
- Restoring the source database from backup

Disabling will cease any ongoing Delphix Continuous Data Engine operations related to the dSource. When you are ready to re-enable the dSource, simply select **Enable** from the Actions menu (...), and it will resume normal function.

9.1.5.5.4 Force disabling a dSource

There might be circumstances that require a dSource to be forcefully disabled, stopping all related Delphix Continuous Data Engine operations immediately.

9.1.5.5.4.1 Steps to force disable a dSource

1. Access the Delphix Management application.
2. Choose the dSource in question.
3. Click on the Actions menu (...) in the upper right corner and opt for **Disable**.
4. Select the **Force Disable** checkbox in the dialog that appears.

9.1.5.5.5 Detach and reattach a dSource

In certain scenarios, you may need to detach a dSource from its source database and later reattach it, possibly to a different source. This process is essential for maintaining the flexibility of your data management within the Delphix Continuous Data Engine.

9.1.5.5.5.1 Understanding dSource detachment

Detaching a dSource breaks its link with the current source database but preserves the existing data and snapshots within the Delphix Continuous Data Engine. Here are some items to note about detached dSources:

- **Continued use for VDBs:** A detached dSource can still provision a Virtual Database (VDB).
- **Re-linking capability:** You can re-link the original source database as a new dSource.
- **Child VDB refresh limitations:** VDBs that were created from the detached dSource can only refresh from the last snapshot taken before detachment.
- **Provisioning from new snapshots:** If a newer snapshot is needed, you will have to provision a new VDB. Subsequently, you may delete the outdated VDBs and the old dSource when they are no longer required.

9.1.5.5.5.2 Steps to detach a dSource

To detach a dSource from its source database:

1. Log into the Delphix Management application.
2. Select the dSource you wish to detach.
3. Click on the Actions menu (...) and choose **Unlink dSource**.
4. A warning message will pop up—confirm the action by clicking **Unlink**.
5. The status of the dSource will update to **Detached**.

9.1.5.5.5.3 Steps to reattach a dSource

When ready to re-establish a connection between a dSource and a source database:

1. Go back to the Delphix Management application.
2. From the Actions menu (...) next to the detached dSource, select **Link dSource**.
3. Follow the prompts to complete the re-linking process.

Remember, reattaching a dSource re-establishes its connection with a source database, allowing it to resume its role in data management operations according to your configurations.

9.1.5.5.6 Delete a dSource

Deleting a dSource will remove its metadata, snapshots, logs, and policies from the Delphix Continuous Data Engine. This action does not affect the source database.

9.1.5.5.6.1 Prerequisites for deleting a dSource

There must be no dependent virtual databases (VDBs) or virtual Pluggable databases (vPDBs). Ensure all dependent databases are deleted as per instructions in the **Deleting virtual databases** under [Provisioning and managing virtual databases](#)³⁰⁹.

9.1.5.5.6.2 Steps to delete a dSource

1. Log in to the Delphix Management application.
2. Select the dSource you wish to delete.
3. From the Actions menu (...), select **Delete**.
4. Click **Delete** to confirm the action.

9.1.5.5.7 SnapSync a dSource

SnapSync is the process that captures the complete dataset on the initial load and only the incremental changes thereafter, creating efficient storage snapshots.

9.1.5.5.7.1 Understanding SnapSync

- The initial SnapSync pulls the complete data set using standard database protocols.
- Subsequent SnapSync operations fetch only incremental changes.
- Each SnapSync operation results in a snapshot, serving as a baseline for VDB provisioning.

9.1.5.5.8 Resync a dSource

Resync is a process similar to the initial SnapSync but is executed at intervals to ensure the dSource is updated with the complete data set from the source database.

9.1.5.5.8.1 Prerequisites for Resync

- The data directory under the mount path must be empty before starting a Resync operation.

³⁰⁹ <https://cd.delphix.com/docs/latest/provisioning-and-managing-virtual-databases#Deleting-virtual-databases>

9.1.5.5.8.2 Steps to Resync a dSource

1. If needed, ensure the data directory is empty to avoid errors.
2. The Resync will capture the complete data set, akin to the initial SnapSync process.

9.1.5.5.9 LogSync a dSource

LogSync complements SnapSync by periodically capturing log files from the source database, allowing for more granular recovery points between SnapSync snapshots.

9.1.5.5.9.1 LogSync details

- Log files are transferred using standard database protocols and stored separately from SnapSync data.
- These logs facilitate the provisioning of VDBs from points in time between SnapSync snapshots.
- The time taken to provision from these intermediate points is proportional to the volume of data change on the source database and the time elapsed since the last snapshot.

9.1.5.5.10 Upgrading a dSource

When the source database connected to a dSource is upgraded, it becomes necessary to update the dSource's metadata to match this new version. This section guides you through upgrading the dSource to align with the updated database.

The upgrade of a dSource is a crucial operation that ensures the Delphix Continuous Data Engine recognizes and correctly associates with the updated version of the source database. Note that this process does not upgrade the database itself; it merely updates the dSource metadata.

9.1.5.5.10.1 Prerequisites for upgrading a dSource

Before you begin the upgrade process:

- Confirm that the source database instance has been upgraded to the newer version.
- Ensure that the dSource is disabled. This is a mandatory step to proceed with the upgrade.

9.1.5.5.10.2 Upgrade procedure

The upgrade process will involve modifying the dSource to use the installation path of the new database version. The general steps are as follows:

1. Disable the dSource. This step is crucial and must be completed before you start the upgrade process. For details on disabling a dSource, refer to the **Disabling a dSource** section above.
2. Once the dSource is disabled, you can proceed with the upgrade according to the specific database you are working with.

9.1.5.5.10.3 Database-specific upgrade instructions

Each database has its own set of instructions for upgrading a dSource. Refer to the respective connector documentation for detailed procedures:

9.1.6 Virtual database (VDB) management

9.1.6.1 Overview

Virtual Database (VDB) is a full read-and-write copy of the source data that is provisioned from either a dSource or another VDB. A VDB is provisioned and managed by the Delphix Continuous Data Engine. Upon successfully adding a data source from an environment and generating snapshots of a [dSource](#)³¹⁰, you can initiate the provisioning of virtual databases (VDBs).

A dSource is a protected, virtualized representation of a source database which Delphix Continuous Data Engine maintains. It cannot be managed, manipulated, or examined by database tools. It is used to create and update virtual databases. To make use of the dSource snapshots, it is imperative to create a VDB.

It is important to note that the VDBs can also be created from existing VDBs. Once a VDB has been provisioned on the target environment, you have the ability to create a snapshot policy for that VDB. This policy enables you to capture and manage changes within the VDB in the same manner as any other conventional logical or physical database.

9.1.6.2 VDB Timeflow

Both dSources and VDBs have timeflows, which describes the timeline of data of a virtual database or dSource. Virtual databases can be provisioned from any snapshot in a timeflow. The virtual database's filesystem will be dependent upon the snapshot used to provision, and as such, that snapshot can not be removed until the dependency is removed. In the Delphix Continuous Data Engine UI, a timeflow is represented vertically with a series of individual snapshots as rows.

9.1.6.3 VDB Snapshot

Snapshots of dSources preserve specific points in time for use later during the virtual database provisioning workflow. Taking a snapshot will create a new snapshot entry in the VDBs timeflow.

9.1.6.4 VDB operations

VDB operations allows you to interact with and manipulate virtualized instances of databases. These operations are pivotal in ensuring the effective utilization, maintenance, and synchronization of virtual databases. Common VDB operations include:

³¹⁰ <https://docs.google.com/document/d/1ZgIUP1aI5iZy-BN3dvhov0InOgfVR8U6sY5htaHGvqE/edit#heading=h.xl1ogq93hrpw>

9.1.6.4.1 Provision a VDB

Virtual databases are a significant part of the Delphix Continuous Data solution. In order to create or provision a virtual database, you will need a linked dSource from a source host and a compatible target environment, as described in the overview for [Managing environments and hosts](#)³¹¹. Since provisioning VDBs vary significantly across connectors, details on this process can be found within the documentation for the specific connector.

At the core, virtual databases are fully functional copies of data sources that can be created and managed at a fraction of the storage and time that are typically required. To end-users, VDBs act and perform just like a standard database.

9.1.6.4.2 Disable and enable a VDB

The act of disabling a VDB serves as a necessary prerequisite for procedures like VDB migration or upgrade. When a VDB is disabled, it consists of the complete removal of all its traces, including configuration files from the target environment in which it was originally provisioned. It's important to note that while the VDB itself, along with its associated metadata, remains intact on the Delphix Continuous Data engine, the configuration files are temporarily eliminated from the target environment.

Subsequently, when you decide to re-enable the VDB, these previously removed configuration files are reinstated within the target environment, facilitating the VDB's return to operational status with its settings and parameters restored.

9.1.6.4.2.1 Procedure

Perform the below steps to disable a VDB.

1. Login to the Delphix Management application.
2. Select the VDB you want to disable.
3. From the Actions menu, select Disable.
4. Click Disable to acknowledge the warning.

When you are ready to re-enable the VDB again, select Enable from the Actions menu, and the VDB will continue to function as it did previously.

9.1.6.4.3 Start and stop a VDB

Stopping your virtual databases is essential when executing actions on the database that requires it to be in an offline state. Beyond simply ensuring the database's proper shutdown, the Delphix Continuous Data engine stop and start actions encompass additional functions, including unmounting and mounting the filesystems supplied by the Delphix Continuous Data engine.

9.1.6.4.3.1 Procedure

Perform the below steps to start/stop a VDB.

³¹¹ <https://cd.delphix.com/docs/latest/managing-environments-and-hosts>

1. Login to the Delphix Management application.
2. Select the VDB you want to manage.
3. To stop an active VDB, click the stop icon at the top right-hand corner. Conversely, to start an inactive VDB, click the start icon at the top right-hand corner.
4. In cases where stopping or starting the VDB requires credentials distinct from the default environment user, then do the following:
 - a. Check Provide Privileged Credentials.
 - b. Enter the username and password.
 - c. Click Validate Credentials.
5. Click Yes to stop or start the VDB.
6. To view the status of the stopping or starting of the VDB, you can use one of the below ways:
 - a. View the Active Jobs on the right-hand corner of the screen
 - b. monitor the progress bar from the VDB Status tab.

9.1.6.4.4 Refresh a VDB

Refreshing a VDB will re-provision it from the dSource. As with the normal provisioning process, you can choose to refresh the VDB from a snapshot or a specific point in time. However, you should be aware that refreshing a VDB will delete any changes that have been made to it over time. When you refresh a VDB, it will revert to its previous state in the specified snapshot or point in time.

When performing a VDB refresh, there is an option to choose between either the faster or more accurate point in time for that database.

Note: Although the VDB no longer contains the previous contents, the previous snapshots and timeflow still remain in the Delphix Continuous Data engine and are accessible through the Command Line Interface (CLI).

9.1.6.4.4.1 Prerequisites

To refresh a VDB, you must have the following permissions:

- **Provisioner** permissions on the dSource associated with the VDB
- **Provisioner** permissions on the group that contains the VDB
- **Owner** permissions on the VDB itself
- **Data** is a role that allows DB_ROLLBACK, DB_REFRESH, READ_ACTION, DB_SYNC, JOB_CANCEL.
- **Read** is a role that allows the user to inspect objects via the READ_ACTION permission.

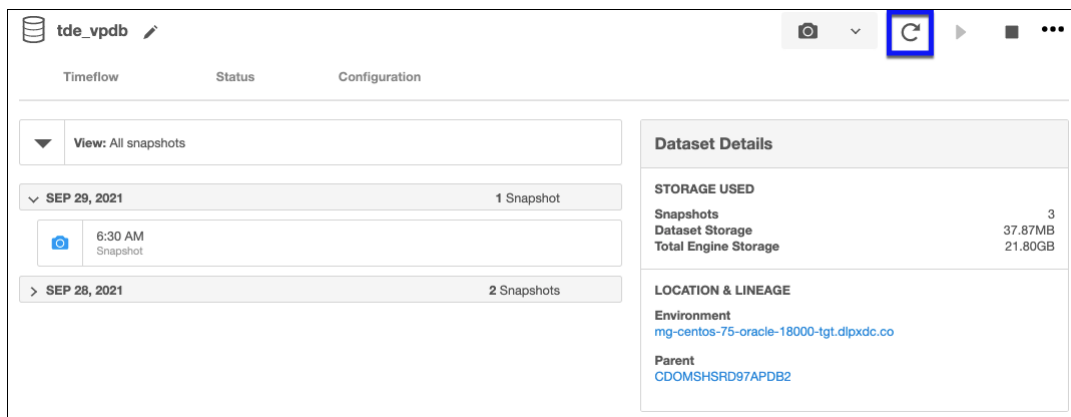

A user with admin credentials can perform a VDB Refresh on any VDB in the system.

9.1.6.4.4.2 Procedure

Perform the following below to refresh a VDB.

1. Login to the Delphix Management application.
2. Navigate to **Manage > Datasets**.
3. Select the VDB that you want to refresh.

4. Click the **Refresh** VDB button. The Refresh VDB screen appears.
5. Select one of the refresh options and click **Next**.
 - a. **Faster** - This option will utilize the most recent snapshot in the timeflow.
 - b. **More accurate** - This option allows you to select a snapshot, a point in time, or a specific log ID.
6. Click **Submit** to confirm.
7. Click the **Actions** button to watch the progress of the refresh job.
8. If you want to know when the VDB was last refreshed/provisioned, check the **Time Point** on the Status page.

9.1.6.4.5 Rewind a VDB

Rewinding a VDB rolls it back to a previous point in its timeflow and re-provisions the VDB. The VDB will no longer contain changes after the rewind point.

- Although the VDB no longer contains changes after the rewind point, the rolled-over snapshots and timeflow still remain in Delphix Continuous Data engine and are accessible through the Command Line Interface (CLI). For instructions on how to use these snapshots to refresh a VDB to one of its later states after it has been rewound, refer to the topic [CLI Cookbook: Rolling forward a VDB](#)³¹².
- Delphix clones a new timeflow from the closest snapshot older than or equal to the rewind point. This creates a dependency between the new timeflow and the parent snapshot and timeflow. The parent snapshot and timeflow cannot be deleted because of this dependency. The VDB must first be refreshed before the parent snapshot and timeflow can be removed.

³¹² <https://cd.delphix.com/docs/latest/cli-cookbook-rolling-forward-a-vdb>

9.1.6.4.5.1 Prerequisites

To rewind a VDB, you must have the following permissions:

- **Auditor** permissions on the dSource associated with the VDB
- **Owner** permissions on the VDB itself

You do not need owner permissions for the group that contains the VDB. A user with admin credentials can perform a VDB Rewind on any VDB in the system.

9.1.6.4.5.2 Procedure

Perform the below steps to rewind a virtual database.

1. Login to the Delphix Management application.
2. Select the VDB you want to rewind.
3. Select the **Timeflow** tab.
4. Select the rewind point as a snapshot or a point in time.
5. Click **Rewind**.
6. If you want to use login credentials on the target environment other than those associated with the environment user, click **Provide Privileged Credentials**.
7. Click **Rewind** to confirm.

You can use timeflow bookmarks as the rewind point when using the CLI. Bookmarks can be useful to:

- Mark where to rewind to - before starting a batch job on a VDB for example.
- Provide a semantic point to revert back to in case the chosen rewind point turns out to be incorrect.

For a CLI example using a timeflow bookmark, refer to the [CLI Cookbook: Provisioning a VDB from a Timeflow Bookmark](#)³¹³.

Undo rewind or refresh operation

An accidental refresh of one or more virtual databases (VDBs) from a source database can remove the important data. To restore the data back, you can undo VDB refresh or rewind actions.

Procedure

Perform the below steps to undo a refresh or rewind operation:

³¹³ <https://cd.delphix.com/docs/latest/cli-cookbook-provisioning-a-vdb-from-a-timeflow-bo>

1. Login to the Delphix Management application.
2. Under Datasets, select the VDB you want to undo your rewind/refresh for.
3. From the **Actions** menu, select **Undo Refresh or Rewind**.

4. Confirm that you want to undo the last refresh or rewind for the selected VDB, by selecting **Undo**.

5. From the Action sidebar menu, you will be able to view the undo action.

9.1.6.4.6 Migrate a VDB

In certain scenarios, you might find it necessary to migrate a virtual database to a different target environment. This need can arise, for instance, when upgrading the host where the VDB is hosted or as part of a broader data center migration effort. Leveraging the VDB migration functionality enables you to relocate the VDB from its current location to a new target environment. This is easily accomplished by first disabling the database, then using the migrate VDB feature to select a new target environment.

9.1.6.4.6.1 Prerequisites

- Set up a new target environment that is compatible with the VDB that you want to migrate.
- Ensure that the VDB has first been disabled.

9.1.6.4.6.2 Procedure

Perform the below steps to migrate a virtual database.

1. Login to the Delphix Management application.
2. Select the VDB you want to migrate.
3. From the Actions menu, select **Migrate**.
4. Select the new target environment for the VDB, the user for that environment, and the database installation where the VDB will reside.
5. Select **Migrate**.
6. From the **Actions** menu, select **Enable**.
7. Click **Enable** to confirm.

Within a few minutes, your VDB will re-start in the new environment, and you can continue to work with it as you would any other VDB.

This feature may vary for different connectors. For workflow related information, refer to the connector specific documentation.

9.1.6.4.7 Upgrade a VDB

Much like the process of upgrading a data source, upgrading a VDB entails modifying the installation path linked to the corresponding data platform. It's important to note that this feature doesn't upgrade the VDB itself; instead, it ensures that Delphix Continuous Data engine correctly associates the VDB with the correct database version to ensure proper functionality.

By performing this upgrade, you have the capability to update the database version used for running the VDB.

This feature may vary for different connectors. For workflow related information, refer to the connector specific documentation.

9.1.6.4.7.1 Procedure for VDB In-Place Upgrade

Perform the below steps to upgrade a virtual database.

1. Remove any VDB refresh policy assigned to the VDB.
2. Upgrade the target database instance.
3. Refresh the target environment.

9.1.6.4.8 Delete a VDB

Deleting a VDB will remove it and its timeflow and snapshots from the Delphix Continuous Data engine entirely. This operation is non-reversible.

9.1.6.4.8.1 Prerequisites

You cannot delete a VDB that has dependent VDBs. Before deleting a VDBs, make sure that you have deleted all dependent VDBs. Otherwise, the delete option will be grayed out.

Deleting a VDB is an unrecoverable operation. Proceed only if you want to permanently destroy the unique data that was created in the VDB.

9.1.6.4.8.2 Procedure

Perform the below steps to delete a virtual database.

1. Login to the Delphix Management application.
2. Select the VDB you want to delete.
3. From the **Actions** menu, select **Delete**.
4. Click **Delete** to confirm.

9.1.6.4.8.3 Force Delete

Deleting a vFiles may fail if it cannot be unmounted successfully from all target environments. You can use the force delete option to ignore all failures during unmount.

9.1.6.4.8.4 Using Force Delete

Deleting unused or outdated objects should be a regular part of Delphix Continuous Data engine administration. This is especially important to prevent low space errors, which can cause the Delphix Continuous Data Engine to stop. The Delphix Continuous Data engine holds a maximum of 750 objects.

Force Delete can be used when:

- The staging host/container is not accessible via Delphix Continuous Data engine anymore.
- The Delphix Connector service is not running (applicable to SQL Server only).
- The normal delete is throwing an error and not working.
- When the target or staging host is decommissioned.

Force Delete should not be used as an alternative to **Delete** in normal circumstances.

Procedure

Perform the below steps to forcefully delete a virtual database.

1. Log into the Delphix Management application.
2. Select **Resources > Storage Capacity**.
3. Select the Trash can next to the object you want to delete.
4. In the **Delete** dialog, select **Force Delete**. Oracle users will have the option to provide additional credentials.

5. Click **Delete**.

9.1.6.4.8.5 Dependencies

If there are dependencies on the snapshot, you will not be able to delete the snapshot free space; the dependencies rely on the data associated with the snapshot. These items are displayed with a lock icon next to the name.

9.1.6.4.9 Export a VDB (V2P)

V2P (Virtual to Physical) refers to the process of exporting a virtual database to a physical one. Once you have created a dSource or a VDB, you have the option to export its contents and log files to a physical

database. This process creates a set of directories on the target environment and populates them with the database data, log files, and scripts that are used to recover the physical database.

You can automatically start the physical database recovery process as part of V2P, or you can use the scripts for manual recovery. When the export process completes, the target environment will contain a copy of the database in its unvirtualized size. Therefore, before you begin the process, ensure that the target directories specified during V2P operation have enough capacity to accommodate the database. For more information, refer to the connector specific documentation.

9.1.6.4.9.1 Provisioning with replication

The process for provisioning from replicated objects closely mirrors the standard VDB provisioning procedure, with one key distinction. Before initiating the provisioning process, you must first select the replica namespace containing the replicated object.

9.1.6.4.9.2 Prerequisites

- You must have a dSource or VDB that has been replicated from one Delphix Continuous Data engine to another, as described in [Replication overview](#)³¹⁴.
- The Delphix Continuous Data engine containing the replicated dSource or VDB must have a compatible target environment that it can use to provision a VDB from the replicated dSource or VDB.
- On the Delphix Continuous Data engine containing the replicated dSource or VDB, login to the Delphix Management application.

9.1.6.4.9.3 Procedure

Perform the below steps to perform provisioning from replicated objects .

1. From the list of replica namespaces, select the replica namespace that contains the dSource or VDB from which you want to provision.
2. The provisioning process is now identical to the process for provisioning standard objects.

9.1.6.5 Automatic VDB restart on target server after reboot

The Continuous Data Engine now automatically detects whether a target server has been rebooted, and proactively restarts any VDB on that server that was previously up and running. This happens independent of the VDB dataset; it is done as if a target server was restarted and a start command was issued from the Delphix Engine. This feature is compatible with Delphix Self-Service (Jet Stream) ordering dependencies for non-clustered VDBs.

This feature is not supported for the following data source types:

- Oracle 12.1 and older vPDBs that are provisioned into a non-virtual CDB.

³¹⁴ <https://cd.delphix.com/docs/latest/replication-overview>

- MSSQL cluster VDBs.

Automatic VDB Restart is supported for following Oracle data sources types:

- Non-Multi-Tenant (non-MT) VDBs
- Oracle 12c and later, vPDBs that are provisioned into a virtual CDB.
 - For Oracle 12.1.0.1, users can choose to enable or disable automatic restart at the virtual CDB level. There is no individual vPDB automatic restart setting.
 - For Oracle 12.1.0.2 and later versions, users can choose to enable or disable automatic restart for a virtual CDB or a virtual PDB.
- Oracle 12.2 and later vPDBs that are provisioned into a non-virtual CDB. Users can choose to enable or disable individual vPDB's automatic restart.

Note:

- The scheduler checks every one minute if any VDB needs to be restarted. The Delphix Engine waits for five minutes after it detects a host has restarted before trying to restart VDBs. The engine will keep trying to restart the VDB for 30 minutes before giving up.
- For Oracle clustered VDBs/vPDBs, the Automatic VDB restart feature does not support ordering for restart purpose if these virtual sources are in a JetStream container. All the VDBs/vPDBs will be started in parallel.

To enable automatic restart, complete either of the following steps:

1. When provisioning a new VDB in the VDB Provisioning wizard, check the **Automatic Restart** box.

Provision VDB

Custom Environment Variables

2. If the VDB has already been provisioned, you can also enable **Automatic VDB Restart** feature by following the steps below.
 - a. In the **Datasets** panel, select the **VDB**.
 - b. Go to the **Configuration** tab
 - c. Select **Source** sub-tab.
 - d. Select the pencil icon for **Source Database** to edit.
 - e. Check the **Auto VDB Restart** checkbox.
 - f. Save the update.

Below is a sample screenshot for editing a VDB for a data source.

Below is a sample screenshot for editing an AppData VDB.

9.1.7 Hook operations

9.1.7.1 Overview

Hook operations enable the execution of custom tasks at specific points in the process of linking sources and managing virtual datasets. This feature is particularly useful in scenarios such as preventing monitoring systems from activating during the startup and shutdown of Virtual Databases (VDBs). Users can utilize pre and post-hooks to execute necessary scripts during VDB start/stop operations.

The execution environment for hook scripts varies depending on the operating system:

- **Unix-based** OS: Hook scripts will be executed using **bash**.
- **Windows** OS: Hook scripts will be executed using **PowerShell**.

Each Delphix Continuous Data object possesses a unique set of hooks. For efficient management across multiple datasets, you have the option to create hook templates. These templates allow you to apply the same hook configuration to numerous objects, streamlining the process (as discussed in the corresponding section later on this page).

9.1.7.2 Creating hook operations

9.1.7.2.1 Creating hook operations via the Delphix Continuous Data Engine UI

Hook operations can be configured either during the provisioning process or on existing virtual datasets.

9.1.7.2.1.1 During provisioning

1. In the **Add dSource** or **Add VDB** wizards, go to the **Hooks** tab.
2. Select the **Operation Type**, enter a **Name**, and input the **Script**.
3. To remove an operation, click the **Trash** icon next to it.
4. After setting all operations, click **Next** to proceed with provisioning.

9.1.7.2.1.2 To edit on existing virtual datasets

1. Log in to the Delphix Management application.
2. In the **Datasets** panel, select the virtual dataset.
3. Navigate to **Configuration > Hooks**.
4. Select a hook and click the **Pencil** icon to edit.
5. Use the **+** icon to add or the **Trash** icon to remove operations.
6. Save changes by clicking the checkmark icon.

9.1.7.2.2 Creating hook operations via the administrative Command-Line Interface (CLI)

9.1.7.2.2.1 To define hook operations

- During linking: Edit the array in **LinkingParameters > Source > Operations**.
- During provisioning: Edit the array in **ProvisionParameters > Source > Operations**.
- On existing dSources: Edit **Source > Operations**.
- On existing virtual datasets: Edit **Source > Operations**.

Detailed documentation on these CLI objects is available in the **Help** menu of the Delphix Management application, including `LinkedSourceOperations`, `VirtualSourceOperations`, `RunCommandOnSourceOperation`, and `RunExpectOnSourceOperation` API.

9.1.7.2.2.2 Example of editing hook operations through the CLI

To modify operations for a source, use the following commands:

1. Navigate to `VirtualSourceOperations` for the source.
2. Select a hook to edit. Example commands:

```
delphix> source
delphix source> select "pomme"
delphix source "pomme"> update
delphix source "pomme" update *> edit operations
delphix source "pomme" update operations *> edit postRefresh
```

3. To add an operation:

```
delphix source "pomme" update operations postRefresh *> add
delphix source "pomme" update operations postRefresh 0 *> set
type=RunCommandOnSourceOperation
delphix source "pomme" update operations postRefresh 0 > set command="echo Refresh
completed."
delphix source "pomme" update operations postRefresh 0 > ls
Properties
  type: RunCommandOnSourceOperation ()
  command: echo Refresh completed. ()
delphix source "pomme" update operations postRefresh 0 *> commit
```

4. To delete an operation:

```
delphix source "pomme" update operations postRefresh *> unset 1
delphix source "pomme" update operations postRefresh *> commit
```

9.1.7.3 Hook operations templates

Hook operation templates are designed to store commonly used operations. This allows for efficient reuse of operations across multiple virtual datasets, reducing repetitive work.

These templates are managed exclusively through the Delphix Continuous Data Engine UI; they are not available via the Command-Line Interface (CLI).

9.1.7.3.1 Creating a hook operation template

The provisioning wizard can import operations from these templates.

Steps to create a template:

1. Log in to the Delphix Management application.
2. Navigate to **Manage > Operation Templates**.
3. Click the **+** icon to initiate a new template creation.
4. Provide a **Name** for the template.
5. Select the **Operation Type**.
6. Enter a **Description** and the **Operation Contents**.
7. Click **Create** to finalize the template.

New Template ✕

Name

Type

Bash Shell Command
▾

Description

Credential Environment Variables +

No items

Content

```
# $ErrorActionPreference = "Stop";
printf "Hello World";
```

Delphix does not perform error checking on PowerShell hook scripts. The user script should perform error checking and logging, and return a non-zero exit code to indicate the scripts failure. Failure to return a non-zero exit code would mean that Delphix will think the hook script succeeded and mark the job as a success.

The variable \$ErrorActionPreference determines how PowerShell responds to a non-terminating error. Default value for this variable is "Continue".

Cancel

Create

9.1.7.3.2 Importing a hook operation template

To import a template into a dataset:

1. Log in to the Delphix Management application.
2. In the **Datasets** panel, select the desired dataset.
3. Go to **Configuration > Hooks**.
4. Select the hook to be edited and click the **+** icon.
5. Choose **Import** and select the template.
6. Click **Import** again.

7. After setting all operations, click **Check** to save changes.

9.1.7.3.3 Exporting a hook operation template

To export a template:

1. Log in to the Delphix Management application.
2. In the **Datasets** panel, choose a dataset.
3. Navigate to **Configuration > Hooks**.
4. Select the hook, add a new operation, and select its type.
5. Edit the operation contents in the text area.
6. Click **Export**, then enter a **Name** and **Description** for the template.
7. Click **Export** to complete the process.

9.1.7.4 Hook operations list

9.1.7.4.1 dSource hook operations

Hook	Description
Pre-sync	<ul style="list-style-type: none"> • Executed before the SnapSync operation of a dSource. • These operations can quiesce data for capture during SnapSync or stop application processes that may interfere with SnapSync.
Post-sync	<ul style="list-style-type: none"> • Executed after the SnapSync operation of a dSource. • Operations undo changes made by pre-sync hooks and will run regardless of the success of pre-sync hooks or SnapSync.

9.1.7.4.1.1 Virtual Database hook operations

Hook	Description
Configure clone	<ul style="list-style-type: none"> • Operations performed after initial provision or after a refresh. • Runs after the virtual dataset has started. • During a refresh, this hook precedes the post-refresh hook.

Pre-refresh	<ul style="list-style-type: none"> • Operations performed before a refresh. • Runs before the virtual dataset is stopped. • Operations can cache data from the virtual dataset for restoration after the refresh.
Post-refresh	<ul style="list-style-type: none"> • Operations performed after a refresh. • Runs after the virtual dataset has started and after configure clone. • Will not run if the refresh or pre-refresh hook operation fails. • Operations can restore cached data after refresh completion.
Pre-rollback	<ul style="list-style-type: none"> • Operations performed before a rollback (rewind). • Runs before the virtual dataset is stopped. • Operations can cache data from the virtual dataset for restoration after rewind.
Post-rollback	<ul style="list-style-type: none"> • Operations performed after a rollback (rewind). • Runs after the virtual database has started. • Will not run if the rewind or pre-rewind hook operations fail. • Operations can restore cached data after rewind completion.
Pre-snapshot	<ul style="list-style-type: none"> • Operations performed before a snapshot. • Operations can quiesce data for capture during the snapshot or stop processes that may interfere with the snapshot.
Post-snapshot	<ul style="list-style-type: none"> • Operations performed after a snapshot. • Runs regardless of the success of the snapshot or pre-snapshot hook operations. • Operations can undo changes made by the pre-snapshot hook.
Pre-start	<ul style="list-style-type: none"> • Operations performed before the startup of a VDB or vFile. • Can be used to initialize configuration files or stop processes that might interfere with the virtual dataset.
Post-start	<ul style="list-style-type: none"> • Operations performed after the startup of a VDB or vFile. • Can clean up temporary files, restart processes stopped by pre-start hooks, or log notifications.
Pre-stop	<ul style="list-style-type: none"> • Operations performed before the shutdown of a VDB or vFile. • Can quiesce data or processes prior to the virtual dataset shutdown.

Post-stop	<ul style="list-style-type: none"> • Operations performed after the shutdown of a VDB or vFile. • Can be used to log notifications, clean up temporary files, or manage related processes.
------------------	--

9.1.7.4.2 Order of execution of hooks for various VDB operations

Provision	Refresh	Rollback	Snapshot	Start	Stop
Pre-start	Pre-refresh	Pre-rollback	Pre-snapshot	Pre-start	Pre-stop
Post-start	Pre-stop	Pre-stop	Post-snapshot	Post-start	Post-stop
Configure clone	Post-stop	Post-stop			
Run masking job	Pre-start	Pre-start			
Pre-snapshot	Post-start	Post-start			
Post-snapshot	Configure clone	Configure clone			
	Run masking job	Run masking job			
	Post-refresh	Post-rollback			
	Pre-snapshot	Pre-snapshot			
	Post-snapshot	Post-snapshot			

9.1.7.4.2.1 Staging server hooks

Staging Server hooks are currently applicable to SAP ASE and will execute on the configured staging server.

Hook	Description
Pre validated sync	Operations performed on a staging server before validated sync. This hook will run before the validated sync operation whenever the validated sync run is triggered.
Post validated sync	Operations performed on staging server after validated sync. This hook will run after the validated sync operation whenever the validated sync run is triggered.

9.1.7.4.2.2 Self-service interaction with hooks

These are the operations performed by the various Self-Service operations:

Rollback

Reset, Undo, and any Restore or Branch operation using source point-in-time or a bookmark that's part of the current container.

Refresh

Refresh and any Restore or Create Branch operation from any shared bookmark or when using the Template as the source of the restore (bookmark or point-in-time).

The Virtual Database Hooks described above will run accordingly. Snapshots are taken, for recovery purposes, before and after every operation that is performed. Bookmark operations will also initiate a snapshot.

9.1.7.5 Self-Service interaction with hooks

This page outlines the operations performed by various Self-Service actions:

9.1.7.5.1 Rollback

- Includes **Reset**, **Undo**, and any **Restore** or **Branch** operation that uses a source point-in-time or a bookmark part of the current container.

9.1.7.5.2 Refresh

- Comprises **Refresh** and any **Restore** or **Create Branch** operation from:
 - Any shared bookmark.
 - Using the template as the source of the restore (bookmark or point-in-time).
- The virtual database hooks described earlier will execute as per these operations.

9.1.7.5.3 Additional notes

- Snapshots are taken for recovery purposes before and after every operation performed.
- Bookmark operations will also initiate a snapshot.

9.1.8 Shell operations

9.1.8.1 RunCommand operation

- Executes a shell command in a Unix environment using `/bin/sh`.`
- The environment user executes the command from their home directory.
- The Delphix Continuous Data Engine captures and logs all command output.
- In case of script failure, output is displayed in the Delphix Continuous Data UI and CLI for debugging.
- **Success criteria:** The command must exit with an exit code of 0. Any other exit codes indicate a failure.

9.1.8.1.1 Examples of RunCommand operations

- Direct command input:

```
remove_dir="$DIRECTORY_TO_REMOVE_ENVIRONMENT_VARIABLE"
if test -d "$remove_dir"; then
    rm -rf "$remove_dir" || exit 1
fi
exit 0
```

- Running existing scripts with executable permission:

```
/opt/app/oracle/product/10.2.0.5/db_1/dbs/myscript.sh "$ARG_ENVIRONMENT_VARIABLE"
"second argument in double quotes" 'third argument in single quotes'
```

9.1.8.2 RunBash operation

- Executes a Bash command in a Unix environment using a bash binary provided by Delphix, unless it's a Linux environment, in which case it uses the system's native bash binary.
- Follows the same execution and logging criteria as the ``RunCommand`` operation.
- **Success criteria:** The Bash command must exit with an exit code of 0.

9.1.8.2.1 Example of RunBash operation

```
remove_dir="$DIRECTORY_TO_REMOVE_ENVIRONMENT_VARIABLE"
# Bashisms are allowed here!
if [[ -d "$remove_dir" ]]; then
    rm -rf "$remove_dir" || exit 1
fi
exit 0
```

9.1.8.3 Running processes in the background

- To detach a process from the Delphix Continuous Data Engine, use the `nohup` command and process backgrounding.

Redirect `stdout` and `stderr` to ensure the Delphix Continuous Data Engine does not block.

9.1.8.4 Examples of running background processes

9.1.8.4.1 Acceptable examples

```
nohup python file.py 1>/dev/null 2>&1 & # both stdout and stderr redirected
```

9.1.8.4.2 Deniable examples

```
nohup python file.py & # no redirection
nohup python file.py 2>&1 & # only stderr is redirected
nohup python file.py 1>/dev/null & # only stdout is redirected
nohup python file.py 2>/dev/null & # only stdout is redirected
```

9.1.9 Other operations

This page introduces the `RunExpect` operation, designed for automating interactions with interactive programs like SSH in a Unix environment. It describes the use of environment variables for script execution, particularly those associated with dSources or VDBs. Guidance on passing credentials securely to hook operations and managing these credentials through the Delphix UI, API, and CLI, including steps for adding, modifying, or deleting credentials in hook operations is also included.

9.1.9.1 RunExpect operation

- Executes an `expect` script in a Unix environment, utilizing the **Expect** utility for automating interactions with typically interactive programs like `ssh`.
- Runs as the environment user from their home directory.
- The Delphix Continuous Data Engine logs all output, displaying it in both the Delphix Management application and CLI for debugging purposes.
- **Success criteria:** The script must exit with an exit code of 0. Other exit codes indicate failure.

9.1.9.1.1 RunExpect operation example

```
spawn ssh user@delphix.com
expect {
  -re {Password: } {
    send "${env(PASSWORD_ENVIRONMENT_VARIABLE)}\n"
  }
  timeout {
    puts "Timed out waiting for password prompt."
    exit 1
  }
}
exit 0
```

9.1.9.2 Environment variables

- Operations executing user-provided scripts have access to OS environment variables.
- For operations associated with dSources or VDBs, specific environment variables are set:
 - `DLPX_DATA_DIRECTORY` : The user-provided mount path on the UI.
 - `USER` : The OS user used for linking the dSource/VDB.

9.1.9.2.1 Environment variables available to hooks

- `<base name>_USER` : Username, present for vault credentials with a username.
- `<base name>_PASSWORD` : For PasswordCredential and vault credentials with a password.
- `<base name>_PRIVKEY` : Private key for KeyPairCredential and vault credentials with a private key.
- `<base name>_PUBKEY` : Public key for KeyPairCredential and vault credentials with a public key.

9.1.9.3 Secure credential management

- Pass credentials securely to hook operations to perform tasks like API calls or service management.

- Credentials are passed via environment variables in a hook operation's list property.
- View or update credentials in the **Credential Environment Variables** section in the Delphix Continuous Data Engine UI.

9.1.9.3.1 Credential management steps

1. Log in to the Delphix Continuous Data Engine UI.
2. Under Datasets, select a dSource or VDB.
3. Go to **Configuration** → **Hooks**, then select a hook operation.
4. To add, modify, or delete credentials, click the edit icon next to Operation type.

- Credentials in the Credential Environment Variables section are declared using a **Base Variable Name** followed by `_PASSWORD`.
- For example, variables JENKINS and GITHUB are used as `$JENKINS_PASSWORD` and `$GITHUB_PASSWORD`.

9.1.9.3.2 API and CLI credential configuration

- The credentials list property in the API and CLI is `credentialsEnvVarsList`.
- Credentials can be direct (password or key) or indirect (password vault).
- Direct credentials are managed securely and encrypted; vault credentials are retrieved just before execution.

- Four credential types: `CyberArkVaultCredential`, `HashiCorpVaultCredential`, `PasswordCredential`, `KeyPairCredential` (API and CLI only).

9.1.9.3.3 Example configuration through CLI

```
delphix source "pomme" update operations postRefresh *> edit 0.credentialsEnvVarsList
delphix source "pomme" update operations.postRefresh 0 credentialsEnvVarsList *>
adddelphix source "pomme" update operations.postRefresh 0 credentialsEnvVarsList 0 *>
set baseVarName=API1delphix source "pomme" update operations.postRefresh 0
credentialsEnvVarsList 0 *> edit credentialsdelphix source "pomme" update
operations.postRefresh 0 credentialsEnvVarsList 0 credentials *> set
type=PasswordCredentialdelphix source "pomme" update operations.postRefresh 0
credentialsEnvVarsList 0 credentials *> set password="API-KEY-02a0b73f"delphix
source "pomme" update operations.postRefresh 0 credentialsEnvVarsList 0 credentials
*> backdelphix source "pomme" update operations.postRefresh 0 credentialsEnvVarsList
*> adddelphix source "pomme" update operations.postRefresh 0 credentialsEnvVarsList 1
*> set baseVarName=API2delphix source "pomme" update operations.postRefresh 0
credentialsEnvVarsList 1 *> edit credentialsdelphix source "pomme" update
operations.postRefresh 0 credentialsEnvVarsList 1 credentials *> set
type=CyberArkVaultCredentialdelphix source "pomme" update operations.postRefresh 0
credentialsEnvVarsList 1 credentials *> set queryString="Safe=Apis;Folder=Root\Servi
ce2;Object=ApiClient"delphix source "pomme" update operations.postRefresh 0
credentialsEnvVarsList 1 credentials *> set vault=MyCyberArk1delphix source "pomme"
update operations.postRefresh 0 credentialsEnvVarsList 1 credentials *> commit
```

Upon execution, the hook receives two sets of environment variables with corresponding credentials:

- `API1_PASSWORD` with value `API-KEY-02a0b73f`.

Variables:

- `API2_USER`
- `API2_PASSWORD` containing the values stored in the vault `MyCyberArk1` at the location of the provided query string. The API2 credentials are retrieved from the vault just before the hook executes, so they will always contain the latest values.

9.1.10 Policies

9.1.10.1 Overview

Creating policies within the Delphix Continuous Data Engine is an effective method to automate dataset management. Users can synchronize data, capture snapshots, and configure both retention and replica retention policies. This ensures that virtual databases are refreshed and data remains ready for use.

To set up policies, go to the **Manage** dropdown menu and select **Policies**. The Delphix Continuous Data Engine offers five main policy categories in relation to dataset objects:

- **SnapSync:** Dictates the frequency of snapshot captures for a source database, known as a dSource.
- **VDB Snapshot:** Determines how often snapshots are taken for a Virtual Database (VDB).
- **Retention:** Specifies the duration for which snapshots and log files are kept for both dSources and VDBs.
- **VDB Refresh:** Automates the refreshing of a VDB using either the latest snapshot or Timeflow logs, with 'None' being the default setting.
- **Replica Retention:** Governs the length of time snapshots are preserved on replicated namespaces after deletion from the replication source. Snapshots are retained unless the source database is deleted. If the source is deleted, subsequent replication updates will remove the database and any snapshots retained on the target.

It is crucial to avoid setting conflicting policies. For instance, a NONE setting for the *Snapshot* policy can directly affect *retention* policies and lead to unexpected growth in VDB data. An example case could involve an engine that runs into a domain space issue because archive logs from a single VDB consume a significant portion of the storage pool.

This would be attributed to a NONE Snapshot policy being in place, coupled with a one-week log retention policy. The logs, necessary for provisioning from the only available snapshot, prevented the engine from enforcing the retention policy.

9.1.10.2 Default vs. Custom policies

There can be default or custom policies for each of the five categories above. Consider the benefits of both.

9.1.10.2.1 Default policies

- **Scope:** Implemented at the domain level; affect all objects within a category.
- **Modification:** Settings can be adjusted, but policy names are fixed.
- **Access:** Available to users with Delphix Admin credentials.

9.1.10.2.2 Custom policies

- **Flexibility:** Designed to cater to specific needs with customizable scheduling.
- **Scheduling:** Time intervals can vary widely, from minutes to days.
- **Access:** Can be created and managed by users with Delphix Admin credentials, as well as by group and object owners.

9.1.10.3 Setting different policies for objects in a group

Policies at the group level influence all contained objects. For unique requirements within a group, set the group-level policies initially, then apply object-specific policies.

9.1.10.3.1 SnapSync policy

SnapSync policies dictate the frequency of source database snapshots. The default SnapSync policy schedules daily snapshots at 3:30 AM local time, with a four-hour completion window. If SnapSync fails to complete in this timeframe, it will attempt again at the next scheduled time. Modify the default policy by

clicking the **Edit** icon or create new ones by clicking **Add**. Policies can be tailored using the **Schedule date** picker, by **Interval**, or with a `cron` expression.

9.1.10.3.2 SnapShot Policy

9.1.10.3.3 Retention policy

The Retention policy determines the duration for keeping snapshots and log files, which are essential for rewinding or provisioning objects. Snapshot retention must be at least as long as log retention. Allocating more storage to the Delphix Continuous Data Engine may be necessary for longer retention periods. The Retention policy, alongside the SnapSync policy, plays a critical role in the engine's performance and storage demands. Customize these to preserve data for a longer period of time, enabling access to earlier data points.

9.1.10.3.4 Replica Retention policy

The Replica Retention policy outlines the retention span for snapshots on replicated namespaces after their deletion from the source. Generally, deletion on the source leads to deletion on the target; however, the new Replica Retention policy extends the life of these snapshots on the target. Apply this policy to an entire namespace or specific groups or objects within. These snapshots support provisioning or refreshing VDBs, but point-in-time provisioning might be limited to optimize disk space. Replica Retention policies are enforced automatically, either on a set schedule or when a replication job is received.

Replica Retention policy is designed to lengthen snapshot lifespans only. They can be deleted when:

- Their policy duration is adjusted, and they fall outside the retention period.
- The original dSource or VDB is deleted.
- For Oracle **virtual pluggable databases** (vPDB), if the controlling **container database** (CDB) is removed or unreplicated, dependent snapshots on both the CDB and the vPDB are deleted. This could occur if a vPDB migrates from one CDB to another.

9.1.10.3.5 Benefits of longer retention

Extending the retention period for snapshots and logs enhances your ability to roll back to earlier data states. The advantages of a more prolonged retention timeline include:

- **Compliance with regulations:** Meets standards like SOX compliance, where data preservation is crucial.
- **Supports development:** Accommodates the needs of environments with frequent application updates and development cycles.
- **Controlled data progression:** Allows for careful and deliberate data changes.
- **Risk mitigation:** Reduces project risks by retaining critical data states.
- **Efficient recovery:** Facilitates a quicker rollback or restoration to previous points in time, enhancing operational resilience.

9.1.10.4 Create a custom policy

This section outlines the steps to create custom policies using `cron` expressions for specific database objects or groups.

Initiation: Custom policies are created by modifying an existing policy tied to a database object. This can be done during the object's initial creation or later through the Policy Management screen. For guidance on creating custom policies for dSources and VDBs during linking and provisioning, refer to the respective topics for each data platform.

Scheduling options: Remember, policies can be set using the Schedule date picker, by specifying an Interval, or by choosing 'Custom' to input a Quartz cron expression.

9.1.10.4.1 Procedure

1. Log in to the Delphix Management application.
2. Click on **Manage**.
3. Choose **Policies**.
4. Click on the tab for the object or group you are creating a policy for.
5. In the relevant tab, click the **Add** button. For instance, to create a new VDB Snapshot policy:
 - a. Go to the VDB snapshot tab.
 - b. Click on **+ VDB snapshot**.
6. Enter a **Name** for your policy.
7. Choose a **Time Zone** (by default, the system time zone is selected if none is specified).
8. Set a **Timeout** to determine how long a job should run before being terminated if not completed.
9. Pick a **Schedule** for the policy.
10. Click **Next** and select the object(s) to which this policy will apply.
11. Review your settings and click **Submit** to finalize the policy creation.

9.1.10.5 Policies and timezones

Time zones are a critical component for scheduling SnapSync, VDB Snapshot, and VDB Refresh policies. Here is how to adjust the time zone settings for these policies:

1. Log into the Delphix Continuous Data Engine UI.
2. Click on **Manage**.
3. Choose **Policies**.
4. Click on the **pencil icon** next to the policy you wish to edit.
5. Select the desired **Time Zone** from the drop-down list.
6. Click **Submit** to apply the new time zone setting.

Retention and Quota policies do not have scheduled times and therefore do not require a time zone configuration.

9.1.10.5.1 Post-upgrade policy cloning

When the Delphix Continuous Data Engine is upgraded, it automatically clones existing policies to maintain consistent behavior. These clones differ from the originals only in their time zone settings. After an upgrade, you may notice policy names include the time zones they are associated with.

Default policies are not cloned and will always follow the time zone settings of the Delphix Continuous Data Engine.

9.1.10.5.1.1 Example of Policy Cloning After an Upgrade

Consider dSources and VDBs that were set to operate under EST (America/New_York) or CST (America/Mexico_City). Post-upgrade, new policies reflecting these time zones will be created:

- **Original policy:** UserSnapSync
 - **New policies:** UserSnapSync (America/Mexico_City), UserSnapSync (America/New_York)
- **Original policy:** SnapshotTest
 - **New policies:** SnapshotTest (America/Mexico_City), SnapshotTest (America/New_York)
- **Original policy:** UserRefresh
 - **New policies:** UserRefresh (America/Mexico_City), UserRefresh (America/New_York)

After the system upgrade, check that the policies are operating as intended. This clarity ensures there is no confusion regarding the execution times of your policies.

9.1.10.6 Configure retention on individual snapshots

This section details how to set a custom retention period for individual snapshots, which can supersede the retention policy assigned to the container. For instance, selecting 'forever' ensures the snapshot is not purged by the retention policy.

9.1.10.6.1 Procedure

1. Login to the Delphix Management application.
2. Go to **Manage > Datasets**.
3. Find and expand the dSource or VDB you wish to modify.
4. Select the **Timeflow** tab.
5. Expand the snapshots section for which you wish to modify the retention time (Note, it may take a moment for individual snapshots to display).
6. Click on the three dots to expand the sub-menu.
7. Select **Keep for**
8. In the **Keep For** dialog, specify the number of days, or select **forever**.

9. Click **Save** to apply the custom retention setting.

9.1.11 Basic troubleshooting

9.1.11.1 Environment

Connectivity issues between environments and engines:

- **SSH connectivity test:** To diagnose network connectivity issues, run an SSH connectivity test to the target host. This will validate the communication link and identify any potential network barriers.
- **DSP throughput test:** Conduct a DSP (Delphix Session Protocol) throughput test to the target host to ensure efficient data transfer rates and troubleshoot any connection issues.
- **Environment refresh:** Periodically, running an environment refresh can resolve detection issues related to installations and databases.

Unable to find installations and databases:

- If the engine fails to locate installations or databases, confirm network configurations and check for any updates or changes in the environment settings.
- Review management logs for signs of connectivity issues or environment detection failures. These logs can be accessed via the support bundle.

9.1.11.2 Delphix Toolkit

Ensure that the Delphix Toolkit is correctly installed and configured as per the environment's requirements. Issues with the toolkit can often lead to broader connectivity or operational problems.

9.1.11.3 dSource and virtual databases (VDB)

Ingestion issues:

- Ingestion problems, particularly with connectors like Oracle, MS SQL Server, etc., require a review of connector-specific logs.
- For AppData or non-Oracle/MS SQL Server/SAP ASE connectors, refer to the specific troubleshooting sections for guidance on managing unique issues.

9.1.11.4 Log management

Plugin logs:

- Plugin logs are crucial for diagnosing issues related to environment connectivity, dSource, and virtual databases.
- These logs are packaged within the standard Support bundle. For detailed information on creating Support bundles, refer to the [Support logs](https://cd.delphix.com/docs/latest/creating-support-logs)³¹⁵ page.

³¹⁵ <https://cd.delphix.com/docs/latest/creating-support-logs>

- The support bundle contains logs stored on the Delphix Continuous Data Engine side but does not include target side plugin logs. The location and management of these logs are detailed in the plugin-specific troubleshooting sections.

Locating logs on the engine:

- Users can find logs directly on the Delphix Continuous Data Engine. Visit the [Monitoring and log management](#)³¹⁶ documentation section for more information.

9.2 Cassandra data sources

Cassandra plugin helps to virtualize Cassandra data sources leveraging the built-in Cassandra tools. One can use the DataStax [OpsCenter](#)³¹⁷ tool to schedule and manage backups and restore from those backups, across all registered DataStax Enterprise (DSE) clusters in OpsCenter.

Cassandra Plugin supports the below Ingestion Model:

Staging Push: The premise of Staging Push is that Delphix will export and mount a filesystem on a staging host. The customers can then push data using existing backup/restore automation to this filesystem location. Delphix can then take a snapshot of this filesystem and interact with it like any other data source. Here are some key features of Staging Push:

1. Customers will own/maintain the staging database.
2. Customers will be responsible for restoring backups and keeping the staging database in sync with the production database.
3. The Staging database's DB files will be stored on Delphix Storage, i.e., the mounted file directory.
4. Delphix will still be responsible for snapshotting the underlying data files and gathering any metadata required to be able to provision from the snapshots. (Customers will initiate the sync operation via manual sync or by configuring a snapsync policy.)

³¹⁶ <https://cd.delphix.com/docs/latest/monitoring-and-log-management>

³¹⁷ https://docs.datastax.com/en/opscenter/docs/6.8/about_c.html

Notes:

- The staging Push Ingestion model creates an empty Cassandra Cluster which one can fill with any data they like using any techniques like built-in load generators like `sstableloader` , `nodetool import` , `dsbulk` , `OpsCenter` , Custom Scripts etc. Periodic snapshots can be taken and VDBs can be created from these dSource snapshots.
- The staging database can be a single-node/multi-node cluster deployed on a single host while the VDB nodes can be expanded to multiple target hosts as per the user’s configuration.

This plugin supports Cassandra cluster virtualization for the following use cases:

- Legacy migration: Helps in migrating existing applications to Cassandra.
- DevOps test data management.

The Cassandra plugin allows you to use existing Cassandra Backups generated via OpsCenter as the source of the dataset in Delphix.

Supported Cassandra Data Ingestion to create dSource:

- **DSE OpsCenter** : OpsCenter is a visual management and monitoring solution for DataStax Enterprise. The OpsCenter Backup Service allows scheduling an automatic backup or running a manual backup of DSE cluster data. A backup is a snapshot of all on-disk data files (SSTable files) stored in the data directory.

- [Backing up a cluster](#)³¹⁸: OpsCenter provides a way to schedule and run backup operations on a cluster. OpsCenter allows organizations to run one-time backup jobs as well as schedule backup jobs to run at a later date and on a recurring basis.
- [Backing up to Amazon S3](#)³¹⁹: OpsCenter provides the option to take backups for Cassandra Cluster to Amazon S3. When adding an Amazon S3 bucket location as an additional location for storing backup snapshots, the DataStax Agent sends the snapshot files to the S3 bucket automatically.
- [Restoring from a backup](#)³²⁰: Restore data from supported backups that have been generated by OpsCenter.

9.2.1 Cassandra virtualization process

The following material introduces you to the overall process of deploying the CassandraDB virtualization solution. A sequence of high-level steps is presented; each step briefly describes the task and the expected result. Refer to the embedded links for more detailed information.

- [Begin by reviewing the general Delphix Continuous Data Engine architecture diagrams](#) (see page 1046). Identify existing or new CassandraDB source, staging, and target Environments, the underlying Operating Systems, and CassandraDB database versions. This will give a good understanding of the architectural strategy and confirm support.
- [Review the CassandraDB support matrix](#) (see page 1114). Confirm that your combination of CassandraDB software, host operating system, Delphix Engine version, and CassandraDB connector version are supported for the various environments that will integrate into your CassandraDB deployment. Early validation will reduce unexpected issues later.
- Deploy and configure Delphix Continuous Data.
- [Install the CassandraDB connector](#). (see page 1117) The CassandraDB connector extends the Delphix Continuous Data Engine to CassandraDB datasets. It is recommended to stay current with the latest version of the connector.
- [Create staging and target environments](#) (see page 1115). Create the staging and target hosts and ensure that they are running and reachable. Follow the host requirements to configure the respective environments. The staging environment will host a CassandraDB instance that the Delphix Continuous Data Engine will ingest from. The target environment will host one or more CassandraDB instance(s) in which the virtual database copies will be created.
 - a. Consult the [source environment](#) (see page 1115) and [staging/target environment](#) (see page 1115) requirements documentation for configuration details.
- [Discover Cassandra Installations](#). (see page 1124) Use the "Add Environment" operation in Delphix Continuous Data Engine for each host, which causes Delphix to register the specific host and catalog the CassandraDB software installation(s) on that host.
- [Link the CassandraDB source database](#). (see page 1129) Configure and create a dSource which allows the Delphix Continuous Data Engine to capture a copy of the source data. There are many ingestion methods which can offer a variety of methods to capture the data to be virtualized by Delphix.

318 https://docs.datastax.com/en/opscenter/docs/6.8/online_help/services/opscBackupCluster.html

319 https://docs.datastax.com/en/opscenter/docs/6.8/online_help/services/opscBackupAmazonS3.html

320 https://docs.datastax.com/en/opscenter/docs/6.8/online_help/services/opscRestoringFromBackup_t.html

Therefore, we encourage you to identify the ingestion method that best suits your organization and infrastructure policies.

- [Provision virtual CassandraDB databases \(see page 1133\)](#). Administrators and users can provision multiple copies of the source data as virtual databases.

9.2.2 Cassandra requirements and prerequisites

9.2.2.1 Support matrix

Refer to the below support matrix to ensure compatibility between the platform, database, connector, and Delphix engine version.

Color	Supported?
Y	Yes
N	No

9.2.2.2 Database / OS support matrix

Supported OS Version	Supported DBMS Versions			
	DataStax Cassandra v5.1.16	DataStax Cassandra v6.8.9 - v6.8.33	Apache Cassandra v3.11.10	Apache Cassandra v4.0.7 - v4.1.1
RHEL 7.4	Y	Y	Y	Y
RHEL 7.9	Y	Y	Y	Y
RHEL 8.0	Y	Y	Y	Y
Windows	N	N	N	N

9.2.2.3 Supported ingestion matrix

Cassandra Distribution	Staging Push	Disk	AWS
DataStax Enterprise	Y	N	N
Open-Source Apache	Y	N	N

9.2.2.4 Engine compatibility matrix

Engine Version	Cassandra v1.0.0	Cassandra v1.1.0	Cassandra v1.1.1	Cassandra v1.2.0
6.0.16.0 - 22.x	Y	Y	Y	Y

9.2.2.5 Limitations

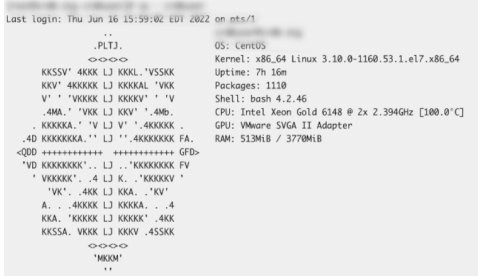

- Cassandra Ingestion from AWS S3, Disk not supported.
- Cassandra Point-in-time restore is not supported.
- Delphix V2P is not supported.
- Delphix Password Vault is not supported.
- Cassandra LDAP Authentication is not supported.
- dSource is limited to a single host. A single host can host up to 9 instances (The host needs to be sized appropriately to handle 3-9 Cassandra instances based on requirements).
- VDB is limited to max 9 nodes in the cluster. Unlike dSource, VDB can use 9 different hosts for each instance.
- Data size is limited to what can be handled by 9 nodes. At present, only small clusters (1-2TB per node with a max of 9 nodes = 9-18 TB per Cluster) can be supported.
- dSource node numbers cannot be altered once defined without reloading data.
- VDB node numbers cannot be altered once defined without VDB refresh.
- Remote Keystore is not supported for SSL Encryption.

9.2.2.6 Requirements for staging and target Cassandra environments

Requirements	Staging Environment	Target Environment
--------------	---------------------	--------------------

The Delphix O/S user must be identical to the Cassandra software installer O/S user. Use the script createDelphixOSUser.sh ³²¹ to create the Delphix O/S user.	Y	Y
The Delphix O/S user must have read and execute privileges on the Cassandra install path, where software binaries are installed.	Y	Y
The Cassandra installation on the staging and target environment must have the same version as the source environment.	Y	Y
The Delphix O/S user configuration must be identical on all additional hosts, with the same UID and GID. NOTE: This needs to be done for multi-node VDB setups on different target hosts.	N	Y
Cassandra binaries should be installed in identical locations. For example: <ul style="list-style-type: none"> • If the primary node has the Cassandra binary at (/u02/cassandra/dse-node/bin/dse). • All additional nodes must have the same version binary at the same location (/u02/cassandra/dse-node/bin/dse). NOTE: This needs to be done for multi-node VDB setups on different target hosts.	N	Y
There must be a directory on the target environment with 2GB of available storage to install the Delphix Plugin.	Y	Y
An empty folder on the host is required to mount the NFS filesystem. This folder does not require additional space and serves as the base for NFS mounts.	Y	Y

³²¹ https://cd.delphix.com/__attachments/149466510/createDelphixOSUser.sh?inst-v=c232af4e-21c4-495b-a334-0492465bcb54

<p>Disable any login banners similar to the one shown in the provided image on the target host.</p> 	<p>Y</p>	<p>Y</p>
<p>The Delphix OS user account requires specific sudo privileges. Below is an example configuration for the sudo privileges for mount, umount, and IP commands on the staging host:</p> <pre>Defaults:delphix !requiretty delphix ALL=NOPASSWD:/bin/mount,/bin/umount,/sbin/ip</pre>	<p>Y</p>	<p>Y</p>
<p>Ensure the expect utility is installed on the staging and target host. Cassandra Connector runs password sensitive commands by making use of expect utility.</p>	<p>Y</p>	<p>Y</p>

9.2.3 Cassandra installation and upgrade

9.2.3.1 Prerequisites

- Install a Delphix Continuous Data Engine of a version compatible with the connector version of the choice. Refer the [Upgrade matrix \(see page 542\)](#) page.
- Install Cassandra binaries on source, staging, and target servers.

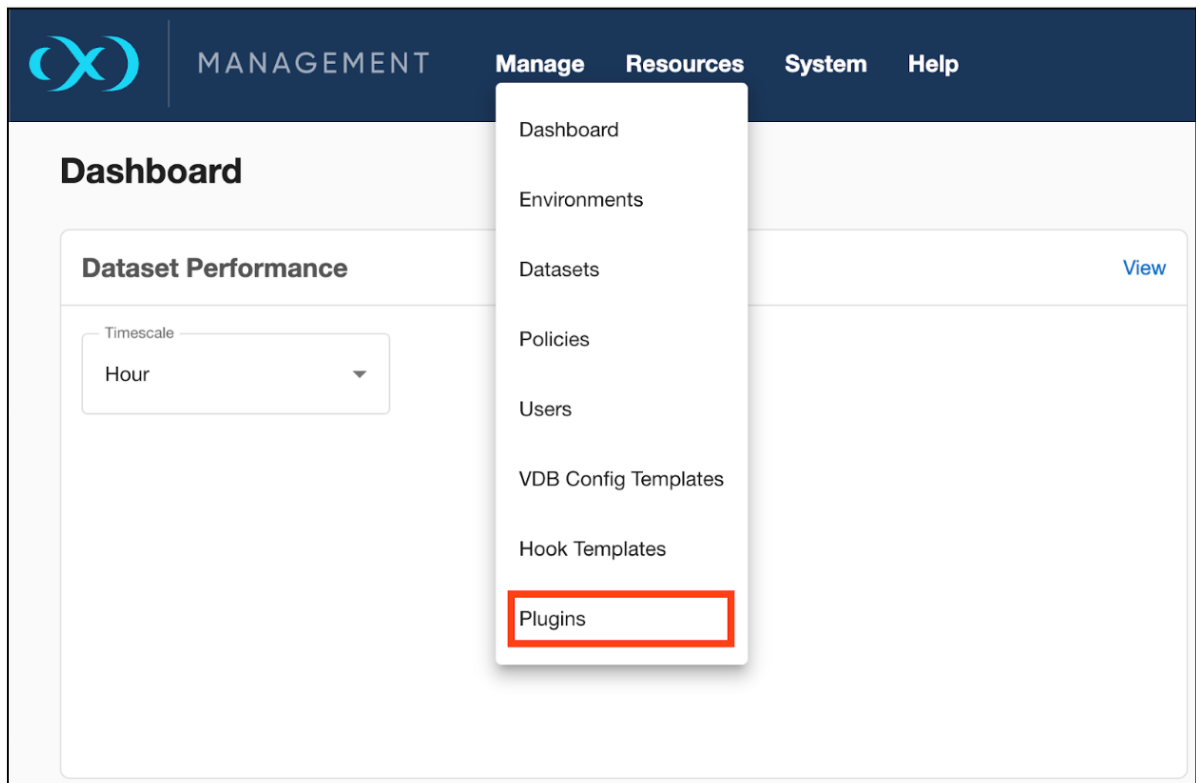

9.2.3.2 Downloading the connector

The Connector is provided as a zip file on the Delphix download site. Follow the below steps to download the connector:

1. In the web browser, go to the Delphix [download](#)³²² site.
2. Log in to the download site using email and password credentialsCustomer support credentials.
3. Go to: **Delphix Product Releases > Continuous Data Connectors > Cassandra > v<version_number> > sc_cassandra-<version_number>.json** and download the connector (JSON file).

9.2.3.3 Installing the connector

1. Login to the **Delphix Management** application.
2. Click **Manage > Plugins**.

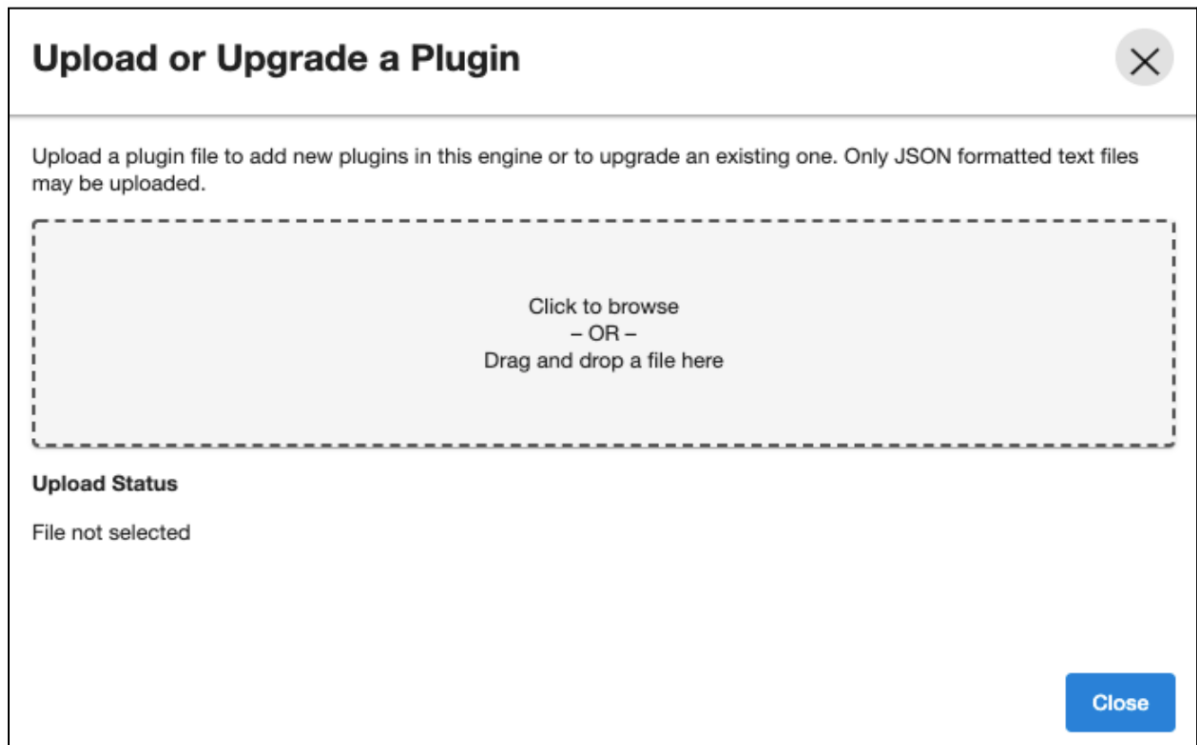

3. To upload a plugin, click the  icon.

³²² <https://download.delphix.com/>

- This step displays the **Upload or Upgrade a Plugin** dialog. Upload the <file_name>.json. For example, sc_cassandra-<version>.json .

For more information, refer to the [Delphix Continuous Data Engine connector management](#)³²³ section.

9.2.3.4 Upgrade the dSource

Periodically Production and Lower environments are upgraded for various reasons like

- To be in compliance
- To mitigate bugs
- Security concerns
- To meet compatibility with other software.

Upgrading the Source database to a higher version will impact dSource snapsyncs if the version upgarded is not compatible with version of staging database. Delphix can handle the upgrade of the databases by updating the configuration in dSource.

9.2.3.4.1 Upgrade dSource to a higher version

1. Install the same version of Cassandra software on the staging host. (same version as source).
2. Refresh Environment in Delphix hosting Staging dSource.
3. Verify the new Cassandra Binaries are discovered in the environment with the entry **[DataStax Cassandra - (version: x.x.x)]**.

The screenshot shows the Delphix Management interface. The top navigation bar includes 'MANAGEMENT', 'Manage', 'Resources', 'System', and 'Help'. The left sidebar shows 'Environments' with a filter set to 'none'. The main content area is for the environment 'rh74-datastax-stg'. The 'Databases' tab is active, showing a list of 'Installations'. The list includes:

- > Apache Cassandra - (version: 4.0.7) [/u01/cassandra/apache-cassandra-4.0.7/bin/cassandra]
- > Datastax Cassandra - (version: 5.1.16) [/u02/cassandra/dse-5116/bin/dse]
- > Datastax Cassandra - (version: 6.8.25) [/u02/cassandra/dse-6825/bin/dse]
- > Datastax Cassandra - (version: 6.8.30) [/u02/cassandra/dse-6830/bin/dse]

4. Disable dSource by navigating to **Manage Datasets > Select dSource > disable**.
5. Log in to the Delphix engine via CLI (ssh) interface and execute the following commands.

```
>cd sourceconfig
>select <dSource_Name>
```

³²³ <https://cd.delphix.com/docs/latest/delphix-engine-plugin-management>

```
>update
>set repository = <New Cassandra Binaries discovered in Step 3 >
>commit;
```

- Enable dSource by navigating to **Manage Datasets > Select dSource > enable**.
- Take a new snapshot to validate that snapsync works as expected.

9.2.3.4.2 Upgrade the VDB

Periodically Lower environments are upgraded for various reasons like

- To be in compliance
- To mitigate bugs
- Security concerns
- To meet compatibility with other software.

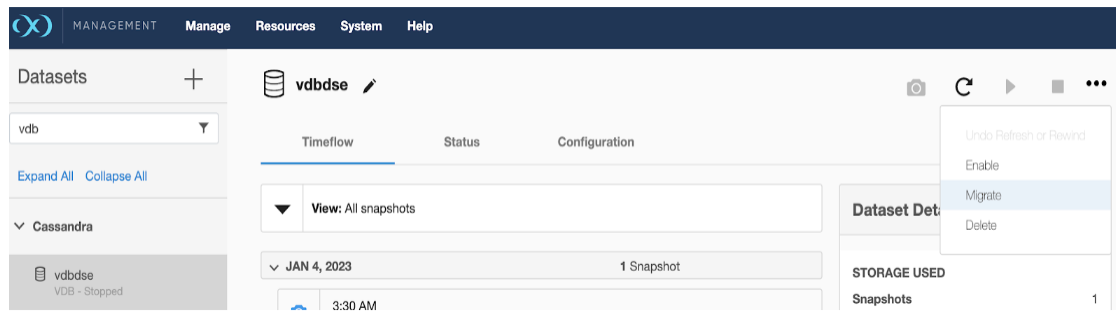

9.2.3.4.2.1 Upgrade VDB to a higher version.

1. Install the new version of Cassandra Binaries on the target host.
2. Follow the Cassandra upgrade process to upgrade VDB to a higher version.
3. Refresh Target Environment in Delphix.
4. Verify new Cassandra Binaries are discovered in the environment with entry **[DataStax Cassandra - (version: x.x.x)]**.

The screenshot shows the Delphix Management console interface. The top navigation bar includes 'MANAGEMENT', 'Manage', 'Resources', 'System', and 'Help'. The left sidebar shows 'Environments' with a filter set to 'none'. The main content area is for the environment 'rh74-datastax-stg' (Unix Host - Enabled). The 'Databases' tab is selected, showing a list of 'Installations' with a 'Filter: none' button. The installations listed are:

- > Apache Cassandra - (version: 4.0.7) [/u01/cassandra/apache-cassandra-4.0.7/bin/cassandra]
- > Datastax Cassandra - (version: 5.1.16) [/u02/cassandra/dse-5116/bin/dse]
- > Datastax Cassandra - (version: 6.8.25) [/u02/cassandra/dse-6825/bin/dse]
- > Datastax Cassandra - (version: 6.8.30) [/u02/cassandra/dse-6830/bin/dse]

5. Disable VDB by navigating to **Manage Datasets > Select VDB > disable**.
6. Update VDB configuration using the Migrate option in Delphix GUI.
 - a. Navigate to **Manage Datasets > Select VDB > Migrate**.

- b. Select Correct Environment.
- c. Select Correct CASSANDRA repository under Installation where you wish to migrate VDB.

Migrate

vdbdse

rh74-dlpx-tgt

Installation

Datastax Cassandra - (version: 6.8.25)
[u02/cassandra/node1/bin/dse]

User

delphix

New Environment

Environment

User

delphix

Installation

Datastax Cassandra - (version: 6.8.25) [u02/cassandra/node1/bin/dse]

If the new installation is not in the current list, you can try to discover it by refreshing the environment. If the new installation is not discovered automatically, you can add it manually.

Cancel

Migrate

- d. Click **Migrate**.
7. Enable VDB by navigating to **Manage Datasets >Select VDB >enable**.
8. Take a new snapshot to validate that the VDB snapshot works as expected.

9.2.4 Cassandra connector operations

To successfully ingest and virtualize a Cassandra instance, you must perform the following connector operations in sequence:

- [Provisioning Cassandra virtual databases](#) (see page 1133)
- [Discovering Cassandra installations](#) (see page 1124)
- [Linking Cassandra data sources](#) (see page 1129)

The respective sections provide detailed information about prerequisites, limitations (if any), and the procedure to be followed for completing each of the operations.

9.2.4.1 Discovering Cassandra installations

Environment discovery is a process that enables the Cassandra Plugin to determine Cassandra installation details on a host. Whenever there are any changes (installing a new binary home) to an already set-up environment in the Delphix application, an environment refresh needs to be performed.

9.2.4.1.1 Prerequisites

Cassandra can be installed in different ways and so the installation path can vary in different environments. To discover correct software binaries information, we have the following options:

- Identify the Cassandra repository through the environment variable defined by the user on the staging or target host.
 - Create a file name (if not present) `.bash_profile` or `.bashrc` in the home directory of the delphix OS user.

```
>touch $HOME/.bash_profile $HOME/.bashrc
```

- Define environment variable (`CASSANDRA_REPO`) pointing to Cassandra binaries installed on the host for manual discovery. Example as below:

```
>echo "CASSANDRA_REPO=/u02/cassandra/node1/bin/dse:/u01/cassandra/apache-cassandra-4.0.7/bin/cassandra" > $HOME/.bash_profile
```

- In case of multiple Cassandra versions installed on the same host, provide all installation paths separated with colon (`:`) to the environment variable defined in `.bash_profile`. Example as below:

```
echo "CASSANDRA_REPO=/u02/cassandra/node1/bin/dse:/u02/cassandra/node2/bin/dse:/u02/cassandra/node3/bin/dse" > $HOME/.bash_profile
```

9.2.4.1.2 Procedure

Perform the following steps to add an environment(staging/target) to the Delphix Continuous Data Engine:

1. Login to the **Delphix Management** application.
2. Navigate to the **Manage > Environments** page.

3. Click the **Actions**  menu and select **Add Environment**.
4. From the **Add Environment** dialog window, select **Unix/Linux**.
5. Select **Standalone Host**.
6. Click **Next**.
7. Provide the name of the environment.
8. Provide the **Host IP address** or **host FQDN**.
9. Provide the **SSH port**. The default value is 22.
10. Provide an **Environment Username** for the environment.
11. Choose the **Login Type** that fits your setup.
 - Username and Password – provide the environment username and password
 - Username and Public Key – provide the environment username
 - Password Vault – select from an existing Enterprise Password Vault

**Note: Using Public Key Authentication**

If you want to use public-key authentication for logging into your Unix-based environment, you have two options:

- Use the Delphix Continuous Data Engine's key pair. For more information on how to use the Delphix Continuous Data Engine's key pair, refer to the [How to use the Continuous Data Engine's key-pair](https://cd.delphix.com/docs/latest/how-to-use-the-delphix-continuous-data-engine-key-pair)³²⁴ section.
 - Provide a key pair for this environment. As an alternative, a key pair specific for this environment can be provided via the API or CLI. For instructions, refer to [CLI Cookbook: Setting up SSH key authentication for UNIX environment users](https://cd.delphix.com/docs/latest/cli-cookbook-setting-up-ssh-key-authentication-for-unix-environment-users)³²⁵.
12. For Password, enter the password associated with the user in step 11.
 13. If you want to use Public Key Encryption for logging into your environment:
 - a. Select Public Key for the Login Type
 - b. Click View Public Key
 - c. Copy the public key that is displayed, and append it to the end of your `~/.ssh/authorized_keys` file. If this file does not exist, it must be created.

³²⁴ <https://cd.delphix.com/docs/latest/how-to-use-the-delphix-continuous-data-engine-key-pair>

³²⁵ <https://cd.delphix.com/docs/latest/cli-cookbook-setting-up-ssh-key-authentication-for-unix-environment-users>

Note: The addition of the public key is a one-time requirement per user and per environment. Additionally, you have the option to add public key authentication to an environment user's profile via CLI (for details, refer to the [CLI Cookbook: Setting up SSH key authentication for UNIX environment users](#)³²⁶ topic).

14. For Password Login, click Verify Credentials to test the username and password.
15. Enter **Toolkit Path** (ensure that the toolkit path does not have any spaces).
16. To provide your own Oracle Java Development Kit, select the **Provide my own JDK** checkbox and click **Next**.
 - a. On the Java Development Kit page, provide an absolute path to your Oracle JDK and click **Next**.
17. Click **Submit**.

After successfully adding and discovering the environment, you should be able to view the newly added environment listed under the Environments tab. In case it does not appear, click the refresh icon in your browser.

After the environment has been successfully discovered if you wish to establish further links, add a source configuration to the previously discovered installation.

Perform the following steps to access the information about any environment you have created:

³²⁶ <https://cd.delphix.com/docs/latest/cli-cookbook-setting-up-ssh-key-authentication-for>

1. Navigate to **Manage > Environments**.
2. Select the environment name.

9.2.4.1.2.1 Adding an installation to a Cassandra environment

If a new Cassandra Installation is added to the environment, then in order to reflect it into the Continuous Data UI, it is required to refresh the environment. Please refer to the "Environment Refresh" and "prerequisites" section in [Managing environments and hosts](#)³²⁷ for more details.

9.2.4.1.3 Add source config

Every environment contains `repositories` and each environment may have any number of repositories associated with it. The `Repository` represents the binaries for Cassandra Instance. Each repository can have many `SourceConfig` which represent Cassandra instances.

There is no sourceconfig generated automatically in the Cassandra plugin. We need to configure `SourceConfig` objects through which we can create a dSource.

9.2.4.1.3.1 Procedure

Source Config is created on the Staging Environment

1. Login to the Delphix Management application.
2. Click Manage.
3. Select Environments.
4. Select the repository.
5. Click on plus(+)icon.

³²⁷ <https://cd.delphix.com/docs/latest/managing-environments-and-hosts>

6. Enter a unique name for the staging database in the identify field section.
7. Enter a cluster name for the database in the Cassandra Cluster Name section.
8. Click **Add** button.

9.2.4.2 Linking Cassandra data sources

Linking a data source will create a dSource object on the engine and allow Delphix to ingest/manage data from this source. The dSource is an object that the Delphix Virtualization Engine uses to create and update virtual copies of your database.

Ingestion of data is done using a staging host. Delphix expects the same version of Cassandra binaries as the source on this staging host. Delphix will create an empty staging Cassandra cluster on the staging host using the staging push model. In this model, Delphix is basically mounting a filesystem on a remote staging host where the customer's data ingestion method will push data. As customers will be keeping the Staging Database in sync with the Production Database, any backup vendor and backup location can be used to restore the backups. For DataStax Cassandra distributions, customers can leverage tools like OpsCenter to restore the database or use any other proprietary backup & restore procedure that they have implemented at their end.

9.2.4.2.1 Things to consider using Staging Push ingestion type

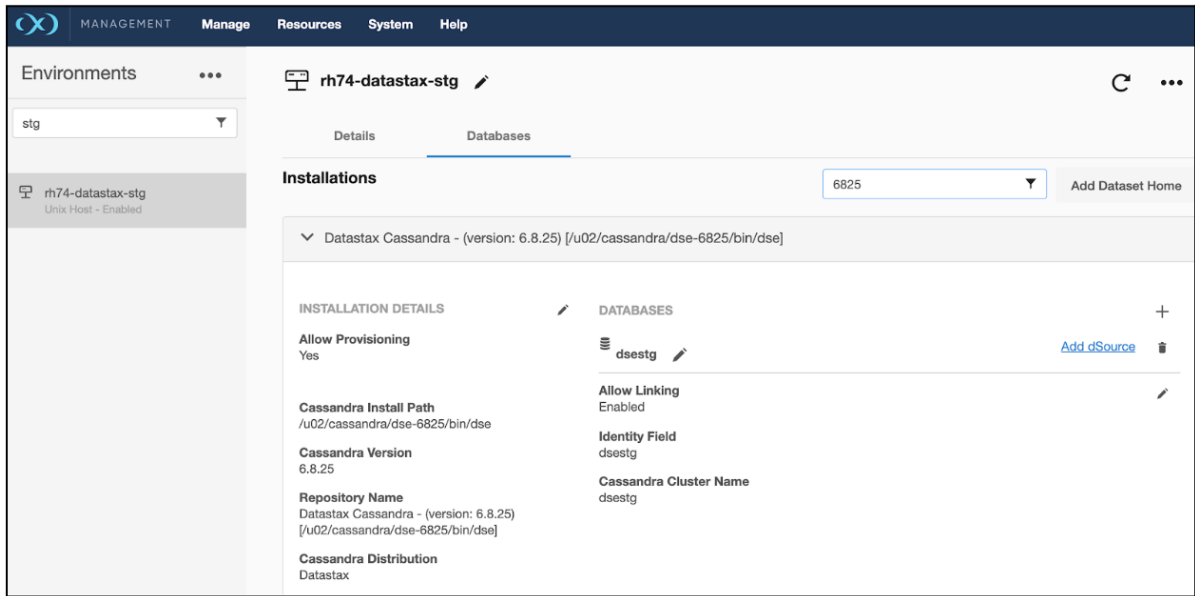

- Once the dSource is linked, a snapshot is generated. However, this snapshot will not contain any data.
- As the dSource initial snapshot is empty, any VDB provisioned from this snapshot does not contain data.
- Customer has to push data to this empty staging Cassandra cluster hosted on the Delphix filesystem. Customers can configure pre-sync hooks to automate this process.
- Any VDB provisioned from this point will have data as per the snapshot timestamp.

9.2.4.2.2 Prerequisites

- Install the Delphix engine compatible with the Cassandra plugin version as per the [support matrix \(see page 1114\)](#)
- Install Cassandra binaries on staging hosts.
- Add Staging environment to Delphix Engine.
- Create sourceConfig on the discovered Cassandra repositories on the staging host.

9.2.4.2.2.1 Creating dSource

1. Login to the Delphix Management application.
2. Click **Manage > Environments**.
3. Select the staging host > click on the **Databases** tab.
4. Select the **Add dSource** button.

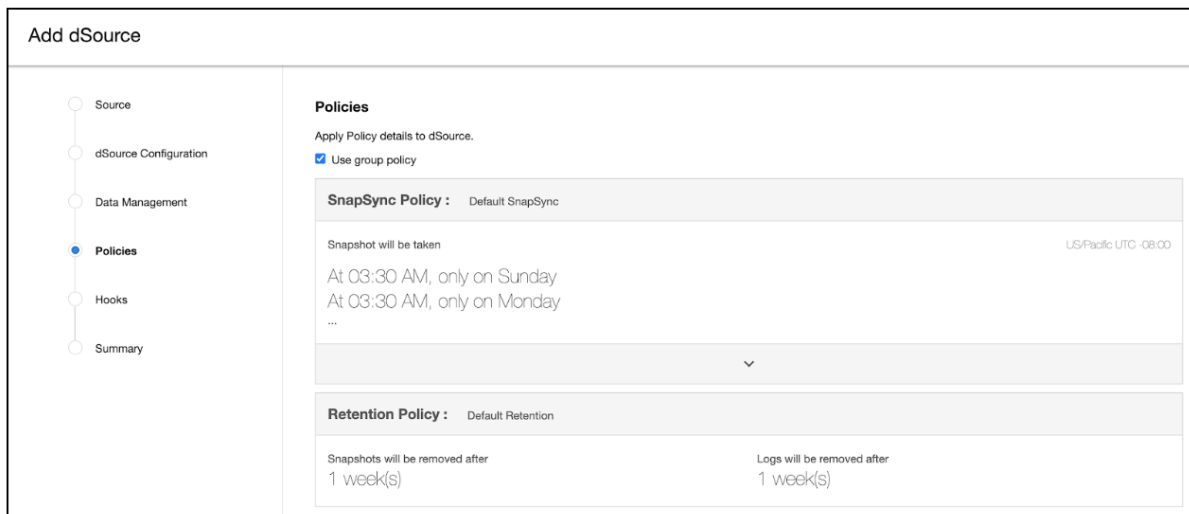

- In the Add dSource wizard, select the Cassandra source config you just created on the staging host.

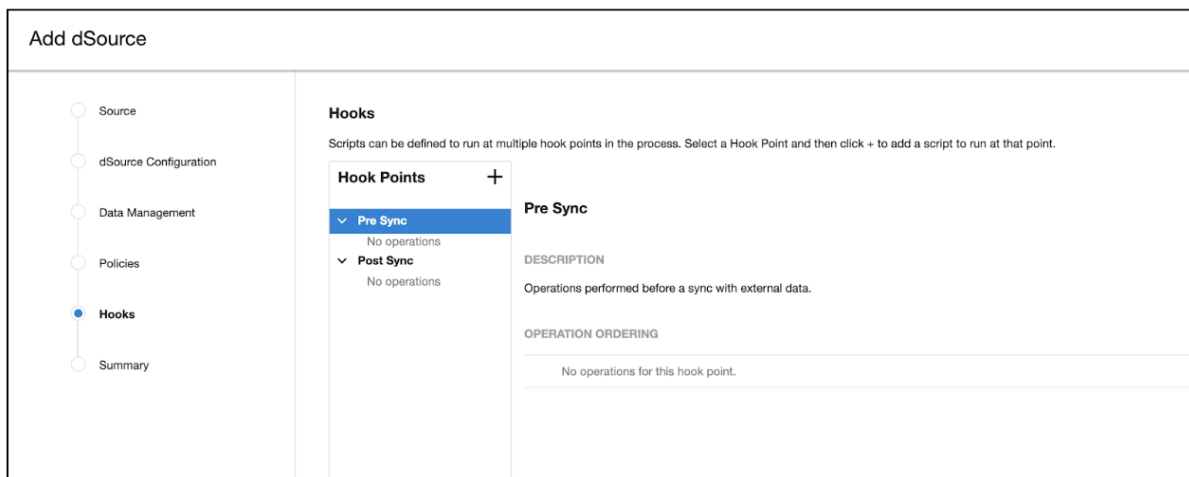

- In the Add dSource wizard, select the dSource Type (Staging Push is selected as default) for creating the Cassandra staging cluster on the staging host.

7. **DSource Type** The type of dSource is based on the type of database restore.
 - a. **Mount Path** The path on the host where Delphix will mount the dSource files via NFS.
 - b. **Cassandra Staging Cluster Node Count** Number of nodes that consists of the Staging Cassandra cluster. Minimum: 3 and Maximum: 9.
 - c. **IP Address / Hostname of the Staging Cluster** IP Address / Hostname of the interface for the Cassandra Staging Cluster (default 127.0.0.1).
 - d. **Staging Cassandra JMX Port Number** Staging Cluster JMX port for the cluster for JMX connection requests. Ports for other nodes will be auto-incremented.
 - e. **Staging Cassandra CQL Native Port Number** Staging Cluster CQL native port where the CQL native transport listens for clients. Ports for other nodes will be auto-incremented.
 - f. **Staging Cassandra TCP Port Number** Staging Cluster TCP port for Cassandra commands and data. Ports for other nodes will be auto-incremented.
 - g. **Enable Authentication** Mode Option to enable the authentication for the Cassandra Staging Cluster.
 - h. **Cassandra Username** Specify the username to be created for Staging Cassandra Cluster.
 - i. **Cassandra Password** Specify the password to be set for the username created for the Cassandra Staging Cluster.
 - j. **Global Node Configuration** Specify the global node configuration for the Cassandra Staging Cluster.
 - i. **Cassandra Configuration Filepath** Specify the relative path of the configuration file to the Cassandra base installation directory.
 - ii. **File Parameters** Specify the additional Cassandra configuration parameters to configure the Cassandra Staging Cluster.
 - iii. **Configuration Parameter Name** Cassandra Cluster configuration parameter name.
 - iv. **Configuration Parameter Value** Cassandra Cluster configuration parameter value.
 - k. **YAML Password-Sensitive Parameters** Specify the additional sensitive Cassandra configuration parameters to configure the Cassandra Staging Cluster.
 - i. **Configuration Parameter Name** Cassandra Cluster sensitive configuration parameter name.

- ii. **Configuration Parameter** Value Cassandra Cluster sensitive configuration parameter value.
- 8. Then click **Next** to proceed further.
- 9. Provide the details for **dSource Name** and **Target group** on the dSource configuration page and click **Next**.
- 10. On the Data management page, select the following and click **Next**.
 - a. **Staging Environment**: This will be your staging host where the source config was created.
 - b. **User**: Database OS user with required privileges for linking the dataset.
 - c. Ensure **Resynchronize dSource** option is selected.
- 11. Select a SnapSync policy and click **Next**.

- 12. Enter any custom pre or post sync logic as Pre-Sync or Post-Sync hook operations. Click **Next**.

- 13. Review the dSource Configuration and Data Management information, and then click **Submit**.

9.2.4.3 Provisioning Cassandra virtual databases

This topic describes how to provision a virtual database (VDB) from a Cassandra dSource using Cassandra plugin.

9.2.4.3.1 Prerequisites

- Install Delphix engine compatible with the Cassandra plugin version as per the [support matrix](#) (see [page 1114](#))
- Install Cassandra binaries on the target host.
- Add Staging environment to Delphix Engine.
- Create dSource on the staging host.
- Add target environments to the Delphix engine.

9.2.4.3.2 Creating VDB

1. Login to the Delphix Management application.
2. Click **Manage**.
3. Select **Datasets**.
4. Select a **dSource**.
5. Select a snapshot from which you want to provision.
6. Click the Provision VDB icon to open the Provision VDB wizard.

7. Select a target environment from the left pane.
8. Select an Installation to use from the dropdown list of available Cassandra repositories on that environment.

Provision Plugin-based VDB

9. Select the Environment User.
10. Enter dSource-specific parameters for your configuration.
 - a. **DSource Type** The type of dSource is based on the type of database restore.
 - b. **Mount Path** The path on the host where Delphix will mount the dSource files via NFS.
 - c. **Cassandra Staging Cluster Node Count** Number of nodes that consists of the Staging Cassandra cluster. Minimum: 3 and Maximum: 9.
 - d. **IP Address / Hostname of the Staging Cluster** IP Address / Hostname of the interface for the Cassandra Staging Cluster (default 127.0.0.1).
 - e. **Staging Cassandra JMX Port Number** Staging Cluster JMX port for the cluster for JMX connection requests. Ports for other nodes will be auto-incremented.
 - f. **Staging Cassandra CQL Native Port Number** Staging Cluster CQL native port where the CQL native transport listens for clients. Ports for other nodes will be auto-incremented.
 - g. **Staging Cassandra TCP Port Number** Staging Cluster TCP port for or Cassandra commands and data. Ports for other nodes will be auto-incremented.

- h. **Enable Authentication** Mode Option to enable the authentication for the Cassandra Staging Cluster.
- i. **Cassandra Username** Specify the username to be created for Staging Cassandra Cluster.
- j. **Cassandra Password** Specify the password to be set for the username created for the Cassandra Staging Cluster.
- k. **Global Node Configuration** Specify the global node configuration for the Cassandra Staging Cluster.
 - i. **Cassandra Configuration Filepath** Specify the relative path of the configuration file to the Cassandra base installation directory.
 - ii. **File Parameters** Specify the additional Cassandra configuration parameters to configure the Cassandra Staging Cluster.
 - 1. **Configuration Parameter Name** Cassandra Cluster configuration parameter name.
 - 2. **Configuration Parameter Value** Cassandra Cluster configuration parameter value.
 - iii. **YAML Password-Sensitive Parameters** Specify the additional sensitive Cassandra configuration parameters to configure the Cassandra Staging Cluster.
 - 1. **Configuration Parameter Name** Cassandra Cluster sensitive configuration parameter name.
 - 2. **Configuration Parameter Value** Cassandra Cluster sensitive configuration parameter value.
- l. **Additional Nodes** Adding new nodes to the Cassandra cluster setup on the Target host.
- m. **Environment** Select the target environment from the drop-down to add the new Cassandra node to the Target cluster.
- n. **Environment User** Select the target environment user to add the new Cassandra node to the cluster.
- o. **IP Address / Hostname of the Additional Node** IP Address / Hostname of the interface for the Additional Cassandra Target Cluster Node.
- p. **Target Cassandra JMX Port Number of the Additional Node** Target Cluster JMX port for the cluster for JMX connection requests. Ports for other nodes will be auto-incremented.
- q. **Target Cassandra CQL Native Port Number of the Additional Node** Target Cluster CQL native port where the CQL native transport listens for clients. Ports for other nodes will be auto-incremented.
- r. **Append Node Configuration** Append the existing primary node configuration parameters to additional node configuration.
- s. **Node Configuration** Provide the specific node configuration for the Cassandra Target Cluster.
- t. **Cassandra Configuration Filepath** Provide the relative path of the configuration file to the Cassandra base installation directory.
- u. **File Parameters** Specify the additional Cassandra configuration parameters to configure the Cassandra Staging Cluster.
 - i. **Configuration Parameter Name** Cassandra Cluster configuration parameter name.
 - ii. **Configuration Parameter Value** Cassandra Cluster configuration parameter value.
- v. **YAML Password-Sensitive Parameters** Specify the additional sensitive Cassandra configuration parameters to configure the Cassandra Staging Cluster.

- i. **Configuration Parameter Name** Cassandra Cluster sensitive configuration parameter name.
- ii. **Configuration Parameter Value** Cassandra Cluster sensitive configuration parameter value.

11. Select a **Target Group** for the VDB.
Provision Plugin-based VDB

12. Click the **Add Dataset Group** icon to add a new group, if necessary.

13. Select a Snapshot Policy for the VDB.
Provision Plugin-based VDB

14. Click **Next**.

15. Select the **masking** option if you wish to mask this VDB.

Provision Plugin-based VDB

- Target Environment
- Target Configuration
- Configuration
- Policies
- **Masking**
- Hooks
- Summary

Masking

You can mask your data during provisioning by selecting "Mask this VDB" and selecting an existing masking job.

If you want to mask your data using scripts, define those scripts as part of the Configure Clone section in the Hooks step. Scripts can be defined in addition to the use of a masking job.

Mask this VDB

16. Click **Next**.
17. Specify any desired hook operations.

Provision Plugin-based VDB

- Target Environment
- Target Configuration
- Configuration
- Policies
- Masking
- **Hooks**
- Summary

Hooks

Scripts can be defined to run at multiple hook points in the process. Select a Hook Point and then click + to add a script to run at that point.

Hook Points	+
<ul style="list-style-type: none"> ▼ Configure Clone No operations ▼ Pre Refresh No operations ▼ Post Refresh No operations ▼ Pre Rollback No operations ▼ Post Rollback No operations ▼ Pre Snapshot No operations ▼ Post Snapshot No operations ▼ Pre Start No operations ▼ Post Start No operations ▼ Pre Stop No operations

9.2.5 Troubleshooting Cassandra data sources

9.2.5.1 Logging

The following logs will help to diagnose dSource/VDB issues related to this plugin.

9.2.5.1.1 Cassandra dSource/VDB log files

```
/{toolkit_directory}/Delphix_COMMON_{appliance_id}/plugin/sc:cassandra_{plugin-id}/Cassandra/log_{os_user}/delphixCassandraDebug.log
```

Cassandra log files: Cassandra can write messages to log files. The files are named using the following format and can be found at location mentioned in `cassandra-env.sh` file:

Verify CASSANDRA_LOG_DIR variable in `{Cassandra_install_path}/resources/cassandra/conf/cassandra-env.sh` file

For Example:

```
/{toolkit_directory}/Delphix_COMMON_{appliance_id}/plugin/sc:cassandra_{plugin-id}/.delphix/{<binary_folder_name>_delphix_<dataset_name>_n_<node_number>}/system.log
```

To make it easier to watch a Cassandra startup log without knowing the full filename, a symlink with the short filename `cassandra.log` is also created. This symlink points to the most recent log. The Cassandra startup log location on staging or target host can be found at below location:

```
{delphix_mount_path}/<dataset_name>/
<binary_folder_name>_delphix_<dataset_name>_n_<node_number>.log
```

9.2.5.1.2 Troubleshooting Queries

Identify DataStax Cassandra Version

```
{Cassandra_install_path}/bin/dse -v
For example:
/u02/cassandra/node1/bin/dse -v
6.8.25
```

Identify Open-Source Apache Cassandra Version:

```
{Cassandra_install_path}/bin/cassandra -v
For example:
/u01/cassandra/apache-cassandra-4.0.7/bin/cassandra -v
4.0.7
```

Start DataStax Enterprise Cassandra multi-node cluster:

```
{Cassandra_install_path}/bin/dse cassandra
```

Stop DataStax Enterprise Cassandra multi-node cluster:

```
{Cassandra_install_path}/bin/dse cassandra-stop -p {pid}
```

Start Open-Source Apache Cassandra multi-node cluster:

```
{Cassandra_install_path}/bin/cassandra
```

Stop Open-Source Apache Cassandra multi-node cluster:

```
# Terminate the active cassandra process using:
kill -9 {pid}
```

Start interactive Cassandra CQL shell:

```
{Cassandra_install_path}/bin/cqlsh {host} {port} --username {username} --password
{password}"
```

Start interactive Cassandra CQL shell with SSL encryption:

```
{Cassandra_install_path}/bin/cqlsh {host} {port} --ssl --username {username} --
password {password}"
```

Configure a cqlshrc file that contains CQL shell session settings that are used when the CQL shell starts.

1. Copy the cqlshrc.sample.ssl file to the ~/.cassandra/ directory. If the Cassandra base installation directory is located at /u02/cassandra/dse-6.8.33, then the sample cqlshrc file will be located under resources/cassandra/conf/cqlshrc.sample.ssl
2. Rename the file to cqlshrc copied in Step 1 under ~/.cassandra/cqlshrc directory.
3. Modify or update the cqlshrc file as per your cluster configuration. For example:

```
> cat .cassandra/cqlshrc
[authentication]
username = dlpxadmin
password = *****

[connection]
hostname = 10.11.12.13
port = 9042
; factory = cqlshlib.ssl.ssl_transport_factory

[ssl]
certfile = /home/delphix/certs/rootca.crt
; optional - true by default.
validate = true
userkey = /home/delphix/certs/client_key.key
usercontent = /home/delphix/certs/client_cert.crt_signed
```

4. Restart the CQL shell.

```
> {Cassandra_install_path}/bin/cqlsh --ssl
Connected to datastaxstg at 10.11.12.13:9042.
[cqlsh 6.8.0 | DSE 6.8.33 | CQL spec 3.4.5 | DSE protocol v2 | TLSv1_2]
Use HELP for help.
delphixadmin@cqlsh>
```

5. Verify Cassandra Cluster Status:

```
For example:
/u02/cassandra/node1_delphix_dsestg_n_0/bin/nodetool status
Datacenter: Cassandra
=====
Status=Up/Down
|/ State=Normal/Leaving/Joining/Moving/Stopped
-- Address      Load          Tokens         Owns (effective)  Host ID
Rack
```

```
UN 127.0.0.1 185.97 KiB 1 61.6% 35a2a647-f3b8-4f2d-
ad25-ab8376bc12ad rack1
UN 127.0.0.2 148.97 KiB 1 44.9% 5f1b513e-6caf-4faa-
bd26-4e9344689c80 rack1
UN 127.0.0.3 148.86 KiB 1 93.5% cf4a0f6f-ffe5-40a4-
b68d-fec5e449f341 rack1
```

6. Verify Cassandra Cluster setting across all nodes:

```
{Cassandra_install_path}/bin/nodetool describeclasser
For example:
/u02/cassandra/node1_delphix_dsestg_n_0/bin/nodetool describeclasser
Cluster Information:
  Name: dsestg
  Snitch: com.datastax.bdp.snitch.DseSimpleSnitch
  DynamicEndPointSnitch: enabled
  Partitioner: org.apache.cassandra.dht.Murmur3Partitioner
  Schema versions:
    a100bba8-50a7-3c2f-959d-695342f1d061: [127.0.0.1, 127.0.0.2, 127.0.0.3]
```

7. Create Cassandra User to restrict access to Cassandra cluster:

```
create role {username} with SUPERUSER = true AND LOGIN = true AND PASSWORD =
' {password}';
```

For more information on common `cassandra` commands, please refer to Cassandra official [documentation](#)³²⁸.

9.2.6 Cassandra developer's guide

- [Linking Cassandra operations](#) (see page 1143)
- [Provisioning Cassandra operations via CLI](#) (see page 1145)
- [Discovering Cassandra environment](#) (see page 1141)
- [Cassandra source config operations](#) (see page 1142)

9.2.6.1 Discovering Cassandra environment

To discover an environment via CLI, login to the Delphix Continuous Data Engine using the admin user account.

(Connection to Continuous Data with FDQN “[dlpx-engine.delphix.com](#)³²⁹”)

³²⁸ https://docs.datastax.com/en/dse/6.8/dse-admin/datastax_enterprise/tools/nodetool/nodetoolOperations.html?hl=commands

³²⁹ <http://dlpx-engine.delphix.com>

```
Syntax -
ssh admin@dlpx-engine.delphix.com
```

9.2.6.1.1 Discovering environment

Run the following commands to discover the environment.

(Adding environment with FQDN "csd-staging.delphix.com³³⁰", hostname "csd-staging", toolkit-path "/var/tmp", os-user "delphix", os-password "delphix")

```
Example -
> environment
> create
> set hostEnvironment.name=csd-staging
> set hostParameters.host.address=csd-staging.delphix.com
> set hostParameters.host.toolkitPath=/var/tmp
> set primaryUser.name=delphix
> set primaryUser.credential.password=delphix
> commit
```

9.2.6.2 Cassandra source config operations

To create a source config and perform updates from the CLI, login to the Delphix Continuous Data Engine using the admin user account.

```
Syntax -
ssh admin@dlpx-engine.delphix.com
```

9.2.6.2.1 Add Source config creation via CLI

Run the following command to add the source config.

```
Example -
> sourceconfig create
> set type=AppDataStagedSourceConfig
> set name=testscfg
> set environmentUser="csd-staging/delphix"
> set parameters="{ \
  \"cluster_name\": \"Staging\", \
  \"pretty_name\": \"testscfg\"
}"
> set repository="csd-staging/'Datastax Cassandra - (version: 6.8.25) [/u02/cassandra/dse-6.8.25/bin/dse]'"
```

³³⁰ <http://csd-staging.delphix.com>

```
> commit
```

9.2.6.2.2 Delete

Run the below command to delete sourceconfig.

```
Example -
> sourceconfig
> select testscfg
> delete
> commit
```

9.2.6.3 Linking Cassandra operations

9.2.6.3.1 Creating Cassandra dSource via CLI

To create a dSource via CLI, you must create a source configuration first. For more information on creating a source configuration, refer to [Add Source Config using CLI \(see page 1142\)](#).

To create a dSource and perform operations via CLI, login to the Delphix Continuous Data Engine using the admin user account.

```
Syntax -
ssh admin@dlpx-engine.delphix.com
```

9.2.6.3.2 Set default linking parameters (This is common for all types of ingestions) :

Run the below commands to set the default linking parameters. The below example uses testscfg source config.

```
Example -
> database link
> set type=LinkParameters
> set linkData.type=AppDataStagedLinkData
> set name=testds
> set group=Untitled
> set linkData.config=testscfg
> set linkData.environmentUser=csd-staging/delphix
> set linkData.stagingEnvironment=csd-staging
> set linkData.stagingEnvironmentUser=csd-staging/delphix
> set linkData.syncParameters.parameters={"resync":true}
```

9.2.6.3.3 Link parameters for ingestion using NFS backup:

Run the below commands to link parameters:

Example -

```
> set linkData.parameters="{\
  \"dsource_type\": \"Staging Push\", \
  \"mount_path\": \"/mnt/provision/dsestg\", \
  \"num_nodes\": 3, \
  \"ip_addr\": \"127.0.0.1\", \
  \"jmx_port\": 7199, \
  \"native_transport_port\": 9042, \
  \"storage_port\": 7000, \
  \"enable_auth_mode\": true, \
  \"cassandra_username\": \"testusr\", \
  \"cassandra_password\": \"testpwd\", \
  \"global_node_config\": [\
    {\
      \"file_path\": \"resources/cassandra/conf/cassandra.yaml\", \
      \"file_parameters\": [\
        {\
          \"parameter_name\": \"\", \
          \"parameter_value\": \"\" \
        } \
      ], \
      \"yaml_sensitive_params\": [\
        {\
          \"parameter_name\": \"\", \
          \"parameter_value\": \"\" \
        } \
      ] \
    } \
  ] \
}"
```

9.2.6.3.4 Commit

Run the below command to commit the change

```
> commit;
```

9.2.6.3.5 Disable

Run the below command to disable the dSource.

```

Example -
> source
> select testdb
> disable
> commit

```

9.2.6.3.6 Enable

Run the below command to enable the dSource.

```

Example -
> source
> select testdb
> enable
> commit

```

9.2.6.4 Provisioning Cassandra operations via CLI

To create a VDB via CLI, you must first create a dSource. For more information on creating a dSource, refer to [Link operation via CLI section](#). (see page 1143)

To create a VDB and perform operations via CLI, login to the Delphix Continuous Data Engine using the admin user account.

```
ssh admin@dlpx-engine.delphix.com
```

9.2.6.4.1 Provision

Run the below commands to provision a VDB. The below example uses testdb dSource.

```

Example -
> database provision
> set type=AppDataProvisionParameters
> set container.name=testvdb
> set container.group=Untitled
> set source.allowAutoVDBRestartOnHostReboot=true
> set sourceConfig.repository="csd-tgt.delphix.com/delphix"
> set timeflowPointParameters.container=testdb
> set sourceConfig.name=testscfgv
> set source.parameters=    "{\
    \"vdb_name\": \"testvdb\", \
    \"mount_path\": \"/mnt/provision/dsestg\", \
    \"num_nodes\": 3, \
    \"ip_addr\": \"127.0.0.1\", \
    \"jmx_port\": 7199, \

```

```

\"native_transport_port\":9042,\
\"storage_port\":7000,\
\"enable_auth_mode\":true,\
\"cassandra_username\":\"testusr\",\
\"cassandra_password\":\"testpwd\",\
\"global_node_config\":[\
  {\
    \"file_path\":\"resources/cassandra/conf/cassandra.yaml\",\
    \"file_parameters\":[\
      {\
        \"parameter_name\":\"\",\
        \"parameter_value\":\"\"\
      }\
    ],\
    \"yaml_sensitive_params\":[\
      {\
        \"parameter_name\":\"\",\
        \"parameter_value\":\"\"\
      }\
    ]\
  },\
  {\
    \"environment\":\"127.0.0.1\",\
    \"environment_user\":\"127.0.0.1\",\
    \"ip_addr\":\"127.0.0.1\",\
    \"jmx_port\":7199,\
    \"native_transport_port\":9042,\
    \"append_node_config\":true,\
    \"node_config\":[\
      {\
        \"file_path\":\"resources/cassandra/conf/cassandra.yaml\",\
        \"file_parameters\":[\
          {\
            \"parameter_name\":\"\",\
            \"parameter_value\":\"\"\
          }\
        ],\
        \"yaml_sensitive_params\":[\
          {\
            \"parameter_name\":\"\",\
            \"parameter_value\":\"\"\
          }\
        ]\
      }\
    ]\
  }\
]\
}
> commit

```

9.2.6.4.2 Disable

Run the below commands to disable a dSource. You must select the same sourceConfig name that was given during VDB creation.

```
Example -  
> source  
> select testscfgv  
> disable  
> commit
```

9.2.6.4.3 Enable

Run the below command to enable a dSource.

```
Example -  
> source  
> select testscfgv  
> enable  
> commit
```

9.2.6.4.4 Stop

Run the below command to stop a dSource.

```
Example -  
> source  
> select testscfgv  
> stop  
> commit
```

9.2.6.4.5 Start

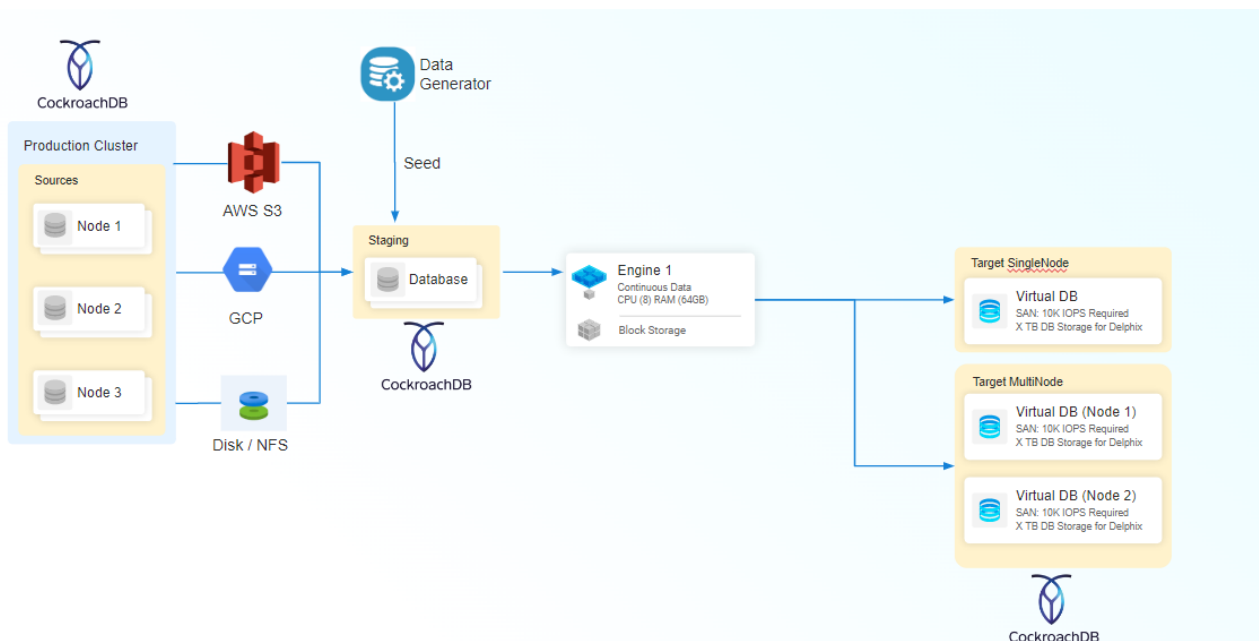

Run the below command to start a dSource.

```
Example -  
> source  
> select testscfgv  
> start  
> commit
```

9.3 CockroachDB data sources

The Delphix CockroachDB virtualization solution uses a [Staging Architecture Model](#). In this model, the source (production) database is copied to a staging environment. The staging environment's database is ingested by the Delphix Continuous Data Engine, which then enables virtualized copies on a target environment.

The CockroachDB plugin leverages CockroachDB's built-in backup and restore procedures to virtualize the data source. You can use the [BACKUP](#)³³¹ statements to efficiently backup the cockroach cluster and data to popular cloud services such as AWS S3 or NFS, and the [RESTORE](#)³³² statement to efficiently restore schema and data as necessary. The CockroachDB restore process is capable of restoring from either a full backup or from a combination of a full backup with incremental backups.

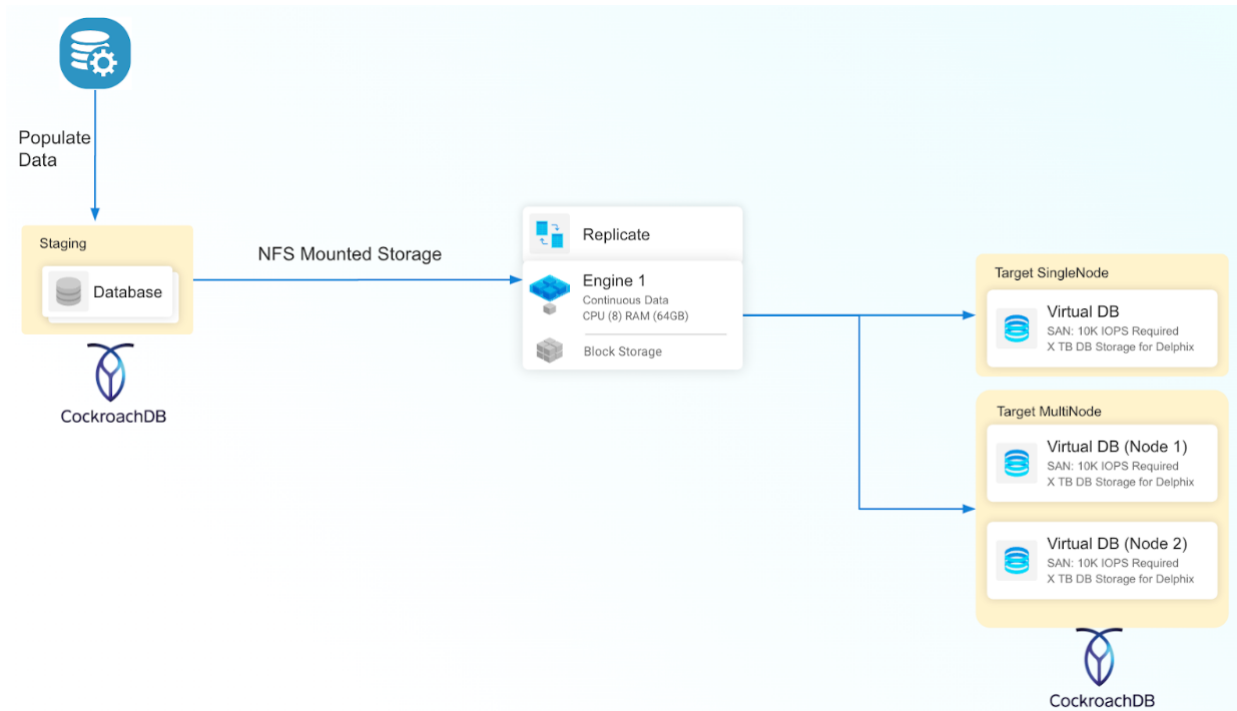

The CockroachDB connector supports the following ingestion mechanisms:

9.3.1 Seed

The Seed ingestion mechanism in the CockroachDB connector serves as a foundational approach for creating a seed database, allowing users to populate it with diverse data through various techniques such as built-in data generators, SQL statements, or the IMPORT command. This seed database serves as the initial dataset, providing a starting point for users to establish their CockroachDB environment.

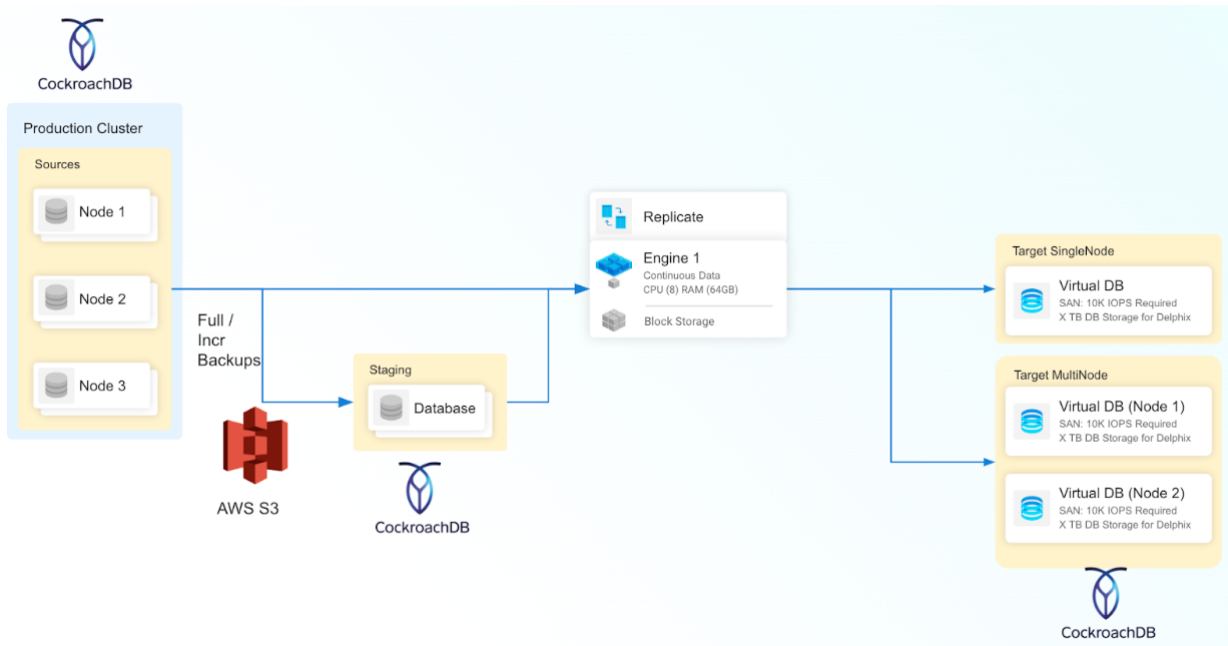

³³¹ <https://www.cockroachlabs.com/docs/v22.1/backup.html>

³³² <https://www.cockroachlabs.com/docs/v22.1/restore>

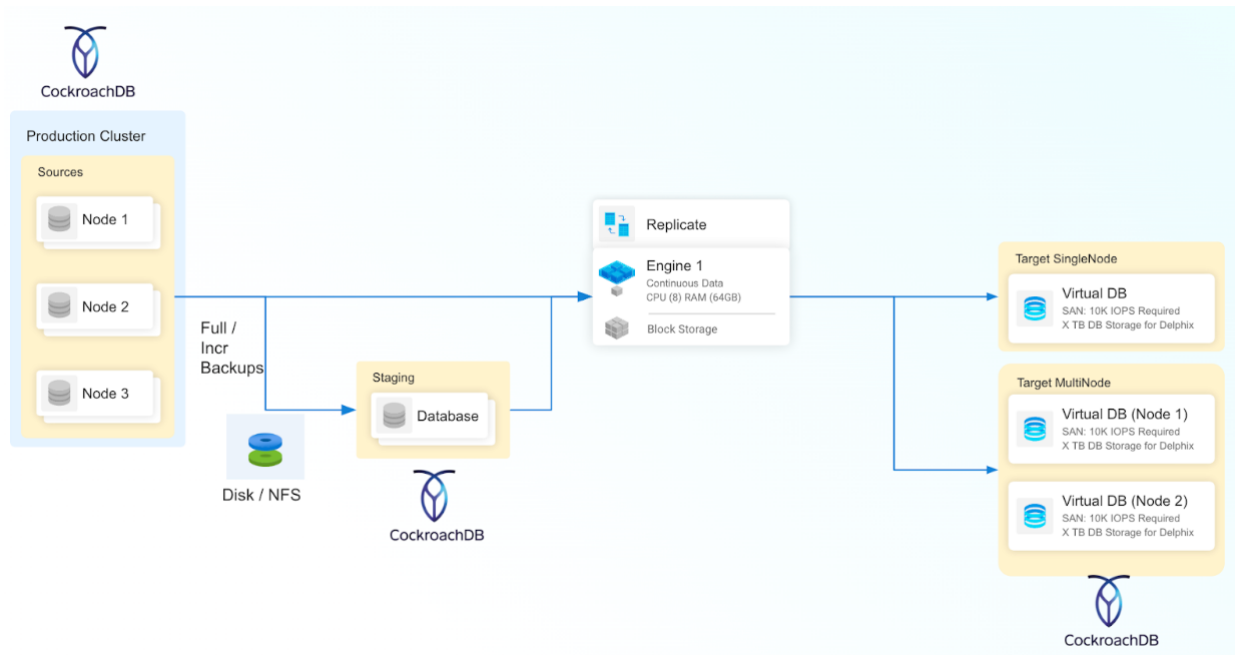

9.3.2 AWS S3 Backup

This ingestion type is generally used to create a staging database by utilizing backup files found within an AWS S3 location. This process facilitates the creation of a staging database through a zero touch production approach. Periodic backups stored on AWS S3 locations can be loaded to create a dSource timeflow.

9.3.3 Disk Backup

This ingestion type is generally used to create a staging database by utilizing backup files found within Disk/ NFS locations which are accessible from the Staging host. This process facilitates the creation of a staging database through a zero touch production approach. Periodic backups stored on Disk/NFS locations can be loaded to create a dSource timeflow.

9.3.4 Google Cloud Platform (GCP)

This ingestion type is generally used to create a staging database by utilizing backup files found within a GCP bucket. This process facilitates the creation of a staging database through a zero touch production approach. Periodic backups stored on GCP bucket can be loaded to create a dSource timeflow.

9.3.5 CockroachDB virtualization process

This topic serves as a quick guide that will walk you through your first implementation of the CockroachDB Connector, providing high-level steps. Each step briefly describes the task and the expected result. Refer to the documentation links for more detailed information.

1. [Begin by reviewing the general Delphix Continuous Data architecture diagrams](#) (see page 1046) Identify existing or new CockroachDB source, staging, and target environments, the underlying Operating Systems, and CockroachDB database versions. This will give you a good understanding of the architectural strategy and confirm support.
2. [Review the CockroachDB Support Matrices](#) (see page 1152) Confirm that all system requirements are supported by the CockroachDB plugin, such as Continuous Data Engine, staging/target environment Operating Systems, and CockroachDB database versions. This will ensure that there are not any unexpected issues later.
3. Deploy and configure Delphix Continuous Data.
4. [Install the CockroachDB plugin](#) (see page 1161) The CockroachDB plugin establishes the connection between the Delphix Continuous Data Engine and the plugin version. It is recommended to stay up-to-date with the latest version.
5. [Create staging and target environments](#) (see page 1154) The staging environment will be a replica of the source environment that Delphix Continuous Data Engine will use to stay in sync. The target environment will provide the infrastructure to generate virtual database copies.
 - a. Consult the [source environment](#) (see page 1154) and [staging/target environments](#) (see page 1154) requirements documentation for configuration details.
6. [Discover Staging and Target Environments](#) (see page 1164) To enable the Delphix Continuous Data Engine to recognize the provided infrastructure, search for CockroachDB installation, and then make it available for database linking and provisioning.

7. [Linking the CockroachDB database \(see page 1168\)](#) This configures a dSource which enables the syncing mechanism between the source database, staging database, and Delphix Continuous Data Engine. There are many ingestion methods that differ between plugins and solve different requirements. Therefore, we encourage you to identify the ingestion method that best suits your organization and infrastructure policies.
8. [Provision virtual CockroachDB databases \(see page 1179\)](#) Administrators and self-service users have the capability to provision an unlimited number of copies for their virtual databases.

Congratulations on successfully creating a virtual database using the Delphix Continuous Data Engine and the CockroachDB plugin! With the basics understood, we encourage you to learn about our more advanced features such as the Seed, AWS S3 and Disk ingestion methodology or our developer’s APIs and CLIs.

9.3.6 CockroachDB requirements and prerequisites

- [Network and connectivity requirements for CockroachDB \(see page 1156\)](#)
- [Sudo privileges for the CockroachDB environment OS user \(see page 1159\)](#)
- [CockroachDB support matrices \(see page 1152\)](#)
- [Requirements for cockroachDB source databases \(see page 1154\)](#)

9.3.6.1 CockroachDB support matrices

9.3.6.1.1 Support Matrix

Refer to the following support matrices to ensure compatibility between the environment, database, connector, and Delphix Continuous Data Engine.

Compatible upgrades have a green **Y**, while incompatible upgrades show a red **N**

Color	Supported?
Y	Yes
N	No

9.3.6.1.2 Environment and Database Compatibility

Refer to this table to learn about supported Linux and Windows OS and DBMS versions of Cockroach DB:

Supported OS Version	Supported DBMS Versions				
	CRDB v21.1.x	CRDB v21.2.x	CRDB v22.1.x	CRDB v22.2.x	CRDB v23.1.x

RHEL 7.x	Y	Y	Y	Y	Y
RHEL 8.x	Y	Y	Y	Y	Y
Windows	N	N	N	N	N

9.3.6.1.3 Engine Compatibility Matrix

Delphix Engine Versions	Supported CockroachDB Connector Versions					
	CRDB v1.0.0	CRDB v1.1.0	CRDB v1.1.1	CRDB v1.1.2	CRDB v1.2.0	CRDB v1.3.0
6.0.12.0 - 6.0.17.x	Y	Y	Y	Y	Y	Y
7.0.0.0 - 26.0.0.0	Y	Y	Y	Y	Y	Y

9.3.6.1.4 Ingestion / Deployment Compatibility Matrix

Ingestion Type	CockroachDB Deployment				
	Seed	Disk	AWS	Azure	GCP
Full	Y	Y	Y	N	Y
Incremental	Y	Y	Y	N	Y

Notes:

- The CockroachDB restore process is capable of restoring from either a full backup or from a combination of a full backup with incremental backups.
- CockroachDB does not support incremental-only restores as highlighted [here](https://www.cockroachlabs.com/docs/v23.2/restore#restore-types)³³³.

³³³ <https://www.cockroachlabs.com/docs/v23.2/restore#restore-types>

9.3.6.1.5 CockroachDB Version compatibility across Delphix environments

- CockroachDB binaries in all environments (source, staging and target) must be of the same version for all data ingestion types (Seed / AWS S3 / GCP / Disk Backup).

9.3.6.1.6 CockroachDB data source limitations

- CockroachDB Ingestion from Azure is not supported.
- CockroachDB Point-in-time restore is not supported.
- Delphix V2P is not supported.
- Delphix Password Vault is not supported.

9.3.6.2 Requirements for cockroachDB source databases

The source database requirements are listed below:

1. Retrieve a comprehensive list of CockroachDB Backup's subdirectories absolute paths by executing the following command:

```
SHOW BACKUPS IN 's3://{bucket name}/{path}?AWS_ACCESS_KEY_ID={placeholder}
&AWS_SECRET_ACCESS_KEY={placeholder}';
```

```
SHOW BACKUPS IN 'nodeLocal:/self/nfsmount/backups';
```

```
SHOW BACKUPS IN 'gs://{bucket name}/{path}?AUTH=specified&CREDENTIALS={placeholder}';
```

The format of the CockroachDB Backup's subdirectory path follows a date-based naming scheme, specifically *<year>/<month>/<day>-<timestamp>..*

2. Before initiating the restoration process on the staging database, make sure to identify the following key information:
 - **For AWS**
 - Storage Bucket Name (AWS S3): Record the name of the storage bucket in AWS S3, including the absolute path where CockroachDB backups are situated in AWS S3.
 - AWS_ACCESS_KEY_ID: The account access name or key associated with object storage holding CockroachDB backups, as it serves a crucial role in authentication.

- `AWS_SECRET_ACCESS_KEY`: The account secret access key associated with the account name field. This is essentially the password that gives access to CockroachDB backups.
- **For GCP**
 - Before initiating the restoration process on the staging database, make sure to identify the following key information:
 - Storage Bucket name (GCP): Record the name of the storage bucket in GCP, including the absolute path where CockroachDB backups are situated in GCP bucket.
 - Credentials: The secret access key associated with the GCP bucket. This is essentially the password that gives access to CockroachDB backups.
 - This pertinent information can be extracted from the backup command utilized for backing up the CockroachDB full cluster on GCP storage, exemplified by the following command:

```
SHOW BACKUPS IN 'gs://{bucket name}?
AUTH=specified&CREDENTIALS={placeholder}';
```

This pertinent information can be extracted from the backup command utilized for backing up the CockroachDB full cluster on AWS S3 storage, exemplified by the following command:

```
BACKUP INTO 's3://{BUCKET NAME}?AWS_ACCESS_KEY_ID={KEY ID}
&AWS_SECRET_ACCESS_KEY={SECRET ACCESS KEY}' AS OF SYSTEM TIME '-10s';
```

9.3.6.2.1 Requirements for CockroachDB staging and target environments

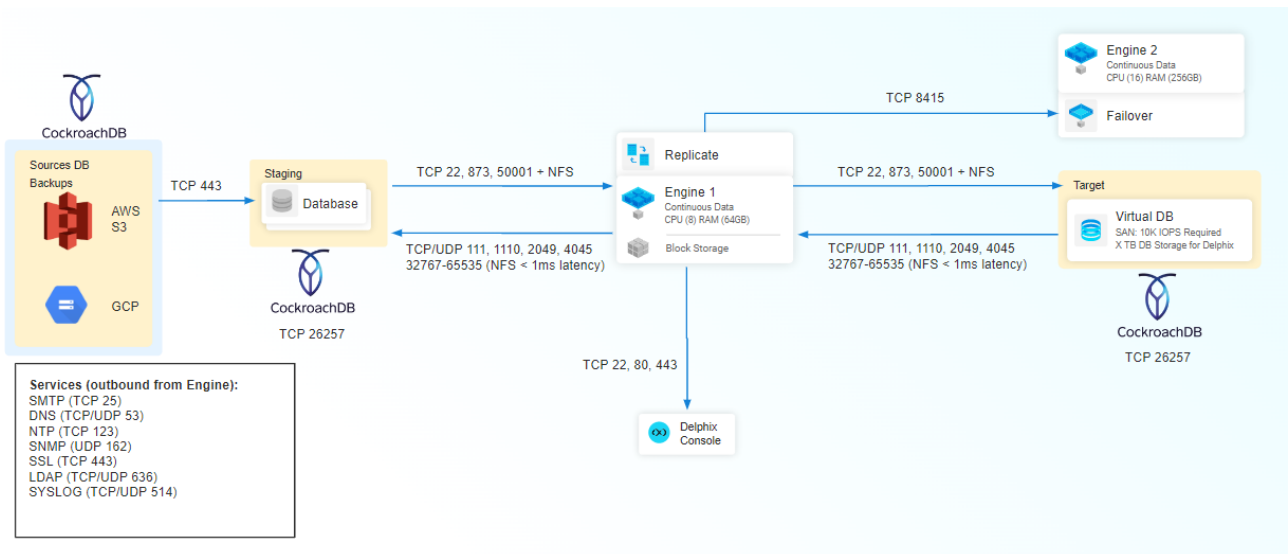

The Staging and Target environments have the same set of requirements for CockroachDB.

9.3.6.2.2 Network and Connectivity Requirements

Ensure that the requirements for [Delphix Engine network connectivity](#)³³⁴ are met before proceeding further. For CockroachDB connector specific network and connectivity requirements, see the relevant topics below.

9.3.6.2.2.1 Ports for AWS S3 / GCP / Disk backup Ingestion

334 <https://cd.delphix.com/docs/latest/network-connectivity-requirements>

9.3.6.3 Network and connectivity requirements for CockroachDB

9.3.6.3.1 SSH connectivity to target host

1. Staging and target environments are required to have sshd running and configured such that the Continuous Data Engine can connect over ssh.
2. The Delphix platform expects to maintain long-running, highly performant ssh connections with the host environment.
3. Depending on the Ingestion type, once connected to a target environment through SSH, the Continuous Data Engine initiates a CockroachDB client connection(cockroach) from the staging environment to the source environment.

Whitelisting inbound port for SSH connection to target host

Protocol	Port Number	Use
TCP	22	SSH connections to the target database environment
TCP/UDP	111	Remote Procedure Call (RPC) port mapper used for NFSv3 mounts
TCP	1110	Network Status Monitor (NSM) client from target hosts to the Continuous Data Engine

TCP	2049	NFS client from target hosts to the Continuous Data Engine (NFSv3 and NFSv4)
TCP	54043	Client mount daemon (NFSv3 only)
TCP	54044	Lock state notification service (NFSv3 only)
TCP	54045	Network Lock Manager (NLM) client from target hosts to Continuous Data Engine (NFSv3 only)
UDP	33434 - 33464	Traceroute from the target database server to the Continuous Data Engine (optional)

9.3.6.3.2 Connecting to CockroachDB Instances [Source + dSource + VDBs]

Outgoing [From]	Incoming [To]	Protocol	Port Number	Use
Staging host	Source CockroachDB Instance	TCP	<source-port>	CockroachDB Source database instance port to connect to setting up replication pipeline. The default port for a CockroachDB instance is 26257.
End-user hosts	Staging / Target CockroachDB instance	TCP	<target-port>	Connecting to the created database instance on the target host.

9.3.6.3.3 Host environment requirements for CockroachDB

Staging/Target Host Requirements	Additional Details
---	---------------------------

<p>Host Compatibility Check</p> <p>The operating system and architecture of the target environment must match the source environment.</p>	<p>It is required that the source and the target environments must have identical Operating system and hardware architecture configurations.</p>
<p>CockroachDB Installation and Compatibility Check</p> <p>There must be an installation of CockroachDB on the staging/target host that is compatible with the installation of CockroachDB on the source host.</p>	<p>The CockroachDB binary version on the staging/target must be identical to the source host.</p>
<p>There must be a directory on the staging/target host where the CockroachDB Connector support files can be installed (for example, /var/tmp) with the following properties:</p> <ol style="list-style-type: none"> 1. The directory must be writable by the operating system user mentioned above. 2. The directory must have at least 1.5 GB of available storage. 	<p>This path is called the “Toolkit Path” on the Environment creation UI page.</p>
<p>During VDB provisioning, there must be a mount point directory (for example, /mnt) that will be used as the base for mount points that are created when provisioning a VDB with the following properties:</p> <ol style="list-style-type: none"> 1. The mount point directory must be writable by the operating system user mentioned above. 2. The mount point directory should be empty. 	
<p>Hostname and IP must be correctly set in /etc/hosts file.</p>	<p>The output of “hostname -i” command should produce the correct result as the IP address of the server.</p> <p>For example:</p> <pre>[root@source ~]# hostname -i 10.110.211.225</pre>

<p>Required Utilities and Tools</p> <p>Ensure that either the netstat or ss utility is installed on the Staging/Target Host.</p>	<p>CockroachDB Connector checks the status of the running CockroachDB instance and validates if ports are available on the staging/target host using the netstat or ss utility.</p> <p>Checking if netstat or ss utility is installed</p> <pre>which netstat</pre> <pre>which ss</pre>
<p>Storage Requirement</p>	<ol style="list-style-type: none"> 1. Staging Host must have enough storage space to hold the source backup file. 2. Empty folder on staging host to hold delphix toolkit [approximate 2GB free space]
<p>Sizing Requirement</p>	<p>For comprehensive details and configuration guidelines on setting up staging/target CockroachDB clusters, refer to the official documentation: CockroachDB Sizing Recommendations³³⁵</p>

9.3.6.4 Sudo privileges for the CockroachDB environment OS user

Continuous Data Engine connects to the target host (via SSH) to perform the following operations:

1. Continuous Data Engine dynamically mounts and unmounts directories for linking and provisioning operations. This privilege is required because mount and unmount are typically reserved for users with superuser (root) permissions.
2. Continuous Data Engine dynamically creates and removes directories for linking and provisioning operations.

Operations (1) and (2) above will require sudo privileges for the OS user.

Configuring sudo access on target environments [as root user]:

1. The sudo configuration exists in /etc/sudoers file. We can edit this file directly or use a utility called [visudo](#)³³⁶ to add the privilege.

```
vi /etc/sudoers
# Or
visudo
```

³³⁵ <https://www.cockroachlabs.com/docs/stable/recommended-production-settings>

³³⁶ <https://www.sudo.ws/docs/man/1.8.13/visudo.man/>

2. Adding the privileges

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: /bin/mount,/bin/umount,/bin/mkdir,/bin/rmdir, /bin/ps
delphix_os ALL=(couchbase) NOPASSWD: ALL
```

The examples used above are for illustrative purposes and the sudo file configuration options are subject to change.

3. To secure communication within your CockroachDB staging/target cluster, it is imperative to ensure that the certificate directory contains valid certificates encompassing the IP address and hostname of the CockroachDB staging/target server.
 - a. List Certificates and Keys

```
cockroach cert list --certs-dir=[path-to-certs-directory]

$ cockroach cert list --certs-dir=/home/cockroach/certs
Certificate directory: /home/cockroach/certs
  Usage | Certificate File | Key File | Expires |
Notes | | | | |
-----+-----+-----+-----+
+-----+
CA | ca.crt | | 2032/03/29 | num certs:
1 | | | | |
Node | node.crt | node.key | 2027/03/26 | addresses:
crdb-node.example.com, 10.1.1.1 | | | |
Client | client.root.crt | client.root.key | 2027/03/26 | user: root
|
(3 rows)
```

- b. Verification of SSL/TLS Connection

```
cockroach sql --certs-dir=[certs-locations] --host=[ip-address]:[port]
```

Make sure to replace **[certs-locations]**, **[ip-address]**, and **[port]** with the actual locations and details.

9.3.6.4.1 Requiretty settings for CockroachDB

The Continuous Data Engine requires that the requiretty setting be disabled for all Continuous Data users with sudo privileges.

It is required to specify the NOPASSWD qualifier within the "sudo" configuration file, as shown here: [Sudo File Configuration Examples for CockroachDB Environments](#)³³⁷. This ensures that the "sudo" command does not demand the entry of a password, even for the "display permissions" (i.e. "sudo -l") command.

- Additionally, requirements for the Delphix OS user are as follows:
 - Should be a regular o/s user with primary group as cockroach software installer O/S user.
 - Must have access to backup files of the source database stored on the staging host.
 - Must have read and execute access on all files within CockroachDB installation Path: locations where software binaries are installed and located on the staging host. Minimum permission level 775 recommended.
- Ensure to disable any login banners that resemble the one depicted in the image below on the staging host.

```
[staging_host]$ su - delphix
*****
*
*           Welcome to the Linux Terminal
*
*-----
*
* You are now logged in as: delphix
*
* Take caution with your actions and be responsible!
*
*****
Password: █
```

9.3.7 CockroachDB installation and upgrade

9.3.7.1 Downloading the connector

The connector is provided as a downloadable .json file from the Delphix download site. Use the steps below to download it:

1. Navigate to the Delphix Download portal by clicking the following link or entering <https://download.delphix.com/> into the address bar.
2. Login to the download portal using the same email and password credentials used for Delphix Support.

³³⁷ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/114529893/21.0.0.0+Sudo+privileges+for+the+CockroachDB+environment+OS+user>

3. Navigate to **Delphix Product Releases > Continuous Data Connectors > CockroachDB > v1.x.x.x -> sc_crdb_v1.x.x.x.json** and the download should automatically begin.

9.3.7.2 Installing the connector

1. Login to the **Delphix Management** application.
2. Navigate to **Manage → Plugins**.

3. Click the **+** icon to upload the connector file.

4. This step shows the **Upload or upgrade a plugin** dialog. Upload the **sc_crdb_v1.x.x.x.json** file downloaded previously.

For more information, refer to the [Continuous Data Engine connector management](#)³³⁸ section.

9.3.7.3 Upgrading the connector

The procedure for upgrading to a higher connector version is the same as installing a new CockroachDB connector. Repeat the previous steps using the .json file corresponding with the version being upgrade to.

9.3.7.3.1 After uploading the new connector version file

1. Refresh all (corresponding) environments.
2. Ensure a connector discovery is completed successfully.
3. Take a new snapshot of the dSource and VDB.

While updating a plugin, disable & enable of datasets is not required. Only refresh of environments is required.

³³⁸ <https://cd.delphix.com/docs/latest/delphix-engine-plugin-management>

To upgrade to newer versions of the CockroachDB connector, the upgrade path as given below must be followed.

Upgrade Path

Released Versions	Recommended Upgrade Path
1.0.0, 1.1.0, 1.1.1, 1.1.2, 1.2.0, 1.3.0	Supports Direct Upgrade to 1.3.0.

9.3.8 CockroachDB connector operations

To successfully ingest and virtualize a CockroachDB instance, you must perform the following connector operations in sequence:

- [Linking CockroachDB data sources](#) (see page 1168)
- [Discovering installations for CockroachDB](#) (see page 1164)
- [Provisioning a CockroachDB virtual database](#) (see page 1179)

The respective sections provide detailed information about prerequisites, limitations (if any), and the procedure to be followed for completing each of the operations.

9.3.8.1 Discovering installations for CockroachDB

Environment discovery/refresh is a process that enables the CockroachDB Connector to determine CockroachDB installation details on a host. Database discovery/refresh is initiated during the environment set up process.

Whenever there is any change (for example: installing a new database home) to an already set up environment in the Continuous Data application, an environment refresh must be performed.

- [Prerequisite for the CockroachDB discovery operation](#) (see page 1164)
- [Adding an environment for CockroachDB](#) (see page 1165)
- [Add CockroachDB database](#) (see page 1166)

9.3.8.1.1 Prerequisite for the CockroachDB discovery operation

The following requirements must be met before starting the discovery process. When you add an environment to Delphix Continuous Data Engine, CockroachDB Connector does an automatic discovery of all CockroachDB installed binaries on the server.

1. Login to the Staging Host as delphix os user.
2. Create a file name (if not present) named `.bash_profile` or `.bashrc` in home directory of delphix OS user.

```
touch $HOME/.bash_profile $HOME/.bashrc
```

3. Define the environment variable pointing to binary path of CRDB_REPO directory on the host for manual discovery of CockroachDB instances and other information. Example as below.

```
echo "CRDB_REPO=/u01/cockroach/cockroach" > $HOME/.bash_profile
```

4. In case of multiple CockroachDB versions installed on same host, provide all installations path separated with colon (:) to the environment variable defined in .bash_profile. Example as below.

```
echo "CRDB_REPO=/u01/cockroach/cockroach:/u02/cockroach/cockroach" >
$HOME/.ba
```

9.3.8.1.2 Adding an environment for CockroachDB

This topic describes how to add a CockroachDB Staging and target environment.

9.3.8.1.2.1 Prerequisites

To set up a CockroachDB staging environment, ensure all the essential requirements, as described in [Requirements and Prerequisites](#) (see page 1152) are met.

9.3.8.1.2.2 Procedure

Perform the following steps to add an environment to the Delphix Continuous Data Engine:

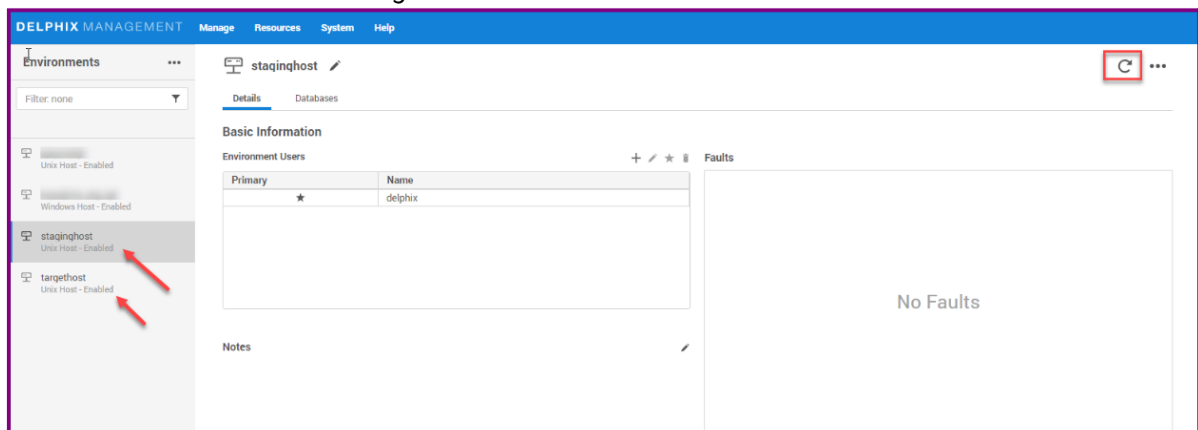

1. Login to the **Delphix Management** application.
2. Click **Manage > Environments**.
3. Click the **Actions ...** menu and select **Add Environment**.
4. From the Add Environment dialog window, select **Unix/Linux**.
5. Select **Standalone Host**
6. Click **Next**.
7. Provide the name of the environment.
8. Provide the **Host IP address** or **host FQDN**.
9. Provide the **SSH port**. The default value is 22.
10. Choose the **Login Type** that fits your setup.
 - a. Username and Password – provide the environment username and password.
 - b. Username and Public Key – provide the environment username.
 - c. Password Vault – select from an existing Enterprise Password Vault.
11. Provide an **OS Username** for the environment.
12. If Applicable, Provide an **OS Password** for the environment..
13. For Password Login, click **Validate** to test the OS Username and OS Password.
14. Enter **Toolkit Path** (ensure that the toolkit path does not have any spaces).

15. To provide your own Oracle Java Development Kit, select the **Provide my own JDK** checkbox and click **Next**.
 - a. On the **Java Development Kit** page, provide an absolute path to your Oracle JDK and click **Next**.
16. Click **Submit**.

9.3.8.1.2.3 Adding an Installation

If a new CockroachDB Installation is added to the environment and you want it to be reflected in the Continuous Data Engine UI, it is required to refresh the environment. Please refer to the below steps to perform "Environment Refresh" operation.

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. In the **Environments** panel, click the name of the environment you want to refresh.
5. Select the **Refresh icon**.
6. In the Refresh confirmation dialog select **Refresh**.

9.3.8.1.3 Add CockroachDB database

As noted above, an environment contains repositories that are CockroachDB installations in the environment. Each environment may have any number of repositories associated with it.

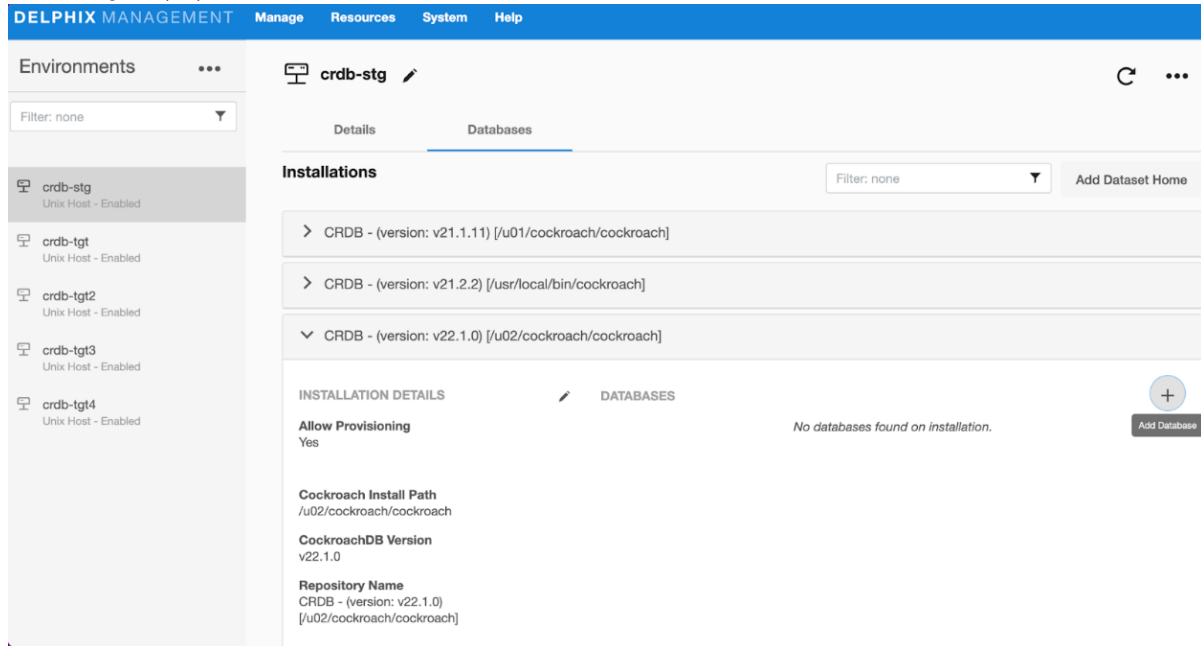

A SourceConfig object defines the configuration of the dSource and is required to create a dSource. You can create any number of SourceConfig objects using a repository, which represents known database instances.

For the CockroachDB plugin, the Source config must be created manually.

9.3.8.1.3.1 Procedure

Perform the following steps to create the Source Config on the Staging Environment:

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Select the repository.
5. Click on **plus(+)** icon.

6. Add required details in the Add **database** section.
7. **Identity field:** Provide unique name for staging database.
8. Click **Add** button.

9.3.8.2 Linking CockroachDB data sources

The Delphix Continuous Data Engine provides various ingestion methods for linking the dSource from a CockroachDB source database.

- [Creating a dSource with ingestion type Seed](#) (see page 1168)
- [Creating a dSource with ingestion type AWS S3](#) (see page 1170)
- [Creating a dSource with ingestion type Disk](#) (see page 1174)
- [Creating a dSource with ingestion type GCP](#) (see page 1176)

9.3.8.2.1 Creating a dSource with ingestion type Seed

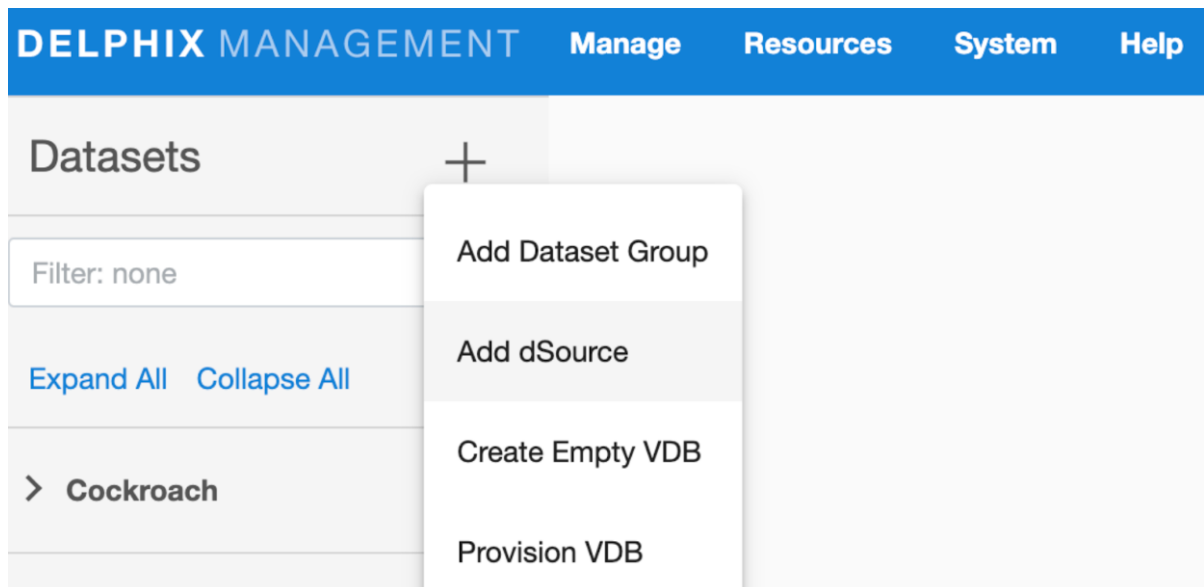

The following procedure provides details on creating a dSource with seed ingestion type.

9.3.8.2.1.1 Prerequisites

The source and staging instances must meet the host requirements as described in [Requirements](#) (see page 1154) for CockroachDB Staging/Target hosts.

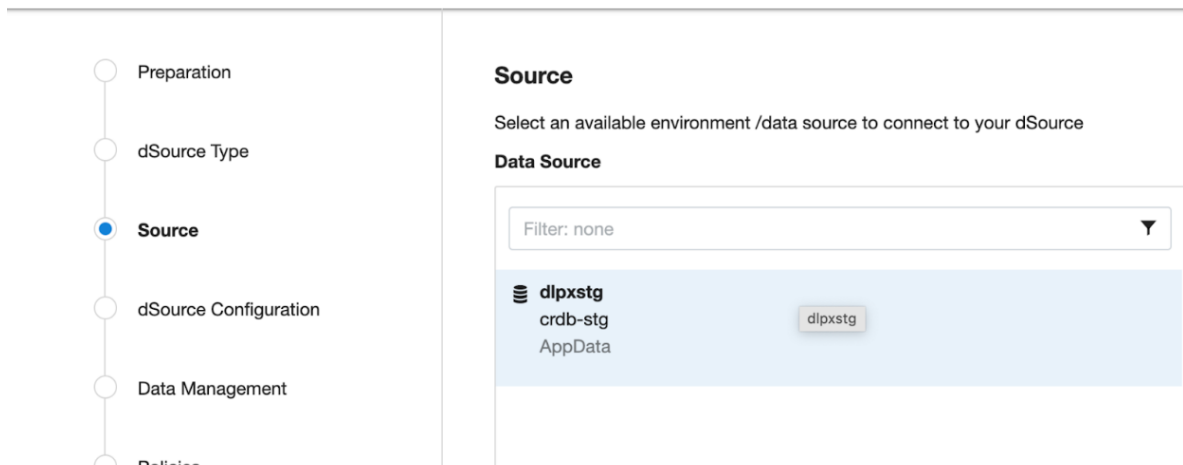

9.3.8.2.1.2 Creating dSource

1. Login to **Delphix Management application**.
2. Click **Manage > Datasets**
3. Click on **Add dSource**.

4. In the Add dSource wizard, select the CockroachDB source config you just created on the staging host.

Add dSource

5. Select the dSource type from the drop-down available on dSource wizard. Refer different [dSource Types](#)³³⁹.
6. Enter the CockroachDB specific parameters for your dSource configuration.
 - a. **dSource Type** Type of dSource
 - b. dSource (**Seed**) Details.
 - i. **Mount Path** The path on the host where Delphix will mount the dSource files via NFS.
 - ii. **IP Address / Hostname of the Staging Cluster** IP Address / Hostname of the interface for the staging Cluster (default 127.0.0.1).
 - iii. **Staging CockroachDB Port Number** Staging DB port for cluster's inter-node communication.
 - iv. **Staging CockroachDB Console Port Number** Staging Console port for HTTP requests.
 - v. **Secure Mode** Option to run the CockroachDB server in secure mode.
 - vi. **Certificate directory path** The absolute path to the certificate directory, it must have valid certificates containing the IP address or hostname for the CockroachDB server.
 - vii. **CockroachDB Cluster Node Count** Number of nodes that consists of Staging CockroachDB cluster. Minimum: 3 and Maximum: 9
 - viii. **CockroachDB Parameters** Additional CockroachDB configuration parameters to start the CockroachDB cluster.
 1. **Parameter Name** CockroachDB Cluster configuration parameter name
 2. **Parameter Value** CockroachDB Cluster configuration parameter value
 - ix. Then click **Next** to proceed further.
 - x. **Additional Nodes:** Specify the node configuration for each node the CRDB cluster.
 1. **Environment** Select environment on which node has to be created.
 2. **Environment User** Select environment user corresponding to the environment.
 3. **IP Address / Hostname** IP Address / Hostname of the interface for the staging node(default 0.0.0.0)

³³⁹ <https://cd.delphix.com/docs/latest/dsource-management>

4. **CockroachDB Port Number** Staging DB port for node’s inter-node communication
 5. **CockroachDB Console Port Number** Staging Console port for HTTP requests
 6. **Certificate directory path** The absolute path to the certificate directory, it must have valid certificates containing the IP address or hostname for the CockroachDB server
 7. **Append cluster CRDB parameters** Check with box if the cluster configuration parameters are applicable for the node. **Additional Node Configuration Parameters** Additional CockroachDB configuration parameters to start the node
7. Provide the details for **dSource Name** and **Target group** on the dSource configuration page and click **Next**.
 8. On the Data management page, select the following and click **Next**.
 9. Staging Environment: This will be your staging host where source config was created.
 - a. User: Database OS user with required privileges for linking the dataset.
 - b. On the next screens, configure a policy, hooks, and review the configuration, then click on **Next** button to view the summary.
 10. Click the **Submit** button which will initiate the linking process
 12. Once dSource is created successfully, you can review the datasets on **Manage > Datasets > dSource Name**.

Notes:

- Must specify the input “**Certificate directory path**” when the “**Secure Mode**” option is selected.
- For more detailed guidance on CockroachDB certificate generation, refer to the official documentation: [CockroachDB Certificate Generation](https://www.cockroachlabs.com/docs/stable/cockroach-cert)³⁴⁰.

9.3.8.2.2 Creating a dSource with ingestion type AWS S3

The following procedure provides details on creating a dSource with AWS S3 ingestion type.

9.3.8.2.2.1 Prerequisites

- The source and staging instances must meet the host requirements as described in [Requirements](#) (see page 1154) for CockroachDB Staging/Target hosts.
- The accessibility of the backup location within the AWS S3 bucket from the Staging host must be verified prior to ingestion.

9.3.8.2.2.2 Creating dSource

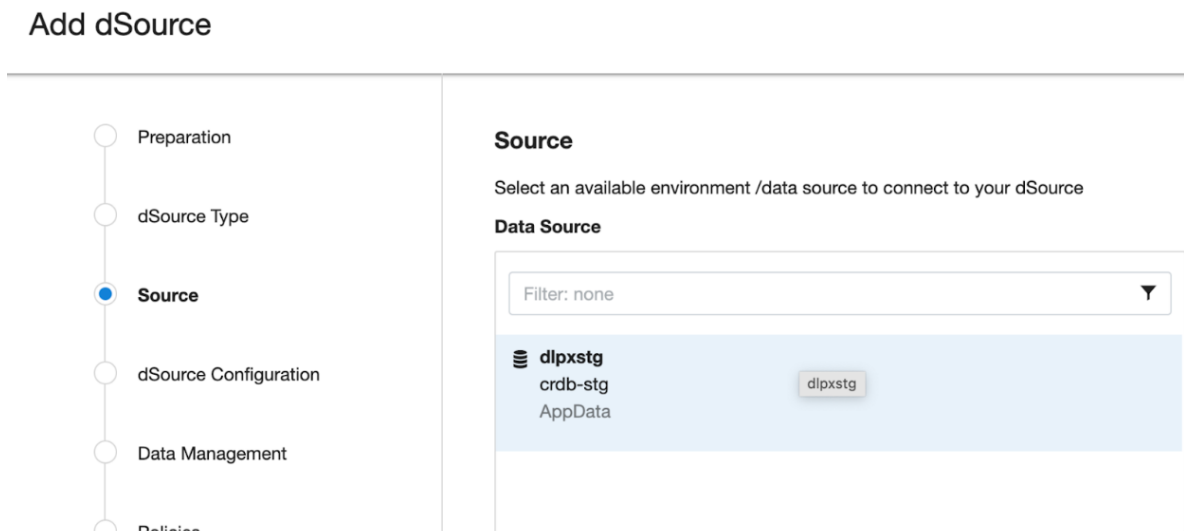

1. Login to **Delphix Management application**.
2. Click **Manage > Datasets**.

³⁴⁰ <https://www.cockroachlabs.com/docs/stable/cockroach-cert>

3. Click on **Add dSource**.

4. In the Add dSource wizard, select the CockroachDB source config you just created on the staging host.

5. Select the dSource type from the drop-down available on dSource wizard. Refer different [dSource Types](#)³⁴¹
6. Enter the CockroachDB specific parameters for your dSource configuration.
 - a. **dSource Type** Type of dSource
 - b. dSource (**AWS_S3**) Details
 - i. **Mount Path** The path on the host where Delphix will mount the dSource files via NFS

³⁴¹ <https://cd.delphix.com/docs/latest/dsource-management>

- ii. **IP Address / Hostname of the Staging Cluster** IP Address / Hostname of the interface for the staging Cluster (default 127.0.0.1)
- iii. **Staging CockroachDB Port Number** Staging DB port for cluster's inter-node communication
- iv. **Staging CockroachDB Console Port Number** Staging Console port for HTTP requests
- v. **CockroachDB Backup's Subdirectory Path** CockroachDB Backup's Subdirectory Absolute Path where backups are located in S3 Bucket
- vi. **CockroachDB Backup's Bucket or Container Name** Storage bucket or container name including absolute path where CockroachDB backups are located
- vii. **Authentication Option for AWS S3 Storage Buckets**
 1. **Specified Authentication** Need to specify the AWS access key ID and secret access key in the dSource configuration fields:
 - a. **Account Name or Access Key** Specify an account access name or key associated with object storage holding CockroachDB backups.
 - b. **Account Secret Access Key** Specify the account secret access key associated with the account name field. This is essentially the password that gives access to CockroachDB backups.
 2. **Implicit Authentication** Store the AWS credentials as environment variables
 - a. When using implicit authentication, ensure that aws credentials are configured on staging host using aws configure command.
 - b. Configure an IAM role attached to the EC2 instance with the necessary permissions (e.g., s3:GetObject, s3:ListBucket, s3:PutObject) to access the S3 bucket where the backups are stored.
 - c. Implement an S3 bucket policy to grant access to specific AWS accounts or IAM entities that need to restore the backup stored inside the S3 bucket. For example:

```

{
  "Version": "2012-10-17",
  "Id": "AWS_S3_Policy",
  "Statement": [
    {
      "Sid": "ExampleStatement01",
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::22420070000:user/
delphix"
      },
      "Action": [
        "s3:PutObject",
        "s3:GetObject",
        "s3:ListBucket"
      ],
      "Resource": [
        "arn:aws:s3:::dlpx-crdb-bucket",

```

```

    "arn:aws:s3:::dlpx-crdb-bucket/*"
  ]
}
]
}

```

- viii. **Skip Checking Localities** Select the checkbox to skip checking the localities of a cluster before a restore.
 - ix. **Secure Mode** Option to run the CockroachDB server in secure mode
 - x. **Certificate directory path** The absolute path to the certificate directory, it must have valid certificates containing the IP address or hostname for the CockroachDB server
 - xi. **CockroachDB Cluster Node Count** Number of nodes that consists of a Staging CockroachDB cluster. Minimum: 3 and Maximum: 9
 - xii. **CockroachDB Parameters** Additional CockroachDB configuration parameters to start the CockroachDB cluster
 1. **Parameter Name** CockroachDB Cluster configuration parameter name
 2. **Parameter Value** CockroachDB Cluster configuration parameter value
 - xiii. Then click **Next** to proceed further.
 - xiv. **Additional Nodes:** Specify the node configuration for each node the CRDB cluster.
 1. **Environment** Select environment on which node has to be created.
 2. **Environment User** Select environment user corresponding to the environment.
 3. **IP Address / Hostname** IP Address / Hostname of the interface for the staging node(default 0.0.0.0)
 4. **CockroachDB Port Number** Staging DB port for node's inter-node communication
 5. **CockroachDB Console Port Number** Staging Console port for HTTP requests
 6. **Certificate directory path** The absolute path to the certificate directory, it must have valid certificates containing the IP address or hostname for the CockroachDB server
 7. **Append cluster CRDB parameters** Check with box if the cluster configuration parameters are applicable for the node.
 8. **Additional Node Configuration Parameters** Additional CockroachDB configuration parameters to start the node
7. Provide the details for **dSource Name** and **Target group** on the dSource configuration page and click **Next**.
 8. On the Data management page, select the following and click **Next**.
 9. Staging Environment: This will be your staging host where source config was created.
 - a. User: Database OS user with required privileges for linking the dataset.
 - b. On the next screens, configure a policy, hooks, and review the configuration, then click on **Next** button to view the summary.
 10. Click the **Submit** button which will initiate the linking process
 11. Once dSource is created successfully, you can review the datasets on **Manage > Datasets > dSource Name**.

**Note:**

- You must specify the input “**Certificate directory path**” when “**Secure Mode**” option is selected.
- For more detailed guidance on CockroachDB certificate generation, refer to the official documentation: [CockroachDB Certificate Generation](https://www.cockroachlabs.com/docs/stable/cockroach-cert)³⁴².

9.3.8.2.3 Creating a dSource with ingestion type Disk

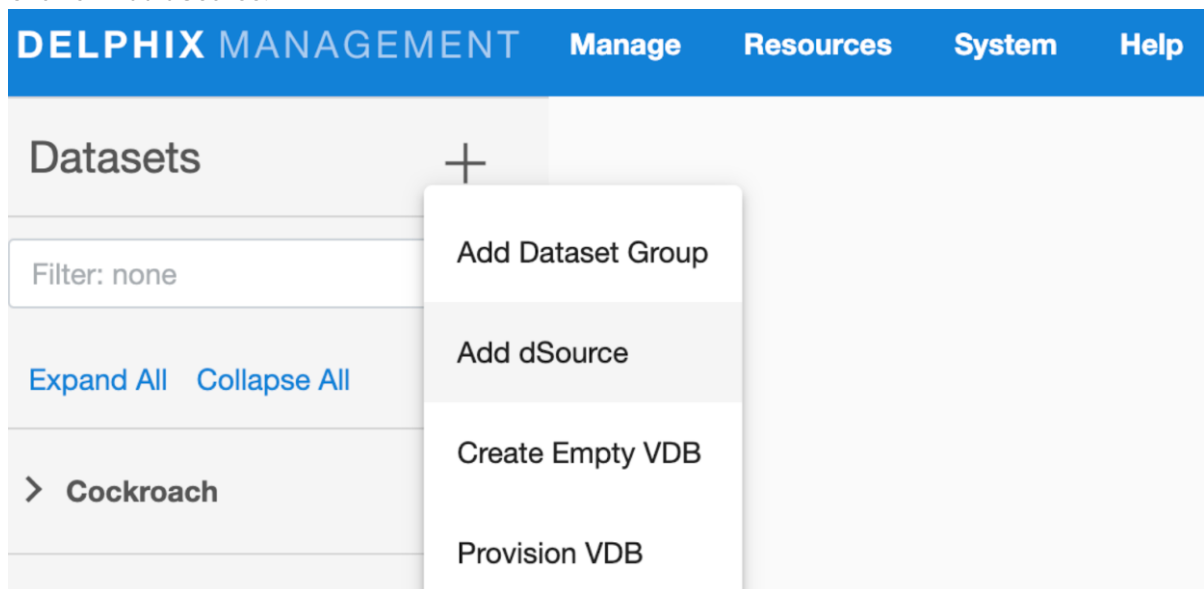

The following procedure provides details on creating a dSource with Disk ingestion type.

9.3.8.2.3.1 Prerequisites

The source and staging instances must meet the host requirements as described in [Requirements](#) (see page 1154) for CockroachDB Staging/Target hosts.

Creating dSource

1. Login to **Delphix Management application**.
2. Click **Manage > Datasets**
3. Click on **Add dSource**.

³⁴² <https://www.cockroachlabs.com/docs/stable/cockroach-cert>

- In the Add dSource wizard, select the CockroachDB source config you just created on the staging host.

Add dSource

- Select the dSource type from the drop-down available on dSource wizard. Refer to different [dSource Types](#)³⁴³
- Enter the CockroachDB specific parameters for your dSource configuration.
 - dSource Type** Type of dSource
 - dSource (Disk) Details**
 - Mount Path** The path on the host where Delphix will mount the dSource files via NFS
 - IP Address / Hostname of the Staging Cluster** IP Address / Hostname of the interface for the staging Cluster (default 127.0.0.1)
 - Staging CockroachDB Port Number** Staging DB port for cluster's inter-node communication
 - Staging CockroachDB Console Port Number** Staging Console port for HTTP requests
 - CockroachDB Backup Subdirectory Path** CockroachDB Backup's Subdirectory Absolute Path where backups are located in S3 Bucket
 - CockroachDB Backup's Directory Path** The absolute path on the staging host where CockroachDB backups are stored.
 - Secure Mode** Option to run the CockroachDB server in secure mode
 - Certificate directory path** The absolute path to the certificate directory, it must have valid certificates containing the IP address or hostname for the CockroachDB server
 - CockroachDB Cluster Node Count** Number of nodes that consists of Staging CockroachDB cluster. Minimum: 3 and Maximum: 9
 - CockroachDB Parameters** Additional CockroachDB configuration parameters to start the CockroachDB cluster
 - Parameter Name** CockroachDB Cluster configuration parameter name
 - Parameter Value** CockroachDB Cluster configuration parameter value
 - Then click **Next** to proceed further.

³⁴³ <https://cd.delphix.com/docs/latest/dsource-management>

- xii. **Additional Nodes:** Specify the node configuration for each node the CRDB cluster.
 1. **Environment** Select environment on which node has to be created.
 2. **Environment User** Select environment user corresponding to the environment.
 3. **IP Address / Hostname** IP Address / Hostname of the interface for the staging node(default 0.0.0.0)
 4. **CockroachDB Port Number** Staging DB port for node’s inter-node communication
 5. **CockroachDB Console Port Number** Staging Console port for HTTP requests
 6. **Certificate directory path** The absolute path to the certificate directory, it must have valid certificates containing the IP address or hostname for the CockroachDB server
 7. **Append cluster CRDB parameters** Check with box if the cluster configuration parameters are applicable for the node.
 8. **Additional Node Configuration Parameters** Additional CockroachDB configuration parameters to start the node
7. Provide the details for **dSource Name** and **Target group** on the dSource configuration page and click **Next**.
8. On the Data management page, select the following and click **Next**.
 - a. Staging Environment: This will be your staging host where source config was created.
 - b. User: Database OS user with required privileges for linking the dataset.
9. On the next screens, configure a policy, hooks, and review the configuration, then click on **Next** button to view the summary.
10. Click the **Submit** button which will initiate the linking process.
11. Once dSource is created successfully, you can review the datasets on **Manage > Datasets > dSource Name**.

**Note:**

- Must specify the input “**Certificate directory path**” when “**Secure Mode**” option is selected.
- For more detailed guidance on CockroachDB certificate generation, refer to the official documentation: [CockroachDB Certificate Generation](https://www.cockroachlabs.com/docs/stable/cockroach-cert)³⁴⁴.

9.3.8.2.4 Creating a dSource with ingestion type GCP

The following procedure provides details on creating a dSource with AWS S3 ingestion type.

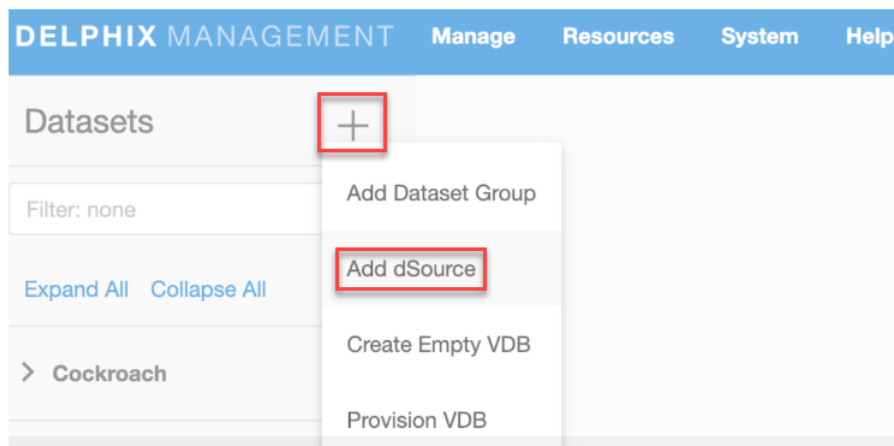

³⁴⁴ <https://www.cockroachlabs.com/docs/stable/cockroach-cert>

9.3.8.2.4.1 Prerequisites

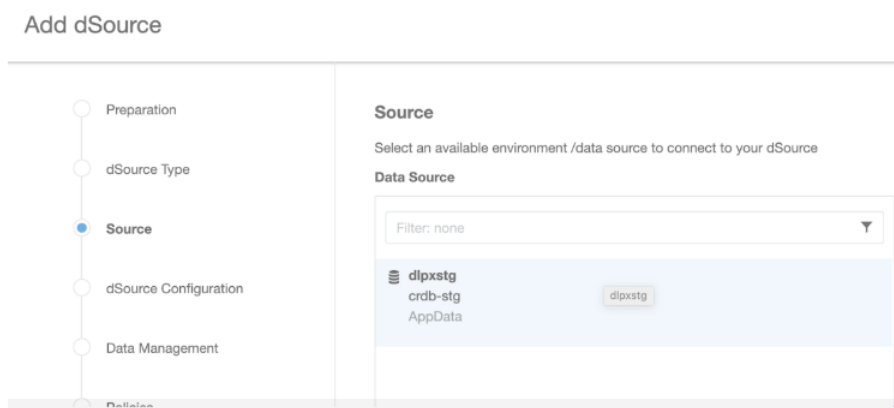

- The source and staging instances must meet the host requirements as described in [Requirements](#)³⁴⁵ for CockroachDB Staging/Target hosts.
- The accessibility of the backup location within the AWS S3 bucket from the Staging host must be verified prior to ingestion.

9.3.8.2.4.2 Creating dSource

1. Login to **Delphix Management application**.
2. Click **Manage > Datasets**.
3. Click on **Add dSource**.

4. In the Add dSource wizard, select the **CockroachDB** source config you just created on the staging host.

345 <https://cd.delphix.com/docs/latest/requirements-for-cockroachdb-source-databases>

5. Select the dSource type from the drop-down available on dSource wizard. Refer different [dSource Types](#)³⁴⁶
6. Enter the CockroachDB specific parameters for your dSource configuration.
 - a. **dSource Type:** Type of dSource
 - b. dSource (**GCP**) details:
 - i. **Mount Path** The path on the host where Delphix will mount the dSource files via NFS
 - ii. **IP Address / Hostname of the Staging Cluster** IP Address / Hostname of the interface for the staging Cluster (default 127.0.0.1)
 - iii. **Staging CockroachDB Port Number** Staging DB port for cluster's inter-node communication
 - iv. **Staging CockroachDB Console Port Number** Staging Console port for HTTP requests
 - v. **CockroachDB Backup's Subdirectory Path** CockroachDB Backup's Subdirectory Absolute Path where backups are located in GCP Bucket
 - vi. **CockroachDB Backup's Bucket or Container Name** Storage bucket or container name including absolute path where CockroachDB backups are located
 - vii. **Authentication Option for GCP Buckets**
 1. **Specified Authentication** Need to specify GCP credentials in dSource configuration fields:
 - a. **Encoded JSON Object Key** Specify JSON encoded key associated with object storage holding CockroachDB backups
 2. **Implicit Authentication** Store GCP credentials in JSON file on the staging host.
 - a. For using implicit authentication with GCP bucket, create a service account corresponding to the bucket.
 - b. Download the service account key for the service account using google cloud console.
 - c. **Location of JSON Credential File** Specify path of json file containing the key.
 - viii. **Skip Checking Localities** Select the checkbox to skip checking the localities of a cluster before a restore.
 - ix. **Secure Mode** Option to run the CockroachDB server in secure mode
 - x. **Certificate directory path** The absolute path to the certificate directory, it must have valid certificates containing the IP address or hostname for the CockroachDB server
 - xi. **CockroachDB Cluster Node Count** Number of nodes that consists of a Staging CockroachDB cluster. Minimum: 3 and Maximum: 9
 - xii. **CockroachDB Parameters** Additional CockroachDB configuration parameters to start the CockroachDB cluster.
 1. **Parameter Name** CockroachDB Cluster configuration parameter name
 2. **Parameter Value** CockroachDB Cluster configuration parameter value
 - xiii. **Additional Nodes:** Specify the node configuration for each node the CRDB cluster.
 1. **Environment** Select environment on which node has to be created.
 2. **Environment User** Select environment user corresponding to the environment.
 3. **IP Address / Hostname** IP Address / Hostname of the interface for the staging node(default 0.0.0.0)

³⁴⁶ <https://cd.delphix.com/docs/latest/dsource-management>

4. **CockroachDB Port Number** Staging DB port for node’s inter-node communication
 5. **CockroachDB Console Port Number** Staging Console port for HTTP requests
 6. **Certificate directory path** The absolute path to the certificate directory, it must have valid certificates containing the IP address or hostname for the CockroachDB server
 7. **Append cluster CRDB parameters** Check with box if the cluster configuration parameters are applicable for the node.
 8. **Additional Node Configuration Parameters** Additional CockroachDB configuration parameters to start the node
- xiv. Then click **Next** to proceed further.
7. Provide the details for **dSource Name** and **Target group** on the dSource configuration page and click **Next**.
 8. On the Data management page, select the following and click **Next**.
 9. Staging Environment: This will be your staging host where source config was created.
 - a. User: Database OS user with required privileges for linking the dataset.
 - b. On the next screens, configure a policy, hooks, and review the configuration, then click on **Next** button to view the summary.
 10. Click the **Submit** button which will initiate the linking process
 11. Once dSource is created successfully, you can review the datasets on **Manage > Datasets > dSource Name**.

- You must specify the input “**Certificate directory path**” when “**Secure Mode**” option is selected.
- For more detailed guidance on CockroachDB certificate generation, refer to the official documentation: [CockroachDB Certificate Generation](https://www.cockroachlabs.com/docs/stable/cockroach-cert)³⁴⁷.

9.3.8.3 Provisioning a CockroachDB virtual database

To provision a virtual database (VDB), you can either use an existing dSource snapshot or use another VDB snapshot for VDB to VDB provisioning. A snapshot is a specific point in time on the timeflow.

9.3.8.3.1 Prerequisites

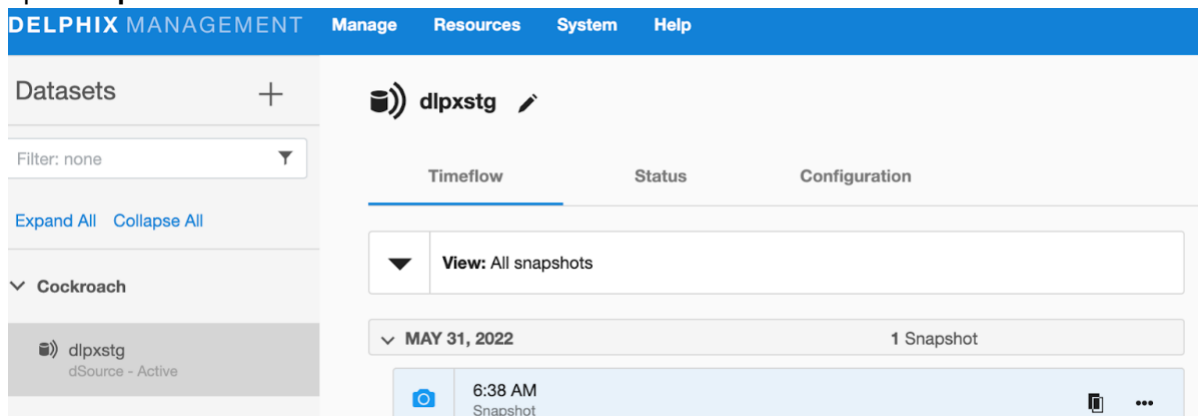

- Must have linked a dSource from a staging instance following the instructions in "[Linking a CockroachDB dSource](#) (see page 1168)," or have already created a VDB from which you intend to provision another VDB.

³⁴⁷ <https://www.cockroachlabs.com/docs/stable/cockroach-cert>

- A CockroachDB target environment must be set-up with the necessary requirements as described in CockroachDB [support and requirements](#) (see page 1152).³⁴⁸
- A CockroachDB binary with the same version as the source database must be installed on the Target.

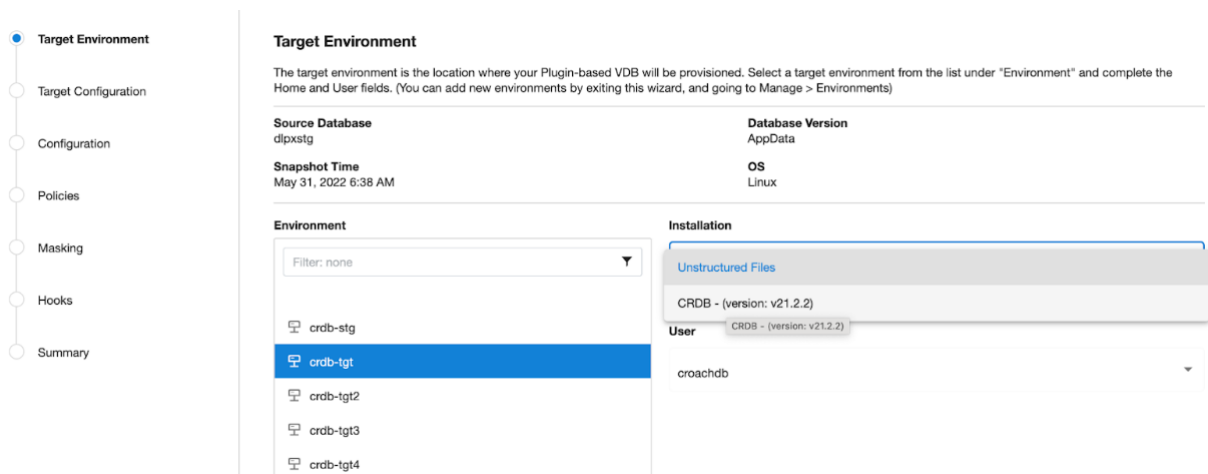

9.3.8.3.2 Procedure

1. Navigate to **Manage**, and select **Datasets**.
2. Select the dataset and the snapshot that you want provision from. Click the provision VDB icon to open the **provision VDB** wizard.

3. Select a target environment from the left pane, and an Installation to use from the dropdown list of available CockroachDB instances on that environment.
4. Set the **Environment User** to be the Instance Owner.

You can only select instance owners if you have multiple environment users set on that host.

348 <https://cd.delphix.com/docs/latest/cockroachDB-requirements-and-prerequisites>

5. Next, You will see the **Target Configuration** section where you need to enter VDB specific parameters.
 - a. **Mount Path** Mount Path for VDB CockroachDB Cluster datafiles
 - b. **IP Address / Hostname of the Primary Target Host** IP Address / Hostname of the interface for Primary Target Host
 - c. **Target CockroachDB Port Number** Target DB port for cluster's inter-node communication
 - d. **Target CockroachDB Console Port Number** Target Console port for HTTP requests
 - e. **CockroachDB VDB Cluster Name** VDB Cluster Name to be configured on Target Host
 - f. **Secure Mode** Option to run the CockroachDB server in secure mode
 - g. **Certificate directory path** The absolute path to the certificate directory, it must have valid certificates containing the IP address or hostname for the CockroachDB server
 - h. **CockroachDB Parameters** Additional CockroachDB configuration parameters to start the CockroachDB cluster
 - i. **Parameter Name** CockroachDB Cluster configuration parameter name
 - ii. **Parameter Value** CockroachDB Cluster configuration parameter value
 - i. On the configuration page, select the Additional Nodes **(+Add)** button for adding new nodes to CockroachDB target cluster.
 - i. **Environment** Select the target environment from drop-down to add the new CockroachDB node to cluster.
 - ii. **Environment User** Select the target environment user to add the new CockroachDB node to cluster.
 - iii. **IP Address / Hostname of the Additional Node** Target Host IP Address / Hostname of the interface for Secondary Target Host.
 - iv. **Target CockroachDB Port Number** Target DB port for cluster's inter-node communication.
 - v. **Target CockroachDB Console Port Number** Target Console port for HTTP requests.
 - vi. **Certificate directory path** The absolute path to the certificate directory, it must have valid certificates containing the IP address or hostname for the CockroachDB server.
 - vii. **Append CRDB Parameters** Option to append the existing primary node CRDB parameters to additional node.
 - j. Next, select **Additional Node CRDB Parameters** to overwrite additional node CockroachDB parameters configured in Target CockroachDB cluster. Click on **(+Add)** button to add CRDB parameters.
 - i. **Parameter Name** CockroachDB Cluster configuration parameter name.
 - ii. **Parameter Value** CockroachDB Cluster configuration parameter value.
 - k. Then click **Next** to proceed further.
6. On the Configuration page, Select the **VDB Name** and **Target Group** for the VDB.
7. Add a new group, if required.
8. Select a **Snapshot Policy** for the VDB.
9. Click **Next**.
10. Specify any desired hook operations.
11. Click **Next**.
12. Review the **Provisioning Configuration** and Data Management information.

13. Click **Submit**.

When provisioning starts, you can review the progress of the job in the Databases panel, or in the **Job History** panel of the Dashboard.

When the provisioning completes a new VDB timeflow will be created. Once the VDB is created successfully, you can review the datasets on the Manage > Datasets screen in the left hand panel. You have now provisioned a CockroachDB VDB. Moreover, the VDB will be included in the group you designated and listed in the Databases panel. If you select the VDB in the Databases panel and click the Open icon, you can view its card, which contains information about the database and its Data Management settings.

9.3.8.3.3 VDB Configuration Changes for CockroachDB

9.3.8.3.3.1 Prerequisites

- Delphix highly recommends disabling the VDB before making any configuration changes to an existing CockroachDB Target cluster. This precautionary measure is advised due to the following reasons:
 - To ensure a smooth transition when altering the topology of the Cockroach cluster, such as scaling up or down the number of nodes, a graceful shutdown is required.
 - A service restart is necessary after applying any configuration changes to a CockroachDB target cluster.
 - From the Delphix workflow perspective, during the disable operation, cluster services are stopped, and the file system is unmounted. If changes to the configuration are made without disabling, it may lead to unforeseen issues when attempting to bring down the services.

Procedure

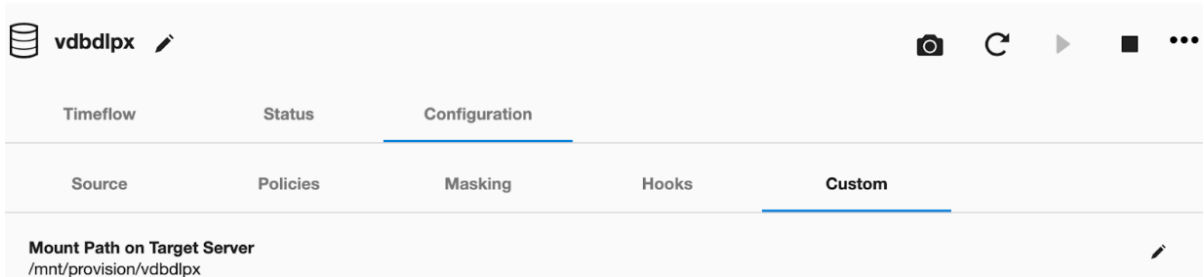

Steps to change the VDB configuration

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Datasets**.
4. Select the VDB for your CockroachDB target cluster.
5. From the Actions menu (...) select **Disable**.

While updating a connector, it is not required to disable and re-enable datasets.

6. Select the VDB and click on **Configurations** -> **Custom** section. Click on edit (pencil) button.

7. Modify the VDB specific parameters you wish to update for your CockroachDB target cluster.
 a. To update additional CRDB Parameters to CockroachDB Target Cluster.

CRDB Parameters

Additional parameters to start the Cockroach DB cluster and first node. (e.g. region, advertise-addr, cache, max-sql-memory log-config-file)

Parameter Name [Enter CockroachDB command line arguments] *	Delete
e.g. store, locality=region, advertise-addr, cache, max-sql-memory log-config-file	
Parameter Value *	

+ Add

b. To add additional nodes to existing CockroachDB Target Cluster.

Additional Nodes

+ Add

Additional Nodes

Environment * ▼ Delete

Host Environment for additional node

Environment User * ▼

User in host environment for additional node

IP Address / Hostname of additional node *
0.0.0.0

IP Address / Hostname of the interface for the node

Target CockroachDB Port Number *
26257

[--listen-addr] Listen address for the VDB node

Target CockroachDB Console Port Number *
8080

[--http-addr] VDB Console port for HTTP requests

Certificate directory path *
Its absolute path to the certificate directory. The directory must contain valid certificates containing the IP address / Hostname for the Cockroach DB server.

Append Cluster CRDB parameters to additional node *
Select the checkbox if cluster CRDB parameters are applicable for node

c. To Remove additional node from existing CockroachDB Target Cluster.

Additional Nodes

Environment * ▼ Delete

crdb-tgt

Host Environment for additional node

Environment User * ▼

croachdb

d. To overwrite additional node CRDB parameter for a specific node.

Additional Node CRDB Parameters

Additional parameters to start the Cockroach DB node. (e.g. region, advertise-addr, cache, max-sql-memory log-config-file)

Parameter Name [Enter CockroachDB command line arguments] * Delete

e.g. store, locality=region, advertise-addr, cache, max-sql-memory log-config-file

Parameter Value *

+ Add

8. Apply the configuration changes by clicking the save button at the bottom.
9. Once the VDB configuration changes are saved. Click the Refresh button and select the Snapshot from which to refresh.

10. In the Refresh VDB dialog, confirm the Refresh by clicking the submit button.

9.3.8.3.4 Rewinding a Cockroach VDB

Rewinding a VDB rolls it back to a previous point in its Timeflow and re-provisions the VDB. The VDB will no longer contain changes after the rewind point.

9.3.8.3.4.1 Prerequisites

To rewind a VDB, you must have the following permissions:

A user with Continuous Data Engine Admin credentials can perform a VDB rewind on any VDB in the system.

9.3.8.3.4.2 Procedure

1. Login to the **Delphix Management** application.
2. Under **Datasets**, select the VDB you want to rewind.
3. On the **Timeflow** tab, select the rewind point as a snapshot or a point in time.
4. Click **Rewind**.
5. If you want to use login credentials on the target environment other than those associated with the environment user, click Provide Privileged Credentials.
6. Click **Yes** to confirm.

9.3.9 Troubleshooting CockroachDB data sources

The CockroachDB connector produces three sets of logs during normal runtime. Refer to the list below to understand what they are and how you can access them.

9.3.9.1 CockroachDB Plugin logs

1. The CockroachDB connector is built using the plugin framework. Therefore, it adheres to Delphix Continuous Data's standard plugin logging behavior. We recommend starting here for all troubleshooting. Refer to the [Troubleshooting document](#) (see page 1186) for more information.
2. Plugin logs for CockroachDB are found at the below locations.

```
{toolkit_directory}/Delphix_COMMON_{appliance_id}/plugin/sc:cockroach_{plugin-id}/CRDB/log_{os_user}/delphixCRDBDebug.log
```

9.3.9.2 CockroachDB Cluster logs

1. CockroachDB can write error messages to log files. The files are named using the following format:

```
cockroach.[host].[user].[start timestamp in UTC].[process ID].logCBBACKUPMGR.
```

2. To make it easier to watch a log without knowing the full filename, a symlink with the short filename `cockroach.log` is also created. `{delphix_mount_path}/node<number>/logs/cockroach.log`
3. This symlink points to the most recent log. The Cockroach log locations on staging or target host can be found at below locations:

```
{CockroachDB_install_path} version --build-tag
For example:
/usr/local/bin/cockroach version --build-tag
v21.2.2
```

4. Start CockroachDB multi-node cluster.

```
cockroach start --certs-dir=[path-to-certs-directory]
--advertise-addr=<node1 address>
--join=<node1 address>,<node2 address>,<node3 address>
--cache=.25 --max-sql-memory=.25
```

5. List CockroachDB certificate and keys.

```
cockroach cert list --certs-dir=[path-to-certs-directory]
```

6. Initialize a Cluster from any CockroachDB node.

```
cockroach init --certs-dir=[path-to-certs-directory]
--host=<address of any node on --join list>
```

7. Start interactive CockroachDB SQL shell.

```
cockroach sql --certs-dir=[path-to-certs-directory]
--host=<address of any cluster-node>:<cockroach_db_port>
```

Use the `--certs-dir` option with the valid path to the certificate directory of the CockroachDB cluster.

8. Find full backup subdirectories details.

```
SHOW BACKUPS IN 's3://{bucket name}/{path}?AWS_ACCESS_KEY_ID={placeholder}
&AWS_SECRET_ACCESS_KEY={placeholder}';
```

9. Find full and incremental backups in a specific full backup subdirectory details.

```
SHOW BACKUP FROM LATEST IN 's3://{bucket name}?AWS_ACCESS_KEY_ID={placeholder}
&AWS_SECRET_ACCESS_KEY={placeholder}';
```

10. Create CockroachDB User to login into CockroachDB console to access secure clusters.

```
create user dlpxadmin WITH PASSWORD 'dlpxadmin';
```

11. Grant access to CockroachDB User to access data.

```
GRANT SELECT, INSERT ON TABLE vehicles to dlpxadmin;
```

9.3.10 CockroachDB developer's guide

- [CockroachDB sourceconfig operations](#) (see page 1188)
- [CockroachDB provision operations](#) (see page 1191)
- [CockroachDB linking operations](#) (see page 1188)

- [CockroachDB discovery operations \(see page 1188\)](#)

9.3.10.1 CockroachDB discovery operations

To discover an environment via CLI, login to the Delphix Continuous Data Engine using the admin user account.

```
ssh admin@<CONTINUOUS-DATA-FQDN-or-IP>
```

Discovering the environment

Run the following commands to discover the environment.

```
Example -
environment
create
set hostEnvironment.name=crdb-stg
set hostParameters.host.address=crdb-stg.dcol2.delphix.com
set hostParameters.host.toolkitPath=/home/delphix/toolkit
set primaryUser.name=delphix
set primaryUser.credential.password=delphix
commit
```

9.3.10.2 CockroachDB sourceconfig operations

Run the following commands to add the source config:

```
Example -
sourceconfig create
set type="AppDataStagedSourceConfig"
set name="dlpxstg"
set environmentUser="crdb-stg/delphix"
set parameters="{\"cluster_name\": \"dlpxstg\"}"
set repository="'CRDB - (version: v22.2.14) [/u03/cockroach/cockroach]'"
```

9.3.10.3 CockroachDB linking operations

9.3.10.3.1 dSource creation via CLI

To create a dSource via CLI, you must create a source configuration first. For more information on creating a source configuration, refer to [Add Source Config using CLI \(see page 1188\)](#).

To create a dSource and perform operations via CLI, login to the Delphix Continuous Data Engine using the admin user account.

```
ssh admin@<CONTINUOUS-DATA-FQDN-or-IP>
```

9.3.10.3.2 Set default linking parameters[This is common for all types of ingestions]:

Run the below commands to set the default linking parameters. The below example uses **testscfg** source config.

```
Example -
database link
set type=LinkParameters
set linkData.type=AppDataStagedLinkData
set name=dlpxstg
set group=cockroach
set linkData.config=dlpxstg
set linkData.environmentUser=crdb-stg/delphix
set linkData.stagingEnvironment=crdb-stg
set linkData.stagingEnvironmentUser=crdb-stg/delphix
set linkData.syncParameters.parameters={"resync":true}
```

9.3.10.3.3 Link parameters for Seed ingestion type:

Run the below commands to link parameters for seed ingestion type.

```
Example -
set linkData.parameters={"dsource_type":"Seed",
  "mount_path":"/mnt/provision/dlpxstg",
  "ip_addr":"10.43.35.72", "cockroach_port":26257,
  "cockroach_db_console_port":8080, "cert_dir":"/home/delphix/toolkit",
  "cluster_config":3, "crdb_parameters":[{"property_name":"max-sql-memory",
  "value":"0.25"}]}
```

9.3.10.3.4 Link parameters for AWS_S3 ingestion type:

Run the below commands to link parameters for AWS_S3 ingestion type.

```
Example -
linkData.parameters={"dsource_type":"AWS_S3",
  "mount_path":"/mnt/provision/dlpxstg-s3",
  "ip_addr":"10.43.34.131", "cockroach_port":36257,
  "cockroach_db_console_port":9080, "backup_piece":"/2022/04/12-105100.23",
  "object_storage":"dlpx-crdb-backup/crdb_full", "account_name":
  "*****", "account_secret_access_key":"*****",
  "enable_secure_mode":true, "cert_dir":"/home/delphix/toolkit",
  "cluster_config":3, "crdb_parameters":[{"property_name":"max-sql-memory",
```

```
\\"value\\":\\"0.25\\"]}]}"
```

9.3.10.3.5 Link parameters for Disk ingestion type:

Run the below commands to link parameters for Disk ingestion type.

```
Example -
linkData.parameters="{\\"dsource_type\\":\\"Disk\\",
\\"mount_path\\":\\"/mnt/provision/dlpxstg-disk\\",
\\"ip_addr\\":\\"10.43.34.131\\",\\"cockroach_port\\":56257,
\\"cockroach_db_console_port\\":5080,\\"backup_piece\\":\\"/2023/10/04-150211.01\\",
\\"staging_host_backup_path\\":\\"/home/delphix/backups\\",
\\"enable_secure_mode\\":true,\\"cert_dir\\":\\"/home/delphix/toolkit\\",
\\"cluster_config\\":3,\\"crdb_parameters\\":[{\\"property_name\\":\\"max-sql-memory\\",
\\"value\\":\\"0.25\\"}]}"
```

9.3.10.3.6 Link parameters for GCP ingestion type:

Run the below commands to link parameters for GCP ingestion type (specified authentication).

```
Example -
set linkData.parameters="{\\"dsource_type\\":\\"GCP\\",\\"mount_path\\":\\"/mnt/provision/
dlpxstg-gcp\\",
\\"ip_addr\\":\\"10.43.34.131\\",\\"cockroach_port\\":36257,
\\"cockroach_db_console_port\\":9080,\\"backup_piece\\":\\"/2022/04/12-105100.23\\",
\\"object_storage\\":\\"dlpx-crdb-backup/crdb_full\\",\\"enable_auth_implicit\\":
false,\\"encoded_key\\":\\"*****\\",
\\"enable_secure_mode\\":true,\\"cert_dir\\":\\"/home/delphix/toolkit\\",
\\"cluster_config\\":3,\\"crdb_parameters\\":[{\\"property_name\\":\\"max-sql-memory\\",
\\"value\\":\\"0.25\\"}]}"
```

Run the below commands to link parameters for GCP ingestion type (implicit authentication).

```
Example -
set linkData.parameters="{\\"dsource_type\\":\\"GCP\\",\\"mount_path\\":\\"/mnt/provision/
dlpxstg-gcp\\",
\\"ip_addr\\":\\"10.43.34.131\\",\\"cockroach_port\\":36257,
\\"cockroach_db_console_port\\":9080,\\"backup_piece\\":\\"/2022/04/12-105100.23\\",
\\"object_storage\\":\\"dlpx-crdb-backup/crdb_full\\",\\"enable_auth_implicit\\":
true,\\"credential_file \\":\\"/home/delphix/gcp_cred_file.json\\",
\\"enable_secure_mode\\":true,\\"cert_dir\\":\\"/home/delphix/toolkit\\",
\\"cluster_config\\":3,\\"crdb_parameters\\":[{\\"property_name\\":\\"max-sql-memory\\",
\\"value\\":\\"0.25\\"}]}"
```

9.3.10.3.7 Commit

Run the below command to commit the change

```
commit;
```

9.3.10.3.8 Disable

Run the below command to disable the dSource.

```
Example -  
source  
select dlpkstg  
disable  
commit
```

9.3.10.3.9 Enable

Run the below command to enable the dSource.

```
Example -  
source  
select dlpkstg  
enable  
commit
```

9.3.10.4 CockroachDB provision operations

To create a VDB via CLI, you must first create a dSource. For more information on creating a dSource, refer to [Link operation via CLI](#)³⁴⁹ [section](#) (see page 1188).

To create a VDB and perform operations via CLI, login to the Delphix Continuous Data Engine using the admin user account.

```
ssh admin@<CONTINUOUS-DATA-FQDN-or-IP>
```

Provision

Run the below commands to provision a VDB. The below example uses **dlpxstg-s3** dSource.

³⁴⁹ <https://cd.delphix.com/docs/latest/cockroachDB-discovery-operations>

```

Example -
database provision
set type=AppDataProvisionParameters
set container.name=dlpxtgt-s3
set container.group=cockroach
set sourceConfig.repository=APPDATA_REPOSITORY-9
set timeflowPointParameters.type=TimeflowPointSnapshot
set timeflowPointParameters.snapshot=APPDATA_SNAPSHOT-3
set sourceConfig.name=dlpxstg-s3
set source.allowAutoVDBRestartOnHostReboot=false
set source.parameters="{\"mount_path\": \"/mnt/provision/dlpxtgt-s3\",
\"ip_addr\": \"10.43.35.72\", \"cockroach_port\": 26257,
\"cockroach_db_console_port\": 8080, \"cockroach_cluster_name\": \"dlpxtgt-s3\",
\"enable_secure_mode\": true, \"cert_dir\": \"/home/delphix/certs\",
\"crdb_parameters\": [{\"property_name\": \"max-sql-memory\",
\"value\": \"0.25\"}, {\"property_name\": \"cache\",
\"value\": \"0.25\"}]}"
commit

```

Disable

Run the below commands to disable a dSource. You must select the same sourceConfig name that was given during VDB creation.

```

Example -
source
select testscfgv
disable
commit

```

Enable

Run the below command to enable a dSource.

```

Example -

source
select testscfgv
enable
commit

```

Stop

Run the below command to stop a dSource.

```

Example -

source
select testscfgv
stop

```

```
commit
```

Start

Run the below command to start a dSource.

```
Example -  
  
source  
select testscfgv  
start  
commit
```

9.4 Couchbase data sources

This section contains the following pages that will help with creating Couchbase data sources (dSources) in Delphix Continuous Data.

- [Couchbase virtualization process \(see page 1193\)](#)
- [Couchbase requirements and prerequisites \(see page 1194\)](#)
- [Couchbase installation and upgrade \(see page 1202\)](#)
- [Couchbase connector operations \(see page 1204\)](#)
- [Couchbase troubleshooting \(see page 1221\)](#)
- [Couchbase developer's CLI guide \(see page 1221\)](#)
- [Couchbase data source limitations \(see page 1230\)](#)

9.4.1 Couchbase virtualization process

This page serves as a quick reference overview of the steps used to perform an implementation of the CouchbaseDB Connector. Each step briefly describes the task and the expected result. Refer to the respective documentation links for more detailed information.

1. [Begin by reviewing the general Delphix Continuous Data architecture diagrams](#)³⁵⁰. Identify existing or new CouchbaseDB source, staging, and target environments, the underlying operating systems, and the CouchbaseDB database versions. This provides a good understanding of the architectural strategy to confirm support.
2. [Review the Couchbase requirements and prerequisites](#)³⁵¹. Please verify the CouchbaseDB Connector complies with all system prerequisites, including those of Continuous Data, staging/target environments, Operating Systems, and CouchbaseDB database versions. Verifying this information is essential to align with the features and functionalities of the connector.

³⁵⁰ <https://cd.delphix.com/docs/latest/general-architecture>

³⁵¹ <https://cd.delphix.com/docs/latest/couchbase-requirements-and-prerequisites>

3. [Install the CouchbaseDB Connector](#)³⁵². The CouchbaseDB Connector establishes the connection between the Delphix Continuous Data Engine and the connector version. It is recommended to stay up-to-date with the latest version.
4. [Adding staging and target environments](#)^{353 354}. The staging environment will host a database that the Delphix Continuous Data Engine keeps in sync with the source environment database, at an interval chosen by the user. The target environment will provide the infrastructure to generate virtual database (VDB) copies.
 - a. Consult the [Couchbase host environment requirements](#)³⁵⁵ documentation for configuration details.
5. [Adding a Couchbase installation to an environment](#)³⁵⁶. To enable the Delphix Continuous Data Engine to recognize the provided infrastructure, search for a CouchbaseDB installation to make available for database linking and provisioning.
6. [Linking the CouchbaseDB database](#)³⁵⁷. This configures a dSource that enables the syncing mechanism between the source database, staging database, and the Delphix Continuous Data Engine. There are many ingestion methods that differ between connectors and solve different requirements. It is best to identify the ingestion method that best suits your organization and infrastructure policies.
7. [Provisioning Couchbase VDBs](#)³⁵⁸. Administrators and Self-Service users can provision one or more copies of their virtual databases (VDBs).

9.4.2 Couchbase requirements and prerequisites

9.4.2.1 Requirements for source databases

1. For **XDCR** ingestion:
 - a. Source database admin credentials with the following privileges:
 - i. XDCR_ADMIN
 - ii. DATA_MONITOR
2. For **Couchbase backup manager** ingestion:
 - a. There are no specific requirements for the source database, as the connector does not establish a connection with it.

352 <https://cd.delphix.com/docs/latest/couchbase-installation-and-upgrade>

353 <https://cd.delphix.com/docs/latest/adding-a-couchbase-staging-target-environment>

354 https://docs.google.com/document/d/19UPeBn_JQqaH09ofS5RcXdpH4viprJ_KfIP-y8avkoY/edit#heading=h.2jok6zkqgsem

355 <https://cd.delphix.com/docs/latest/couchbase-host-environment-requirements>

356 <https://cd.delphix.com/docs/latest/adding-a-couchbase-installation-to-an-environment>

357 <https://cd.delphix.com/docs/latest/linking-couchbase-data-sources>

358 <https://cd.delphix.com/docs/latest/provisioning-couchbase-vdbs>

9.4.2.2 Requirements for staging and target databases

The staging and target environments have the same set of requirements for CouchbaseDB.

9.4.2.3 Staging prerequisites for ingestion using backups

The backup can exist on the staging server or can be accessed over NFS.

For performing the backup operation, the following commands must be executed. This example uses a backup location of `/u01/couchbase_backup` and the repository name `delphix`.

- Create a config file using the following command, this file will be required at the time of dSource creation using `CBACKUPMGR`.

```
/opt/couchbase/bin/cbackupmgr config --archive /u01/couchbase_backup --repo delphix
```

- Backup from the source host to the backup directory (archive) mentioned in the previous step.

```
/opt/couchbase/bin/cbackupmgr backup -a /u01/couchbase_backup -r delphix -c couchbase://<production server> -u user -p password
```

9.4.2.4 Couchbase support matrices

9.4.2.4.1 OS and Database compatibility

Supported OS version	Supported DBMS versions			
	Couchbase 6.0.x	Couchbase 6.5.x	Couchbase 6.6.x	Couchbase 7.1.x
RHEL 6.x	Y	Y	Y	Y
RHEL 7.x	Y	Y	Y	Y
RHEL 8.x	Y	Y	Y	Y
Windows	N	N	N	N

9.4.2.4.1.1 Engine and Connector compatibility

Delphix Engine versions	Supported Couchbase connector versions	
	Version 1.2.1	version 1.2.2
6.0.7.x - 6.0.11.x	Y	N
6.0.12.x - 6.0.15.x	Y	N
7.x - 16.x	Y	Y

9.4.2.4.1.2 Database and Connector compatibility

Couchbase version	Supported Couchbase connector versions	
	Version 1.2.1	Version 1.2.2
Couchbase 6.0.x	Y	Y
Couchbase 6.5.x	Y	Y
Couchbase 6.6.x	Y	Y
Couchbase 7.1.x	N	Y

9.4.2.4.1.3 Database and Database Edition compatibility

CouchbaseDB version	Couchbase Community Edition (XDCR Only)	CouchbaseDB Enterprise Edition
Couchbase 6.0.x	Y	Y

Couchbase 6.5.x	Y	Y
Couchbase 6.6.x	Y	Y
Couchbase 7.1.x	Y	Y

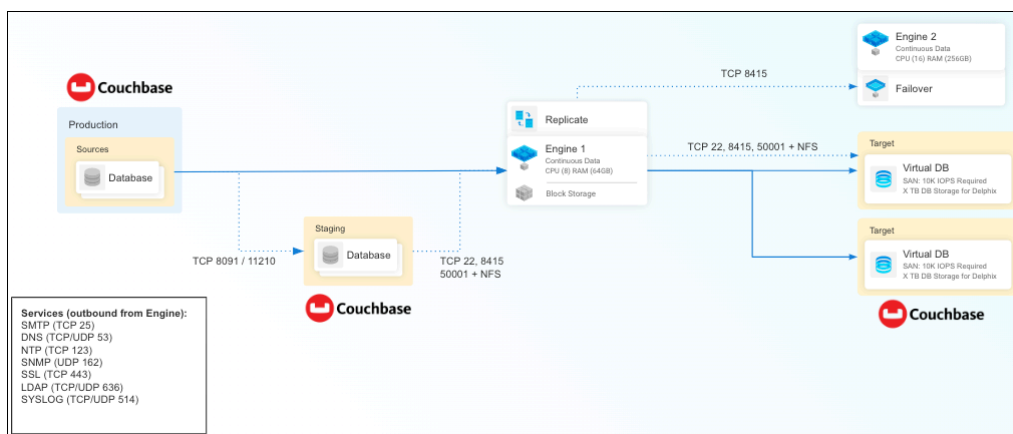

9.4.2.5 Couchbase network and connectivity requirements

Ensure that the requirements for [Delphix Engine network connectivity](#)³⁵⁹ are met before proceeding further. This page addresses CouchbaseDB connector specific network and connectivity requirements.

9.4.2.5.1 Ports for XDCR

9.4.2.5.2 Ports for Ingestion using backups

359 <https://cd.delphix.com/docs/latest/network-connectivity-requirements>

9.4.2.5.3 SSH connectivity to staging and target host

1. Staging and target environments are required to have `sshd` running and configured for Continuous Data to connect over SSH.
2. The Delphix platform expects to maintain long-running, highly performant SSH connections with the host environment.
3. Depending on the **ingestion type**, once connected to a target environment through SSH, the Continuous Data initiates a Couchbase client connection (`couchbase-cli`) from the staging environment to the source environment.

9.4.2.5.4 Whitelisting the inbound port for SSH connection to the target host

9.4.2.5.4.1 Creating NFS mounts on the target host

Delphix Continuous Data Engine shares its storage space with the target host using NFS mounts.

Protocol	Port Number	Use
TCP	22	SSH connection to the target database environment.
TCP/UDP	111	Remote Procedure Call (RPC) port mapper used for NFSv3 mounts.
TCP	1110	Network Status Monitor (NSM) client from target hosts to the Continuous Data Engine.
TCP	2049	NFS client from target hosts to the Continuous Data Engine (NFSv3 and NFSv4).
TCP	54043	Client mount daemon (NFSv3 only).
TCP	54044	Lock state notification service (NFSv3 only).
TCP	54045	Network Lock Manager (NLM) client from target hosts to Continuous Data Engine (NFSv3 only).
UDP	33434 - 33464	Traceroute from the target database server to the Continuous Data Engine (optional).

9.4.2.5.4.2 Connecting to CouchbaseDB instances (Source, dSource, and VDBs)

Outgoing (from)	Incoming (to)	Protocol	Port number	Use
Staging host	Source CouchbaseDB Instance	TCP	<source-port>	CouchbaseDB Source database instance port to connect to setting up the replication pipeline. The default port for a CouchbaseDB instance is 8901.
End-user hosts	Staging / Target CouchbaseDB instance	TCP	<target-port>	Connecting to the created database instance on the target host.

9.4.2.6 Couchbase host environment requirements

Staging/target host requirements	Explanation
<p>Host compatibility check</p> <p>The operating system and architecture of the target host must match the source environment.</p>	It is required that the source and the target environments should have identical OS and hardware configurations.
<p>There must be a directory on the staging/target host where the Couchbase Connector support files can be installed (for example, /var/tmp) with the following properties:</p> <ol style="list-style-type: none"> 1. The directory must be writable by the operating system user mentioned above. 2. The directory must have at least 1.5 GB of available storage. 	This path is called the “Toolkit Path” in the Environment creation UI page.

<p>CouchbaseDB installation and compatibility check</p> <p>There must be an installation of CouchbaseDB on the staging/target host that is compatible with the installation of CouchbaseDB on the source host.</p>	<p>The CouchbaseDB binary version on the staging/target must be identical to the source side.</p>
<p>There must be a mount point directory (for example, /mnt) that will be used as the base for mount points that are created when provisioning a VDB with the following properties:</p> <ol style="list-style-type: none"> 1. The mount point directory must be writable by the operating system user mentioned above. 2. The mount point directory should be empty. 	
<p>Hostname and IP must be correctly set in /etc/hosts file.</p>	<p>The output of the hostname <code>-i</code> command should produce the correct result as the IP address of the server.</p> <p>For example:</p> <pre>[root@source ~]# hostname -i 10.110.211.225</pre>
<p>Required utilities and tools</p> <p>Ensure the expect utility is installed on the staging/target host.</p>	<p>CouchbaseDB Connector runs password sensitive commands by making use of expect utility.</p> <p>Checking if the expect utility is installed with:</p> <pre>which expect</pre>
<p>Storage requirement</p>	<ol style="list-style-type: none"> 1. The Staging Host must have enough storage space to hold the source backup file OR NFS mount Source backup filesystem. 2. An empty folder on the staging host to hold the delphix toolkit (approximately 2GB free space).

9.4.2.6.1 Sudo privileges for the environment OS user

Continuous Data Engine connects to the target host (via SSH) to majorly perform the following operations:

1. Continuous Data dynamically mounts and unmounts directories for linking and provisioning operations. This privilege is required because mount and unmount are typically reserved for superuser.

2. Continuous Data dynamically creates and removes directories for linking and provisioning operations.

The operations above will require sudo privileges for the OS user.

Configuring sudo access on target environments (as root user):

1. The sudo configuration exists in the **/etc/sudoers** file. The file can be edited directly or a utility called `visudo` can be used to add the privilege.

```
vi /etc/sudoers
# Or
visudo
```

2. Adding the privileges

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: /bin/mount,/bin/umount,/bin/mkdir,/bin/rmdir, /bin/ps
delphix_os ALL=(couchbase) NOPASSWD: ALL
```

The examples used above are for illustrative purposes and the sudo file configuration options are subject to change.

9.4.2.6.1.1 Requiretty settings

Continuous Data requires that the requiretty setting be disabled for all Continuous Data users with sudo privileges.

It is required to specify the NOPASSWD qualifier within the sudo configuration file. This ensures the `sudo` command does not demand the entry of a password, even for the display permissions (i.e. `sudo -l`) command.

- Additionally, Delphix OS user should be:
 - Regular OS user (e.g., `delphix_os`)
 - Add OS user to couchbase OS group
 - Must have access to backup files of the source database stored on the staging host.
 - Must have access to the path create and modify files in `/opt/couchbase/var/lib/couchbase`.
 - An empty folder with approximately 2GB of free space on the host, to hold Delphix Toolkit (`dxtoolkit`).

- An empty folder on the host to mount the NFS filesystem. This is just an empty folder with no space requirements and acts as a base folder for NFS mounts.
- Sudo privileges for mount and umount. The sample above uses delphix_os as delphix user.
- If Couchbase service is installed using a Couchbase user, the Delphix OS user (e.g., delphix_os) must have privilege to run any command as a Couchbase user, using sudo.
- Please ensure any login banners similar to the one in the image below must be disabled on the staging host.
- Couchbase binaries installed and configured:
 - Disable auto start using OS services:
 - `systemctl disable couchbase-server.service`
 - `systemctl stop couchbase-server.service`

```
[staging_host]$ su - delphix
*****
*
*           Welcome to the Linux Terminal
*
*-----*
*
* You are now logged in as: delphix
*
* Take caution with your actions and be responsible!
*
*****
Password: █
```

9.4.3 Couchbase installation and upgrade

9.4.3.1 Prerequisites

- Consult the [Couchbase support matrices](#)³⁶⁰ page to ensure your Delphix Continuous Data Engine is on a version compatible with the Connector version of choice.
- Install Couchbase binaries on the source, staging, and target servers.

9.4.3.2 Downloading the connector

The connector is provided as a downloadable .json file from the Delphix download site. Use the steps below to download it:

1. Navigate to the Delphix Download portal by clicking the following link or entering <https://download.delphix.com/> into the address bar.
2. Login to the download portal using the same email and password credentials used for Delphix Support.
3. Navigate to **Delphix Product Releases** → **Continuous Data Connectors** → **Couchbase** → **v1.x.x.x** → **sc_couchbase_v1.x.x.x.json** and the download should automatically begin.

³⁶⁰ <https://cd.delphix.com/docs/latest/couchbase-support-matrices>

9.4.3.3 Installing the connector

1. Login to the **Delphix Management** application.
2. Navigate to **Manage** → **Plugins**.
3. Click the **+** icon to upload the connector file.
4. This step shows the **Upload or upgrade a plugin** dialog. Upload the **sc_couchbase_v1.x.x.x.json** file downloaded previously.

For more information, refer to the [Continuous Data Engine connector management](#)³⁶¹ section.

9.4.3.4 Upgrading the connector

The procedure for upgrading to a higher connector version is the same as installing a new CouchbaseDB connector. Repeat the previous steps using the .json file corresponding with the version being upgrade to.

9.4.3.4.1 After uploading the new connector version file

1. Refresh all (corresponding) environments.
2. Ensure a connector discovery is completed successfully.
3. Take a new snapshot of the dSource and VDB.

While updating a connector, it is not required to disable and re-enable datasets.

To upgrade to newer versions of the CouchbaseDB connector, the upgrade path as given below must be followed.

Connector upgrade path: 1.2.0 -> 1.2.2

9.4.3.5 Upgrading Couchbase version on source, staging, and target host

If the Couchbase version at the staging or target host changes, the staging database and target database have to be recreated.

If the existing staging database or target database is refreshed with an upgraded installation, the database might not function properly.

³⁶¹ <https://cd.delphix.com/docs/latest/delphix-engine-plugin-management>

9.4.4 Couchbase connector operations

To successfully ingest and virtualize a Couchbase instance, you must perform the following connector operations in sequence:

1. [Discovering installations](#)³⁶²
2. [Linking data sources](#)³⁶³
3. [Provisioning virtual databases](#)³⁶⁴

The respective sections provide detailed information about prerequisites, limitations (if any), and the procedure to be followed for completing each of the operations.

9.4.4.1 Discovering Couchbase installations

Environment discovery (or refresh) is a process that enables the Couchbase Connector to discover Couchbase installations on a host and determine their details. Database discovery is initiated during the environment setup process. Whenever there is any change (installing a new database home) to an environment that's already setup in the Delphix application, an environment refresh must be performed.

9.4.4.1.1 Adding a Couchbase staging/target environment

This page describes the steps for adding a CouchbaseDB staging and target environment.

9.4.4.1.1.1 Prerequisites

- A Couchbase staging environment must be setup with the necessary requirements, as described in [Couchbase requirements and prerequisites](#)³⁶⁵.
- Installation of the Couchbase Connector is required before the discovery.
- Install Couchbase binaries on the staging and target servers.
 - Couchbase installed at the path `/opt/couchbase`.
 - Environment variable `$COUCHBASE_PATH` should be set on the staging/target host (which contains the binary path of Couchbase) for the user who added the environment (in our case, `delphix_os`).

9.4.4.1.1.2 Procedure

Perform the following steps to add an environment (staging/target) to the Delphix Continuous Data Engine:

1. Login to the **Delphix Management** application.

³⁶² <https://cd.delphix.com/docs/latest/adding-a-couchbase-installation-to-an-environment>

³⁶³ <https://cd.delphix.com/docs/latest/linking-couchbase-data-sources>

³⁶⁴ <https://cd.delphix.com/docs/latest/provisioning-couchbase-vdbs>

³⁶⁵ <https://cd.delphix.com/docs/latest/couchbase-requirements-and-prerequisites>

2. Navigate to the **Manage** → **Environments** page.
3. Click the **Actions** ⋮ menu and select **Add Environment**.
4. From the **Add Environment** dialog window, select **Unix/Linux**.
5. Select **Standalone Host**.
6. Click **Next**.
7. Provide the name of the environment.
8. Provide the **Host IP address** or **host FQDN**.
9. Provide the **SSH port**. The default value is 22.
10. Provide an **Environment Username** for the environment.
11. Choose the **Login Type** that fits your setup.
 - Username and password: provide the environment username and password.
 - Username and public key: provide the environment username.
 - Password Vault: select from an existing Enterprise Password Vault.

Using Public Key authentication

If you want to use public key authentication for logging into your Unix-based environment, there are two options:

1. Use the Delphix Continuous Data Engine's key pair. For more information on how to do this, refer to the [How to use the Continuous Data Engine's key-pair](https://cd.delphix.com/docs/latest/how-to-use-the-delphix-continuous-data-engine-key-pair)³⁶⁶ section.
2. Provide a key pair for this environment. As an alternative, a key pair specific for this environment can be provided via the API or CLI. For instructions, refer to [CLI Cookbook: Setting up SSH key authentication for UNIX environment users](https://cd.delphix.com/docs/latest/cli-cookbook-setting-up-ssh-key-authentication-for-unix-environment-users)³⁶⁷.

12. For Password, enter the password associated with the user in step 11.
13. If you want to use Public Key Encryption for logging into your environment:
 - a. Select Public Key for the Login Type
 - b. Click View Public Key
 - c. Copy the public key that is displayed, and append it to the end of your `~/ .ssh/ authorized_keys` file. If this file does not exist, it must be created.

³⁶⁶ <https://cd.delphix.com/docs/latest/how-to-use-the-delphix-continuous-data-engine-key-pair>

³⁶⁷ <https://cd.delphix.com/docs/latest/cli-cookbook-setting-up-ssh-key-authentication-for-unix-environment-users>

The addition of the public key is a one-time requirement per user and per environment. Additionally, you have the option to add public key authentication to an environment user's profile via CLI (for details, refer to the [CLI Cookbook: Setting up SSH key authentication for UNIX environment users](#)³⁶⁸ topic).

14. For Password Login, click Verify Credentials to test the username and password.
15. Enter **Toolkit Path** (ensure that the toolkit path does not have any spaces).
16. To provide your own Oracle Java Development Kit, select the **Provide my own JDK** checkbox and click **Next**.
 - a. On the Java Development Kit page, provide an absolute path to your Oracle JDK and click **Next**.
17. Click **Submit**.

After successfully adding and discovering the environment, you should be able to view the newly added environment listed under the Environments tab. In case it does not appear, click the refresh icon in your browser.

After the environment has been successfully discovered, if you wish to establish further links, add a source configuration to the previously discovered installation.

The screenshot displays the Oracle Cloud console interface. On the left, the 'Environments' tab is selected, showing a list of environments with 'couchbasestg.dlpxdc.co' highlighted. The main area shows the details for this environment, with the 'Databases' sub-tab active. Under 'Installations', there is a section for 'Couchbase (6.6.2-9588 (EE))'. This section is divided into 'INSTALLATION DETAILS' and 'DATABASES'. The 'INSTALLATION DETAILS' section lists various configuration parameters: 'Allow Provisioning' is set to 'Yes'; 'Couchbase Install Path' is '/opt/couchbase/bin/couchbase-server'; 'Couchbase Shell Path' is '/opt/couchbase/bin/couchbase-cli'; 'Version' is '6.6.2-9588 (EE)'; 'Identity Name' is 'Couchbase (6.6.2-9588 (EE))'; 'Couchbase User ID' is '5001'; and 'Couchbase Group ID' is '5001'. Below this, there is an 'Unstructured Files' section. The 'DATABASES' section shows 'No databases found on installation.'

Perform the following steps to access the information about any environment you have created:

1. Navigate to **Manage > Environments**.
2. Select the environment name.

³⁶⁸ <https://cd.delphix.com/docs/latest/cli-cookbook-setting-up-ssh-key-authentication-for>

9.4.4.1.2 Adding a Couchbase installation to an environment

If a new CouchbaseDB Installation is added to the environment, then in order to reflect it into the Continuous Data UI, it is required to refresh the environment. Please refer to the "Environment Refresh" and "prerequisites" section at [Managing environments and hosts](https://cd.delphix.com/docs/latest/managing-environments-and-hosts)³⁶⁹ for more details.

9.4.4.1.3 Adding a Couchbase SourceConfig

An environment contains repositories that are CouchbaseDB installations in the environment. Each environment may have any number of repositories associated with it.

A SourceConfig object defines the configuration of the dSource and is required to create a dSource. You can create any number of SourceConfig objects using a repository, which represents known database instances.

For the CouchbaseDB connector, the Source config must be created manually.

9.4.4.1.3.1 Procedure

Source Config is created on the Staging Environment

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Select the **repository**.
5. Click on plus **+** icon.
6. Add the required details in the **Add** database section.
7. Enter the **port number** in the **Source Couchbase** port section.
8. Enter the **source host address** in the **Source Host** (this will be used as the Source cluster for XDCR replication).
9. Enter the **unique name** for the **staging database** in the **Identify Field** section.
10. Enter the **Couchbase data path** of the **staging host** in **Database Data Path** section. The DB data path is the designated directory where Couchbase Server stores essential data files, encompassing data files, metadata, logs, and internal database files.
11. Click the **Add** button to complete.

9.4.4.2 Linking Couchbase data sources

Linking a data source will create a dSource object on the engine and allow Delphix to ingest data from this source. The dSource is an object that the Delphix Virtualization Engine uses to create and update virtual copies of your database.

Note: An environment can be associated with only one dSource/VDB at a time

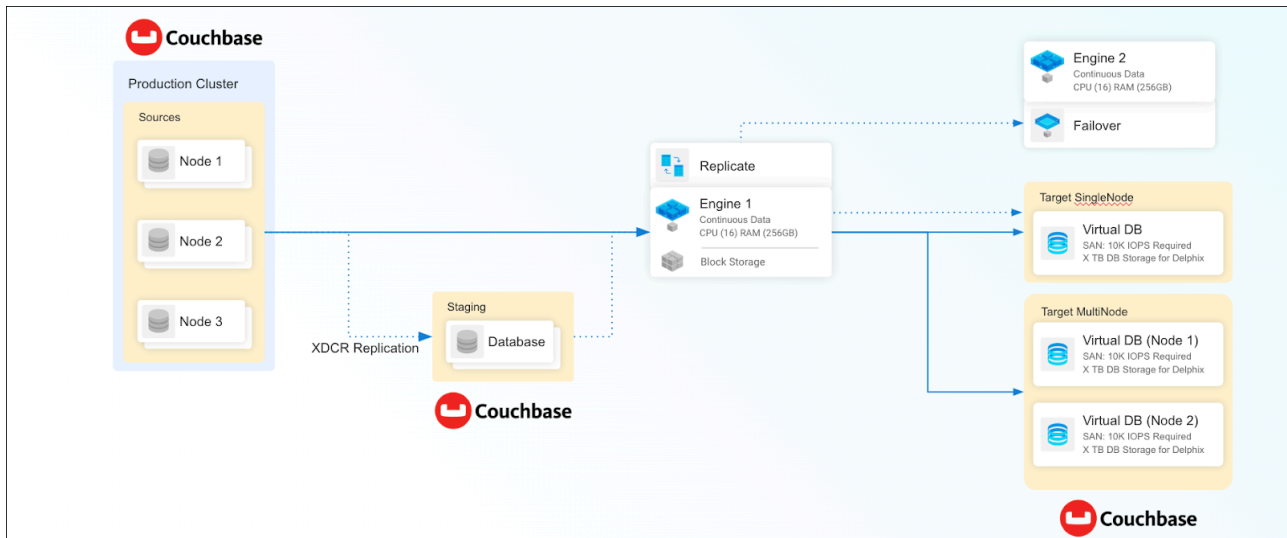

³⁶⁹ <https://cd.delphix.com/docs/latest/managing-environments-and-hosts>

9.4.4.2.1 Prerequisites

Staging environment created and source database configured in discovered repository.

9.4.4.2.2 Creating a Couchbase dSource using XDCR

The image below is an illustrated representation of the architecture of Continuous Data Engine support for Couchbase databases using XDCR.

9.4.4.2.2.1 Steps to create the dSource

1. Login to **Delphix Management** application.
2. Click **Manage** → **Datasets**.
3. Select **Add dSource**.
4. In the Add dSource wizard, select the Couchbase source configuration which is created on the staging host.
5. Enter the Couchbase-specific parameters for your dSource configuration.
6. Select the dSource type XDCR from the drop-down available on dSource wizard.
7. Enter the details for **Staging Couchbase host** - FQDN or IP address recommended.
8. Enter the details for **Staging Port Number** available on the staging host. The default port for couchbase is 8091.
9. Enter the details for **Mount Path** available on the staging host. This empty folder acts as a base for NFS mounts.
10. Enter the details for **Staging Cluster Name** to setup new cluster on the staging host.
11. Enter the configuration details for your staging cluster as per resource availability on the staging host.

- Cluster RAM Size
 - Cluster Index RAM Size
 - Cluster FTS RAM Size
 - Cluster Eventing RAM Size - this should be 0
 - Cluster Analysis RAM Size - this should be 0
12. Enter the details for **Staging Cluster Admin User** and **Staging Cluster Admin Password**
 13. Enter the details for **Source Cluster Admin User** and **Source Cluster Admin Password**
 14. Enter Bucket Size. A bucket size of zero means the connector will extract bucket size from the source database and apply the same in staging. Giving it any other value, would mean imposing that value on all buckets irrespective of the size in the source database.
 15. If not all, buckets need to be replicated, click on **+** plus symbol to modify configuration settings. Mention bucket list for which cross datacenter replication (XDCR) only be enabled.
 16. Enter the details of **Bucket Name** to be part of XDCR. Then click **Next**.
 17. Provide the details for **dSource Name** and **Target group** on the dSource configuration page.
 18. On the **Data management** page, select the following:
 - Staging Environment: This will be your staging host where source config was created.
 - User: Database OS user with required privileges for linking the dataset.
 19. On the next screens, configure a policy, hooks, and review the configuration, then click on **Next** button to view the summary.
 20. Click the **Submit** button which will initiate the linking process.
 21. Once dSource is created successfully, you can review the datasets on **Manage > Datasets > dSource Name**.

9.4.4.2.3 Creating a Couchbase dSource using an offline backup (Couchbase Backup Manager)

Below is the brief architecture of Continuous Data Engine support for Couchbase database

Prerequisites: Access to production backup e.g.,:

/backup - archive

PROD - repository

/opt/couchbase/bin/cbbackupmgr info -a /backup -r PROD

Name	Size	# Backups
PROD	58.03MB	1

+ Backup Events Aliases Complete	Size	Type	Source	Cluster UUID	Range
+ 2022-01-10T11_29_26.465860528-05_00 08f7937a26b2d20178a5ed16d7a2dd1c N/A 0 0 true	58.03MB	FULL	http://couchbasesrc.dlpxdc.co:8091		

1. Login to **Delphix Management** application.
2. Click **Manage > Datasets**.
3. Select **Add dSource**.
4. In the Add dSource wizard, select the Couchbase source configuration which is created on the staging host.
5. Enter the Couchbase-specific parameters for your dSource configuration.
6. Select the dSource type **Couchbase Backup Manager** from the drop-down available on dSource wizard.
7. Enter the details for **Staging Couchbase host** - FQDN or IP address recommended.
8. Enter the details for **Staging Port Number** available on the staging host. The default port for couchbase is 8091.
9. Enter the details for **Backup Location** available on the staging host. For instance, if your Backup Path is specified as `"/u01/couchbase/backups/,"` the corresponding **Backup Location** should be set as `"/u01/couchbase"`.
10. Enter the details for **Backup Archive Name**.
 - If Backup Path is specified as `"/u01/couchbase/backups/,"` the corresponding **Backup Archive Name** should be set as `"backups"`.
 - If the **Backup Archive Name** field left empty then it will automatically ingest new full backups. The plugin will search for backup folders in the format `%Y%m%d%H%M%S` within **Backup Location**.
11. Enter the details for **Backup repository**
12. Enter the details for **Mount Path** available on the staging host. This empty folder acts as a base for NFS mounts.
13. Enter the details for **Staging Cluster Name** to setup new cluster on the staging host.
14. Enter the configuration details for your staging cluster as per resource availability on the staging host.
 - Cluster RAM Size
 - Cluster Index RAM Size
 - Cluster FTS RAM Size
 - Cluster Eventing RAM Size - this should be 0
 - Cluster Analysis RAM Size - this should be 0
15. Enter the details for **Staging Cluster Admin User** and **Staging Cluster Admin Password**.

16. Enter **Bucket Size**. A bucket size of zero means the connector will extract bucket size from the source database backup and apply the same in staging. Giving it any other value, would mean imposing that value on all buckets irrespective of the size in the source database.
17. Then click on **Next** button
18. Provide the details for **dSource Name** and **Target group** on the dSource configuration page.
19. On the **Data management** page, select the following:
 - Staging Environment: This will be your staging host where source config was created.
 - User: Database OS user with required privileges for linking the dataset.
20. On the next screens, configure a policy, hooks and review the configuration and click on **Next** button to view the summary.
21. Click the **Submit** button which will initiate the linking process.
22. Once dSource is created successfully, you can review the datasets on **Manage > Datasets > dSource Name**.

9.4.4.3 Provisioning Couchbase VDBs

9.4.4.3.1 Provisioning a Couchbase virtual database

To provision a virtual database (VDB), you can either use an existing dSource snapshot or use another VDB snapshot for VDB to VDB provisioning. A snapshot is a timeflow created in a dSource or VDB.

An environment can be associated with only one dSource/VDB at a time.

9.4.4.3.2 Prerequisites

- You should either have linked a dSource from a staging instance following the instructions in [Linking a CouchbaseDB dSource \(see page 1207\)](#), or you should have already created a VDB from which you intend to provision another VDB.
- A CouchbaseDB target environment must be set-up with the necessary requirements as described in CouchbaseDB [support and requirements \(see page 1199\)](#).
- A CouchbaseDB binary with the same version as the source database must be installed on the Target host.

9.4.4.3.3 Provisioning a VDB

1. Navigate to Manage, and select Datasets.
2. Select the dataset and the snapshot that you want provision from. Click the provision VDB icon to open the provision VDB wizard.

The screenshot shows the 'Datasets' page for 'cbase661_stg'. On the left, a list of datasets is shown, with 'cbase661_stg' selected. The main area displays a 'Timeflow' view of snapshots. A tooltip 'Provision a VDB: Create a Virtual Database from this point in time' is visible over a snapshot from 6:31 AM on Oct 9, 2023. On the right, 'Dataset Details' are shown, including 'STORAGE USED' (3 snapshots, 274.60MB dataset storage, 21.80GB total engine storage) and 'LOCATION & LINEAGE' (Environment: ayesha-cbase661-stg1).

3. Select the target host from the dropdown on which VDB needs to be created.

The screenshot shows the 'Provision Plugin-based VDB' wizard at the 'Target Environment' step. A progress bar on the left indicates the current step. The main content area includes:

- Target Environment:** The target environment is the location where your Plugin-based VDB will be provisioned. Select a target environment from the list under "Environment" and complete the Home and User fields. (You can add new environments by exiting this wizard, and going to Manage > Environments)
- Source Database:** source660
- Database Version:** AppData
- Snapshot Time:** Jan 11, 2022 6:31 AM
- OS:** Linux
- Environment:** A dropdown menu with a filter 'none' and three options: 'couchbasestg.dlpxdc.co', 'couchbasestgt.dlpxdc.co' (selected), and 'couchbasestg2.dlpxdc.co'.
- Installation:** Couchbase (6.6.2-9588 (EE))
- User:** delphix

 At the bottom right, there are buttons for 'Cancel', 'Back', 'Next', and 'Submit'.

4. Enter the following values for the target configuration:

- **Target Port Number:** Port number on which Couchbase services will be started. (ex. 8091).
- **Mount Path:** NFS mount path where dSource snapshot will be mounted by Engine (ex. /mnt/provision/targetdemo).
- **Target Cluster name:** Cluster name which is required to be set up on the target host. (ex. targetdemo).
- **Cluster Ram Size:** Whole Cluster memory.

- **Cluster Index Ram Size:** Cluster indexer memory.
- **Cluster FTS Ram Size:** Cluster FTS memory (if needed and FTS service will be configured).
- **Cluster Eventing Ram Size:** Cluster Eventing memory (if needed and Eventing service will be configured).
- **Cluster Analytics Ram Size:** Cluster Analytics memory (if needed and Analytics service will be configured).

5. Enter the following values for the target configuration:

- **Target couchbase Admin User:** Target Cluster admin username.
- **Target couchbase Admin password:** Target Cluster admin password.
- Select services needed on the target cluster (FTS, Eventing, Analytics).

The screenshot shows the 'Provision Plugin-based VDB' wizard with the 'Target Configuration' step selected. The left sidebar contains a vertical list of steps: Target Environment, Target Configuration (selected), Configuration, Policies, Masking, Hooks, and Summary. The main content area includes the following fields and options:

- Cluster FTS RAM Size *: 256
- Cluster Eventing RAM Size *: 256
- Cluster Analytics RAM Size *: 1024
- Bucket Eviction Policy *: valueOnly (dropdown menu)
- Target Couchbase Admin User *: Administrator
- Target Couchbase Admin Password * (empty field)
- Additional Nodes section with a '+ Add' button
- Three checked checkboxes: FTS Service, Analytics Service, and Eventing Service

At the bottom right, there are four buttons: Cancel, Back, Next (highlighted in blue), and Submit.

6. Provision connector based VDB. Enter the following value:
 - **VDB Name:** Delphix Target Cluster name.
 - **Target group:** Delphix Target Cluster group.
7. Select a policy for VDB, select **Next**.
8. Select masking for VDB if needed, select **Next**.
9. Add hooks for VDB if needed, select **Next**.

The screenshot shows the 'Provision Plugin-based VDB' wizard with the 'Policies' step selected. The left sidebar contains a vertical list of steps: Target Environment, Target Configuration, Configuration, Policies (selected), Masking, Hooks, and Summary. The main content area includes the following elements:

- Policies** section header
- Text: "Default policies are available for use, but if you prefer to create custom policies, exit this wizard and go to Manage > Policies."
- Checked checkbox: Use group policy
- VDB Snapshot Policy :** Default Snapshot
- Text: "Snapshot will be taken" with a time zone of "US/Pacific UTC -08:00"
- Text: "At 03:30 AM, only on Sunday" and "At 03:30 AM, only on Monday"
- Text: "..."
- Dropdown arrow at the bottom of the policy box

At the bottom right, there are four buttons: Cancel, Back, Next (highlighted in blue), and Submit.

10. Preview the summary and select **Submit**.

- Once the VDB is created successfully, you can review the datasets on **Manage > Datasets > vdb Name**.

9.4.4.3.4 Provisioning a multi-node Couchbase VDB

- Navigate to Manage, and select Datasets.
- Select the dataset and the snapshot that you want provision from. Click the provision VDB icon to open the provision VDB wizard.

- Select the target host from the dropdown on which VDB needs to be created.
- Enter the following values for the target configuration:
 - Target Port Number:** Port number on which Couchbase services will be started. (ex. 8091)
 - Mount Path:** NFS mount path where dSource snapshot will be mounted by Engine (ex. /mnt/provision/targetdemo)
 - Target Cluster name:** Cluster name which is required to be set up on the target host. (ex. targetdemo)

 - **Cluster FTS Ram Size:** Cluster FTS memory (if needed and FTS service will be configured)
 - **Cluster Eventing Ram Size:** Cluster Eventing memory (if needed and Eventing service will be configured)
 - **Cluster Analytics Ram Size:** Cluster Analytics memory (if needed and Analytics service will be configured)
5. Enter the following values for the target configuration:
 - **Target couchbase Admin User:** Target Cluster admin username
 - **Target couchbase Admin password:** Target Cluster admin password
 - Select services needed on the first node of the cluster (FTS, Eventing, Analytics)
 - Click Add buton to open a dialog box for additional node. If you need more nodes, click Add button again to add more nodes
 - Enter the following values for each node:
 - **Delphix Environment Name:** Select an additional node environment from drop-down menu
 - **Delphix Environment User:** Select an environment user
 - **Node hostname / IP:** Enter a hostname or IP of the new node - it will be used as a server name in Couchbase configuration
 - Select services needed on the additional node of the cluster (FTS, Eventing, Analytics)
 6. Provision connector based VDB. Enter the follwing value:
 - **VDB Name:** Delphix Target Cluster name
 - **Target group:** Delphix Target Cluster group
 7. Select a policy for VDB, select **Next**.
 8. Select masking for VDB if needed, select **Next**
 9. Add hooks for VDB if needed, select **Next**
 10. Preview the summary and select **Submit**

9.4.4.3.5 Accessing target Couchbase VDB cluster

Use an IP / Hostname of the target environment and VDB port defined above to access Target Cluster VDB. Admin user name and password are defined based on input from part 4.

An example screenshot of Couchbase Console of the provisioned VDB can be found below:

9.4.5 Couchbase troubleshooting

9.4.5.1 Logging

There are the following sets of logs for the CouchbaseDB connector.

1. The connector logs are part of the Delphix Engine. Refer to [How to Retrieve Logs] (<https://developer.delphix.com/References/Logging/#how-to-retrieve-logs>) to find out how to get the Delphix connector Logs.
2. CouchbaseDB Instance logs
 - a. CouchbaseDB Instance logs are located at `/opt/couchbase/var/lib/couchbase/logs` (for staging/target instances)

9.4.6 Couchbase developer's CLI guide

- [Discovering a Couchbase environment](#) (see page 1221)
- [Couchbase SourceConfig operations](#) (see page 1222)
- [Couchbase linking operations](#) (see page 1223)
- [Couchbase provisioning operations via CLI](#) (see page 1227)

9.4.6.1 Discovering a Couchbase environment

To discover an environment via CLI, login to the Delphix Continuous Data Engine using the admin user account.

[Connection to Continuous Data with FDQN "dlpx-engine.delphix.com³⁷⁰]

Syntax –

```
ssh admin@dlpx-engine.delphix.com
```

9.4.6.1.1 Discovering the environment

Run the following commands to discover the environment.

[Adding environment with FQDN "rh74-cbase.delphix.com³⁷¹", hostname "rh74-cbase", toolkit-path `"/var/tmp"`, os-user "delphix_os", os-password "delphix"]

Example –

³⁷⁰ <http://dlpx-engine.delphix.com>

³⁷¹ <http://rh74-cbase.delphix.com>

```

> environment
> create
> set hostEnvironment.name=rh74-cbase.delphix.com
> set hostParameters.host.address=rh74-cbase
> set hostParameters.host.toolkitPath=/var/tmp
> set primaryUser.name=delphix_os
> set primaryUser.credential.password=delphix
> commit

```

Run the following commands to discover the environment.

[Adding environment with FQDN “rh74-cbase.delphix.com³⁷²”, hostname “rh74-cbase”, toolkit-path “/var/tmp”, os-user “delphix_os”, os-password “delphix”]

Example -

```

> environment
> create
> set hostEnvironment.name=rh74-cbase.delphix.com
> set hostParameters.host.address=rh74-cbase
> set hostParameters.host.toolkitPath=/var/tmp
> set primaryUser.name=delphix_os
> set primaryUser.credential.password=delphix
> commit

```

9.4.6.2 Couchbase SourceConfig operations

Run the following command to add the source config.

Example -

```

> sourceconfig create
> set type=AppDataStagedSourceConfig

```

³⁷² <http://rh74-cbase.delphix.com>

```

> set name=testscfg
> set parameters="{ \
\"couchbaseSrcHost\": \"rh74-src-cbase.delphix.com\", \
\"couchbaseSrcPort\": 8091, \
\"dbPath\": \"/opt/couchbase/var/lib/couchbase\", \
\"prettyName\": \"testscfg\"
}"
> set repository="rh74-cbase/Couchbase (7.1.3-3479 (EE))"
> commit

```

9.4.6.2.1 Delete

Run the below command to delete sourceconfig.

```

Example -
> sourceconfig create
> select testscfg
> delete
> commit

```

9.4.6.3 Couchbase linking operations

9.4.6.3.1 Couchbase dSource creation via CLI

To create a dSource via CLI, you must create a source configuration first. For more information on creating a source configuration, refer to [Add Source Config using CLI](#)³⁷³.

To create a dSource and perform operations via CLI, login to the Delphix Continuous Data Engine using the admin user account.

```

Syntax -
ssh admin@dlpx-engine.delphix.com

```

³⁷³ https://docs.google.com/document/d/1darUpOgXmGaDNcMyQ_gCLHhVgEAQoyg9s3h2GFYk-JY/edit#heading=h.9l0qtkvk9xv

9.4.6.3.2 Set default linking parameters for Couchbase

Run the below commands to set the default linking parameters. The below example uses testscfg source config.

Example -

```
> database link
> set type=LinkParameters
> set linkData.type=AppDataStagedLinkData
> set name=testds
> set group=Untitled
> set linkData.config=testscfg
> set linkData.environmentUser=rh74-cbase/delphix_os
> set linkData.stagingEnvironment=rh74-cbase
> set linkData.stagingEnvironmentUser=rh74-cbase/delphix_os
> set linkData.syncParameters.parameters={"resync":true}
```

9.4.6.3.2.1 Link parameters for the Couchbase XDCR ingestion type

Run the below commands to link parameters for XDCR ingestion type.

Example -

```
> set linkData.parameters="{ \
\"dSourceType\":\"XDCR\", \
\"couchbaseHost\":\"rh74-cbase.delphix.com\", \
\"couchbasePort\":8091, \
\"couchbaseBakLoc\":\"\", \
\"couchbaseBakRepo\":\"\", \
\"mountPath\":\"/mnt/provision/testds\", \
\"stgClusterName\":\"dlpx_staging_cluster\", \
\"clusterRAMSize\":2000, \
\"clusterIndexRAMSize\":256, \
```

```

\"clusterFTSRAMSize\":256, \
\"clusterEventingRAMSize\":256, \
\"clusterAnalyticsRAMSize\":1024, \
\"bucketEvictionPolicy\": \"valueOnly\", \
\"bucketSize\":0, \
\"couchbaseAdmin\": \"Administrator\", \
\"couchbaseAdminPassword\": \"delphix\", \
\"xdcrAdmin\": \"Administrator\", \
\"xdcrAdminPassword\": \"\", \
\"fts_service\":false, \
\"eventing_service\":false, \
\"analytics_service\":true, \
\"config_settings_prov\":[]
}

```

9.4.6.3.2.2 Link parameters for Couchbase Backup Manager ingestion type

Run the below commands to link parameters for Couchbase Backup Manager ingestion type.

Example -

```

> set linkData.parameters="{ \
\"dSourceType\": \"Couchbase Backup Manager\", \
\"couchbaseHost\": \"rh74-cbase.delphix.com\", \
\"couchbasePort\":8091, \
\"couchbaseBakLoc\": \"/home/delphix_os/backups\", \
\"couchbaseBakRepo\": \"delphix_backup_repo\", \
\"mountPath\": \"/mnt/provision/testds\", \
\"stgClusterName\": \"dlpx_staging_cluster\", \

```

```

{"clusterRAMSize":2000, \
"clusterIndexRAMSize":256, \
"clusterFTSRAMSize":256, \
"clusterEventingRAMSize":256, \
"clusterAnalyticsRAMSize":1024, \
"bucketEvictionPolicy":{"valueOnly"}, \
"bucketSize":0, \
"couchbaseAdmin":{"Administrator"}, \
"couchbaseAdminPassword":{"delphix"}, \
"xdcrAdmin":{"Administrator"}, \
"xdcrAdminPassword":{""}, \
"fts_service":false, \
"eventing_service":false, \
"analytics_service":true, \
"config_settings_prov":[]
}

```

9.4.6.3.3 Commit, disable, and enable

9.4.6.3.3.1 Commit

Run the below command to commit the change

```
> commit;
```

9.4.6.3.3.2 Disable

Run the below command to disable the dSource.

Example -

```
> source
```

```
> select testdb
```

```
> disable
```

```
> commit
```

9.4.6.3.3.3 Enable

Run the below command to enable the dSource.

Example -

```
> source
```

```
> select testdb
```

```
> enable
```

```
> commit
```

9.4.6.4 Couchbase provisioning operations via CLI

To create a VDB via CLI, you must first create a dSource. For more information on creating a dSource, refer to [Link operation via CLI section](#)³⁷⁴.

To create a VDB and perform operations via CLI, login to the Delphix Continuous Data Engine using the admin user account.

```
ssh admin@dlpx-engine.delphix.com
```

9.4.6.4.1 Provision

Run the below commands to provision a VDB. The below example uses testdb dSource.

Example -

```
> database provision
```

```
> set type=AppDataProvisionParameters
```

```
> set container.name=testvdb
```

```
> set container.group=Untitled
```

```
> set source.allowAutoVDBRestartOnHostReboot=true
```

```
> set sourceConfig.repository="rh74-cbase.delphix.com/delphix_os vFiles (15.2)"
```

³⁷⁴ <https://docs.google.com/document/d/1S48-GbC7zUvE-jses4aRonuVRSYHAizSLjjqBmRCM4/edit#heading=h.guuursro9gzw>

```

> set timeflowPointParameters.container=testdb
> set sourceConfig.name=testscfgv
> set source.parameters="{ \
\"couchbasePort\":8091, \
\"mountPath\":\"/mnt/provision/testvdb\", \
\"tgtClusterName\":\"dlpx_tgt_cluster\", \
\"clusterRAMSize\":2000, \
\"clusterIndexRAMSize\":256, \
\"clusterFTSRAMSize\":256, \
\"clusterEventingRAMSize\":256, \
\"clusterAnalyticsRAMSize\":1024, \
\"bucketEvictionPolicy\":\"valueOnly\", \
\"couchbaseAdmin\":\"Administrator\", \
\"couchbaseAdminPassword\":\"delphix\", \
\"fts_service\":false, \
\"analytics_service\":false, \
\"eventing_service\"true, \
\"node_list\":[]
}"
> commit

```

9.4.6.4.2 Disable, enable, start, and stop

9.4.6.4.2.1 Disable

Run the below commands to disable a dSource. You must select the same sourceConfig name that was given during VDB creation.

Example –

```
> source
```

```
> select testscfgv
```

```
> disable
```

```
> commit
```

9.4.6.4.2.2 Enable

Run the below command to enable a dSource.

Example -

```
> source
```

```
> select testscfgv
```

```
> enable
```

```
> commit
```

9.4.6.4.2.3 Stop

Run the below command to stop a dSource.

Example -

```
> source
```

```
> select testscfgv
```

```
> stop
```

```
> commit
```

9.4.6.4.2.4 Start

Run the below command to start a dSource.

Example -

```
> source
```

```
> select testscfgv
```

```
> start
```

```
> commit
```

9.4.7 Couchbase data source limitations

Note the following limitations for Couchbase data sources.

- Child VDB cannot be provisioned from Multi-node VDB.
- Multi-node VDB can't be cloned.
- V2P is not supported
- Point in time recovery is not supported. Provision / refresh / rewind time is based on snapshot only

9.5 IBM Db2 data sources

9.5.1 Overview

The IBM Db2 virtualization solution consists of the Delphix Continuous Data Engine, and the connector for IBM Db2 which must be uploaded and installed into the Delphix Continuous Data Engine. This solution ingests source data using the [staging architecture](#) (see page 1046), which copies the production database from the source environment into a staging environment. The Delphix Continuous Data Engine captures the persistent storage layer of the staging database, which then allows Delphix Continuous Data Engine to create virtualized copies in target environments.

9.5.1.1 IBM Db2 connector architecture

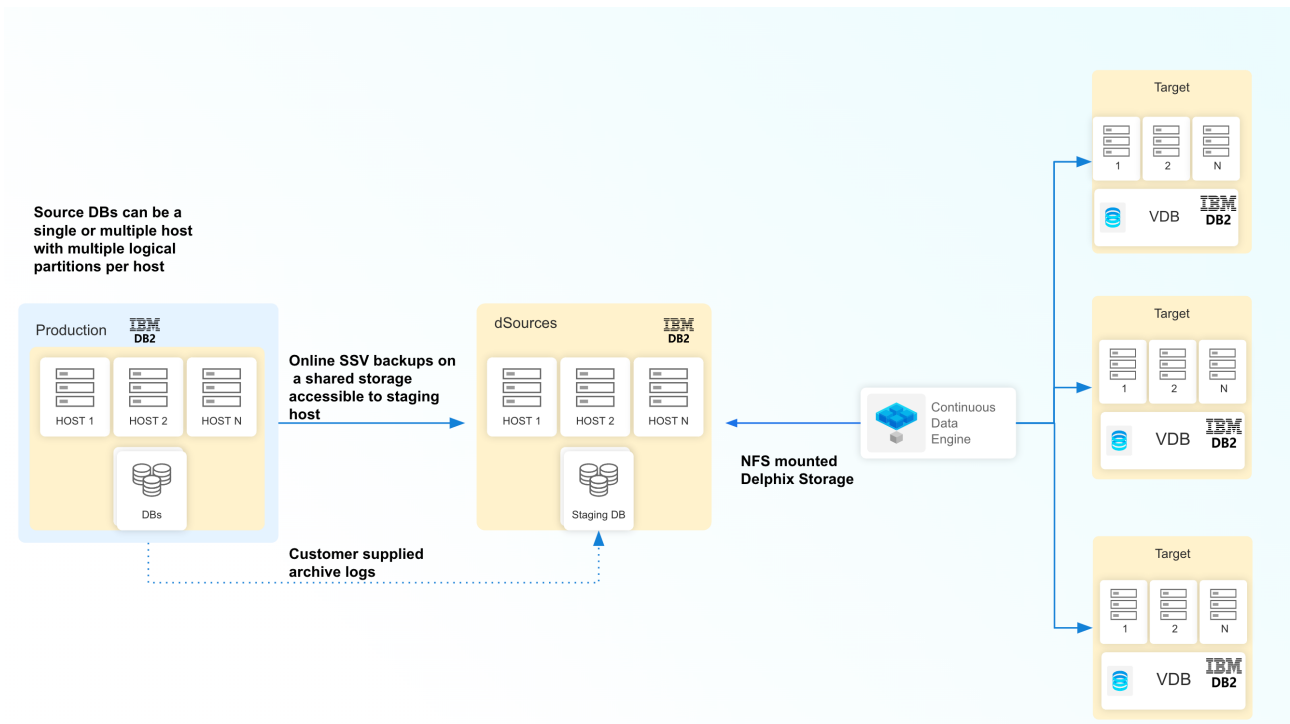

IBM Db2 connector supports ingestion of both single partition (non-DPF) AND multi-partition (logical) also known as [DPF \(Database Partition Feature\) databases](#). (see page 1302)

IBM Db2 architecture for single partition (non-DPF) databases:

9.5.1.1.1 IBM Db2 architecture with multi-partition database (DPF):

A multi-partition, or partitioned, database is a database with more than one partition. Depending on your hardware environment, there can be several configurations in which you can partition your database. During DPF dSource ingestion, the production database can be physically partitioned across multiple hosts. However, for the dSource ingestion or VDB provisioning process, the staging and target hosts will have to be configured using logical partitions only.

The IBM Db2 connector supports both staging pull and staging push.

The following specific ingestion methods are supported:

- **Staging Pull:** This ingestion method allows Delphix Continuous Data Engine to execute the necessary operations to prepare the data content in the Staging database. Staging pull supports the below ingestion methods for both DPF and non-DPF databases.
 - HADR (High Availability Disaster Recovery)
 - Backup only
 - Backup with Archived logs
 - Rollforward to Point-in-Time (RFPIT)
- **Staging Push:** This ingestion method requires you to execute the necessary operations to prepare the data content in the staging database for both DPF and non-DPF databases.

9.5.1.2 Limitations of the IBM Db2 solution

Delphix Continuous Data Engine and the IBM Db2 connector should not be considered a replacement for backup and recovery of your source instances and databases. The Delphix Continuous Data Engine solution is intended for very different purposes, primarily to create non-production database copies.

The following are not supported:

- Architecture other than 64-bit OS
- Windows OS type
- Db2 Versions below 10.5 i.e (10.1, 9.8 etc)
- Db2 Offline backup at staging for staging push
- Migrating existing VDBs to a different host

- Virtual to Physical (V2P) VDB operation
- Db2 Pure Scale databases
- Multi-node configuration of dSource or VDB databases

9.5.1.3 Support

License for the IBM Db2 connector is included with the standard Delphix License Agreement, and the solution is supported by Delphix Technical Support. For any questions, bugs, or feature requests, contact us via [Delphix Support](https://support.delphix.com/)³⁷⁵ or [Delphix Community](https://community.delphix.com/contactus)³⁷⁶ portals.

9.5.2 IBM Db2 virtualization process

The following material introduces you to the overall process of deploying the IBM Db2 virtualization solution. A sequence of high-level steps is presented. Each step briefly describes the task and the expected result. For more information, refer to the embedded links.

1. [Begin by reviewing the general Delphix Continuous Data Engine architecture diagrams](#) (see page 1046). Identify existing or new IBM Db2 source, staging, target environments, the underlying operating systems, and IBM Db2 database versions. This will give you a good understanding of the architectural strategy and confirm support.
2. [Review the IBM Db2 support matrix](#) (see page 1234). Confirm that your combination of IBM Db2 software, host operating system, Delphix Continuous Data Engine version, and IBM Db2 connector version are supported for the various environments that will integrate into your IBM Db2 deployment. Early validation will reduce unexpected issues later.
3. Deploy and configure the Delphix Continuous Data Engine.
4. [Install the IBM Db2 connector](#) (see page 1257). The IBM Db2 connector extends the Delphix Continuous Data Engine to IBM Db2 datasets. It is recommended to stay current with the latest version of the connector.
5. [Create staging and target environments](#) (see page 1261). The staging environment will host an IBM Db2 instance that the Delphix Continuous Data Engine will ingest from. The target environment will host one or more IBM Db2 instance(s) in which the virtual database copies will be created.
 - a. Consult the [source environment](#) (see page 1243) and [staging/target environments](#) (see page 1245) requirements documentation for configuration details.
6. [Add staging and target environments in the Delphix Continuous Data Engine](#) (see page 1261). Use the "Add Environment" operation in the Delphix Continuous Data Engine for each host, which causes the Delphix Continuous Data Engine to register the specific host and catalog the IBM Db2 software installation(s) on that host.
7. [Link the IBM Db2 source database](#) (see page 1266). Configure and create a dSource which allows the Delphix Continuous Data Engine to capture a copy of the source data. There are many ingestion methods that can offer a variety of methods to capture the data to be virtualized by the Delphix

375 <https://support.delphix.com/>

376 <https://community.delphix.com/contactus>

Continuous Data Engine. Therefore, we recommend identifying the ingestion method best suits your organization and infrastructure policies.

8. [Provision virtual IBM Db2 databases](#) (see page 1290). Administrators and users can provision multiple copies of the source data as virtual databases.

9.5.3 IBM Db2 requirements and prerequisites

This section contains the following pages about IBM Db2 requirements and prerequisites in Delphix Continuous Data Engine.

- [IBM Db2 support matrix](#) (see page 1234)
- [Requirements for IBM Db2 source databases](#) (see page 1243)
- [Requirements for IBM Db2 staging and target environments](#) (see page 1245)
- [Sudo privileges for the environment users](#) (see page 1251)

9.5.3.1 IBM Db2 support matrix

Refer to the following support matrices to ensure compatibility between the environment, database, connector, and Delphix Continuous Data Engine.

Compatible upgrades have a green **Y**, while incompatible upgrades show a red **N**.

Following Delphix support policies, when a minor release is certified, all the patch releases falling under that minor release are also considered certified.

9.5.3.1.1 Environment and database compatibility

9.5.3.1.1.1 Database editions

The following are the IBM Db2 database editions supported by connector version 4.0.0 and above.

- Standard edition
- Advanced edition
- Advanced enterprise server edition
- Enterprise server edition
- Community edition
 - Only available for IBM Db2 v11.5+.
- IBM Db2 with BLU Acceleration Pattern 1.2.19.0
 - Db2 v11.5.8.0 [Special fix_29133](#)³⁷⁷.

³⁷⁷ <https://www.ibm.com/docs/en/cloud-pak-system-w4600/2.3.3?topic=patterns-db2-blu-acceleration-pattern>

 For more information on support for BLU or column-organized tables with DB2 connector, please reference [IBM Db2 additional information](#) (see page 1302).

9.5.3.1.1.2 Operating system

The IBM Db2 connector is certified for use in source, staging, and target environments with the following operating systems and database versions.

9.5.3.1.2 Red Hat Enterprise Linux (RHEL)

 Support for RHEL 8.x requires installing the libncurses.5 library onto the host. Please reference [KBA 5622](#)³⁷⁸ for actionable steps.

IBM Db2 connector supports the following OS and Db2 Database versions.

OS version	Db2 Database version		
	10.5	11.1	11.5
RHEL 6.9	Y	Y	N
RHEL 7.0	Y	Y	N
RHEL 7.1	Y	Y	N
RHEL 7.2	Y	Y	N
RHEL 7.3	Y	Y	N
RHEL 7.4	Y	Y	N

³⁷⁸[https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Operations_Fail_With_%22bash%3A_error_while_loading_shared_libraries%3A_libncurses.so.5%3A_cannot_open_shared_object_file%3A_No_such_file_or_directory%22_\(KBA5622\)](https://support.delphix.com/Delphix_Virtualization_Engine/Delphix_Admin/Environment_Operations_Fail_With_%22bash%3A_error_while_loading_shared_libraries%3A_libncurses.so.5%3A_cannot_open_shared_object_file%3A_No_such_file_or_directory%22_(KBA5622))

RHEL 7.5	Y	Y	N
RHEL 7.6	Y	Y	N
RHEL 7.7	N	Y	N
RHEL 7.8	N	Y	Y 6.0.5+
RHEL 7.9	N	Y	Y
RHEL 8.0	N	Y	Y
RHEL 8.1	N	Y	Y
RHEL 8.2	N	N	Y
RHEL 8.3	N	N	Y
RHEL 8.4	N	N	Y
RHEL 8.5	N	N	Y
RHEL 8.6	N	N	Y 6.0.16+
RHEL 8.7	N	N	Y
RHEL 8.8	N	N	Y 12.0.0.0+
RHEL 9.0	This operating system version is not supported by IBM Db2.		
RHEL 9.1	This operating system version is not supported by IBM Db2.		
RHEL 9.2	N	N	Y 19.0.0.0+

9.5.3.1.3 Advanced Interactive eXecutive (AIX)

IBM Db2 connector supports below mentioned OS and Db2 versions.

OS Version	Database version		
	10.5	11.1	11.5
AIX 7.1	Y	Y	Y
AIX 7.2	Y	Y	Y

IBM frequently drops support for operating system versions that are still under general support by the operating system vendor on Mod (third digit) IBM Db2 releases. Please consult the [IBM Db2 System Requirements](#)³⁷⁹ page to confirm an operating system is supported for your IBM Db2 version. Delphix can only supports operating system and database version combinations that are also supported by the vendor.

Certified IBM AIX v7.2 on POWER9 hardware. To learn more about IBM Db2 Power9 hardware support, read the [IBM Documentation](#)³⁸⁰.

9.5.3.1.4 IBM Db2 connector and Delphix Continuous Data Engine compatibility

For more information, refer to the Delphix [End of Support](#)³⁸¹ policy to determine whether a connector version is in primary, extended, or legacy support. Contact Delphix customer support with any questions.

9.5.3.2 Requirements for IBM Db2 source databases

IBM Db2 connector is based on the zero touch production concept, meaning the production environment and staging environments are mutually exclusive except for HADR (High Availability Disaster Recovery) where the staging environment acts as a standby for the production. Source Db2 hosts are considered primary/production servers that have Db2 binaries installed and have Db2 instances created on them. The hosts that contain the data that you wish to ingest are referred to as the source environment. This topic describes the requirements for creating connections between the Delphix Continuous Data Engine and Db2 hosts and instances.

Requirements	Explanation	
	Single Partition (Non-DPF)	Multi Partitions(DPF)
HADR Ports	The configuration values for HADR_LOCAL_SVC and HADR_REMOTE_SVC should be set. These ports are used at the end user's discretion and need to be specified during the linking process. It is highly recommended that these ports also be defined in the <code>/etc/services</code> file to ensure that they are only used by Db2 for the specified databases.	N/A
SSL certificate	For encrypted HADR transmission, SSL certificate should be made available on source host.	N/A
HADR source state	Source instance and database must be in active state to create HADR connection.	N/A

<p><i>dbadm</i> and <i>secadm</i> privileges for database</p>	<p>The database instance users must have dbadm³⁸² and secadm³⁸³ permissions to enable cross instance restore.</p> <p>Delphix Continuous Data Engine uses the Db2 instance owner account on the dSource for multiple operations, including querying data inside the databases. In order to ingest a database on the staging server with different instances, you need permissions on the source database in order to perform a restore on the staging server. For example, if you have an instance named "auto1051" at the source with a database name "delphix" and you want to create a dSource on the "auto1052" instance on the staging server, then you must explicitly grant DBADM and SECADM to the dSource instance "auto1052" on the source instance using the following steps:</p> <ul style="list-style-type: none"> • Connect to the source database as the source instance owner. <ul style="list-style-type: none"> • <code>connect to <DB_NAME> user <SOURCE_INSTANCE_OWNER> .</code> • Issue database grant command, <ul style="list-style-type: none"> • <code>grant DBADM, SECADM on the database to user <DSOURCE_INSTANCE_OWNER></code> • <code>grant DBADM, SECADM on the database to user <VDB_INSTANCE_OWNER></code> • Repeat step 2 for every database to be included in the dSource, on the corresponding source database. 	<p>Same as non-DPF</p>
<p>Database container requirement</p>	<p>It is recommended not to use special characters for source database container paths as this may create problems while parsing such container paths and may also result in failures during dSource and VDB creation.</p>	<p>Same as non-DPF</p>

382 <https://www.ibm.com/docs/en/db2/11.5?topic=authorities-database-administration-authority-dbadm>

383 <https://www.ibm.com/docs/en/db2/11.5?topic=authorities-security-administration-authority-secadm>

<p>Banners (see page 1302)</p>	<p>For connector versions < 4.2.0, Banners are not supported</p> <p>For connector versions >= 4.2.0, <code>.profile</code>, <code>MOTD</code>, and <code>ssh</code> banners are supported.</p> <p>Note: Print/echo statements in <code>.bashrc</code> are not supported by the connector.</p>	<p>Same as non-DPF</p>
--	--	------------------------

9.5.3.3 Requirements for IBM Db2 staging and target environments

This section elaborates on the various host requirements for the staging host where the dSource is linked and the target where the VDB is provisioned based on the type of ingestion method being used.

Requirements	Explanation	
	Single Partition (Non-DPF)	Multi Partitions (DPF)
<p>Access to database backups</p>	<p>The staging environment must have access to a full online backup of the source database on disk to create the first full copy. Delphix Continuous Data Engine recommends using compressed backups as that will reduce storage needs and speed up ingestion. It is recommended to test the integrity of the backup before using it for ingestion using the utility db2ckbkp³⁸⁴. Once this first fill backup is ingested into the staging database, representing the Db2 dSource, subsequent synchronizations can be accomplished via HADR or Archive Logs.</p>	
<p>HADR Ingestion - port specific</p>	<p>The configuration values for <code>HADR_LOCAL_SVC</code> and <code>HADR_REMOTE_SVC</code> should be set. These ports are used at the end user's discretion and need to be specified during the linking process. It is highly recommended that these ports also be defined in the <code>/etc/services</code> file to ensure that they are only used by Db2 for the specified databases.</p>	

³⁸⁴ <https://www.ibm.com/docs/en/db2/11.5?topic=commands-db2ckbkp-check-backup>

Db2 instance	The staging and target Db2 instances that you wish to use must already exist on the host. We can use the same instance for the dSource and VDB creation and can also have multiple VDBs on the same instance.	Same as non-DPF
Db2 instance configuration parameters	Instance level configuration values such as the bufferpool value will need to be managed by the end users independent of Delphix Continuous Data Engine.	Same as non-DPF
Db2 instance compatibility	The IBM Db2 instance binaries and versions for staging and target environments must be compatible with the source Db2 instance.	Same as non-DPF
Db2 version	Db2 versions on staging and target should be identical i.e., major, minor, modpack and fixpack should be the same on both staging and target instances for smoother provision.	Same as non-DPF
No of partitions (Logical)	NA	The staging and target hosts must be configured with the same number of logical partition nodes as the source.

<p>Logical partition configuration</p>	<p>NA</p>	<p>The logical partition configuration must be added in the <code>\$HOME/sqllib/db2nodes.cfg</code> file where <code>\$HOME</code> is the home directory of the instance user. The hostname to be used in the <code>db2nodes.cfg</code> file should be a fully qualified domain name.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code>db2 nodes.cfg</code> file configured for 4 logical partitions should look like: <pre style="border: 1px solid black; padding: 5px;"> 0 <FQDN hostname> 0 1 <FQDN hostname> 1 2 <FQDN hostname> 2 3 <FQDN hostname> 3 </pre>
<p><code>/etc/services</code> entry</p>	<p>NA</p>	<ul style="list-style-type: none"> • Each logical partition must have a corresponding port entry in <code>/etc/services</code> of hosts. • In the example below, <code>db2inst1</code> is the instance where the user and port number from 60000 to 60003 are reserved for inter-partition communication. <pre style="border: 1px solid black; padding: 5px;"> DB2_db2inst1 60000/tcp DB2_db2inst1_1 60001/tcp DB2_db2inst1_2 60002/tcp DB2_db2inst1_END 60003/ tcp </pre>
<p>Registry variable setting</p>	<p>Registry variables <code>DB2RSHCMD</code> and <code>DB2COMM</code> should be updated with values as shown below:</p> <pre style="border: 1px solid black; padding: 5px;"> SSHCMD=\$(which ssh) db2set DB2RSHCMD="\$SSHCMD" db2set DB2COMM=TCPIP </pre>	<p>Same as non-DPF</p>

db2_all utility test	NA	After the environment is configured on staging and target, execute <code>db2_all echo hello</code> on both staging and target servers to add host key in the <code>known_hosts</code> file. This will also help to check for any ssh issues on these servers.
Archive logs	Instance users should have permission to read logs.	The backup files (or log directory if using Archive Logs) should be consistent with the partitions configured on staging.
SSH configuration parameters	NA	When configuring staging and target environments for multiple partitions (dpf), the <code>ClientAliveInterval</code> option must be set to 0 or commented out to prevent the SSH connection from getting severed in the midst of command executions.
Primary user permissions	<p>There must be an operating system user (delphix_os) with these privileges:</p> <ul style="list-style-type: none"> • Ability to login to the staging and target environment via SSH • Ability to run <code>mount</code>, <code>umount</code>, <code>mkdir</code>, and <code>rmdir</code> as a super-user. If the staging and target host is an AIX system, permission to run the <code>nfso</code> command as a super-user. 	Same as non-DPF

<p>Toolkit directory and its permissions</p>	<p>There must be a directory on the staging and target environment where you can install the IBM Db2 connector. For example, <code>/var/opt/delphix/toolkit</code>.</p> <ul style="list-style-type: none"> • The primary user (<code>delphix_os</code>) must own the toolkit path directory (<code>__/ var/opt/delphix/toolkit</code>). • If the primary user and instance users are sharing any common group, then the toolkit path directory (<code>__/ var/opt/delphix/toolkit</code>) must have permissions <code>rwxrwx-- (0770)</code>, but you can also use more permissive settings. This allows instance users who are part of the same group as the <code>delphix_os</code> user's group to be able to create directories inside the toolkit path directory. • If the <code>delphix_os</code> user and instance users are not sharing any common group, then the toolkit path directory must have <code>-rwxrwxrwx (0777)</code> permissions. • The directory should have 1.5GB of available storage: 400MB for the connector and 400MB for the set of logs generated by each Db2 instance that runs on the host • The connector directory will be used as the base location for the mount point by default if no other custom mount base is provided. 	<p>Same as non-DPF</p>
<p>Common group between primary and instance users</p>	<p>The primary environment user should share its primary group with the instance user. For example, if the <code>delphix_os</code> is the primary environment user which is used for environment addition and its primary group is also <code>delphix_os</code> then instance users (responsible for the Delphix Continuous Data Engine operations such as linking and provisioning) should share group <code>delphix_os</code> as their secondary group</p>	<p>Same as non-DPF</p>

<p>Instance user requirement</p>	<ul style="list-style-type: none"> • The instance owner of each instance you wish to use within staging or a target host must be added as an environment user within the Delphix Continuous Data Engine. • For HADR synced dSources the staging instance owner must be able to "read" the ingested database contents as Delphix Continuous Data Engine will check the validity of the database by querying tables before each dSource snapshot. Note: If a Db2 database tablespace container is added or deleted on primary/source database, the dSource will have to be resynced. • Ensure that the following database configurations are set to default values: <ul style="list-style-type: none"> • LOGPRIMARY, LOGSECOND - default values are set by DB2 configuration advisor and shouldn't be changed. For more information, refer to logsecond - Number of secondary log files configuration parameter³⁸⁵. • LOGARCHCOMPR1, LOGARCHCOMPR2- the default values are set to OFF so that the workflows can work properly. 	<p>Same as non-DPF</p>
<p>DB2_RESTORE_GRANT_ADMIN_AUTHORITIES</p>	<p>If the instance user doesn't have access to the source database and the staging host uses a different instance user to ingest the dSource, the user can set the DB2 registry variable <code>db2set DB2_RESTORE_GRANT_ADMIN_AUTHORITIES=ON</code> . Db2 will then grant administrative authorities to the staging host instance after the restore is complete. However, since this only works during restore operation, VDBs can only be provisioned on instance with the same name as staging database.</p>	<p>Same as non-DPF</p>

³⁸⁵ <https://www.ibm.com/docs/en/db2/11.5?topic=parameters-logsecond-number-secondary-log-files>

<p>Database level requirement</p>	<ul style="list-style-type: none"> • The staging and target hosts must have the empty instances created prior to Delphix Continuous Data Engine using them • The desired OS user to execute commands related to dSource and VDB operation for each instance has been added as an environment user. • Make sure the staging instance used for linking doesn't have an existing restoring database with the same name. • The dSource ingestion or VDB provisioning should not be performed on the source instance to maintain the integrity of the source database. 	<p>Same as non-DPF</p>
<p>Banners (see page 1302)</p>	<p>For connector versions < 4.2.0, Banners are not supported</p> <p>For connector versions >= 4.2.0, <code>.profile</code>, <code>MOTD</code>, and <code>ssh</code> banners are supported.</p> <p>Note: Print/echo statements in <code>.bashrc</code> are not supported by the connector.</p>	<p>Same as non-DPF</p>

It is highly recommended that the Database Partitioning Feature (DPF) for IBM Db2 staging and target should be configured on separate hosts due to the reason that the DPF instances in staging or target environments consume a lot of resources.

9.5.3.4 Sudo privileges for the environment users

This topic describes the rationale behind specific `sudo` privilege requirements for virtualizing IBM Db2 databases along with a few default commands. As required by the IBM Db2 connector, you must grant this OS account the following key privileges:

1. **Disable requiretty:** The Delphix Continuous Data Engine requires the ``requiretty`` setting to be disabled. This allows the OS user to run sudo commands without a logged-in terminal session (tty).
2. **Add NOPASSWD:** By including the NOPASSWD qualifier, you ensure that the "sudo" command does not prompt for a password when executing certain commands such as `mount`, `umount`, `mkdir`, and `rmdir`.

In the example configurations, the OS username `delphix_os` is used. Make sure to modify the username based on the OS user available in the environment for performing the linking and/or provisioning operations.

9.5.3.4.1 Procedure

Perform the following steps on both the staging and target environments.

1. The sudo configuration is located in the `/etc/sudoers` file. Run the following commands to open the `'sudoers'` file:

```
vi /etc/sudoers
```

 Third party tools like `'visudo'`, can be helpful in minimizing syntax errors.

2. Next, update the file with the following snippet to grant the required privileges to the `'delphix_os'` user:

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: \
/bin/mount, /bin/umount, /bin/mkdir, /bin/rmdir
```

9.5.3.4.2 Configuring `sudo` access on AIX for IBM Db2 staging and target environments

In addition to `sudo` access to the `mount`, `umount`, and `ps` commands on AIX target hosts, Delphix Continuous Data Engine also requires `sudo` access to `nfso`. This is required on the staging/target hosts for the Delphix Continuous Data Engine to monitor the NFS read-write sizes configured on the AIX system. A super-user access level is needed to run the `nfso` command.

Example: AIX `/etc/sudoers` file for a Delphix Continuous Data Engine target

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: \
/usr/sbin/mount, \
/usr/sbin/umount, \
/usr/sbin/nfso, \
/usr/bin/ps, \
/bin/mkdir, \
/bin/rmdir
```

9.5.3.4.3 Example 1

This example restricts the **delphix_os** user's use of `sudo` privileges to the directory `/db2`.

Note that the wildcards are allowed for the `mount` and `umount` options because those commands expect a fixed number of arguments after the options. The option wildcard on the `mount` command also makes it possible to specify the file system being mounted from the Delphix Continuous Data Engine.

However, wildcards are not acceptable on `mkdir` and `rmdir` commands because they can have any number of arguments after the options. For those commands, you must specify the exact options (`-p`, `-p -m 755`) used by the Delphix Continuous Data Engine.

Example `/etc/sudoers` file configuration on the target environment for `sudo` Privileges on the VDB mount directory only (Linux OS)

```
Defaults:delphix_os !requiretty
delphix_os ALL=(root) NOPASSWD: \
/bin/mount * /db2/*, \
/bin/umount * /db2/*, \
/bin/umount /db2/*, \
/bin/mkdir -p /db2/*, \
/bin/mkdir -p -m 755 /db2/*, \
/bin/mkdir /db2/*, \
/bin/rmdir /db2/*
```

9.5.3.4.4 Example 2

This example restricts the **delphix_os** user's use of `sudo` privileges to the directory `/db2`, restricts the `mount` commands to a specific Delphix Continuous Data Engine hostname and IP, and does not allow user-specified options for the `umount` command.

This configuration is more secure, but there is a tradeoff with deployment simplicity. This approach would require a different `sudo` configuration for targets configured for different Delphix Continuous Data Engines.

Example: Configuring the `/etc/sudoers` file on the target environment for privileges on the VDB mount directory only, and allows mounting only from a single server (Linux OS)

```
Defaults:delphix_os !requiretty
delphix_os ALL=(root) NOPASSWD: \
/bin/mount <delphix-server-name>* /db2/*, \
/bin/mount * <delphix-server-name>* /db2/*, \
/bin/mount <delphix-server-ip>* /db2/*, \
/bin/mount * <delphix-server-ip>* /db2/*, \
/bin/mount "", \
/bin/umount /db2/*, \
/bin/umount * /db2/*, \
```

```

/bin/mkdir [*]      /db2/*, \
/bin/mkdir          /db2/*, \
/bin/mkdir -p      /db2/*, \
/bin/mkdir -p -m 755 /db2/*, \
/bin/rmdir         /db2/*

```

9.5.3.4.5 Privilege elevation requirements

The optional privilege elevation feature allows a non-privileged OS user (e.g., delphix_os) to gain the permissions of a privileged OS user (e.g., dlpqqa) for operations on the staging or target environments. This configuration can be valuable to maximize an environment's security posture. Privilege elevation can be used to work with Kerberos environments.

9.5.3.4.5.1 Procedure

First, the Privilege Elevation script, dlp_x_db_exec, must be created and uploaded onto the Delphix Continuous Data Engine. Then, the non-privileged OS user must be granted the appropriate permissions.

Upload the privilege elevation script.

Perform one of the following methods to upload the privilege elevation script:

a) CURL file upload method

Before running any of the following commands, update <CONTINUOUS-DATA-FQDN-or-IP>, <USERNAME>, and <PASSWORD> placeholder values.

1. Create a session with the Delphix Continuous Data Engine.
 - a. Also, update the version values for the `major`, `minor`, and `micro` fields.
 - i. The correct values for your Delphix Continuous Data Engine version can be found in the [API version information](#) (see page 2784).

```

curl -i -c cookies.txt -X POST -H "Content-Type:application/json"
https://<CONTINUOUS-DATA-FQDN-or-IP>/resources/json/delphix/
session -d '{
  "version":{
    "major":1,
    "minor":11,
    "micro": 5,
    "type":"APIVersion"
  },
  "type":"APISession"
}'

```

2. Login to Delphix Continuous Data Engine as the `admin` user.

```

curl -i -c cookies.txt -b cookies.txt -X POST -H "Content-Type:application/
json" https://<CONTINUOUS-DATA-FQDN-or-IP>/resources/json/delphix/login -d '{

```

```
"username": "<USERNAME>",
"password": "<PASSWORD>",
"type": "LoginRequest",
"target": "DOMAIN"
}'
```

3. Copy `DLPX_DB_EXEC` contents to the Delphix Continuous Data Engine.

```
curl -i -b cookies.txt -X POST -H "Content-Type:application/json" https://
<CONTINUOUS-DATA-FQDN-or-IP>/resources/json/delphix/host/privilegeElevation/
profileScript/HOST_PRIVILEGE_ELEVATION_PROFILE_SCRIPT-7 -d '{"type":
"HostPrivilegeElevationProfileScript","contents": "#\n# Copyright (c) 2017 by
Delphix. All rights reserved.\n#\n#\n#\n# This script allows customization of
command execution with an alternate user\n# account.\n# Arg $1 contains \"-
u<optional user account>\" for the desired user under\n# which database
commands will be executed.\n# By default this argument is ignored and the
script is executed as the default\n# account.\n#\n#\nif [[ $1 != -u* ]]; then\n
echo \"Incorrect command line paramaters, -u<optional user account> is required
as the first parameter\"\n    exit 1\nfi\nuser_id=`echo $1 | sed -e \"s/^\n-
u/\n`\necho \"$user_id\" >> /tmp/test.log\nshift 1\n#echo \"$user_id and
$DB2_DB_NAME\" >> /tmp/test.log\nif [ -z $user_id ]; then\n\"$@\n\"\nelif
[[ $user_id != \"delphix_os\" ]]; then\ncommand=$(printf \"%s \" \"$@\n\")\nsudo
su - $user_id -c \"cd /home/delphix_os;export DB2DBDFT=$DB2DBDFT;
$command\"\nelse\n\"$@\nfi"}'
```

If the `dplx_db_exec` script is updated after the environment(s) is added, refresh the environment to propagate the changes.

b) CLI Method

For steps on creating a privilege elevation profile, refer to [CLI Cookbook: How to create or edit privilege elevation profiles and profile scripts](#) (see page 2624).

9.5.3.4.5.2 Configure sudo privileges to grant privilege elevation

With privilege elevation, all IBM Db2 connector commands are run via the `dplx_db_exec` script with the first parameter being the user to execute, and the remaining parameters being the command to execute and within this script, the commands are run using 'sudo'(or some other custom elevation utility). This script may be customized by the end user, but it must always return the results of the executed command and exit with the return code from the executed command.

When a command is invoked with `dplx_db_exec`, instance IDs that were discovered during the discovery phase will be passed to the script. All Db2 changes are based on top of the Db2 DB level changes.

To execute the connector commands as the high-privileged OS user, sudoers entries are required.

To add additional sudoers entries you need to edit the `/etc/sudoers` file. Run the following commands to open the `sudoers` file:

```
vi /etc/sudoers
# or
visudo
```

 Third party tools like `visudo`, can be helpful in minimizing syntax errors.

Entries required for both linking and provisioning via low-privileged user (delphix_os):

```
Defaults:delphix_os !requiretty
delphix_os ALL=(ALL) NOPASSWD: /bin/mkdir, /bin/rmdir, /bin/mount, /bin/umount
delphix_os ALL=(ALL) NOPASSWD: ALL
```

The dlp_x_db_exec script

The formatted `dlpx_db_exec` script is presented here for completeness.

```
# This script allows customization of command execution with an alternate user
account.

# Arg $1 contains "-u<optional user account>" for the desired user under
# which database commands will be executed.

# By default this argument is ignored and the script is executed as the default
# account.

if [[ $1 != -u* ]]; then
echo "Incorrect command line parameters, -u<optional user account> is required as the
first parameter"
exit 1
fi

user_id=`echo $1 | sed -e "s/^-u//"`
echo "$user_id" >> /tmp/test.log
shift 1
echo "$user_id and $DB2_DB_NAME" >> /tmp/test.log
if [ -z $user_id ]; then
$@
elif [[ $user_id != "delphix_os" ]]; then
command=$(printf "%s " "$@")
sudo su - $user_id -c "cd /home/delphix_os;export DB2DBDFT=$DB2DBDFT;$command"
```

```
else
```

```
$@
```

```
fi
```

9.5.4 IBM Db2 installation and upgrade

The IBM Db2 connector is managed through the Delphix Continuous Data Engine's plugin framework. Plugins are distributed separately from the Delphix Continuous Data Engine. The plugin must be installed before IBM Db2 environments can be added, and before attempting any IBM Db2 virtualization operations.

9.5.4.1 Downloading the connector

Perform the following steps to download the IBM Db2 connector to your desktop system.

1. Log in to the [Delphix download portal](#)³⁸⁶ using your credentials from the Delphix support portal.
2. Select **Delphix Product Release > Continuous Data Connectors** and choose [IBM Db2 folder](#)³⁸⁷.
3. Locate the desired version of the plugin you need, and download the corresponding .zip file. The file format should appear as follows: `Plugin_DB2_<version>.zip`.
4. After the download is complete, extract the contents of the downloaded .zip file to obtain a JSON file. For example, `db2db.json`.

9.5.4.2 Installing the connector

Perform the following steps to upload and install a new connector.

1. Log in to the **Delphix Management application**.
2. Navigate to the **Manage > Plugins** page.
3. To upload a plugin, click the plus icon. This action displays a **Upload or Upgrade a Plugin** dialog window.
4. Browse to the JSON file on your desktop which you downloaded and extracted in the previous step.
5. Upload the downloaded JSON (for example, `db2db.json`) file.
6. Once the upload is complete, close the popup window and proceed with adding the environment.

³⁸⁶ <https://download.delphix.com/>

³⁸⁷ <https://download.delphix.com/folder/5353/Delphix%20Product%20Releases/Continuous%20Data%20Connectors/IBM%20Db2>

Upload or Upgrade a Plugin ✕

Upload a plugin file to add new plugins in this engine or to upgrade an existing one. Only JSON formatted text files may be uploaded.

For more information, refer to the [Delphix Continuous Data Engine connector management](#)³⁸⁸ section.

9.5.4.3 Upgrading the connector

Users must upgrade their connectors to use new features and apply bug fixes.

Connectors are not upgraded through engine upgrades. However, some connector upgrades are only compatible with a minimum Delphix Continuous Data Engine version. Please ensure your engine is upgraded to a compatible version before upgrading the connector. For full compatibility details, refer to the [IBM Db2 support matrix](#)³⁸⁹.

Perform the following process to upgrade your IBM Db2 connector to a later version.

Since v4.0.0, connector upgrades have been streamlined. However, skipping a version upgrade step before then may lead to configuration issues. If upgrading from a pre-v4.0.0, follow the [Upgrade matrix \(see page 0\)](#) instructions closely.

9.5.4.3.1 Upgrade process

Perform the following steps when upgrading your IBM Db2 connector.

1. Disable all IBM Db2 dSources and VDBs. (Only required for IBM Db2 connector versions lower than v4.0.0).

³⁸⁸ <https://cd.delphix.com/docs/latest/delphix-engine-plugin-management>

³⁸⁹ <https://cd.delphix.com/docs/latest/ibm-db2-support-matrix>

Note: Consult the [Upgrade matrix](#) (see page 1257) instructions for more details.

2. Upload the newer connector version into the Delphix Continuous Data Engine. For more information, refer to the [Installing the IBM Db2 connector](#)³⁹⁰ documentation.
3. Refresh all the associated IBM Db2 environments to trigger the discovery workflow. Verify that the workflow is completed.
4. Enable dSources and VDBs, if disabled, and create new dSource and VDB snapshots.
5. Review the newly created snapshot's metadata for the new plugin version to confirm the upgrade was successful.

9.5.4.3.2 Upgrade matrix

This section lists IBM Db2 connector versions that a user can upgrade from and to.

You must adhere to the following upgrade considerations. Ignoring the below upgrade matrix may result in incompatible IBM Db2 data sources.

- It is mandatory to upgrade to the v3.1.1 version of the IBM Db2 connector and then upgrade to v4.0.0. of the IBM Db2 connector.
- After upgrading to v4.0.0, you may upgrade directly to any higher version.

Follow the matrix below to avoid connector corruption:

Your installed version	Required upgrade path	dSource and VDB Downtime Required?
v3.0.0 v3.0.1 v3.0.2	Upgrade to v3.1.0.	Yes
v3.1.0	Upgrade to v3.1.1	Yes
v3.1.1	Upgrade to v4.0.0.	Yes
v4.0.0+ (vSDK)	Upgrade to any more recently released version.	No

9.5.5 IBM Db2 connector operations

To successfully ingest and virtualize a IBM Db2 instance, you must perform the following connector operations in sequence:

- [Discovering IBM Db2 installations \(see page 1261\)](#)
- [Linking IBM Db2 data sources \(see page 1266\)](#)
- [Provisioning IBM Db2 virtual databases \(see page 1290\)](#)

9.5.5.1 Discovering IBM Db2 installations

Discovery is a process that allows the IBM Db2 connector to gather information about the IBM Db2 installation details in an environment. The database's discovery occurs during the environment creation or refresh operations.

Whenever there is any modification, such as installing a new database home to an environment, it is necessary to perform an environment refresh operation.

9.5.5.1.1 Prerequisites for discovery operation

The following requirements must be met before starting the discovery process.

When you add or refresh an environment to Delphix Continuous Data Engine, the IBM Db2 connector will automatically perform a discovery of all the IBM Db2 installed binaries on the server.

1. Install the IBM Db2 connector.
2. The environment user must be able to execute the `db2` command.
3. Verify environment and host compatibility with Delphix Continuous Data Engine and IBM Db2. For more information on the procedure, refer to the [Host Checker documentation](#) (see page 618).

9.5.5.1.2 Adding an IBM Db2 environment

This topic describes the process of adding IBM Db2 staging and target environment.

9.5.5.1.2.1 Prerequisites

To set up an IBM Db2 staging environment, ensure all the essential requirements as described in [Requirements and Prerequisites](#) (see page 1234) are met.

In addition, we recommend verifying environment and host compatibility with Delphix Continuous Data using the Host Checker tool. You can learn more about this in the [Host Checker](#) (see page 1071) section.

9.5.5.1.2.2 Procedure

Perform the following steps to add an environment to the Delphix Continuous Data Engine:

1. Login to the **Delphix Management** application.
2. Navigate to the **Manage > Environments** page.
3. Click the **Actions** menu and select **Add Environment**.
4. From the **Add Environment** dialog window, select **Unix/Linux**.
5. Select **Standalone Host**.
6. Click **Next**.
7. Provide the name of the environment.

8. Provide the **Host IP address** or **host FQDN**.
9. Provide the **SSH port**. The default value is 22.
10. Choose the **Login Type** that fits your setup.
 - a. **Username and Password** – provide the OS username and password.
 - b. **Username and Engine Public Key** – provide the OS username.
 - c. **Username and Custom Key Pair** - provide the OS username.
 - d. **Password Vault** – select from an existing Enterprise Password Vault.
11. Based on your **Login Type**, authenticate the environment by following the directions below:
 - a. For **Login Type** 'Username and Password', enter the password associated with the user in step 11.
 - b. For **Login Type** 'Username and Engine Public Key',
 - i. Enter the **OS username**.
 - ii. Click **View Public Key**.
 - iii. Copy the public key that is displayed, and append it to the end of your `~/.ssh/authorized_keys` file. If this file does not exist, it must be created. **Note:** If you want to use public-key authentication for logging into your Unix-based environment, you have two options:
 - Use the Delphix Continuous Data Engine's key pair. For more information on how to use the Delphix Continuous Data Engine's key pair, refer to the [How to use the Continuous Data Engine's key-pair](#) (see page 1308) section.
 - Provide a key pair for this environment. As an alternative, a key pair specific for this environment can be provided via the API or CLI. For instructions, refer to [CLI Cookbook: Setting up SSH key authentication for UNIX environment users](#) (see page 2579).
 - iv. For **Login Type** 'Username and Custom Key Pair':
 1. Enter the **OS username**.
 2. Provide **Private Key** for the environment.
 3. Provide **Public Key** for the environment.

Provide a Custom key pair for this environment. This key pair is specific for the environment and can be provided via the API or CLI as well. For instructions, refer to [CLI Cookbook: Setting up SSH key authentication for UNIX environment users](#) (see page 2579).

- The addition of the public key is a one-time requirement per user and per environment. Additionally, you have the option to add public key authentication to an environment user's profile via CLI (for details, refer to the [CLI Cookbook: Setting up SSH key authentication for UNIX environment users](#) (see page 2579) topic).

- If you intend to use a low-privileged OS user, ensure that you have fulfilled the [Prerequisites for Privilege Elevation using DLPX_DB_EXEC Script](#). (see page 1846)

12. Enter **Toolkit Path** (ensure that the toolkit path does not have any spaces).
13. Click on **Validate** to verify the user Credentials.
14. To provide your own Oracle Java Development Kit, select the **Provide my own JDK** checkbox and click **Next**.
 - a. On the Java Development Kit page, provide an absolute path to your Oracle JDK and click **Next**.
15. Review the environment configuration **Summary** and click **Submit**.

After successfully adding and discovering the environment, you should be able to view the newly added environment listed under the Environments tab. In case it does not appear, click the refresh icon in your browser.

After the environment has been successfully added to the Delphix Continuous Data Engine, you should be able to see all the discovered repositories under the **Databases** tab.

Perform the following steps to access the information about any environment you have created:

1. Navigate to **Manage > Environments**.
2. Select the environment name.

9.5.5.1.3 Adding an IBM Db2 installation

If you have added a new IBM Db2 Installation to your environment and want it to be reflected in the Delphix Continuous Data Engine UI, you must refresh the environment. For more information, refer to the "Environment Refresh" section on the [Environment management](#) (see page 1050) page.

9.5.5.1.4 Adding IBM Db2 environment users

All Db2 Delphix Continuous Data Engine operations such as linking, snapshot, and provisioning always occur on the database level. As a result, we require that any DB2 instance that you wish to use either as staging or target must have its associated instance owner added as an environment user to the host within the Delphix Continuous Data Engine. Perform the following steps to add each IBM DB2 instance owner you use on the host.

It is important to note that Delphix Continuous Data Engine will not create new instances on the host and can only use existing DB2 instances that it finds on the host machine.

9.5.5.1.4.1 Procedure

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click on the existing environment name you want to modify and open the environment information screen.
5. In the **Details** tab, click the Plus icon located next to **Environment users**.
6. Enter the **Username** and **Password** of the user.
7. Click on **Validate** to verify the user credentials
8. Click on **Add** to add the environment user.
9. To change the primary user for this environment, click the Star icon next to Environment Users. Only the primary user will be used for environment discovery.
10. To delete a user, click the Trash icon next to their username.

9.5.5.1.5 Environment-related IBM Db2 operations via CLI

There are many operations related to a Delphix Continuous Data Engine environment:

- Create/Discover
- Update
- Refresh
- Disable
- Enable
- Delete

CLI operations for each will appear below:

To discover an environment via CLI, log in to the Delphix Continuous Data Engine using the admin user account.

```
ssh admin@<CONTINUOUS-DATA-FQDN-or-IP>
```

9.5.5.1.5.1 Discovering the environment

Run the following commands to discover the environment.

```
environment
create
set hostEnvironment.name=rh88-stg
set hostParameters.host.address=rh88-stg.dlpxdc.co
set hostParameters.host.toolkitPath=/tmp
set primaryUser.name=delphix
set primaryUser.credential.password=delphix
commit
```

9.5.5.1.5.2 Updating the environment

Run the following commands to update the environment. The name of the environment can be updated from `rh88-stg` to `rh88-stg.dlpxdc.co` using the following command.

```
environment
select rh88-stg
update
set name=rh88-stg.dlpxdc.co
commit
```

9.5.5.1.5.3 Refreshing the environment

Run the following commands to refresh the environment.

```
environment
select rh88-stg.dlpxdc.co
refresh
commit
```

9.5.5.1.5.4 Disabling the environment

Run the following commands to disable the environment.

```
environment
select rh88-stg.dlpxdc.co
disable
commit
```

9.5.5.1.5.5 Enabling the environment

Run the following commands to enable the environment.

```
environment
select rh88-stg.dlpxdc.co

commit
```

9.5.5.1.5.6 Deleting the environment

Run the following commands to delete the environment.

```
environment
select rh88-stg.dlpxdc.co
delete
commit
```

9.5.5.2 Linking IBM Db2 data sources

The Delphix Continuous Data Engine provides various ingestion methods for linking the dSource from an IBM Db2 source database.

- [HADR \(see page 1266\)](#)
- [Backup only \(see page 1272\)](#)
- [Backup with archived logs \(see page 1274\)](#)
- [IBM Db2 staging push \(see page 1278\)](#)
- [Optional parameters \(see page 1281\)](#)
- [Take a IBM Db2 snapshot \(see page 1283\)](#)
- [Source sizing implementation for IBM Db2 dSource \(see page 1284\)](#)
- [IBM Db2 link operations via CLI \(see page 1286\)](#)

9.5.5.2.1 HADR

The following diagram demonstrates the architecture of the Delphix Continuous Data Engine support for the IBM Db2 database with HADR between the source and staging database. HADR ingestion type is supported only with non-partitioned databases and the terms staging and standby can be used interchangeably in this context.

9.5.5.2.1.1 Prerequisites

- Be sure that the source and staging instances meet the host requirements and the databases meet the container requirements described in the [requirements section](#) (see page 1234).³⁹¹
- The environment user or the privileged user must be able to run `mount`, `umount`, `mkdir` and `rmdir`.
- The Instance owner/user must have `dbadm` and `secadm` permission.
- The instance owner/user must have a common group with the primary/os user.

HADR single standby database

- The following database configuration settings must be set at the source:
 - `db2 update db cfg for <DB_NAME> using HADR_LOCAL_HOST <PRIMARY_IP> HADR_LOCAL_SVC <PRIMARY_PORT > immediate`
 - `db2 update db cfg for <DB_NAME> using HADR_REMOTE_HOST <STANDBY_IP> HADR_REMOTE_SVC <STANDBY_PORT> immediate`
 - `db2 update db cfg for <DB_NAME> using HADR_REMOTE_INST <STANDBY_INSTANCE_NAME> immediate`
 - `db2 update db cfg for <DB_NAME> using HADR_SYNCMODE SUPERASYNC immediate`
- If the database configuration parameter `LOGINDEXBUILD` is set to `OFF`, do the following:
 - `db2 update db cfg for <DB_NAME> using LOGINDEXBUILD ON`
 - Turn off all connections to the database and reactivate the database
- If the database configuration parameter `LOGARCHMETH1` is set to `OFF`, do the following:
 - `db2 update db cfg for <DB_NAME> using LOGARCHMETH1 XXXX` (must be a valid log archiving method)
 - Take an offline backup

³⁹¹ <https://docs.google.com/document/d/1cz2PZHJ62kRLjgQC6XgPLqBXklok6hoHtBVdzkLbkN0/edit#heading=h.ywjz4zydmkep>

- If LOGARCHMETH1 points to a third-party backup server (i.e. TSM or Netbackup) define LOGARCHMETH2 to disk
 - i. `db2 update db cfg for <DB_NAME> using LOGARCHMETH2 DISK:<full path to archive log directory>`
 - Log files in the directory must be available from the time of the backup until the restore has successfully completed on the dSource.
- `db2 start hadr on db <DB_NAME> as primary by force`
- Take a full online backup as defined in the "[How to take a full online backup of a db2 database](#)" (see [page 1308](#)) section.
- Record the following information, as it must be entered on the Delphix Continuous Data Engine while creating the dSource.
 - HADR Primary hostname
 - [HADR Primary SVC](#)³⁹²
 - [HADR Standby SVC](#)³⁹³ (auxiliary standby port)

HADR multiple standby databases

This assumes a single standby database HADR setup already exists. The existing standby will be referred to as the main standby. The new standby will be referred to as the auxiliary standby.

- The following database configuration settings must be set on the primary database:
 - `db2 update db cfg for <DB_NAME> using HADR_SYNCMODE <SYNC MODE> immediate -- set whichever sync mode you wish to use on your main standby .`
 - `db2 update db cfg for <DB_NAME> using HADR_TARGET_LIST "<MAIN_STANDBY_IP:MAIN_STANDBY_PORT|AUXILIARY_STANDBY_IP:AUXILIARY_STANDBY_PORT>" immediate`
 - You may have up to two auxiliary standbys defined and separated by a '|'. One of the auxiliary standbys must be the dSource.
- `db2 stop hadr on db <DB_NAME> .`
- `db2 start hadr on db <DB_NAME> as primary by force .`
- Take a full online backup as defined in the "[Backup Source Database](#) (see [page 1308](#))" section below. While this backup is running, you may continue with the next step.

[Best practices to follow while taking a backup](#) (see [page 1308](#)).

³⁹² <https://www.ibm.com/docs/en/db2/11.5?topic=parameters-hadr-local-svc-hadr-local-service-name>

³⁹³ <https://www.ibm.com/docs/en/db2/11.5?topic=parameters-hadr-remote-svc-hadr-remote-service-name>

- The following database configuration settings must be set on the existing main standby database:
 - `db2 update db cfg for <DB_NAME> using HADR_SYNCMODE <same mode as defined in 1.a above.> -- It must be the same value used for the primary database.`
 - `db2 update db cfg for <DB_NAME> using HADR_TARGET_LIST "<PRIMARY_IP:PRIMARY_PORT|MAIN_STANDBY_IP:MAIN_STANDBY_PORT>" .`
- `db2 stop hadr on db <DB_NAME> .`
- `db2 start hadr on db <DB_NAME> as standby .`
- Record the following information, as it must be entered on the Delphix Continuous Data Engine while creating the dSource (the auxiliary standby database):
 - HADR Primary hostname
 - HADR Primary SVC
 - HADR Standby SVC (auxiliary standby port)
 - `HADR_TARGET_LIST <PRIMARY_IP:PRIMARY_PORT | MAIN_STANDBY_IP:MAIN_STANDBY_PORT>`

Enable SSL for HADR

- Create a local keystore in a dedicated directory with suitable permissions on both the primary and standby instances, using the provided command. Ensure that the Db2 instance user grants 700 permissions to the directory, while for privileged elevation or low-privileged users, 750 permissions should be assigned to the directory.
 - `gsk8capicmd_64 -keydb -create -db <KEYSTORE_NAME> -pw <PASSWORD> -type pkcs12`

Note:

 - Use an extension like ".ps12," ".p12," or ".pfx" for the keystore file name.
 - Use `-stash` option to create a stash file at the same path as the keystore, with a file extension of `.sth` . At instance start-up, GSKit uses the stash file to obtain the password to the keystore.
- Update the database manager configuration for `SSL_SVR_KEYDB` and `SSL_SVR_STASH` (if the stash file is created) on both the primary and standby instances:
 - `db2 update dbm cfg using SSL_SVR_KEYDB <KEYSTORE_FILE_PATH>`
 - `db2 update dbm cfg using SSL_SVR_STASH <STASH_FILE_PATH>`

Note:

 - You must restart the instance to apply the configuration changes on both the primary and standby instances.
 - While it's possible to configure HADR with SSL without specifying the stash file, it's generally recommended to use the stash file to enhance security and automation. If

you decide not to use a stash file and do not specify the `SSL_SVR_STASH` parameter in the dbm cfg, you would be prompted to enter the password manually each time you start the Db2 instance. This can be done using the `db2start` command, and you will be prompted to enter the password.

- You must restart the instance to apply the configuration changes on both the primary and standby instances.
- You must add certificates on both the primary and standby instances. You can create a self-signed digital certificate or use a CA-signed certificate.
 - Create a self-signed digital certificate:
 - `gsk8capicmd_64 -cert -create -db <KEYSTORE_NAME> -pw <PASSWORD> -label <CERT_LABEL_NAME> -dn "CN=<COMMON_NAME>"`
 - CA-signed certificate:
 - `gsk8capicmd_64 -cert -import -db <CA_SIGN_CERT> -pw <CA_SIGN_CERT_PWD> -target <KEYSTORE_NAME> -target_pw <PASSWORD>`

Note: On the standby instance, use the label naming convention as `DB_NAME>_*_STANDBY`. If using CA signed certificate, rename the label based on a naming convention for the standby instance.
- Extract the respective certificate's public key to a certificate file on both the primary and standby instances:
 - `gsk8capicmd_64 -cert -extract -db <KEYSTORE_NAME> -pw <PASSWORD> -label <CERT_LABEL_NAME> -target <CERT_NAME>.crt`
- Share the extracted certificates between the primary and standby instances.
- Add the shared certificates to the Keystore on both the primary and standby instances:
 - `gsk8capicmd_64 -cert -add -db <KEYSTORE_NAME> -pw <PASSWORD> -label <CERT_LABEL_NAME> -file <CERT_NAME>`
- Check and confirm that the labels used for the certificates are present in both the primary and standby instance's keystore:
 - `gsk8capicmd_64 -cert -list -db <KEYSTORE_NAME> -pw <PASSWORD>`

9.5.5.2.1.2 Limitation

- All source, staging, and target environments must be on the same fix pack version.
- For HADR SSL/TLS, a local keystore of type "PKCS12" with either a password provided by the user or a stashed password is supported.

9.5.5.2.1.3 Procedure

1. Login to the **Delphix Management** application.

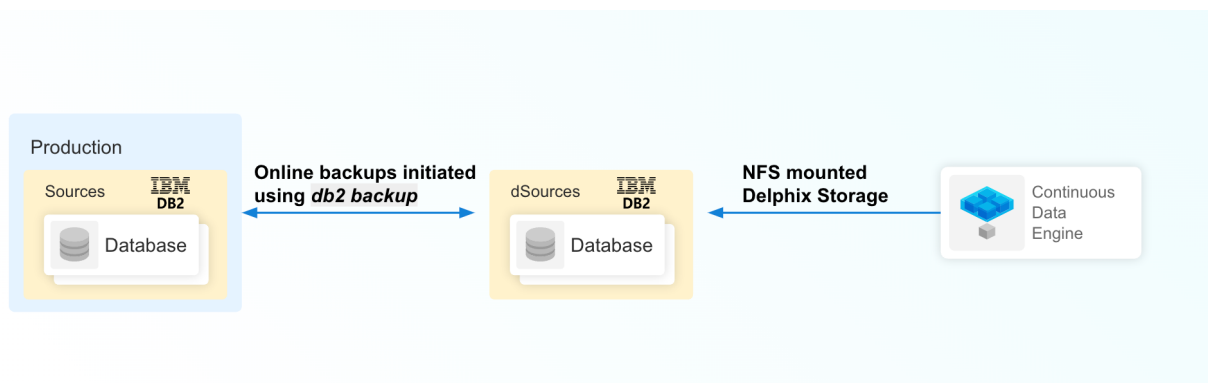

2. On the **Databases** tab of the Environment Management screen, [add a source config \(see page 1067\)](#) against the discovered staging instance.
3. Then, click **Manage** and select **Datasets**.
4. Click the **Plus (+)** icon and select **Add dSource**, you'll get a list of available source configs using which you can go for dSource creation.
5. In the **Add dSource** wizard, select the required source configuration.
6. Provide the Database Name.
7. Optionally, provide a custom mount base using the [Mount Base \(see page 1281\)](#) parameter.
8. Enter the complete **Backup Path** where the database backup file resides. If no value is entered, the default value used is the instance home directory. If there are multiple backup files for a non-DPF database on the backup path, the most current one will be used.
9. Optionally, provide multi-part backup using [Additional Backup Path \(see page 1281\)](#) parameter.
10. Optionally, you can add the [Parallelism factor for Database restore \(see page 1281\)](#) parameter.
11. Check the **Link against the source using HADR** checkbox. Selecting this checkbox reveals a collapsible group where the HADR-related details such as Primary hostname, service ports, target list and SSL/TLS related options that the end user wishes to configure HADR using SSL/TLS protocol.
12. If the dSource is set up to use **HADR** please enter the following fields. For more information about HADR please view [High Availability Disaster Recovery \(see page 1294\)](#) under IBM Db2 glossary.
 - a. Enter a fully qualified HADR Primary Hostname. This is a required field for HADR and must match the value set for `HADR_LOCAL_HOST` on the master.
 - b. Enter the port or `/etc/services` name for the HADR Primary SVC. This is a required field for HADR and uses the value set for `HADR_LOCAL_SVC` on the master.
 - c. Enter the port or `/etc/services` name for the HADR Standby SVC. This is a required field for HADR and uses the value set for `HADR_REMOTE_SVC` on the master.
13. If the dSource is to use HADR with SSL, check the **Configure SSL** checkbox under **HADR DETAILS**. If a stash file is not available, provide the password for Key Store.
14. Optionally, you can set the [database configuration \(see page 1281\)](#) parameters using Staging Database Configuration Settings.
15. Optionally, you can provide a bash script using the [Use Plugin Hooks \(see page 1281\)](#) parameter.
16. Click **Next**.
17. Enter a name and select a group for your dSource. Adding a dSource to a dataset group lets you set Delphix Domain user permissions for that database and its objects, such as snapshots. See the topics under [Users and Groups \(see page 688\)](#) for more information.
18. Click **Next** and set the **Staging Environment** to be the same as the dSource host. Select the **Staging Environment User** to be the same as the instance owner of the dSource instance.

Info: If you need to change or add an environment user for the dSource instance, follow the instructions [here \(see page 1264\)](#).

- a. Ensure that the Staging environment must be the environment that you have chosen to create the source config.
Select the **User** from the drop-down and set the **SNAPSHOT PARAMETERS** for the dSource snapshot.
 - i. Select **Resynchronize dSource** to resynchronize the dSource. This will force a non-incremental load of data from the source similar to when the dSource was created. This action avoids duplicating storage requirements and maintains a Timeflow history.
19. In the **Policies** tab, apply policy details to the dSource if needed, and then click **Next** to continue.
20. In the **Hooks** tab, select a Hook Point and then click **+** to add a script that you want to run at that hook point. You have the flexibility to define scripts to run at multiple hook points in the process.
21. In the **Summary** tab, review the configuration profile for your dSource.
22. Click **Submit**. The Continuous Data Engine will initiate two jobs, namely DB_Link and DB_Sync to create the dSource. You can monitor the progress of these jobs on the Running Actions section on the top right panel, or by navigating to **System > Jobs**. Upon successful completion of the jobs, the database icon will change to a dSource icon on the **Environments > Host > Databases** screen. The dSource will also be listed under Datasets within its assigned group.

9.5.5.2.2 Backup only

The following diagram demonstrates the architecture of the Delphix Continuous Data Engine support for the IBM Db2 database with full online backup-only ingestion between the source and staging database.

9.5.5.2.2.1 Prerequisites

- Be sure that the source and staging instances meet the host requirements and that the databases meet the container requirements described in the [Requirements and prerequisites \(see page 1234\)](#) section.
- The environment user or the privileged user must be able to run mount, unmount, mkdir, and rmdir.
- The Instance owner/user must have `dbadm` and `secadm` permissions.
- The instance owner/user must have a common group with the primary/os user.

9.5.5.2.2 Limitation

- You can not apply archived logs and rollforward to a given time.
- To update the database, you need to re-ingest with newer backup files.

9.5.5.2.3 Procedure

1. Login to the **Delphix Management** application.
2. On the **Databases** tab of the Environment Management screen, [add a source config \(see page 1067\)](#) against the discovered staging instance.
3. Then, click **Manage** and select **Datasets**.
4. Click the **Plus (+)** icon and select **Add dSource**, you'll get a list of available source configs using which you can go for dSource creation.
5. In the **Add dSource** wizard, select the required source configuration.
6. Provide the Database Name.
7. Optionally, provide a custom mount base using the [Mount Base \(see page 1281\)](#) parameter.
8. Enter the complete **Backup Path** where the database backup file resides. If no value is entered, the default value used is the instance home directory. If there are multiple backup files for a non-DPF database on the backup path, the most current one will be used. If there are multiple sets of backup files for a DPF database on the backup path, the most recent one will be used.
9. Optionally, provide multi-part backup using [Additional Backup Path \(see page 1281\)](#) parameter.
10. Optionally, you can add the [Parallelism factor for Database restore \(see page 1281\)](#) parameter.
11. Optionally, users can set the [database configuration \(see page 1281\)](#) parameters using Staging Database Configuration Settings.
12. Optionally, users can provide a bash script using the [Use Plugin Hooks \(see page 1281\)](#) parameter.
13. Click **Next**.
14. Enter a name and select a group for your dSource. Adding a dSource to a dataset group lets you set Delphix Domain user permissions for that database and its objects, such as snapshots. See the topics under [Users and Groups \(see page 688\)](#) for more information.
15. Click **Next** and set the **Staging Environment** to be the same as the dSource host. Select the **Staging Environment User** to be the same as the instance owner of the dSource instance.
Info: If you need to change or add an environment user for the dSource instance, follow the instructions [here \(see page 1264\)](#).

Ensure that the Staging environment must be the environment that you have chosen to create the source config.

Select the **User** from the drop-down and set the **SNAPSHOT PARAMETERS** for the dSource snapshot.

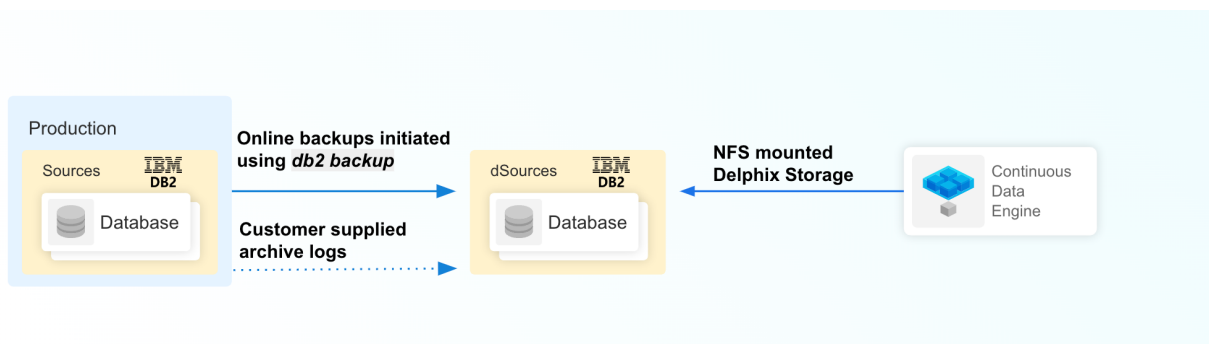

1. Select **Resynchronize dSource** to resynchronize the dSource. This will force a non-incremental load of data from the source similar to when the dSource was created. This action avoids duplicating storage requirements and maintains a Timeflow history.

16. In the **Policies** tab, apply policy details to the dSource if needed, and then click **Next** to continue.
17. In the **Hooks** tab, select a Hook Point and then click **+** to add a script that you want to run at that hook point. You have the flexibility to define scripts to run at multiple hook points in the process.
18. In the **Summary** tab, review the configuration profile for your dSource.
19. Click **Submit**. The Continuous Data Engine will initiate two jobs, namely DB_Link and DB_Sync to create the dSource. You can monitor the progress of these jobs on the Running Actions section on the top right panel, or by navigating to **System > Jobs**. Upon successful completion of the jobs, the database icon will change to a dSource icon on the **Environments > Host > Databases** screen. The dSource will also be listed under Datasets within its assigned group.

9.5.5.2.3 Backup with archived logs

The following diagram demonstrates the architecture of the Delphix Continuous Data Engine support for the IBM Db2 database with full online backup with end user-supplied archive logs ingestion between source and staging database.

With archived logs, either the database can be roll forwarded to the current time or to a specific point in time using the Rollforward to PIT (RFPIT) checkbox during ingestion. In case DPF is enabled, you need to place archive logs inside a folder with a name as NODE<Partition number> where <Partition number> is a four-digit number. For example, if the source environment has two partitions, then the user-provided log path will have folder names NODE0000 and NODE0001. Both these folders will have respective archive logs. Snapshot operation will be used to apply the archive logs.

9.5.5.2.3.1 Prerequisites

- Be sure that the source and staging instances meet the host requirements and the databases meet the container requirements described in the [requirements section](#). (see page 1234)
- The environment user or the privileged user must be able to run mount, unmount, mkdir, and rmdir.
- The Instance owner/user must have `dbadm` and `secadm` permissions.
- The instance owner/user must have a common group with the primary/os user.
- A full backup must be accessible on the staging server, it could be a shared location but must be mounted on the staging host and visible as a file system.
- Archived logs must also be accessible on the staging server
 - The following command can be used to generate archive logs from the source database.
 - i. `db2 archive log for database <database name>`
 - Instance users must have read permissions on logs so that Delphix-managed recovery can apply the logs.
 - Instance users must have read permissions on logs and additional write permissions on end user-provided log locations if the Delphix Continuous Data Engine is planning to use end user-provided log locations for applying the logs.
 - If the user has placed the archive logs at a user-provided log location, then the logs must be valid and the first active log of the staging database must be present in the user-provided log location.
- If the database configuration parameter `LOGINDEXBUILD` is set to `OFF`, do the following:
 - `update db cfg for <DB_NAME> using LOGINDEXBUILD ON`
 - Force off all connections to the database and reactivate the database.
- The end user does log purging from the provided log location. Delphix Continuous Data Engine only provides the list of logs that are eligible for purging.

9.5.5.2.3.2 Limitation

- Continuous updates to the dSource are not available. The snapsync operations apply new logs from the log location and keep the dSource updated with changes on the source.
- Read access to the staging database is not available.
- RFPIT timestamp is supported only with UTC timezone. If no time zone is provided, a local time zone will be applied.

9.5.5.2.3.3 Procedure

1. Login to the **Delphix Management** application.
2. On the **Databases** tab of the Environment Management screen, [add a source config](#) (see page 1067) against the discovered staging instance.
3. Then, click **Manage** and select **Datasets**.

4. Click the **Plus (+)** icon and select **Add dSource**, you'll get a list of available source configs using which you can go for dSource creation.
5. In the **Add dSource** wizard, select the required source configuration.
6. Provide the Database Name.
7. Optionally, provide a custom mount base using the **Mount Base** (see page 1272) parameter.
8. Enter the complete **Backup Path** where the database backup file resides. If no value is entered, the default value used is the instance home directory. If there are multiple backup files for a non-DPF database on the backup path, the most current one will be used. If there are multiple sets of backup files for a DPF database on the backup path, the most recent one will be used.
9. Optionally, provide multi-part backup using **Additional Backup Path** (see page 2653).
10. Optionally, you can add the **Parallelism factor for Database restore** (see page 1281).
11. If you want to roll forward a snapshot to a user-specified timestamp, then you must select the **Rollforward to PIT** checkbox. You can also manually do this through the snapshot option. This option is visible only if you have selected the Archive logs checkbox since DB2 requires archive logs to rollforward to a specific timestamp.
Info: The user-specified timestamp needs to be provided along with the timezone. For example, 2021-11-14-04.15.00 **UTC**. If the timezone is not entered, then the user's local timezone is applied.
12. If you are using **Archive Logs** for dSource creation complete the following fields:
 - a. Check the **Archive logs** checkbox.
 - b. Provide the log location of the archive logs. In this location, you can supply load copy files by appending schema and table name to it so that connector can process those load copy files during the rollforward process. Archive logs will be used for applying the logs during the snapshot operation. This location must be a part of the staging server and this location must be different from a full backup location.

- c. The **Archive Log Location is READ ONLY**(default) option indicates whether Delphix should copy the log files to the dSource's file system prior to the log apply process. If this is not

selected the staging database will read the log files directly from the user-provided log location and perform the log apply operation.

Note:

- (Special considerations for Archive Log Location is READ ONLY) If this operation is performed on the source database and the user wants the Connector to process the load files, place the load copy files in your location and append the schema and table names (for example: <DB Name>.<Number>.<Instance>.DBPART<partNumber>.<Timestamp>.001.<schema name>.<table name>) to the load copy file names. If you do not want to process load copy files via the Connector place the load copy files in a similar structure as it is on the source or set a DB2 registry parameter `DB2LOADREC` .
- Special consideration during dSource upgrade from older version connector to Archive Logs feature enabled connector. Suppose you have a dSource with an older version of the connector and now you want to upgrade that dSource to **Archive Logs** feature, then you need to perform the following steps :
 1. Go to the configuration tab of dSource and then click on the custom sub-tab.
 2. Click on the edit icon.
 3. Check the **Archive Logs** and **Archive Log Location is the READ ONLY** checkbox.

13. Click on submit and then go for RESYNC operation to upgrade the dSource.
14. Optionally, you can set the **database configuration** (see page 1281) parameters using Staging Database Configuration Settings.
15. Optionally, users can provide a bash script using the **Use Plugin Hooks** (see page 1281) parameter.
16. Click **Next**.
17. Enter a name and select a group for your dSource. Adding a dSource to a dataset group lets you set Delphix Domain user permissions for that database and its objects, such as snapshots. See the topics under **Users and Groups** (see page 688) for more information.
18. Click **Next** and set the **Staging Environment** to be the same as the dSource host. Select the **Staging Environment User** to be the same as the instance owner of the dSource instance.
Info: If you need to change or add an environment user for the dSource instance, follow the instructions [here](#) (see page 1264).

Ensure that the staging environment must be the environment that you have chosen to create the source config.

Select the **User** from the drop-down and set the **SNAPSHOT PARAMETERS** for the dSource snapshot.

1. Click on the **Timestamp** input field to enter the timestamp at which the snapshot will be taken.
The user-specified timestamp needs to be provided along with the timezone in YYYY-MM-DD-HH.MM.SS format. For example, 2022-03-12-04.15.00**UTC**. If the timezone is not entered, then the user's local timezone is considered.
Providing the timestamp will only work if the user has checked the **Rollforward to PIT** option.
2. Select **Resynchronize dSource** to resynchronize the dSource. This will force a non-incremental load of data from the source similar to when the dSource was created. This action avoids duplicating storage requirements and maintains a Timeflow history.

19. In the **Policies** tab, apply policy details to the dSource if needed, and then click **Next** to continue.
20. In the **Hooks** tab, select a Hook Point and then click **+** to add a script that you want to run at that hook point. You have the flexibility to define scripts to run at multiple hook points in the process.
21. In the **Summary** tab, review the configuration profile for your dSource.
22. Click **Submit**. The Delphix Continuous Data Engine will initiate two jobs, namely DB_Link and DB_Sync to create the dSource. You can monitor the progress of these jobs on the Running Actions section on the top right panel, or by navigating to **System > Jobs**. Upon successful completion of the jobs, the database icon will change to a dSource icon on the **Environments > Host > Databases** screen. The dSource will also be listed under Datasets within its assigned group.

9.5.5.2.4 IBM Db2 staging push

The staging push transfers the responsibility of preparing the staging database to the end user. This ingestion method allows you to manually push the source data into the mount path backed by the Delphix Continuous Data Engine storage. It offers an alternative approach to the staging pull model where the Delphix Continuous Data Engine takes care of preparing the staging database.

The Delphix appliance provides storage savings via combination of compression and storing new data by only writing file system blocks that are different from the current blocks. For Staging Push, Delphix operates, not at the file level, but file system level. Anything updating data on the filesystem would need to leave unchanged blocks untouched in the same place and apply updates by modifying or appending existing files. For this reason, it is recommended to choose a data synchronization method that leaves datafiles in place and only modifies or appends them. If a data synchronization method is used which effectively recreate the datafiles, then even if the bulk of the data is unchanged, unless written to the exact same block offset on the filesystem (there is no way to guarantee that when creating new files), it is going to appear as new data to the Delphix appliance and data deduplication is going to be less effective and the results extremely variable in terms of storage impact.

9.5.5.2.4.1 Backups for staging push ingestion

Although the method used for pushing the source data into the mount point can be completely your choice, there are a few limitations when it comes to the type of backups used for the ingestion. The backups will have to be online backups since Delphix Continuous Data Engine relies on the archive logs to rollforward the database to specific timestamps and offline backups can be created by databases running circular logging rather than an archive logging mechanism.

The staging push ingestion method has been verified with the following mechanisms for both DPF and non-DPF databases:

- Backups Only with rollforward to MRT (Minimum Recovery Time)
- Backups with Archive logs (Rollforward to PIT)
- HADR (Only for non-DPF databases)

The first snapshot created will be an empty directory and doesn't contain any database and hence a VDB cannot be provisioned using this VDB.

Prerequisites

Ensure that you meet the following requirements before you begin creating a dSource.

- The environment requirements are met by the source and staging environments as described [Requirements for staging/target environments](#). (see page 1245)
- To use privilege elevation, you must meet the [Privilege elevation requirements](#) (see page 1245).

For more information, refer to [Requirements and Prerequisites](#) (see page 1234).

Limitation

- You cannot rollforward the staging database to the end of logs.

Procedure

Perform the following steps to create a dSource using the staging push ingestion method.

1. Login to the **Delphix Management** application.
2. Navigate to the **Manage > Environments** page.
3. On the **Databases** tab, choose a repository for your dSource and click the plus icon.
4. In the **Add Database** dialog window, provide the **name** of your source configuration and click **Add**.
5. Select your source configuration and click the **Add dSource** link located on the right.
6. In the **Source** tab, do the following:
 - a. Provide the database name.

- b. Select the **Use Staging Push** checkbox. To use the Database partition feature along with staging push also check the Use DPF checkbox.
 - c. Click **Next**.
7. In the **dSource Configuration** tab, provide a dSource name and then select a group for your dSource. Adding a dSource to a dataset group allows you to manage user permissions for that database and its objects, including snapshots. For more information, refer to the topics under [Users and Groups](#) (see [page 688](#)).
8. In the **Data Management** tab, specify your staging environment, user, and snapshot parameters. Select the **Resynchronize dSource** checkbox if you want to resynchronize the dSource. This operation will force a non-incremental load of data from the source. This operation is similar to creating a new dSource but prevents duplication of the storage requirements and maintains timeflow history. Click **Next** to proceed.
9. In the **Policies** tab, apply policy details to the dSource if needed, and then click **Next** to continue.
10. In the **Hooks** tab, select a Hook Point and then click **+** to add a script that you want to run at that hook point. You have the flexibility to define scripts to run at multiple hook points in the process.
11. In the **Summary** tab, review the configuration profile for your dSource.
12. Click **Submit**. The Continuous Data Engine will initiate two jobs, namely DB_Link and DB_Sync to create the dSource. You can monitor the progress of these jobs on the **Running Actions** section on the top right panel or by navigating to **System > Jobs**. Upon successful completion of the jobs, the database icon will change to a dSource icon on the **Environments > Host > Databases** screen. The dSource will also be listed under Datasets within its assigned group.
13. Look in connector logs generated at `<toolkit path>/Delphix_COMMON_<long id>/plugin/DB2_18f4ff11-b758-4bf2-9a37-719a22f5a4b8/logs/<instance_name>/<database_name>.diag.log` and follow the steps mentioned under Steps to restore and rollforward the staging database to restore and rollforward the database and bring the database to a consistent state.
14. Once the database has been restored and rollforwarded to a specific point in time, take a snapshot of the dSource as explained [here](#) (see [page 1283](#)).

9.5.5.2.4.2 Staging push with HADR

Staging push ingestion can also be used along with HADR to make sure the staging database is always in sync with the source database. The advantage of this method is that the user doesn't have to provide the path to archive logs and run rollforward commands manually. Instead, the staging database starts syncing with the source database once it is connected to the source database by following the steps provided in [here](#). (see [page 1266](#))

Prerequisites

Ensure that you meet the following requirements before you begin creating a dSource.

- The environment requirements are met by the source and staging environments as described [Requirements for staging/target environments](#). (see [page 1245](#))

- To use privilege elevation, you must meet the [Privilege elevation requirements](#) (see page 1245).

For more information, refer to [Requirements and prerequisites](#) (see page 1234).

Limitations

- HADR configuration should be set at source and staging manually
- You need to stop HADR on the staging database before performing any operation on the dsource.

Procedure

1. Create staging push dSource as described in Procedure above.
2. Set up HADR configuration at source and staging as mentioned [here](#).³⁹⁴
3. Start HADR on source followed by staging:
 - a. For Source: `db2 start hadr on db <DB_NAME> as primary by force .`
 - b. For staging: `db2 start hadr on db <DB_NAME> as standby .`
4. Once the logsync is complete or satisfactory between the source and staging or when the customer is ready to take a snapshot, HADR needs to be stopped in standby by running:
 - a. `db2 deactivate db <DB_NAME>`
 - b. `db2 stop hadr on db <DB_NAME>`

The logsync between primary (production) and staging can be verified by running `db2pd -hadr` on the staging host and looking for the parameter “HADR_CONNECT_STATUS” and “HADR_LOG_GAP”.

5. Take a snapshot of the the dSource by following the steps [here](#) (see page 1283).

9.5.5.2.5 Optional parameters

9.5.5.2.5.1 Custom mount base

Users can specify their own mount path to host the dSource dataset by specifying the base path in the **Mount Base** field. Make sure this path exists on the staging host.

³⁹⁴ <https://delphixdocs.atlassian.net/wiki/spaces/CD/pages/31443272/14.0.0.0+Linking+a+Db2+dSource>

9.5.5.2.5.2 Additional backup paths

Once the Backup path is entered, a new field will pop up below the Backup path namely the **Additional Backup path** where you can provide multiple backup paths if the backup is split into multiple filesystems during the backup operation.

Parallelism factor for database restore

Optionally, you can add the **Parallelism factor for Database restore** to provide the degree of parallelization to run the database restore operation. If no value is entered, the IBM Db2 connector inherently assigns a parallelism factor.

- Parallelism factor depends on the resources provided on the staging host; users may not see any difference in performance if there aren't enough resources for the IBM Db2 connector to implement the parallelism.
- You can provide any positive integer value for the parallelism factor. IBM Db2 connector will provide that level of parallelism given that the system has appropriate resources to offer.
- Parallelism factor is inversely proportional to the Database restore time, which implies that a higher parallelism factor will result in reduced restoration time.
- For optimal performance during restoration, make sure to provide the same parallelism factor while creating the backups.

Config Settings

Optionally, you can set the database configuration parameters during the linking operation in the **Config Settings** section. For example `DATABASE_MEMORY` , `LOGFILSIZ` .

Connector defined hooks

Optionally, users can provide a bash script as a connector-defined hook. Delphix Continuous Data Engine has two connector managed Hooks:

- **Plugin Pre-Restore Hook:** The bash script entered in this field will get executed before restoration. This hook is useful in such cases where the users want to prepare the full backup before the restore operation.
- **Plugin Post-Restore Hook:** The bash script entered in this field will get executed after completion of the restore operation. This hook is useful in such cases where the user wants to purge the full backup file after the restore operation.

Plugin-managed pre-Hook - You can copy the required full backup file from some remote location to the staging host. Below is an example of such a bash script (the name of the below script is copyBackup.sh)

```
#!/bin/bash
```

```
# Copying backup file from a remote host remote.delphix.com
scp auto1051@remote.delphix.com:/backuplocation/R74D105A.0.auto1051.DBPART000.20180510073639.001 /db2backup/
```

The user can provide the above script in Plugin managed pre-Hook field as "sh copyBackup.sh"

2. Plugin managed post-Hook – User can purge the full backup file from the staging host. Below is an example of such bash script (name of below script is purgeBackup.sh)

```
#!/bin/bash
```

```
# Purging full backup file from staging host for saving the staging storage
rm -f /db2backup/R74D105A.0.auto1051.DBPART000.20180510073639.001
```

The user can provide the above script in Plugin managed post-Hook field as "sh purgeBackup.sh"

9.5.5.2.6 Take a IBM Db2 snapshot

Taking a snapshot creates a new snapshot entry in the dSource's Timeflow. The staging pull dSource allows you to select the parameters before taking the snapshot. These parameters are provided as input to the snapshot operation. The default snapshot operation uses parameters defined in the dSource environment.

9.5.5.2.6.1 Snapshot (Default)

This section lists the steps to take a snapshot and delete the same.

1. Login to the **Delphix Management** application.
2. Click **Manage** and select **Datasets** from the dropdown list.
3. Select the dSource you want to Snapshot.
4. Click the **Camera** icon. Alternatively, click the arrow next to the Camera icon and select **Snapshot (default)**.
5. From the Snapshot dialog prompt, click on **Yes**.
6. Click **View:** under **Timeflow** to verify the Snapshot you just created.
7. To delete, select the snapshot you just created, and from the Actions menu (...) select **Delete Snapshot**.
8. In the Delete Snapshot dialog, select **Delete**.
9. Click **View:** under **Timeflow** to verify the Snapshot, you just deleted.

9.5.5.2.6.2 Snapshot (with params)

1. Login to the **Delphix Management** application.
2. Click **Manage** and select **Datasets** from the dropdown list.
3. Select the dSource you want to Snapshot.
4. Click the arrow next to the Camera icon and select **Snapshot with Params...**
5. From the Snapshot dialog provide the required options and select **Perform Snapshot**.
 - a. Provide **Timestamp**, when the database needs to be rollforwarded to a specific timestamp
 - b. Select the **Resynchronize the dSource** checkbox when the database needs to be resynced.
6. Click **View:** under **Timeflow** to verify the Snapshot you just created.
7. To delete, select the snapshot you just created, and from the Actions menu (...) select **Delete Snapshot**.
8. In the Delete Snapshot dialog, select **Delete**.
9. Click **View:** under **Timeflow** to verify the Snapshot, you just deleted.

Snapshot ✕

Timestamp

Timestamp till which rollforward is performed for dSource snapshot. If the timestamp is in UTC this needs to be explicitly mentioned. Ex: "2021-11-14-04.15.00 UTC". If the timestamp is in the local timezone the user should only provide the timestamp.

Resynchronize dSource

Resynchronizing dSource will force a non-incremental load of data from the source. This operation is similar to creating a new dSource, but avoids duplicating storage requirements and maintains Timeflow history. Are you sure you want to Resynchronize this dSource?

Cancel
Perform Snapshot

9.5.5.2.7 Source sizing implementation for IBM Db2 dSource

The source sizing feature enables you to visualize the dSource size based on the total allocated space on the mount point provided by the Delphix Continuous Data Engine for the dSource.

9.5.5.2.7.1 Procedure

- For all Non-AIX hosts, the size of dSource can be calculated using `du -sb <staging db mount path>` command that provides the correct volume and apparent size of the dSources.
- For AIX hosts, the size of the dSource can be calculated by executing any one of the following commands depending on whether the database is open for connections or not.
 - a. `select sum(TBSP_TOTAL_SIZE_KB)*1024 from sysibmadm.TBSP_UTILIZATION,` if the database is open for connections and it is possible to connect to the database.
 - b. `db2dart <dbname> /DTSF` , if the database is not open for connections and is in a rollforward pending state.
- For AIX hosts, the connector won't be able to display the size of the database during the creation of dSource, since it needs to be restored to read the size of the database.
- If the connector is unable to list the database or the database is yet to be restored, then the status tab under dSource displays **Not available**.
- The value can be found in two distinct locations within the Delphix Continuous Data Engine's UI.
 - Under the Configuration tab of dSource.

- Under **Resources > Managed Source Data**.

Name	Last collected	Space used	Type Of Data
C78D11A	Nov 7, 2023 1:45 PM	244.13 MB	DB2

Total Space Used

244.13 MB

Nov 7, 2023

DB2 244.13 MB

*Space usage data is available when Delphix sources are able to be monitored.

9.5.5.2.8 IBM Db2 link operations via CLI

9.5.5.2.8.1 dSource creation from CLI

To create a dSource via CLI, you must create a source configuration first. For more information on creating a source configuration, refer to [Add Source Config using CLI \(see page 1074\)](#).

To create a dSource and perform operations via CLI, log in to the Delphix Continuous Data Engine using the admin user account.

```
ssh admin@<CONTINUOUS-DATA-FQDN-or-IP>
```

9.5.5.2.8.2 Set default linking parameters (This is common for all types of ingestions)

Run the following commands to set the default linking parameters. The following example uses **testds** source config.

```
database link;
set linkData.type=AppDataStagedLinkData;
set name=testds
set group=Untitled
set linkData.config=testds
set linkData.environmentUser=dlpxdb21
set linkData.stagingEnvironment=rh88-stg.dlpxdc.co
set linkData.stagingEnvironmentUser=dlpxdb21
set linkData.syncParameters.parameters={"resync":true}
```

9.5.5.2.8.3 Link parameters for backup only

Run the following commands to link parameters for backup-only ingestion type.

```
set linkData.parameters="{\"dbName\": \"R88D115A\", \"backupPath\": \"/db2backup/11_5\",
  \"stagingPushFlag\": false, \"dpfFlag\": false, \"monitorHADR\": false,
  \"toolkitHookFlag\": false, \"logIngestionFlag\": false, \"copyToApplyFlag\": false,
  \"rfPIT\": false}";
```

For DPF

```
set linkData.parameters="{\"dbName\": \"R88D115A\", \"backupPath\": \"/db2backup/11_5\",
  \"stagingPushFlag\": false, \"dpfFlag\": true, \"monitorHADR\": false,
  \"toolkitHookFlag\": false, \"logIngestionFlag\": false, \"copyToApplyFlag\": false,
  \"rfPIT\": false}";
```

9.5.5.2.8.4 Link parameters for backup with archived logs

Run the following commands to link parameters for backup and archived logs.

```
set linkData.parameters="{\"dbName\": \"R88D115A\", \"backupPath\": \"/db2backup/11_5\",
  \"stagingPushFlag\": false, \"dpfFlag\": false, \"monitorHADR\": false,
  \"toolkitHookFlag\": false, \"logIngestionFlag\": true, \"logPath\": \"/home/dlpxdb21/
  logs\", \"copyToApplyFlag\": false, \"rfPIT\": false}";
```

For DPF

```
set linkData.parameters="{\"dbName\": \"R88D115A\", \"backupPath\": \"/db2backup/11_5\",
  \"stagingPushFlag\": false, \"dpfFlag\": true, \"monitorHADR\": false,
  \"toolkitHookFlag\": false, \"logIngestionFlag\": true, \"logPath\": \"/home/dlpxdb21/
  logs\", \"copyToApplyFlag\": false, \"rfPIT\": false}";
```

9.5.5.2.8.5 Link parameters for backup with archived logs (Using RFPIT option)

Run the following commands to link parameters for backup with archived logs with RFPIT.

```
set linkData.parameters="{\"dbName\": \"R88D115A\", \"backupPath\": \"/db2backup/11_5\",
  \"stagingPushFlag\": false, \"dpfFlag\": false, \"monitorHADR\": false,
  \"toolkitHookFlag\": false, \"logIngestionFlag\": true, \"logPath\": \"/home/dlpxdb21/
  logs\", \"copyToApplyFlag\": false, \"rfPIT\": true}";

set linkData.syncParameters.parameters={\"resync\": true, \"rtimestamp\": \"2023-10-25-0
8.50.00\"}
```

For DPF

```
set linkData.parameters="{\"dbName\": \"R88D115A\", \"backupPath\": \"/db2backup/11_5\",
  \"stagingPushFlag\": false, \"dpfFlag\": true, \"monitorHADR\": false,
  \"toolkitHookFlag\": false, \"logIngestionFlag\": true, \"logPath\": \"/home/dlpxdb21/
  logs\", \"copyToApplyFlag\": false, \"rfPIT\": true}";

set linkData.syncParameters.parameters={\"resync\": true, \"rtimestamp\": \"2023-10-25-0
8.50.00\"}
```

9.5.5.2.8.6 Link parameters for HADR

Run the following commands to link parameters for HADR.

```
set linkData.parameters="{\"dbName\": \"C78d111A\", \"backupPath\": \"/db2backup/11_1\",
  \"additionalBackupPath\": [], \"stagingPushFlag\": false, \"dpfFlag\": false,
  \"monitorHADR\": true, \"toolkitHookFlag\": false, \"logIngestionFlag\": false,
  \"copyToApplyFlag\": false, \"rfPIT\": false, \"hadrDetails\": {\"hadrPrimaryHostname\":
  \"c78-s1.dlpxdc.co\", \"hadrPrimarySVC\": \"60055\", \"hadrStandbySVC\": \"60056\",
  \"hadrTargetList\": \"\", \"configureSSL\": false}}"
```

9.5.5.2.8.7 Link parameters for HADR with SSL

Run the following commands to link parameters for HADR with SSL.

```
set linkData.parameters="{\"dbName\": \"C78d111A\", \"backupPath\": \"/db2backup/11_1\",
  \"additionalBackupPath\": [], \"stagingPushFlag\": false, \"dpfFlag\": false,
  \"monitorHADR\": true, \"toolkitHookFlag\": false, \"logIngestionFlag\": false,
  \"copyToApplyFlag\": false, \"rfPIT\": false, \"hadrDetails\": {\"hadrPrimaryHostname\":
  \"c78-s1.dlpxdc.co\", \"hadrPrimarySVC\": \"60055\", \"hadrStandbySVC\": \"60056\",
  \"hadrTargetList\": \"\", \"configureSSL\": true, \"keyStorePassword\": \"delphix\"
  }}"
```

9.5.5.2.8.8 Link parameters for additional backup path

```
set linkData.parameters="{\"dbName\": \"R88D115C\", \"backupPath\": \"/db2backup/11_5/
  backup_path1\", \"additionalBackupPath\": [{\"bpath\": \"/db2backup/11_5/
  backup_path2\"}, {\"bpath\": \"/db2backup/11_5/backup_path3\"}],
  \"stagingPushFlag\": false, \"dpfFlag\": false, \"monitorHADR\": false,
  \"toolkitHookFlag\": false, \"logIngestionFlag\": true, \"logPath\": \"/home/dlpxdb21/
  logs\", \"copyToApplyFlag\": false, \"rfPIT\": false}";
```

For DPF

```
set linkData.parameters="{\"dbName\": \"R88D115C\", \"backupPath\": \"/db2backup/11_5/
backup_path1\", \"additionalBackupPath\": [{\"bpath\": \"/db2backup/11_5/
backup_path2\"}, {\"bpath\": \"/db2backup/11_5/backup_path3\"}],
\"stagingPushFlag\": false, \"dpfFlag\": true, \"monitorHADR\": false,
\"toolkitHookFlag\": false, \"logIngestionFlag\": true, \"logPath\": \"/home/dlpxdb21/
logs\", \"copyToApplyFlag\": false, \"rfPIT\": false}";
```

9.5.5.2.8.9 Link parameters for staging push

Run the following commands to link parameters for staging push.

```
set linkData.parameters="{\"dbName\": \"R88D115A\", \"stagingPushFlag\": true,
\"dpfFlag\": false, \"monitorHADR\": false, \"toolkitHookFlag\": false,
\"logIngestionFlag\": false, \"copyToApplyFlag\": false, \"rfPIT\": false}";
```

For DPF

```
set linkData.parameters="{\"dbName\": \"R88D115A\", \"stagingPushFlag\": true,
\"dpfFlag\": true, \"monitorHADR\": false, \"toolkitHookFlag\": false,
\"logIngestionFlag\": false, \"copyToApplyFlag\": false, \"rfPIT\": false}";
```

9.5.5.2.8.10 Commit

Run the following command to commit the change

```
commit;
```

9.5.5.2.8.11 Disable

Run the following command to disable the dSource.

```
source
select testdb
disable
commit
```

9.5.5.2.8.12 Enable

Run the following command to enable the dSource.

```
source
select testdb
enable
commit
```

9.5.5.3 Provisioning IBM Db2 virtual databases

The virtual database (VDB) is a Delphix Continuous Data Engine virtualized copy of your source database that runs on your target environment. A VDB is provisioned from a dSource or VDB snapshot.

9.5.5.3.1 Prerequisites

You must meet the following requirements to create a VDB:

1. Identify an originating dataset and snapshot.
 - a. Link a dSource by following the instructions in [Linking a IBM Db2 dSource](#) (see page 1266).
 - b. Select a VDB that has been previously provisioned.
2. Set up an IBM Db2 target environment as described in [IBM Db2 support and requirements](#). (see page 1234)
3. To use privilege elevation, you must meet the [Privilege elevation requirements](#) (see page 1245).
4. Once you have restored the databases into your target environment, If the version of IBM® Db2® in your source environment is at a different fix pack level than the version of Db2 in your target environment, then you need to update the 11.1 version databases with `db2updv111` command and 11.5 databases with `db2updv115` command utility. Run the below command as a Pre-snapshot hook:

```
db2updv111 -d <DBNAME> -a
db2updv115 -d <DBNAME> -a
```

More details on the above can be found [here](#) (see page 1308).

9.5.5.3.2 Limitations

By default, the IBM Db2 connector will not allow provisioning a VDB on an instance that contains a database that has an identical name to the source database.

For example,

1. When we are provisioning a VDB from a VDB then the source VDB will be treated as the source database.
2. When we are provisioning a VDB from a dSource then a staging database will be treated as the source database.

If you want to provision a VDB on an instance that contains a source database, then you need to follow the steps mentioned [here](#). (see page 1057)

9.5.5.3.3 Procedure

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Datasets**.
4. Select a **dSource**.
5. Select a **snapshot** from which you want to provision.
6. Click the Provision **VDB** icon to open the **Provision VDB** wizard.
7. Select a target environment from the left pane.
8. Select an **Installation** to use from the dropdown list of available DB2 instances on that environment.
9. Set the **Environment User** to be the Instance Owner. Note: The picking of instance owners is only possible if you have multiple environment users set on that host.
10. Provide VDB Name as database name as parameter.
11. Optionally, provide the VDB Mount Base for the VDB.
12. Optionally, set the database configuration parameters for the VDB.
13. Click **Next**.
14. Select a **Target Group** for the VDB. Click the green **Plus** icon to add a new group, if necessary.
15. Select a **Snapshot Policy** for the VDB.
16. Click **Next**.
17. Specify any desired hook operations.
18. Click **Next**.
19. Review the **Provisioning Configuration** and **Data Management** information.
20. Click **Submit**. When provisioning starts, you can review the progress of the job in the **Databases** panel, or in the **Job History** panel of the **Dashboard**. When provisioning is complete, the VDB will be included in the group you designated and listed in the **Databases** panel. If you select the VDB in the Databases panel and click the **Open** icon, you can view its card, which contains information about the database and its Data Management settings. Once the VDB provisioning has successfully completed, if the source and target instance ids are not the same, you may want to grant secadm and dbadm on the database to the target instance id. For more information, refer to [Requirements and prerequisites](#) (see page 1234).

9.5.5.3.4 Provisioning operations of IBM Db2 via CLI

To create a VDB via CLI, you must first create a dSource. For more information on creating a dSource, refer to [Link operation via CLI section](#) (see page 1286).

To create a VDB and perform operations via CLI, log in to the Delphix Continuous Data Engine using the admin user account.

```
ssh admin@<CONTINUOUS-DATA-FQDN-or-IP>
```

9.5.5.3.4.1 Provision

Run the following commands to provision a VDB. The following example uses `testdb` dSource.

Common commands

```
database provision
set type=AppDataProvisionParameters
set container.name=testvdb
set container.group=Untitled
set source.allowAutoVDBRestartOnHostReboot=true
set sourceConfig.name=""
set sourceConfig.repository="dlpxdb21 - 11.5.8.0 - db2adv"
set sourceConfig.environmentUser=dlpxdb21
set timeflowPointParameters.container=testdb
```

9.5.5.3.4.2 With default mount base

```
set source.parameters="{\"databaseAliasName\": \"testvdb\", \"config_settings_prov\": [ { \"propertyName\": \"NUM_DB_BACKUPS\", \"value\": \"11\" } ] }";
```

9.5.5.3.4.3 VDB with custom mount base

```
set source.parameters="{\"databaseAliasName\": \"testvdb\", \"VDBmountLocation\": \" /vdb_mount_base/test\", \"config_settings_prov\": [ { \"propertyName\": \"NUM_DB_BACKUPS\", \"value\": \"11\" } ] }";
```

9.5.5.3.4.4 Commit

Run the following command to commit the change.

```
commit
```

9.5.5.3.4.5 Disable

Run the following commands to disable a VDB.

```
source  
select testvdb  
disable  
commit
```

9.5.5.3.4.6 Enable

Run the following command to enable a VDB.

```
source  
select testvdb  
enable  
commit
```

9.5.5.3.4.7 Stop

Run the following command to stop a VDB.

```
source  
select testvdb  
stop  
commit
```

9.5.5.3.4.8 Start

Run the following command to start a VDB.

```
source  
select testvdb  
start  
commit
```

9.5.5.3.4.9 Refresh

Run the following to refresh a VDB to the latest snapshot, where the parent dsources is `testdb`.

```
database
select testvdb
refresh
set timeflowPointParameters.container=testdb
commit
```

9.5.6 IBM Db2 troubleshooting

This section covers the following topics:

- [IBM Db2 advanced configuration \(see page 1294\)](#)
- [IBM Db2 logging \(see page 1300\)](#)
- [Managing IBM Db2 log rotation and log level \(see page 1301\)](#)

9.5.6.1 IBM Db2 advanced configuration

This topic provides details on customizing IBM Db2 connector logging and controlling supported dataset configurations. You can modify the following parameters at any stage of the dataset lifecycle. The IBM Db2 connector will ignore values for a parameter if the values do not fit the description below and will continue the operation with the default set of values for that particular parameter.

9.5.6.1.1 Configuration parameters for connector versions 4.x and later

Parameter Value	Usage
usersHaveCommonGroup	<p>Sets the permission for the <i>"mnts"</i> directory located under the <code>/ <toolkit_path>/DB2/</code> and for the <code>logs</code> directory located under <code><toolkit path>/Delphix_COMMON_<long id>/plugin/DB2_18f4ff11-b758-4bf2-9a37-719a22f5a4b8/logs/</code>.</p> <p>The value is set to True, if the primary group of the primary environment user (user which is used to do discovery) is shared with the instance user otherwise it is set to False.</p> <p>Once the necessary changes are made, refresh the environment in order to apply the changes.</p> <p>Default Value: True</p>

Parameter Value	Usage
allowSourceDbOnSameInstance	<p>IBM Db2 connector restricts the provisioning of a VDB on a DB2 instance which contains a database with the same name as the VDB's source database</p> <p>For example:</p> <ul style="list-style-type: none"> • When provisioning a VDB from a VDB then the latter is treated as the source database. • When provisioning a VDB from a dSource then the staging database representing the dSource is treated as the source database. <p>If the user wants to provision a VDB on an instance which contains a database with the same name as the VDB's source database, then the parameter allowSourceDbOnSameInstance must be set to true.</p> <p>Default value: False</p>
restorePipelineLimit	<p>Db2 DPF connector performs restoration of all non-catalog partitions in parallel.</p> <p>The parameter <code>restorePipelineLimit</code> allows the user to configure the number of partitions that could be restored in parallel by the connector. The valid value for this field is any positive integer.</p> <p>Default value: 10</p>
skipArchiveLogValidation	<p>This option allows the user to set the connector to skip the validation process of end user supplied archive logs and perform a partial validation.To³⁹⁵ be able to use this functionality, the parameter value must be set to True.</p> <p>Default value: False</p>
skipDataPathVerification	<p>This option allows the user to set the connector to skip the data path verification process during VDB snapshot operation.³⁹⁶ The parameter should be used when upgrading from connector versions <= 3.1.1 and users do not wish to perform VDB re-provision or refresh after the connector upgrade. To be able to use this functionality, the parameter value must be set to True.</p> <p>Default value: False</p>

³⁹⁵ <http://validation.To>

³⁹⁶ <http://validation.to/>

Parameter Value	Usage
skipDb2VersionCheck	<p>DB2 version checks can be skipped in the following scenarios:</p> <ol style="list-style-type: none"> 1. During provision or refresh using snapshots taken with connector version below 4.5.1, the verification of db2 version can be skipped if the end user chooses to avoid the VDB Provision or refresh error due to changed metadata contents. 2. During provision when the staging and target environments have different db2 modpack/fixpack versions. This will be on user's discretion and an override from usual workflow where the exact match is expected. <p>Default Value: False</p>
level	<p>Sets the connector debug log levels.</p> <p>Default value: INFO</p>
logFileSize	<p>Sets the maximum connector log file size in MB.</p> <p>Default value: 1</p>
retention	<p>Sets the maximum number of connector log files.</p> <p>Default value: 2</p>

9.5.6.1.1.1 Connector Config file

After adding the environment to Delphix Continuous Data Engine, you can find the connector configuration file, `db2_plugin.conf` on the remote environment. It is typically located at the following specified path:

```
<toolkit path>/Delphix_COMMON_<long id>/plugin/DB2_18f4ff11-
b758-4bf2-9a37-719a22f5a4b8/db2_plugin.conf
```

This file is divided into 2 sections - "plugin_custom_parameters" and "plugin_logging_parameters".

```
#
# The parameters must not be left padded with spaces. The plugin will otherwise not
# accept the specified parameter
# values and will use the default values.
#

[plugin_custom_parameters]
#
# If the user has not shared a common group between primary environment user and
# instance user.
```

```
# Then the user needs to set parameter usersHaveCommonGroup as False.
#
usersHaveCommonGroup=True

#
# During provision operations the plugin checks if the target instance contains a
database name which is identical to
# the source DB name from which the VDB is to be created. By default the plugin will
never allow creating a VDB on the
# instance where the source database already exists, or on any instance that has a
database with the same name. If the
# users still want to create a VDB on an instance which contains a database with the
same name as the source DB then
# they need to set parameter allowSourceDbOnSameInstance as True.
#
allowSourceDbOnSameInstance=False

#
# If the users want to control the number of parallel restores then they can tune the
parameter restorePipelineLimit.
# By default the value of this parameter would be 10.
#
restorePipelineLimit=10

#
# The archive logs validation process can be skipped if the end user so chooses.
Instead, a speedier technique can be used,
# in which the archive logs are only validated for the first and last logs and the
file sequences in between are confirmed.
#
skipArchiveLogValidation=False

#
# When upgrading from versions 3.1.1 or below, the verification of paths can be
skipped if the end user chooses to avoid
# the VDB snapshot error due to changed data path structure
#
skipDataPathVerification=False

#
# DB2 version checks can be skipped in following scenarios:
# 1. During provision or refresh using snapshots taken with connector version below
4.5.1, the verification of db2 version can be skipped if the end user chooses to
avoid
# the VDB Provision or refresh error due to changed metadata contents
# 2. During provision when the staging and target environments have different db2
modpack/fixpack versions.
```

```
# This will on user's discretion and an override from usual workflow where the exact
match is expected.
#
skipDb2VersionCheck=True

[plugin_logging_parameters]
#
# This flag will set the debug level of plugin logs on the remote server (both
staging and target). There are two levels:
# Info
# Debug
# The above are the only valid values that can be assigned. If any other value is
assigned, the plugin will set the
# default level as Info. the string is case insensitive so info, Info and INFO are
acceptable.
#
level=INFO

#
# This parameter will set the maximum size of the active log file in MB. Once this
limit is reached, the plugin will
# rotate the log as per the retention property defined below. The minimum value of
this parameter is 1 MB and maximum
# value is 10 MB. This parameter only takes in a positive integer value. The default
value is 1 MB
# logFileSize=<positive integer>
#
logFileSize=1

#
# Whenever the size of <DB Name>.diag.log file exceeds the value provided by
logFileSize parameter then the plugin will
# rename the active log file to <DB Name>.diag.log.<number> and a new log file with
name <DB Name>.diag.log will be
# generated. For example, if LogRetention is set to 4, the plugin will have the
following log files: <DB Name>.diag.log,
# <DB Name>.diag.log.1, <DB Name>.diag.log.2, <DB Name>.diag.log.3, <DB
Name>.diag.log.4.
# File <DB Name>.diag.log.4 will be the oldest one.
# File <DB Name>.diag.log.1 will be the most recent archive log file.
# File <DB Name>.diag.log will be the active log file.
# The minimum and default value for retention flag is 2.
# retention=<positive integer>
#
retention=2
```

 Please adhere to the configuration parameters provided above. Adding unknown parameters in this file could result in workflow errors.

9.5.6.1.2 Configuration parameters for connector versions 3.x and prior

The advanced config file is named `advanceConfFlag.conf` and is created under the `<Toolkit directory>` during discovery or environment refresh operation if the file does not pre-exist already. This file will have the following configurable parameters:

Parameter Value	Usage
<code>notCommonGroupFlag</code>	<p>Sets the permission for the "mnts", "logs" and "code" directory located under the <code>/<toolkit_path>/DB2/</code>.</p> <p>The value is set to True, if the primary group of the primary environment user (user which is used to do discovery) is shared with the instance user otherwise it is set to False.</p> <p>Once the necessary changes are made, refresh the environment in order to apply the changes.</p> <p>Default Value: True</p> <p>By default, the <code>notCommonGroupFlag</code> parameter is commented out in the file. This means that the connector implicitly assumes its value as false.</p>
<code>allowSourceDBonSameInst</code>	<p>DB2 connector restricts the provisioning of a VDB on a DB2 instance which contains a database with the same name as the VDB's source database</p> <p>For example:</p> <ul style="list-style-type: none"> • When provisioning a VDB from a VDB then the latter is treated as the source database. • When provisioning a VDB from a dSource then the staging database representing the dSource is treated as the source database. <p>If the user wants to provision a VDB on an instance which contains a database with the same name as the VDB's source database, then the parameter <code>allowSourceDbOnSameInstance</code> must be set to true.</p> <p>Default value: False</p>

Parameter Value	Usage
<i>restorePipelineLimit</i>	<p>Db2 DPF connector performs restoration of all non-catalog partitions in parallel.</p> <p>The parameter <code>restorePipelineLimit</code> allows the user to configure the number of partitions that could be restored in parallel by the connector. The valid value for this field is any positive integer.</p> <p>Default value: 10</p>

9.5.6.1.2.1 Connector Config file

After adding the environment to Delphix Continuous Data Engine, you can find the connector configuration file, `advanceConfFlag.conf` on the remote environment. It is typically located at the following specified path:

```
<toolkit path>/advanceConfFlag.conf
```

Sample config file

```
# If the user is not sharing a common group between primary environment user and
instance user.
# Then the user needs to set parameter notCommonGroupFlag as true.
# notCommonGroupFlag=true

# During provision operation check if instance contains a database name which is
identical to the source DB name used for provisioning operation.
# By default plugin will never allow creating a VDB on the instance where source
database (or other database which is identical in name with source DB) already
exists.
# If the user still wants to create a VDB on the instance which contains a database
name which is identical to the source DB name used for provisioning operation,
# then the user needs to set parameter allowSourceDBonSameInst as true.
# allowSourceDBonSameInst=true

# Limit for parallel restores
restorePipelineLimit=10
```

9.5.6.2 IBM Db2 logging

You can find the IBM Db2 connector logs within the scratch path on the remote environment, located at the following path:

```
<toolkit path>/Delphix_COMMON_<Long id>/plugin/DB2_18f4ff11-
b758-4bf2-9a37-719a22f5a4b8/logs/<os_user>/diag.log
```

You can configure the logging mechanism by modifying the following parameters defined in the `db2_plugin.conf` file. This feature offers options to provide customized connector logging.

1. **level** - Sets the connector debug log levels.
2. **logFileSize** - sets the maximum connector log file size in MB.
3. **retention** - Sets the maximum number of connector log files.

9.5.6.3 Managing IBM Db2 log rotation and log level

9.5.6.3.1 Setting the log level (level)

Delphix users can set the logging level of the connector-generated logs by setting the parameter `level` under the `plugin_logging_parameters` header. Higher logging levels will help to expedite debugging issues. There are two levels of logging which are: Info and Debug. The configured logging level will apply to all the objects (both dSources and VDBs) present on a staging/target host. For example; if we have 4 dSources on a host associated with a Delphix Engine then the log level will apply to all the dSources.

Log level description:

- `level=INFO`: This level will print only informational logs. This is the default log level.
- `level=DEBUG`: This level will print informational logs and debug statements.

9.5.6.3.2 Setting maximum size (logFileSize)

Delphix users can set the maximum size of the active log file by defining the value of the `logFileSize` parameter under the `plugin_logging_parameters` header of the `db2_plugin.conf` file. Once this maximum size limit is reached, the connector will rotate the log as per the retention property described below. This parameter only takes in a positive integer value. The minimum value of this parameter is 1 MB and the maximum value is 10 MB. The default value is 1 MB.

9.5.6.3.3 Setting the number of log files to retention (retention)

Delphix users can set a retention level for connector-generated logs for each dataset (`<Db name>.diag.log`) using the parameter `retention` under the `plugin_logging_parameters` header. As per this parameter, the log files are moved (archived), renamed, or deleted once they reach the value set in the `logFileSize` parameter. New incoming log data is directed into a new fresh file (at the same location).

By default, the value for this parameter will be set to a minimum value of 2. The user can change this value and set its value within the range 2 and 50. For example; if `retention` is set to 4, the connector will have the following log files: `<DB Name>.diag.log`, `<DB Name>.diag.log.1`, `<DB Name>.diag.log.2`, `<DB Name>.diag.log.3`, `<DB Name>.diag.log.4`.

- File `<DB Name>.diag.log` is the active log file

- File <DB Name>.diag.log.1 is the most recent archive log file
- File <DB Name>.diag.log.4 is the oldest one

For known issues, refer to the [Known issues](#) (see page 370) section from the release notes.

9.5.7 IBM Db2 additional information

9.5.7.1 Delphix Virtualization glossary

9.5.7.1.1 Rollforward to Point-in-Time (RFPIT)

Since Delphix virtualization doesn't support VDB point-in-time for DB2, the DB2 connector provides a feature called dSource Rollforward to Point-in-Time (or dSource Timestamp) where the customer can rollforward the dSource to a particular point-in-time so that they can provision a VDB out of the dSource snapshot where the database was rollforwarded to a specific timestamp thereby providing the functionality of Point-in-time VDB provisioning.

9.5.7.1.2 Support for BLU or column-organized tables with DB2 connector

DB2 BLU Acceleration is a feature of IBM's DB2 relational database management system that is designed to deliver high performance for analytical workloads.

It is a high-performance, scalable, and easy-to-use platform for running analytical workloads on large datasets to derive insights from the data quickly and efficiently.

Based on a single registry setting, `DB2_WORKLOAD=ANALYTICS`, DB2 automatically adapts resources, configuration, workload management, and storage parameters to optimize resource consumption for the platform you are running on.

BLU Acceleration reuses the same SQL compiler and optimizer. Most utilities—including LOAD, INGEST, EXPORT, BACKUP and RESTORE, ROLLFORWARD, and many others—work as usual. In addition there is the ability to mix row-organized and column-organized tables in the same storage (tablespace), bufferpool, schema, and even within the same SQL statement.

Prerequisites in Staging and target environments -

- Users must set the DB2 registry variable to `DB2_WORKLOAD=ANALYTICS` before dsource/VDB dataset workflows.
- Users must make sure memory settings are set according to the target server's instance memory.
- Restore operation restores the database configuration file from the backup image.

For more information, read [IBM documentation](#)³⁹⁷.

³⁹⁷ <https://www.ibm.com/docs/en/db2/11.5?topic=organization-column-organized-tables>

9.5.7.2 IBM Db2 glossary

9.5.7.2.1 Db2 tablespace Container

In the db2 connector context, DB2 uses containers to physically store data. A container can be a file, a directory, or a raw device. Since containers are objects that actually exist on a disk or a raw device, they are considered as physical database objects. In contrast to containers, tablespaces are logical database objects.

9.5.7.2.2 IBM Db2 authentication

Db2 User and group authentication is managed in a facility external to Db2 LUW, such as the operating system, a domain controller, or a Kerberos security system. This is different from other database management systems (DBMSs), such as Oracle and SQL Server, where user accounts may be defined and authenticated in the database itself, as well as in an external facility such as the operating system.

Any time a user ID and password is explicitly provided to Db2 LUW as part of an instance attachment or database connection request, Db2 attempts to authenticate that user ID and password using this external security facility. If no user ID or password is provided with the request, Db2 implicitly uses the user ID and password that were used to login to the workstation where the request originated. More information on Db2 authentication and authorization is available via [IBM documentation](#)³⁹⁸.

9.5.7.2.3 Delphix Db2 authentication

Delphix for Db2 requires that the staging and target hosts must already have the necessary users and authentication systems created/installed on them. Delphix will neither create users nor change database passwords as part of the provisioning process.

9.5.7.2.4 Db2 database level support

Delphix supports a number of Db2 database-level features. An overview of Db2 database level support is as follows:

- Support for multiple databases linking in a Single Instance, which allows Delphix Engine users to utilize an available instance on the target more efficiently.
- Support for using an end user supplied directory for the Delphix Connector, Db2 Mount Points, and Db2 Delphix files and logs.
- Support for Kerberos environments.
- Support for VDB provisioning of the same OS version level or one version higher than the source and staging instances.
- Intelligent handling of HADR logs.

³⁹⁸ <https://www.ibm.com/developerworks/data/library/techarticle/dm-0508wasserman/>

9.5.7.2.5 High Availability Disaster Recovery (HADR)

The HADR feature of IBM Db2 provides a high availability solution for both partial and complete site failures. It protects against data loss by replicating data changes from a source database, called the primary, to one or more target databases, called the standby.

9.5.7.2.5.1 Delphix HADR support

HADR replication takes place at a database level, not at the instance level. Therefore, a standby instance can have multiple databases from multiple different primary servers/instances on it. If the instance ID on the Delphix standby is not the same as the instance ID on the primary, the Delphix standby instance ID must have database permissions **secadm** and **dbadm** granted to it on the primary database. These permissions and all HADR settings must be implemented on the primary database before you take the backup on the primary database.

9.5.7.2.5.2 Log transmitting

All changes that take place at the primary database server are written into log files. The individual log records within the log files are then transmitted to the secondary database server, where the recorded changes are replayed to the local copy of the database. This procedure ensures that the primary and the secondary database servers are in a synchronized state. Using two dedicated TCP/IP communication ports and a heartbeat, the primary and the standby databases track where they are processing currently, the current state of replication, and whether the standby database is up-to-date with the status of the primary database. When a log record is "closed" (still in memory, but has yet to be written to disk on the primary), it is immediately transmitted to the HADR standby database(s). Transmission of the logs to the standbys may also be time-delayed.

9.5.7.2.5.3 Multiple standby

Beginning in Db2 v10.1, the HADR feature supports multiple standby databases. This enables an advanced topology where you can deploy HADR in multiple standby mode with up to three standby databases for a single primary. One of the databases is designated as the principal HADR standby database, with the others termed as auxiliary HADR standby databases. As with the standard HADR deployment, both types of HADR standbys are synchronized with the HADR primary database through a direct TCP/IP connection. Furthermore, both types support the reads on standby feature and can be configured for time-delayed log replay. It is possible to issue a forced or unforced takeover on any standby, including the delphix auxiliary standby. However, you should never use the Delphix auxiliary standby as a primary, because this will impact Delphix performance.

9.5.7.2.5.4 Delphix HADR synchronization

The Delphix for Db2 uses the HADR capability of Db2 to synchronize data from a production Db2 database into a Delphix-controlled Db2 "standby" server. By using this mature and existing Db2 capability, the Delphix Engine is able to ingest data and keep the standby server in sync with only a minimal impact on production. The HADR connection is configured to Super-Asynchronous (SUPERASYNC) mode where log writes are considered successfully transmitted when the log records are sent from the primary database. Because the primary database does not wait for acknowledgments from the standby database, there is no delay on the primary and transactions are considered committed regardless of the state of the replication of that

transaction. For further information on Delphix synchronization, see Data synchronization section for more information.

9.5.7.2.5.5 SSL/TLS support for HADR

Starting from Db2 version 11.1 and onwards, the introduction of the HADR_SSL_LABEL configuration parameter marks a significant advancement in Db2's security capabilities. It grants you the ability to establish SSL encryption for your Db2 databases, significantly bolstering security and data protection, particularly during critical operations like replication and synchronization.

With the inclusion of HADR_SSL_LABEL support in the IBM Db2 connector, you gain a streamlined method to seamlessly integrate SSL security within their Db2 HADR setups. This entails that all data replication and communication between primary and standby databases can now benefit from robust encryption in-transit, effectively securing sensitive information from potential threats.

Utilizing this feature within the IBM Db2 connector ensures that you can maintain the utmost security and encryption for their data while it's in transit between the primary and standby databases, reinforcing the integrity and confidentiality of their Db2 environment.

9.5.7.2.6 Database partitioning feature

Database Partitioning Feature (DPF) lets you partition your database across multiple servers. Since you can add new machines and spread your database across them, this allows users to scale their database. This means more CPUs, more memory, and more disks from each of the additional machines are available for your database. DPF can be used to manage large databases for a variety of use cases including data warehousing, data mining, online analytical processing (OLAP), or online transaction processing (OLTP) workloads.

DPF enables the user to divide a database into database partitions, a database partition is a part of a database that consists of its own data, indexes, configuration files, and transaction logs. Each database partition can be configured on the different physical server having its own set of computing resources, including CPU and storage. When a query is processed, the request is divided so each database partition processes the rows that it is responsible for. DPF can maintain consistent query performance as the table grows by providing the capability to add more processing power in the form of additional database partitions. This capability is often referred to as providing linear scalability using Db2s shared-nothing architecture.

DPF is an approach to sizing and configuring an entire database system. Please follow the recommended practices for optimal performance, reliability, and capacity growth. Please refer to IBM documentation of DPF for more details in [IBM knowledge center](#)³⁹⁹.

9.5.7.2.6.1 Backup types supported in DPF

The type of backups supported by IBM Db2 connector when used with DPF are:

- SSV backups through backup files or named pipes.
- Non-SSV backups through backup files or named pipes.

Example backup command for DB2 SSV backups: `db2_all db2 BACKUP DATABASE<DB_NAME> ON all dbpartitionnums online to <Backup File Location> compress include logs.`

³⁹⁹ <https://www.ibm.com/developerworks/data/library/techarticle/dm-0608mcinerney/index.html>

Example backup command for DB2 Non SSV backups: `db2_all db2 backup database <DB_NAME> online to <Backup File Location> compress include logs.`

9.5.7.2.7 Source database with Raw DEVICE type storage

Several users use raw device-based tablespaces for source Db2 databases. To leverage these environments with Delphix, Delphix has built a workflow using Db2's native tools that allow Delphix to discover and convert a raw device-based tablespace into an automatic storage-based tablespace during ingestion. Once the data is ingested into staging, end users will be able to provision VDBs of the automatic storage-based database.

9.5.7.2.8 Support for named pipe type Db2 backup

Users can also provide Db2 backups of type named-pipe. IBM Db2 connector will check the type (type will be either named-pipe or a file) of backup and will use the restore syntax accordingly.

9.5.7.2.9 Purging of archive logs after snapshot operation

Logs can be purged from your log location after the snapshot operation. The Connector will preserve the list of logs that are eligible for purging in the snapshot's metadata. The snapshot metadata can be accessed via the Delphix CLI or API.

9.5.7.2.10 Pipelining logic for implementing parallel restores

The connector employs a parallel pipeline methodology so that the restore operation of non-catalog partitions can be performed in parallel in the Database Partitioning Feature (DPF). The number of parallel restores is determined by the value of "restorePipelineLimit" (default value is 10) in `<toolkit path>/Delphix_COMMON_<long id>/plugin/DB2_18f4ff11-b758-4bf2-9a37-719a22f5a4b8/db2_plugin.conf`. For more details on this please refer to [Requirements for Db2 Hosts and Databases \(see page 1234\)](#). The parameter "restorePipelineLimit" is configurable by end-users. The connector performs parallel restore for all non-catalog partitions. For e.g. If the total number of non-catalog partitions is 15, and the "restorePipelineLimit" parameter is set to 10, the first set of 10 restores will happen in parallel. The connector will track the restore of each partition present in the pipe. Whenever a restore of a partition completes, it will move out from the pipe and a new partition will enter into that pipe. Thus, the connector ensures that the pipe will always have the user-configured number of partitions being restored (default=10).

In case of a restore failure for a particular partition, the connector will track that failure and will print the same in the connector-generated logs so that the user can take the necessary action. If the user received failure during restore operation for a few partitions and then decided to manually initiate the restores for failed partitions, the connector will verify the datapaths during snapshot operation. In case it finds wrong path information (such as paths outside the mount point), then the connector will error out of the operation.

The connector will track the status of each restore in a file named `<DB Name>_metadata.json`. The connector can handle a scenario where the staging host reboots in-between the parallel restores. In this case, the user can perform a "Resynchronisation" operation again. At this time, the remaining restores will resume from scratch. For more details on this please refer to [Requirements for Db2 Hosts and Databases \(see page 1234\)](#)

9.5.7.2.11 Data synchronization

Delphix provides the following options to keep your dSource in sync with the source database:

1. During the linking process, you can set up a HADR connection between the original source database and the Standby instance. This allows the Standby instance using HADR for log shipping to always keep its databases in sync with the source. It is important to note that a single Standby instance (dSource) can contain multiple databases from multiple different servers and instances as long as each database has a unique name.
2. Users can opt to configure SSL with the HADR connection to enhance security by encrypting data-in-transit between the primary and the standby databases.
3. The users can opt for the "Staging Push" feature by selecting the checkbox "Use Staging Push". With this feature, the user can manage the restore and roll forward of a staging database without involving the Delphix Engine.
4. Users can opt for a non-HADR method of database ingestion. The database will be ingested to a standalone staging host and the user can trigger a resynchronization operation with a most recent online full backup to keep the staging database up to date with the source database.
5. Users can opt for the Delphix Recovery with the end user Supplied Archive Logs method. During an update, the dSource user can trigger a snapshot operation where user-provided archive logs will get applied to the staging database.
6. Optionally, when the DPF feature is in use, users can use the "Archive Logs" feature. Users need to place archive logs inside a folder with a name as NODE<Partition number> where <Partition number> is a four-digit number. For example, if the source environment has two partitions then the user-provided log path will have folder names NODE0000 and NODE0001. Both the folders will have respective archive logs. Snapshot operation will be used to apply the archive logs.

Delphix HADR standby configuration may not meet Db2 DR requirements and should only be used for Delphix use cases.

9.5.7.2.12 Banners

Banners are any kind of messages that are printed from commands or scripts that are executed on a new session. They are mainly used to print welcome messages or information regarding the host when you start a new session. There are four ways to accomplish this,

1. Print statements in `.profile` `/etc/motd` .
2. SSH banner configured under `/etc/ssh/sshd_config` .
3. Print statements in `.bashrc` .
4. Adding print statements or commands that return strings in `.bashrc` .
5. can hurt the execution of the connector's workflows and also basic unix commands such as scp or rsync, etc. Therefore, it is extremely important to avoid using print statements in the `.bashrc` file.

9.5.8 IBM Db2 FAQs

9.5.8.1 What are the best practices for taking a backup?

The following best practices can help improve backup and restore performance:

1. Compression should be enabled
2. The following parameters should be optimally configured:
 - Utility Heap Size (UTIL_HEAP_SZ)
 - No. of CPUs
 - No. of Table Spaces
 - Extent Size
 - Page Size
3. Parallelism & Buffer configuration may be used to improve backup performance. Parameters that should be configured are:
 - Parallelism
 - Buffer Size
 - No. of Buffers

More information about backup best practices is available in [IBM Knowledge Center](#)⁴⁰⁰.

9.5.8.2 How to take a full online backup of a db2 database?

For the examples below we are using the database name as TEST and location as '/backup_dir'. If no path is provided backups will be generated in the current directory.

Non-DPF backups

```
db2 backup db TEST online to /backup_dir compress include logs
```

DPF, SSV backups

```
db2 backup db TEST ON ALL DBPARTITIONNUMS online to /backup_dir compress include logs
```

DPF, NONSSV backups

```
db2_all "db2 backup db TEST online to /backup_dir compress include logs"
```

⁴⁰⁰ https://www.ibm.com/support/knowledgecenter/en/SSEPGG_10.5.0/com.ibm.db2.luw.admin.ha.doc/doc/c0006205.html

Multi-part backup

```
b2 backup db TEST online to /backup_dir1,/backup_dir2,/backup_dir3 compress include
logs
```

9.5.8.3 What is the user-side validation prior to the snapshot?

User-side validation prior to a snapshot operation:

- The user must validate the backup files using db2ckbkp utility on the staging host.
- The user must validate the archive logs using db2cklog utility on the staging host.
- The authenticity of archive logs would be managed by the user.
- The user has to provide the first active log at the staging database log directory location after applying the logs.
- If there is a scenario where a user performed some load copy (non-logged transactions) operations on the source side then it's the responsibility of the user to make those non-logged transactions available on the staging database.

9.5.8.4 How to use the Delphix Continuous Data Engine key pair?

Perform the following steps to use the Delphix Continuous Data Engine key pair:

1. Select **Public Key** for the **Login Type**.
2. Click **View Public Key**.
3. Copy the public key that is displayed, and append it to the end of your `~/.ssh/authorized_keys` file. If this file does not exist, you must create it.
 - a. Run `chmod 600 ~/.ssh/authorized_keys` to allow only the file's owner to read and write to it (make sure the file is owned by you).
 - b. Run `chmod 755 ~` to restrict access to your home directory so that no other may write to it.
 - c. Run `chmod 700 ~/.ssh` so that others cannot write to it. The `~/.ssh` directory is not writable by group or others. Otherwise, authentication will fail.

9.5.8.5 How to update the Db2 version level?

This is applicable only when the target environment is using a different Db2 fix pack level than the source. Consider the following scenarios for the optional prerequisite mentioned above:

1. if your source environment uses Db2 version 11.5.5 and your target environment uses Db2 11.5.8 or a later fix pack, you need to update the databases in the target environment.
2. If your databases were created or upgraded to Db2 Version 11.1 GA and you applied Db2 Version 11.1 Fix Pack 1 or later, then running the above command will automatically apply all updates required from Version 11.1 GA up to and including the fix pack level that you are installing.

3. To know how to update databases, see [db2updv115 - Update database to Version 11.5 mod pack command](#)⁴⁰¹
4. Certain database or instance operations are restricted while an online fix pack update is in progress.
5. See [db2updv111 - Update database to Version 11.1 fix pack command](#)⁴⁰², which mentions it is mandatory to run db2updv111 on the database if one is coming from a higher version of fix pack to Lower OR vice versa.
6. For more information, you can also refer: [Update the databases for a Db2 11.1.x fix pack](#)⁴⁰³

If your source environment uses version 11.1.x and your target is to be upgraded to 11.5.x, following are the steps to perform for an in-place upgrade of dsource and VDB.

9.5.8.6 How to match the DB2 common directory when the target host is added in multiple Delphix Continuous Data Engines?

The connector path directory structure is as follows in the target host `<toolkit path>/<Delphix_COMMON>/DB2_18f4ff11-b758-4bf2-9a37-719a22f5a4b8/logs/<instance name>`. However, if there are multiple Delphix Continuous Data Engines using this target, then multiple common directories are created on the target host like this (three engines access the same target and plugin code):

```
delphix@support-tools:/nas/support/truist/69459$ ls -lart
total 875888
drwxrwxr-x  8 delphix delphix    8192 Oct 20 11:54
Delphix_COMMON_17b1429568c0_290c7f251296_28_host/
drwxrwxr-x  8 delphix delphix    8192 Oct 20 11:59
Delphix_COMMON_ce55f7389c2d_7e296fa53e07_24_host/
drwxrwxr-x  8 delphix delphix    8192 Oct 20 12:04
Delphix_COMMON_cd1f039b057f_63d00dbd3271_22_host/
drwxrwx---  5 delphix delphix    152 Oct 27 11:59
Delphix_cd1f039b057f_63d00dbd3271_23_host/
```

To identify the common directory corresponding to the Delphix Continuous Data Engine:

- Collect the Engine UUID (You can get "Server ID" from the GUI "About" menu). In this case Engine UUID is:

```
421de915-558f-68a1-fac8-cd1f039b057f
```

- Take the last group of numbers:

```
cd1f039b057f
```

⁴⁰¹ <https://www.ibm.com/docs/en/db2/11.5?topic=sc-db2updv115-update-database-version-115-fix-pack-command>

⁴⁰² <https://www.ibm.com/docs/en/db2/11.1?topic=sc-db2updv111-update-database-version-111-fix-pack-command>

⁴⁰³ <https://www.ibm.com/docs/hr/opw/8.2.0?topic=db2-update-databases-111x-fix-pack>

- Match this group with the FIRST group of numbers following the "COMMON_" characters in the directory name, and in this case it is:

```
De\lphix_COMMON_cd1f039b057f_63d00dbd3271_22_host
```

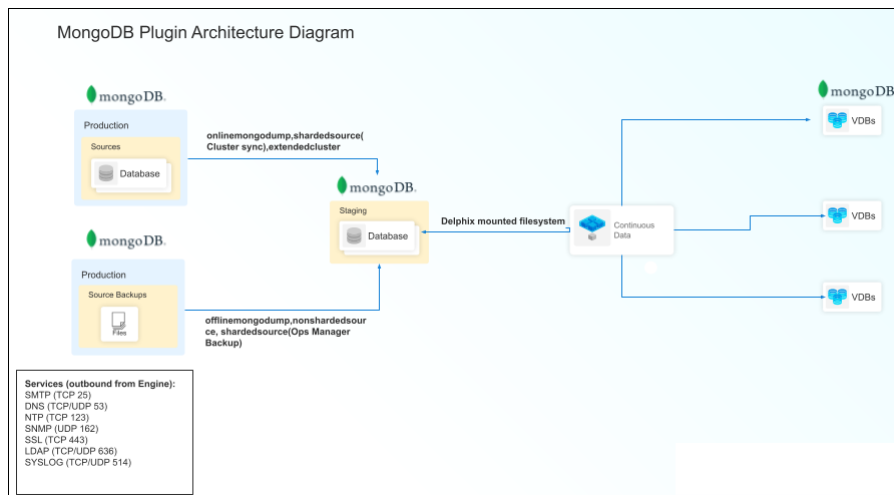

9.6 MongoDB data sources

This section contains the following pages that will help with creating MongoDB data sources (dSources) in Delphix Continuous Data.

- [MongoDB virtualization process \(see page 1311\)](#)
- [MongoDB ingestion types \(see page 1315\)](#)
- [MongoDB requirements and prerequisites \(see page 1317\)](#)
- [MongoDB installation and upgrade \(see page 1327\)](#)
- [MongoDB connector operations \(see page 1330\)](#)
- [Provisioning MongoDB virtual databases \(VDBs\) \(see page 1353\)](#)
- [MongoDB logging \(see page 1357\)](#)
- [MongoDB developer's guide \(see page 1358\)](#)

9.6.1 MongoDB virtualization process

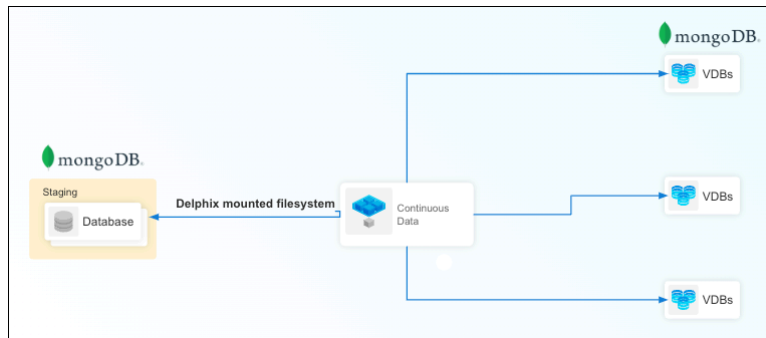

The Delphix MongoDB connector solution uses a staging architecture. In this solution, the source (production) database is copied to a staging environment. The staging environment's database is ingested by the Delphix Continuous Data Engine, which then enables virtualized copies on a target environment.

The MongoDB connector supports the following ingestion mechanisms:

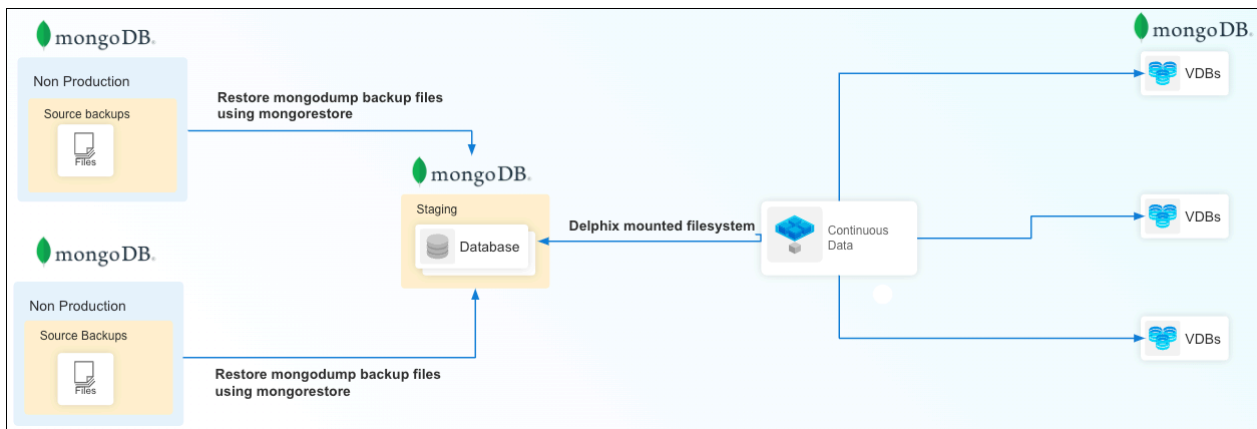

9.6.1.1 seed

This data ingestion type is used for pure development purposes. There is no source instance associated with it. It creates an empty instance, which is managed by the Delphix continuous Data Engine, and helps to create virtual MongoDB instances to avail benefits of all its features.

9.6.1.2 offlinemongodump

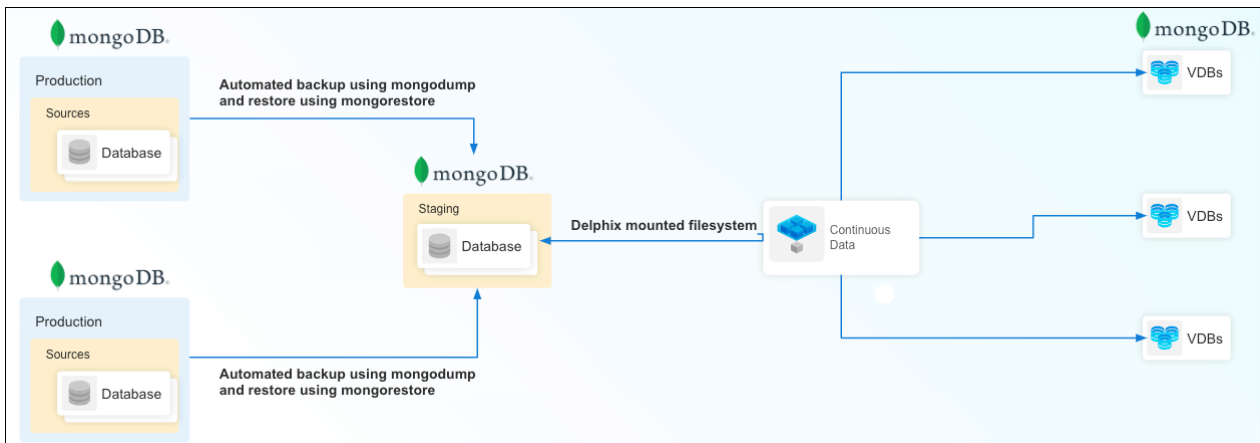

This staging database is created using `mongodump` backup file(s) of the source MongoDB instance. It helps to create a staging database using zero touch production (defined in the [MongoDB ingestion types](#)⁴⁰⁴ page). You can load periodic backups to create a dSource timeflow.

9.6.1.3 onlinemongodump

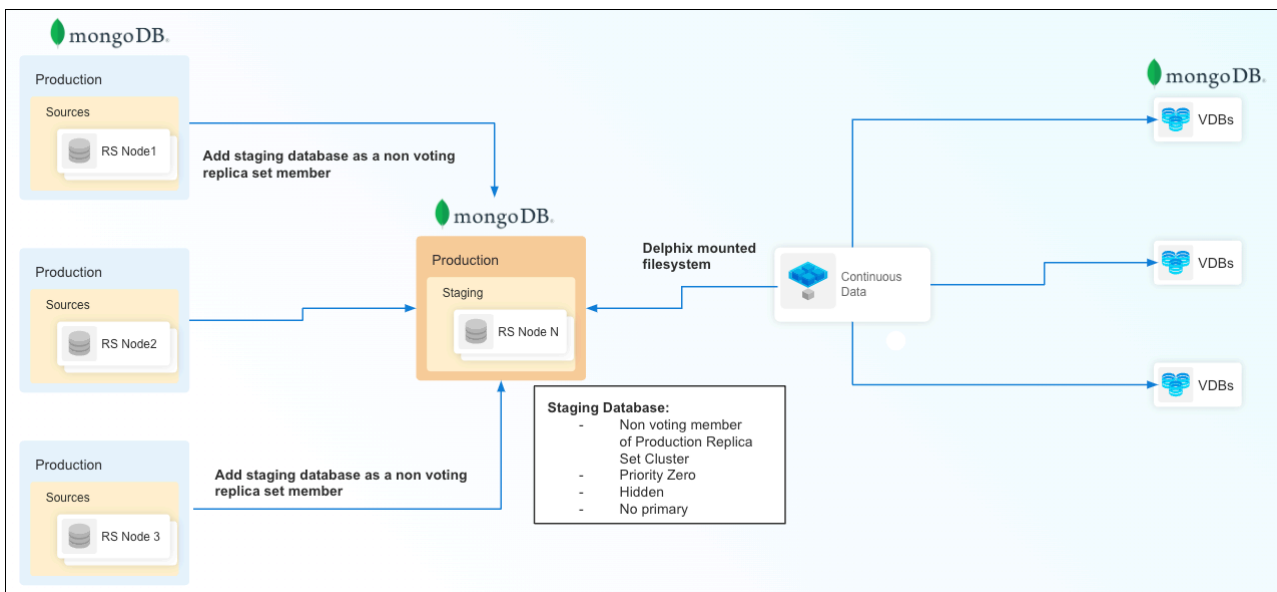

This staging database is created using a `mongodump` online backup of source MongoDB instance. You can schedule a policy to capture periodic backups and generate a dSource timeflow.

404 <https://cd.delphix.com/docs/latest/mongodb-ingestion-types>

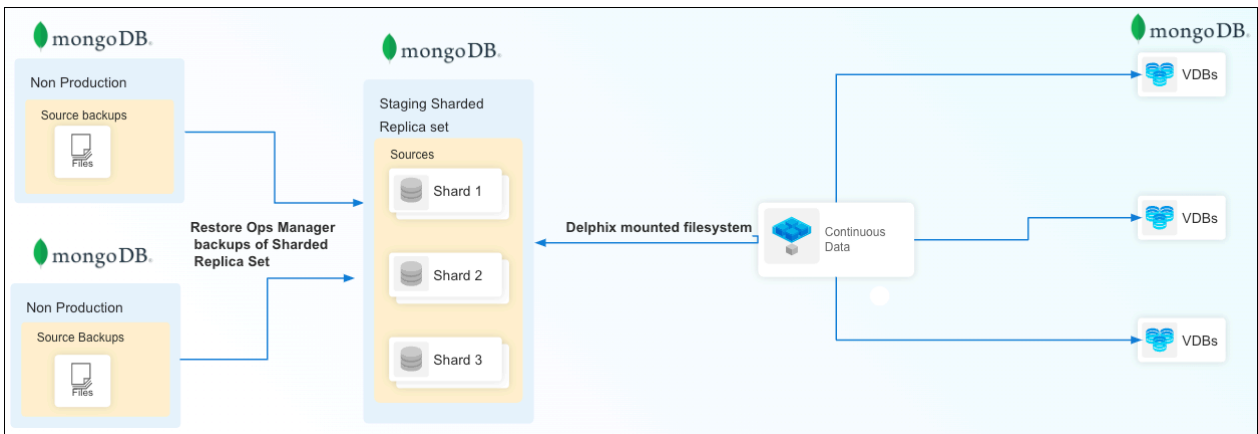

9.6.1.4 extendedcluster

This staging database is created by adding a secondary member to the existing source cluster. This member does not participate in voting and never becomes primary, nor serves any read operations. It's the fastest way of capturing incrementals. You can setup a policy to take snapshots to generate a dSource timeflow.

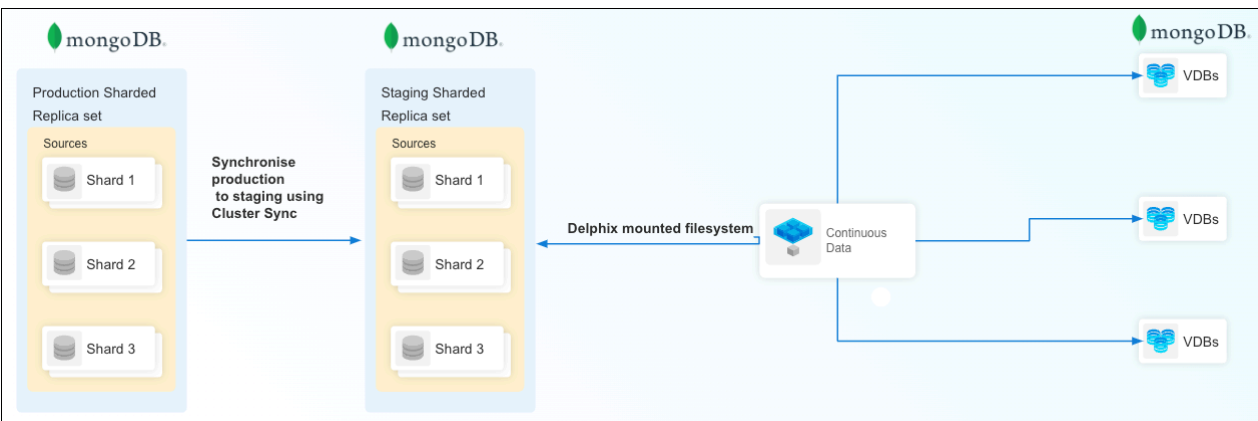

9.6.1.5 shardedsource (using MongoDB Ops Manager backup files)

This staging database is created using backup files of the source MongoDB instances created by MongoDB Ops Manager. It helps to create a staging database using zero-touch production. You can load periodic backups to create a dSource timeflow.

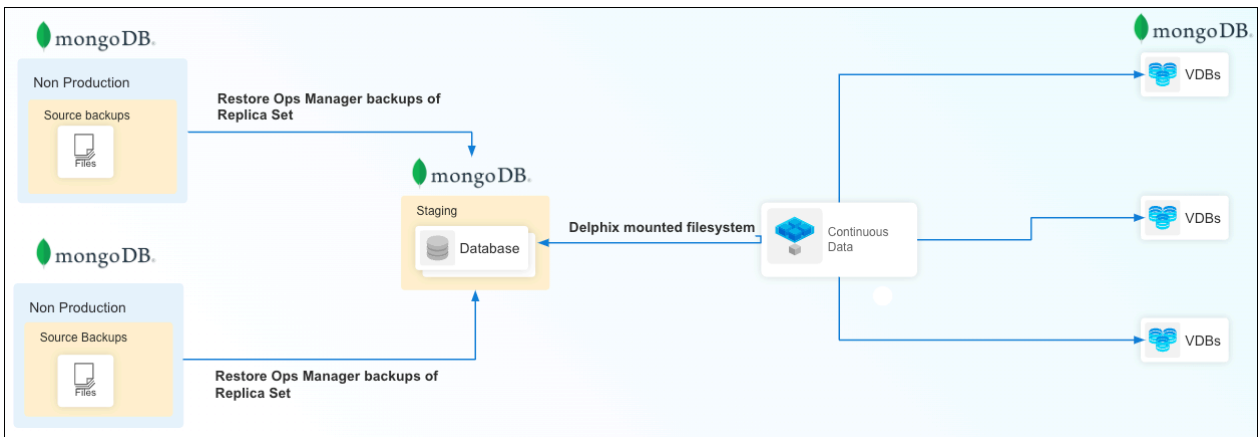

9.6.1.6 shardedsource (using cluster-to-cluster sync)

This staging database is created by setting up a MongoSync synchronization pipeline between the staging database and source sharded cluster. It is the fastest way of capturing incrementals of a sharded cluster. You can set a policy to take snapshots to generate a dSource timeflow.

9.6.1.7 nonshardedsource (using MongoDB Ops Manager backup files)

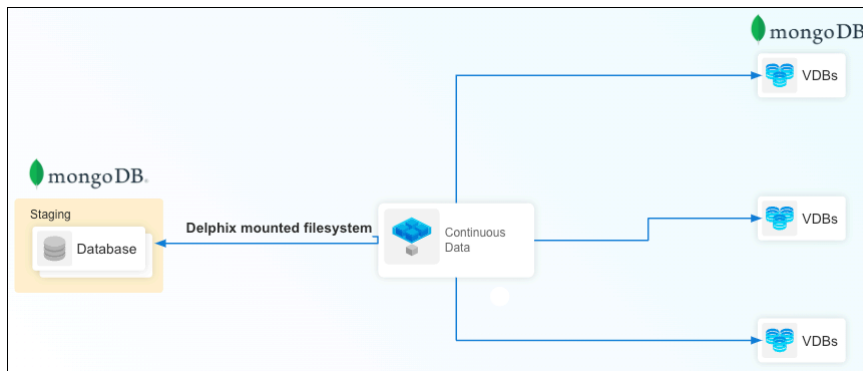

This staging database is created using a backup file of a source MongoDB instance created by MongoDB Ops Manager. It helps to create staging database using zero touch production. You can load periodic backups to create a dSource timeflow.

9.6.1.8 stagingpush

This staging database can be created in multiple ways. It varies based on the use cases. It can be created manually, by copying files at o/s level, or using tools like MongoDB Ops Manager.

Delphix Continuous Data Engine only exhibits the operations needed to capture data. It is your responsibility to create or delete the MongoDB instance on the staging host.

9.6.2 MongoDB ingestion types

The following table describes the MongoDB ingestion types with additional details, like **Mechanism**, **Topology**, whether or not it's **Zero Touch Production**, and whether or not it **Supports Incrementals**.

- Zero Touch Production (Y) = Interaction with source server is not required by Delphix Continuous Data Engine.

- Zero Touch Production (N) = Interaction with source server is needed by Delphix Continuous Data Engine. Delphix Continuous Data Engine expects connection to source using credentials etc.

dSource Type	Mechanism	Topology	Zero Touch Production	Description	Support Incrementals
seed	New ReplicaSet Instance	ReplicaSet	N/A	New empty MongoDB instance created by the Delphix Continuous Data Engine. This is for development of new applications without ingesting data from any source.	N/A
extendedcluster	Add member to existing replica set	ReplicaSet	N	Add member to existing source replica set. Instant and near real time incremental data capture in the Delphix Continuous Data Engine.	Y
onlinemongodump	Automated mongodump backups	ReplicaSet	N	Delphix Continuous Data Engine connects to source from staging environments, executes mongodump utility and captures source data. Delphix Continuous Data Engine captures all databases from the MongoDB instance.	N
offlinemongodump	Manual mongodump backups	ReplicaSet	Y	Delphix Continuous Data Engine leverages existing mongodumps made available to staging host.-	N

shardedsource	MongoDB Ops Manager Backups	Sharded	Y	Delphix Continuous Data Engine leverages existing MongoDB ops manager backups of sharded source as backup files presented to staging host.	N
